In less than a month from the writing of this story, something very unusual and unexpected happened to me. A manuscript was returned by the editor of the periodical in which "His Wife's Deceased Sister" had appeared. "It is a good story," he wrote, "but not equal to what you have just done. You have made a great hit, and it would not do to interfere with the reputation you have gained, by publishing anything inferior to 'His Wife's Deceased Sister,' which has had such a deserved success."

I was so unaccustomed to having my work thrown back on my hands that I think I must have turned a little pale when I read the letter. I said nothing of the matter to my wife, for it would be foolish to drop such grains of sand as this into the smoothly oiled machinery of our domestic felicity. But I immediately sent the story to another editor. I am not able to express the astonishment I felt when, in the course of a week, it was sent back to me. The tone of the note accompanying it indicated a somewhat injured feeling on the part of the editor. "I am reluctant," he said, "to decline a manuscript from you, for you know very well that if you sent me anything like 'His Wife's Deceased Sister' it would be most promptly accepted."

I now felt obliged to speak of the affair to my wife, who was quite as much surprised, though perhaps not quite as much shocked, as I had been.

"Let us read the story again," she said, "and see what is the matter with it."

When we had finished its perusal, Hypatia remarked: "It is quite as good as many of the stories you have had printed, and I think it very interesting, although, of course, it is not equal to 'His Wife's Deceased Sister.'"

"Of course not," said I; "that was an inspiration that I cannot expect every day. But there must be something wrong about this last story which we do not perceive. Perhaps my recent success may have made me a little careless in writing it."

"I don't believe that," said Hypatia.

"At any rate," I continued, "I will lay it aside, and will go to work on a new one."

In due course of time I had another manuscript finished, and I sent it to my favorite periodical. It was retained some weeks, and then came back to me. "It will never do," the editor wrote quite warmly, "for you to go backward. The demand for the number containing 'His Wife's Deceased Sister' still continues, and we do not intend to let you disappoint that great body of readers who would be so eager to see another number containing one of your stories."

I sent this manuscript to four other period-

icals, and from each of them it was returned with remarks to the effect that, although it was not a bad story in itself, it was not what they would expect from the author of "His Wife's Deceased Sister."

The editor of a western magazine wrote to me for a story, to be published in a special number which he would issue for the holidays. I wrote him one of the character and length he asked for, and sent it to him. By return mail it came back to me. "I had hoped," the editor wrote, "when I asked for a story from your pen, to receive something like 'His Wife's Deceased Sister,' and I must own that I am very much disappointed."

I was so filled with anger when I read this note that I openly objurgated "His Wife's Deceased Sister."

"You must excuse me," I said to my astonished wife, "for expressing myself thus in your presence, but that confounded story will be the ruin of me yet. Until it is forgotten, nobody will ever take anything I write."

"And you cannot expect it ever to be forgotten," said Hypatia, with tears in her eyes.

It is needless for me to detail my literary efforts in the course of the next few months. The ideas of the editors with whom my principal business had been done, in regard to my literary ability, had been so raised by my unfortunate story of "His Wife's Deceased Sister" that I found it was of no use to send them anything of lesser merit; and as to the other journals which I tried, they evidently considered it an insult for me to send them matter inferior to that by which my reputation had lately risen. The fact was that my successful story had ruined me. My income was at an end, and want actually stared me in the face; and I must admit that I did not like the expression of its countenance. It was of no use for me to try to write another story like "His Wife's Deceased Sister." I could not get married every time I began a new manuscript, and it was the exaltation of mind caused by my wedded felicity which had produced that story.

"It's perfectly dreadful," said my wife. "If I had had a sister, and she had died, I would have thought it was my fault."

"It could not be your fault," I answered, "and I do not think it was mine. I had no intention of deceiving anybody into the belief that I could do that sort of thing every time, and it ought not to be expected of me. Suppose Raphael's patrons had tried to keep him screwed up to the pitch of the Sistine Madonna, and had refused to buy anything which was not as good as that. In that case I think he would have occupied a much earlier

and narrower grave than that on which Mr. Morris Moore hangs his funeral decorations."

"But, my dear," said Hypatia, who was posted on such subjects, "the Sistine Madonna was one of his latest paintings."

"Very true," said I; "but if he had married as I did, he would have painted it earlier."

I was walking homeward one afternoon about this time, when I met Barbel, a man I had known well in my early literary career. He was now about fifty years of age, but looked older. His hair and beard were quite gray, and his clothes, which were of the same general hue, gave me the idea that they, like his hair, had originally been black. Age is very hard on a man's external appointments. Barbel had an air of having been to let for a long time, and quite out of repair. But there was a kindly gleam in his eye, and he welcomed me cordially, and on his invitation I went with him to his room. It was at the top of a very dirty and well-worn house, which stood in a narrow and lumpy street, into which few vehicles ever penetrated except the ash and garbage carts, and the rickety wagons of the venders of stale vegetables.

"This is not exactly a fashionable promenade," said Barbel, as we approached the house, "but in some respects it reminds me of the streets in Italian towns, where the palaces lean over toward each other in such a friendly way."

Barbel's room was, to my mind, rather more doleful than the street. It was dark, it was dusty, and cobwebs hung from every corner. The few chairs upon the floor, and the books upon a greasy table, seemed to be afflicted with some dorsal epidemic, for their backs were either gone or broken. A little bedstead in the corner was covered with a spread made of New York "Heralds," with their edges pasted together.

"There is nothing better," said Barbel, noticing my glance toward this novel counterpane, "for a bed-covering than newspapers. They keep you as warm as a blanket, and are much lighter."

The only part of the room which was well lighted was at one end near the solitary window. Here, upon a table with a spliced leg, stood a little grindstone.

"At the other end of the room," said Barbel, "is my cook-stove, which you can't see unless I light the candle in the bottle which stands by it; but if you don't care particularly to examine it I won't go to the expense of lighting up. You might pick up a good many odd pieces of bric-à-brac around here, if you chose to strike a match and investigate, but I would not advise you to do so. It would pay better to throw the things out of the win-

dow than to carry them down stairs. The particular piece of in-door decoration to which I wish to call your attention is this." And he led me to a little wooden frame which hung against the wall near the window. Behind a dusty piece of glass it held what appeared to be a leaf from a small magazine or journal. "There," said he, "you see a page from 'The Grasshopper,' a humorous paper which flourished in this city some half dozen years ago. I used to write regularly for that paper, as you may remember."

"Oh yes, indeed," I exclaimed. "And I shall never forget your 'Conundrum of the Anvil,' which appeared in it. How often have I laughed at that most wonderful conceit, and how often have I put it to my friends."

Barbel gazed at me silently for a moment, and then he pointed to the frame.

"That printed page," he said solemnly, "contains the 'Conundrum of the Anvil.' I hung it there so that I can see it while I work. That conundrum ruined me. It was the last thing I wrote for 'The Grasshopper.' How I ever came to imagine it, I cannot tell. It is one of those things which occur to a man but once in a life-time. After the wild shout of delight with which the public greeted that conundrum, my subsequent efforts met with hoots of derision. 'The Grasshopper' turned its hind legs upon me. I sank from bad to worse,—much worse,—until at last I found myself reduced to my present occupation, which is that of grinding points to pins. By this I procure my bread, coffee, and tobacco, and sometimes potatoes and meat. One day, while I was hard at work, an organ-grinder came into the street below. He played the serenade from *Trovatore*, and the familiar notes brought back visions of old days and old delights, when the successful writer wore good clothes, and sat at operas; when he looked into sweet eyes, and talked of Italian airs; when his future appeared all a succession of bright scenery and joyous acts, without any provision for a drop-curtain. And as my ear listened, and my mind wandered in this happy retrospect, my every faculty seemed exalted, and, without any thought upon the matter, I ground points upon my pins so fine, so regular, and smooth, that they would have pierced with ease the leather of a boot, or slipped, without abrasion, among the finest threads of rare old lace. When the organ stopped, and I fell back into my real world of cobwebs and mustiness, I gazed upon the pins I had just ground, and without a moment's hesitation threw them into the street, and reported the lot as spoiled. This cost me a little money, but it saved me my livelihood."

After a few moments of silence Barbel re-

sumed: "I have no more to say to you, my young friend. All I want you to do is to look upon that framed conundrum, then upon this grindstone, and then to go home and reflect. As for me, I have a gross of pins to grind before the sun goes down."

I cannot say that my depression of mind was at all relieved by what I had seen and heard. I had lost sight of Barbel for some years, and I had supposed him still floating on the sun-sparkling stream of prosperity, where I had last seen him. It was a great shock to me to find him in such a condition of poverty and squalor, and to see a man who had originated the "Conundrum of the Anvil" reduced to the soul-depressing occupation of grinding pin-points. As I walked and thought, the dreadful picture of a totally eclipsed future arose before my mind. The moral of Barbel sank deep into my heart.

When I reached home I told my wife the story of my friend Barbel. She listened with a sad and eager interest.

"I am afraid," she said, "if our fortunes do not quickly mend, that we shall have to buy two little grindstones. You know I could help you at that sort of thing."

For a long time we sat together and talked, and devised many plans for the future. I did not think it necessary yet for me to look out for a pin contract, but I must find some way of making money or we should starve to death. Of course the first thing that suggested itself was the possibility of finding some other business; but, apart from the difficulty of immediately obtaining remunerative work in occupations to which I had not been trained, I felt a great and natural reluctance to give up a profession for which I had carefully prepared myself, and which I had adopted as my life-work. It would be very hard for me to lay down my pen forever, and to close the top of my inkstand upon all the bright and happy fancies which I had seen mirrored in its tranquil pool. We talked and pondered the rest of that day and a good deal of the night, but we came to no conclusion as to what it would be best for us to do.

The next day I determined to go and call upon the editor of the journal for which, in happier days, before the blight of "His Wife's Deceased Sister" rested upon me, I used most frequently to write; and, having frankly explained my condition to him, to ask his advice. The editor was a good man, and had always been my friend. He listened with great attention to what I told him, and evidently sympathized with me in my trouble.

"As we have written to you," he said, "the only reason why we did not accept the manuscripts you sent us was, that they would

have disappointed the high hopes that the public had formed in regard to you. We have had letter after letter asking when we were going to publish another story like 'His Wife's Deceased Sister.' We felt, and we still feel, that it would be wrong to allow you to destroy the fair fabric which yourself has raised. But," he added, with a kind smile, "I see very plainly that your well-deserved reputation will be of little advantage to you if you are to starve at the moment that its genial beams are, so to speak, lighting you up."

"Its beams are not genial," I answered. "They have scorched and withered me."

"How would you like," said the editor, after a short reflection, "to allow us to publish the stories you have recently written under some other name than your own? That would satisfy us and the public; would put money in your pocket, and would not interfere with your reputation."

Joyfully I seized that noble fellow by the hand and instantly accepted his proposition. "Of course," said I, "a reputation is a very good thing; but no reputation can take the place of food, clothes, and a house to live in; and I gladly agree to sink my over-illuminated name into oblivion, and to appear before the public as a new and unknown writer."

"I hope that need not be for long," he said, "for I feel sure that you will yet write stories as good as 'His Wife's Deceased Sister.'"

All the manuscripts I had on hand I now sent to my good friend the editor, and in due and proper order they appeared in his journal under the name of John Darmstadt, which I had selected as a substitute for my own, permanently disabled. I made a similar arrangement with other editors, and John Darmstadt received the credit of everything that proceeded from my pen. Our circumstances now became very comfortable, and occasionally we even allowed ourselves to indulge in little dreams of prosperity.

Time passed on very pleasantly one year; another, and then a little son was born to us. It is often difficult, I believe, for thoughtful persons to decide whether the beginning of their conjugal career or the earliest weeks in the life of their first-born be the happiest and proudest period of their existence. For myself, I can only say that the same exaltation of mind, the same rarefaction of idea and invention, which succeeded upon my wedding day, came upon me now. As then, my ecstatic emotions crystallized themselves into a motive for a story, and, without delay, I set myself to work upon it. My boy was about six weeks old when the manuscript was finished; and one evening, as we sat before a

comfortable fire in our sitting-room, with the curtains drawn and the soft lamp lighted, and the baby sleeping soundly in the adjoining chamber, I read the story to my wife.

When I had finished, my wife arose, and threw herself into my arms. "I was never so proud of you," she said, her glad eyes sparkling, "as I am at this moment. That is a wonderful story! It is, indeed! I am sure it is just as good as 'His Wife's Deceased Sister.'"

As she spoke these words, a sudden and chilling sensation crept over us both. All her warmth and fervor, and the proud and happy glow engendered within me by this praise and appreciation from one I loved, vanished in an instant. We stepped apart, and gazed upon each other with pallid faces. In the same moment the terrible truth had flashed upon us both:

This story *was* as good as "His Wife's Deceased Sister"!

We stood silent. The exceptional lot of Barbel's super-pointed pins seemed to pierce our very souls. A dreadful vision rose before me of an impending fall and crash, in which our domestic happiness should vanish, and our prospects for our boy be wrecked just as we had begun to build them up.

My wife approached me, and took my hand in hers, which was as cold as ice. "Be strong and firm!" she said. "A great danger threatens us, but you must brace yourself against it. Be strong and firm!"

I pressed her hand, and we said no more that night.

The next day I took the manuscript I had just written, and carefully folded it in stout

wrapping paper. Then I went to a neighboring grocery store, and bought a small strong tin box, originally intended for biscuit, with a cover that fitted tightly. In this I placed my manuscript; and then I took the box to a tinsmith, and had the top fastened on with hard solder. When I went home I ascended into the garret, and brought down to my study a ship's cash-box, which had once belonged to one of my family who was a sea-captain. This box was very heavy, and firmly bound with iron, and was secured by two massive locks. Calling my wife, I told her of the contents of the tin case, which I then placed in the box; and having shut down the heavy lid, I doubly locked it.

"This key," said I, putting it in my pocket, "I shall throw into the river when I go out this afternoon."

My wife watched me eagerly, with a pallid and firm-set countenance, but upon which I could see the faint glimmer of returning happiness.

"Wouldn't it be well," she said, "to secure it still further by sealing-wax and pieces of tape?"

"No," said I; "I do not believe that any one will attempt to tamper with our prosperity. And now, my dear," I continued in an impressive voice, "no one but you and, in the course of time, our son shall know that this manuscript exists. When I am dead, those who survive me may, if they see fit, cause this box to be split open, and the story published. The reputation it may give my name cannot harm me then."

Frank R. Stockton.

TOPICS OF THE TIME.

The Difficulty of Political Reform.

THE difficulty of effecting political reforms is illustrated in every age, and is a frequent source of discouragement to those actually engaged in such work. Even simple reforms often require years for their accomplishment, while greater ones are sometimes delayed for generations. Nothing could be much simpler or more obviously advantageous, for instance, than the administrative reforms that have so long been desired in this country; yet, after more than twenty years of discussion and agitation, these reforms are only just begun. Among the greater political movements we may mention that for the abolition of slavery, which had continued for nearly a generation before public sentiment was thoroughly aroused. In this case, indeed, there was a powerful interest arrayed against the reformers; but the

strangest circumstance in the case was the prolonged opposition or apathy of the people of the free States themselves. Another remarkable example of the difficulty of reform was seen in the case of the anti-corn-law movement in England. The abolition of the corn-laws was obviously for the benefit of the mass of the English people; yet it is matter of history that at first the people could not be brought to take an interest in the reform, and that the difficulty of effecting it was so great that at one time Cobden himself, the great leader of the movement, was on the point of abandoning the task in despair. We think that few instances can be found in history of important improvements in political affairs without a prolonged and persistent agitation in advance.

The reasons for this fact are various. The sluggishness of public opinion, the opposition of sinister interests, the absorption of men's minds in their personal

affairs, and that pride of opinion which makes men unwilling to acknowledge that anything they have approved or sanctioned can be wrong, all have an influence in keeping things as they are, even when a change is imperatively required. The fact, too, that most men are impervious to new ideas after they have reached middle life is an essential factor in the case; and it not infrequently happens that a new generation has to be trained up in the reform principles before any outward improvement can be effected.

Our purpose at this time, however, is not to inquire into the causes which render political changes difficult, but to point out certain circumstances which, in a free country, go far to compensate the evil, and which deserve to be accounted among the benefits of free government. Some men, seeing the difficulty of moving public opinion in a democratic community, and eager to effect improvements in political affairs, are led to doubt the wisdom of popular government, and to say that a benevolent despot and an enlightened aristocracy is a better depository of political power than the people themselves. But, besides the difficulty of securing benevolence in a despot or enlightenment in an aristocracy, history shows that even if they possess these qualities, they are less easily moved to effect reforms than the people themselves.

There have been benevolent despots who effected nothing for the political improvement of the nations they governed. The Antonines, for instance, were among the best personal rulers the world ever saw; yet they did nothing of importance in the way of political reforms, but left the Roman empire as they found it. As for aristocracies, though they often administer the government with much intelligence so far as their own interests are concerned, they are, nevertheless, the most conservative, the most bigotedly opposed to progress of all the species of government that ever existed, as the history of Sparta, Carthage, and Venice abundantly proves. The states that have been most largely and most uniformly progressive have been without exception those of a popular character, or those in which popular influence has been powerfully felt; and therefore the impatience that earnest reformers sometimes feel at the sluggishness and perversity of the popular mind ought never to make them lose faith in the benefits of free government.

But even if monarchs and aristocracies were as active friends of progress and as ready to effect improvements as popular governments are, yet improvements made through the agency of the people are far more beneficial than those effected without them. For, in the first place, reforms effected by the people themselves, or in accordance with their deliberate desire, are likely to be permanent; while if not thus effected, their permanence is uncertain. A benevolent monarch may make great improvements in laws and institutions, and thereby largely promote the well-being of the people; but if his successor happens to be a man of a different stamp, as is quite likely to be the case, all the improvements thus made may be set aside, and the condition of the people may become worse than before. Besides, the government of a nation, even under an absolute monarch, is largely influenced by public opinion; and if public opinion has not been educated to approve and support a reform, it may be set aside or rendered nugatory by the opposition of the people

themselves. There are even instances in history where a nation has surrendered liberty itself, simply because the mass of the people had not learned to appreciate its value. But, under a popular government, where no considerable change can be made without the concurrence of the people, a reform once effected is very rarely reversed. So well is this understood in England, that when an important measure has been carried there with the express approval of the people, no statesman ever thinks of repealing it, but the popular decision is everywhere accepted as final. This, then, is one of the benefits of free government—that political improvements once effected are certain to endure; and in this fact reformers may find encouragement when their temper is tried and their patience exhausted by the sluggishness of public opinion and the seeming dullness of the popular conscience.

But there is another consideration of still greater importance. The general and prolonged discussion which necessarily precedes reform in a popular government has an educating effect of the highest value. This has long been recognized by political philosophers as one of the principal benefits that popular government confers, and the history of such government in all ages bears out this view. Even the routine work of government, such as the conduct of municipal affairs, has an educating influence of no little value; but it is far surpassed in this respect by those discussions of principle which necessarily precede the enactment of great reforms. Questions involving the principles of morals and the happiness perhaps of millions cannot be pondered by any man without improving to some extent both his intellect and his character; and this educating influence is especially valuable in the case of the masses of men, because of the narrowness of their mental horizon. Men of leisure and men of intellectual tastes can find means of culture and mental stimulus in various ways; but the minds of the uneducated and toiling masses are seldom roused to thought except by some matter of great practical importance. Now, political affairs are of the highest importance to every one; and hence, in a country where the control of affairs is lodged in the hands of the people, the educating influence of political discussion and action is felt in a high degree, and is one of the most potent means of popular culture. This influence cannot be made available except under popular government; for the people will seldom take a very lively interest in governmental affairs if they are not to be called upon to help in deciding them. But if their voice is potent in deciding what shall be done, no question of importance can arise in which they will not take an interest; and then the discussion of such questions by the more instructed minds will quicken the popular intelligence and educate the popular conscience as few other agencies will.

When, therefore, the advocates of political reform in a free country grow discouraged, as they sometimes will, and wish, perhaps, that they themselves had independent power to carry out their measures, they may find comfort in the thought that while the reforms they desire, if really beneficial, can hardly fail to be realized at last, the mere discussion of them before the people has an effect on the popular mind that may be little less important than the reforms themselves.

Religious Snobbery.

THERE is a tone in the manner in which some men preach religion that may be called demagogical. It is, as it were, an ignoble bidding for votes, an appeal to something not the best in the man who is listening in order to win his sympathy and suffrage. It is a spirit that ignores the decent instincts of human nature; that does not hesitate to offend the refined listener, while catering to the prejudices and vulgarities of the more ignorant and brutal. It is a kind of preaching that has not even the excuse of being based on the dangerous principle of doing evil that good may come. It is the preaching of vulgarians, who naturally express themselves in terms that are coarse, and who are, moreover, bent upon making effects by fair means or foul. They are themselves vulgar by nature, and their determination to be effective carries them into oratorical excesses, unmitigated either by taste or conscience. We could give numerous and recent examples of demagogical preaching of the Gospel, but we should then be compelled to disfigure our page with vulgarities, and even with shameless blasphemies.

On the other hand, there is a certain kind of religious snobbery which is not altogether unknown in America, but which has hitherto taken no very deep root here. That it is not a wide-spread or serious social disease in this country may be inferred from the fact that our fiction does not often deal with examples of this sort of snobbery, though the thing is, of course, by no means unknown, and is perhaps yet to receive the treatment it deserves at the hands of our story-writers.

Native religious snobbery does not flourish among us very vigorously, nor does the plant give signs of powerful growth in its exotic varieties. We are led to this statement by the comparative non-success, on this side of the water, of one who has been called in England "the apostle to the genteel." This apostle (famous not only socially, but by means also of the glamour wrought by the pen of an eminent romancer) came among us not long ago and began at once a public career of interviewing and lecturing. In the natural course of events, a number of "wealthy" and "fashionable" (in lieu of "noble") converts should have adorned the mission of the distinguished apostle. So far, however, we have heard of few or no "conversions," and we have been led to consider the cause. As nearly as we can determine, this cause lies in the fact that Americans recognized immediately the uncongenial tone and bearing of the religious snob. The interviewers early discovered in the apostle a willingness to talk, with seemingly deprecation, of the fact that he had been the means of converting the rich and the noble; and when the apostle called their attention to the fact that he had also converted at least one poor man, this poor man, it was noticed, was that interesting social phenomenon, a noble bankrupt. Finally the

reporters were called upon to chronicle the public statement, by the modern apostle, that his great predecessor as a converter, St. Paul, was the one man among the Apostles who might be called a "gentleman!"

It was, therefore, soon understood that the genius of the romancer had created a fascinating image which had no counterpart in reality; and as snobbery in religion is not considered beautiful or desirable in this country, the "apostle to the genteel" evidently made the same mistake, in coming to America, that was made by a fellow-countryman and fellow-apostle of his who, instead of the robes of a priest, wore the knee-breeches of an æsthete.

"Minister and Citizen."

THE recent consecration of Dr. Henry C. Potter as Assistant Bishop of the Protestant Episcopal diocese of New York, while an event of unusual interest and importance inside the denomination to which Bishop Potter belongs, is also an event of public and general interest, not only on account of the prominence of the office, but more especially owing to the antecedents and character of the man. For Dr. Potter, as rector of Grace Church, has not only proved himself on occasion a sympathizer and co-worker with other communions, but he has shown himself to be one of those clergymen who were described not long ago in these columns (on the occasion of the death of Dr. Bellows) as equally zealous and useful in the capacity of minister and in that of citizen.

While rector of a parish which has been unfortunately known as "fashionable," Dr. Potter has distinguished himself and his church as leaders in charitable work; he has been a helper of the poor,—not of the miserably poor only, but also of the respectably (and therefore sometimes neglected) poor. He has not troubled himself with partisan politics in either church or state, but his labors have been directed to advance the causes of religion and civilization in this great and teeming city among the poor and among the rich as well; and he has been an earnest worker in every movement in which a good and public-spirited citizen should make himself felt. It is not every faithful preacher of the Gospel who has the qualities which fit him in addition for this work of citizenship; it is not necessary that every minister should be so gifted; nevertheless, such men are greatly needed in New York. They form, and always have formed, an important and most valuable part of our life as a community; and it is a satisfaction that Dr. Potter's church, in bidding him go higher, has not bidden him go away from a city where his usefulness has been so pronounced, but has merely placed him in an office of wider and more visible influence.

OPEN LETTERS.

"New York as a Field for Fiction."

COMMENT.

DEAR MR. BUNNER: The chief fault I should find with your literary family, as presented in your "Open Letter" on "New York as a Field for Fiction," in *THE CENTURY* for September, is that the best part of it is under ground. The next faults I should find are its over deference to the "foreign" sentiment and the episodical character of the material suggested as new. I dare say that you did not intend to convince me, but I do not see how you can expect to convince others, in these active times, that your Dutch colonists of the earliest period, or those coming next after them, with a "forced infusion of English blood,"—your Huguenots, your Knickerbockers of the middle period, your Battery beaux and Bowling Green belles,—are more suitable material than their descendants now actually alive and well. We want vital questions, even in our fiction. I will back Gertrude's descendant, "leading the dance of youth and love in some grander new house far up-town," for interest against Gertrude herself in old Bleecker street or Greenwood Cemetery, every time. So, too, the briefless young lawyer, whom we fully understand, struggling for his living up in the rarefied air of sky-offices near Trinity chimes and through Marine Court, Part II., seems a much more worthy object of sympathy than your English Cambridge graduate, whose customs we know nothing about except by hearsay, and whom we only half believe in. Such a one, if stranded here,—as he might be stranded anywhere,—would be but a mere episode in the life of the great city, and not an essential part of it. If it were intended to display New York, he would have to be connected with its typical and essential features, which would still remain to be discovered.

Nor do I see why even the Columbia boys should be ruled out of New York fiction. For my part, I no longer seem to yield the same prompt allegiance as once to the warm and mellow Good Old Times, to the Quaint, the Genial, nor even the Foreign; and I believe that many story-reading persons are of the same way of thinking. The old times have been pretty thoroughly utilized, in one way and another. To have recourse to them now seems a manner of dodging the present. Here we are, with all our passions, humors, fancies, stirrings of romance as genuine as ever were. Who will picture us? who go a little deeper than ever before? who add a trifle to the knowledge of human nature? That is the original field. The original man will have a keen eye for such study of character as can be actually put to the test. Something in the nature of social science is what is wanted, rather than archæology; the method of examination of the subject on his feet and going about his affairs, instead of that by exhumation and autopsy, after long burial.

I think, perhaps, I have been a rather extreme example of the opposite view. I fear that I was a bad case of it. I remember when I thought Egypt,

classic antiquity, knights, minnesingers, chatelaines, moss-troopers, burghers, pilgrim-fathers, and buccaneers,—you know the whole menagerie,—down to about the year 1800, the only part of created existence worth the slightest attention. The greatest recommendation to favor was that one should be dead and should have worn a party-colored costume. Next to this, if he *would* live, it was to be European. At present, I flatly do not believe in them. They were no better, no whit more worthy of interest, than ourselves. Come! They were not so good. We are the fish still remaining in the sea better than any yet caught.

It was Europe itself that finally dispelled that impression. I found that an individual was not necessarily the more great, glorious, wise, nor entertaining for being a European, and it occurred to me that he might not be for being dead, even for several hundred years. Foreignness is a kind of antiquity; distance in time and in space is practically the same thing, and the sentiment about them hangs together.

You allow a small modern and home department, however, to those who will not be satisfied, for a novel of New York, with colonial ancestors merely. A part of the new material is "the New England invasion." But you will surely remember that this is just what Rodman Harvey was,—a New England invasion. He had succeeded with his store in a smaller place, had come here and had married, for a second wife, a representative of the Knickerbocker blood, and had become a magnate. He must have resembled, in several ways, the late ex-Governor Morgan, William E. Dodge, and their class, and no men were more essentially of New York than these.

You omit from the list, entirely, low life, which we must agree to be full of interest, and characteristic, here as elsewhere. You omit, too, the life around the great newspaper offices, the seat of government and local politics, and the great financial institutions. And then you choose a class in one of the lower wards, who ran with the machine to fires in their youth, and now go to church on Sundays, and call them the bourgeois of New York. If there be a proper bourgeois of New York, since when has this thick-witted class anywhere—the Philistines of the violent modern protest—become the most entertaining material for the use of the literary artist? Upon what theory, too, can it be maintained that East Broadway, with half a dozen immigrant Mulligans and Lochmüllers domiciled in it to each ex-running-to-fires-with-the-machine bourgeois, is more essentially New York than the vast area of brown-stone houses above Twenty-third street?

Of all the material which you sketch in, after having somewhat too hastily cleared the decks, I venture to find most serviceable the contingent of Parisianized Americans fleeing from the wreck of the last French Empire. A similar contingent is at this moment intimately allied with the British Empire. Both of these would do excellently in New York as a field

for fiction, not simply for themselves, but because they are part and parcel of the society which gives New York its peculiar aspect at home and reputation abroad.

We must agree that everything cannot be put into a single book. What, then, is the thing to do, having set out with the purpose of giving some faint idea of the life of the metropolis in a story? Is it to take isolated and eccentric figures and episodes, however interesting, which might have passed anywhere? It is rather to take those leading personages, traits, and localities with which its identity is bound up. You appear to complain of the typicalness of the characters with which I have very inadequately attempted to do this, as if typicalness were a vice. I have taken, you say, "the typical merchant," "the typical belle," "the typical snob," and so forth; and you would seem to imply that this should not have been done, but that the future aspirant should depend for his effects upon personages of a very different sort, it is not at all clear what. An interesting supplement to your article would be a brief review of fiction in New York, to show whether the field is really so preëempted as to leave no room on that score for the figures most prominent in actual life. I think it would be found much less full than indicated. It is doubtful if it can ever be so full as to exclude that central figure of our money-making day, the merchant prince, at all.

However poorly I have treated them, the typicalness of my characters cannot justly be blamed. There is considerable misconception on this point. It is fancied that a character which is a type must become a mere abstraction. But a type should be a very clearly cut individual, who has the added value of representing not only himself, but a whole interesting class. It is of such characters that we can say "How natural!" "I, too, have seen that." To seek for mere individuals who are not types, if such a thing were possible, would be to make a literature of bearded ladies and living skeletons, to pretend that "cranks" and monstrosities were the best material. I do not think we are really at issue on this point, but rather in some difference of statement. I have happened, just at the moment of writing this, upon Païlleron's amusing play of "le Monde où l'on s'ennuie." There is a short preface to it, in which it appears that he has been attacked for alleged portraiture in some of his characters. He replies, defending himself in a few words which express so well what types really are and ought to be as to seem worth quoting as a final definition. He says: "I have taken the traits of which I have made my types from drawing-rooms and from individuals in the privacy of home. And they are so thoroughly types and so little portraits that as many as five different names have been given to each of them.*"

Yours very truly,

W. H. Bishop.

MY DEAR MR. BISHOP: The chief fault I should find with your pleasant note, just received, is that it seemingly is addressed to some person of views very

different from those of the writer of the "Open Letter" in the September CENTURY.

I have looked carefully over that document, and I cannot find that anything I have said there makes me responsible for the somewhat startling theory which you attribute to me,—that an individual is the less an individual because he is also a type. What I did try to point out is that one cannot draw an individual by describing merely the traits he has in common with all others of his class,—which is, you will agree with me, simply substituting an abstraction for a character.

And I must have made myself sadly misunderstood if you have taken the few incidental suggestions I sketched out as prescriptive or directive, or designed to cover the whole field of fiction. I chose them, in fact, purely as illustrations of my idea,—that the roots of our metropolitan life are deeper and older, and the fruit that springs therefrom richer and mellow, than most people believe.

It makes little matter, I think, when or where a man finds the time and scene of his story. But it is all-essential that he should give his work sympathetic, conscientious, and unprejudiced study, and should not trust too readily to accepted traditions or unconventional valuations.

Allow me to thank you for the pleasant way in which you have met me, and to add a sincere wish that whatever field you choose for yourself may prove prolific in laurels.

Yours sincerely,

H. C. Bunner.

Our Jury System.

TO THE EDITOR OF THE CENTURY:

SIR,—In reading in the June CENTURY the replies to "Is the Jury System a Failure?" it struck me that the defenders of the present system had confined themselves too strictly to a statement of the direct and immediate results that would be likely to ensue from the abolition of the jury system and the substitution therefor of a tribunal of judges. Not infrequently the indirect, uncalculated results of a sweeping change in civil government are of vastly greater moment to society than the direct results.

The consideration of such a change in our judicial system suggests three important queries as to its results. These are:

First. Its direct effect upon the administration of justice.

Second. Its ultimate effect upon the constitution and character of the new tribunal.

Third. Its effect upon public opinion regarding the administration of justice.

There is, I presume, no advocate of the jury system who will deny that it might be improved by wiser legislation, especially as regards the manner of selecting juries. And no one who has seen its workings will deny that it has some advantages over any system that has ever been tried. It is an advantage that no litigant can know, until his case is on trial, the precise personnel of the tribunal which is to decide his case. He may know a few days beforehand, it is true, who will probably compose the panel from which his jury will be drawn, but no man can tell him who will be drawn.

* "J'ai pris dans les salons et chez les individus les traits dont j'ai fait mes types. Et ce sont si bien des types et si peu des portraits qu'on a mis sur chacun d'eux jusqu'à cinq noms différents."

If he knows or believes that any member of the panel is hostile or prejudiced against him, or will be influenced by sinister motives in deciding the cause, he has only to challenge him peremptorily, without giving any reason, and his opponent has a like opportunity. And any party to a cause who desires to use improper means to influence the tribunal in his favor, is likely to be baffled in any attempt he may make by this uncertainty as to who will constitute this tribunal. In fact, the obstacles to any attempt to tamper with the jury are, in most cases, practically insurmountable, since the majority of cases which are tried by juries occupy less than two days after the jury is drawn, and this affords too little time to make the acquaintance of the individual jurors sufficiently to enable a man to approach them safely with corrupt propositions. It is the opinion of many of our ablest lawyers that on questions of fact, where the jury are carefully instructed as to the law, the average judgment of twelve good jurymen is quite as likely to be correct as that of a bench of judges.

Upon the second question, the ultimate effect of the proposed change upon the constitution and character of the new tribunal, we must first remember that we cannot presume that the new tribunals would be composed of the same quality of men as those who now constitute the judges of our courts; for I will premise, for the sake of the argument, that the judges of our courts throughout the United States are, as a class, upright, incorruptible, impartial, and able men. When it is charged in the public prints that the appointment of a judge of the most august tribunal of the nation (I might say in the whole world, since no other tribunal has such extensive powers conferred upon it) has at least in a single instance been the work of an unscrupulous speculator, would it not be well, whether we believe this terrible accusation or not, to pause before making such changes in our judicial system, to consider whether we should not be making it easy for soulless corporations and millionaires whose god is mammon, in many localities, and especially in our great commercial centers, to pack our judicial tribunals and to give us courts in comparison with which the New York city courts during the Tweed régime were Aristidean?—courts that would not only nullify as unconstitutional all legislation that sought to release the people from the toils of the masters whose behests these courts would be chosen to carry out, but courts that would, upon occasion, twist the facts in a case into conformity with the desires of their masters. It is said that some men of shining legal abilities, but of sullied personal character, have made very acceptable judges. It is not difficult for a lawyer to see how this might be. Since men are always controlled by the strongest motive, and with some men ambition may be a stronger motive than avarice, a desire to rank high as a jurist might prevail over any other incentive with a man not over-scrupulous. When a judge decides questions of law, he does it under the eyes and in the face of a jury he dare not defy, *i. e.*, a vigilant and critical bar. He has before him two interested contending parties, each ever ready and watchful to take exceptions to his errors of judgment even. He must state clearly his positions in regard to the law, and they are subject to revision by a higher tribunal. They then go into the reports,

and are read and reread by lawyers who have made a thorough and exhaustive study of their subject matter, and who are competent to pass upon his rulings. In matters of law, all his faults "observed, Set in a note-book, learned and coned by rote." And a man of good legal abilities who, while occupying the position of a *nisi prius* judge even, should attempt to go very far in modifying or wresting the existing law, contrary to precedent and authority, would soon find that he had entered upon a thorny road, whatever might be his motive for wandering.

Any one who has prepared a case for an appellate court, when it is essential to review the evidence, knows how extremely difficult it is, in many cases, to present any adequate picture of the testimony to the higher court, even with the aid of a stenographer's report of the testimony. The appearance and manner of the different witnesses, which oftentimes, and justly too, has so much weight with the jury, is entirely wanting. A skillful and unscrupulous court, organized in the interests of a wealthy corporation, seconded by able attorneys, as such corporations usually employ, might make short shrift for a poor man with a doubtful or even a just cause, aided, as too often he would be, only by inexperienced counsel, such as his lack of means would frequently compel him to employ. The testimony in such cases would often not be reported, and very frequently the only spectators of the conduct of the court would be the litigants and their witnesses. Moreover, every party having a cause for trial could know with tolerable certainty, for days and usually for weeks and months before the trial, what persons would constitute the tribunal which would try the case, and, if he had corrupt intentions, would have ample time to discover the weakest points in the character of each individual composing the tribunal. The old saying, that "every man has his price," is undoubtedly true in the sense that every man is approachable in some way, and is susceptible to certain influences,—in some cases consciously, and in others unconsciously.

Proceeding to the third point,—the effect of the proposed system upon public opinion,—there are men, and their number is not small, whose own self-knowledge justifies them in the belief that all courts are corrupt and that a poor man has no chance in our courts, or who have so often asserted such an opinion that they have come to believe it. Under our present system, most reproaches of this kind are thrown upon the jury; but the jury is an impersonal, ever-changing body. The odium of an unjust verdict, or one that is condemned by public sentiment, whether such condemnation is merited or not, is divided among twelve men, who separate to their several homes and never meet again to act together under any circumstances whatsoever. If, through mistake, or for any other reason, they have given an unrighteous verdict, the harm is largely confined to the particular case decided; there is no danger that the same body will repeat the offense and thus acquire a cumulation of odium. Would not a succession of unpopular verdicts, occurring in tolerably close succession, even if right, tend to bring a continuing tribunal into contempt, and would not the tendency be toward causing the populace to suspect bribery and corruption on the part of the court? Would not every decision in which there was any general interest, if made contrary to an uninformed

public opinion, whether right or wrong, by a court already unpopular, add to its unpopularity? I need not occupy space to show that anything that tends to bring our courts into contempt, or to throw suspicion upon them, is subversive of our institutions.

When we see what an outcry is raised in one of the larger States of this Union against its supreme court, for deciding a question of abstract law, *i. e.*, whether a certain proposed amendment to the State constitution was legally adopted so as to become a part of that constitution, and such decision was against the wishes of what claimed to be a majority of the people of the State, and the renomination of the Chief Justice of that court was successfully opposed by some of the leading journals of his own political party for the reason, openly avowed, that his decision on this question was not satisfactory, we may well hesitate before we subject our courts to the odium to which they would certainly be subjected in doing their duty to men accused of heinous crimes and generally suspected by the community to be guilty, where there is yet no sufficient evidence of guilt. And a fair-minded man with an average amount of common sense has often but to carefully sit through and watch an important trial of this kind to know how unjustly juries are sometimes abused by the newspapers and the general public, for performing their plain duty under the law and the evidence submitted to them.

Eugene Lewis.

MOLINE, ILL.

Some New Inventions.

A DESCRIPTION was given in this magazine some months since of a new design in steam-ship construction, with a promise of further information when the design was realized in actual practice. A small steamer, built to test this design, has been launched, and from an examination of the vessel in dock at East Boston a note may be made of the present position of the experiment. The objects sought appear to be speed and safety. To insure these, the hull is extremely sharp and built upon very fine lines, the boat being very long and narrow, and with the greatest width somewhat in advance of the center. The upper part of the vessel is rounded, beginning just above the water-line, the sides bending inward and meeting in the center in the form of a low arch slightly flattened in the middle. To give the ship this peculiar form, the ribs are continuous from the keel upward and over the deck, the outer skin being carried directly over the top of the vessel. On the deck is a small wheel-house, with a dome-shaped roof of heavy glass, one or two hatchways, and the two smoke-stacks. A light railing serves as a guard round the narrow deck, and, beyond the ventilators and sky-lights, there is nothing more visible on the outside. This peculiar form is intended to give great strength to resist the shock and weight of water falling on the deck as the vessel is forced through the waves. It is thought the hull will plunge through the waves instead of riding over them, and that in rough water the deck will be often swept by heavy seas that, finding no hold, will simply roll off without inflicting damage or materially checking the headway. How far this interesting theory may prove correct, experiment can alone decide. At the present writing nothing has been done. This

is explained by an apparent failure of the motive-power put into the vessel. Suitable boilers and engines are to be provided, and the tests will be made upon a complete and thorough scale. The vessel as it now stands certainly presents an admirable opportunity to conduct what might be called physical research in the field of navigation, and it is to be hoped that when the new engines are complete something of value may be added to the science of ship-building.

Objections are sometimes raised against the study of mechanics by girls as being, in a general way, useless, seeing that the feminine mind is not inventive. To the mechanical mind this objection has a certain flavor of decayed absurdity, a mingled air of ignorance and prejudice. How shall the bird fly if it is born and reared in a cage? The most valuable mental faculty in invention is imagination. Women certainly have that. The trouble is not that they cannot invent, but that they have not imagined the necessity of an invention. One of the greatest of American inventors could construct complete in his mind a working carpet-loom, and then make the drawings and build the loom, and it would at once make such carpets as he saw in his mind. Given imagination, there need be only a knowledge of the laws of mechanics, patience, and work. These are the essentials of invention, and they are as much feminine as masculine. The seeing a want prompts to a lively imagination of a way of supplying the want, and this is invention. When women are educated to see the relations of things and understand something of mechanics, feminine inventions will follow quickly enough. In fact, the Patent Office reports already contain a very considerable number of patents issued to women, some of which have proved of great commercial value.

One of the two exhibitions recently opened in Boston devoted liberal space for the display of work by women and girls. From an examination of this display, something may be learned of the more recent inventions brought to a practical commercial position by women. The list is small, but suggestive, as it includes such diverse subjects as iron castings, bronze bearings for journals, and improved furniture. The only criticism that can be made against the display assumes the form of a regret that what seems to be a really good alloy, that has stood the severe test of regular work in heavy machinery, should not be boldly put with the machine tools in another part of the exhibition, where it would be seen of men. In the "woman's department" it is half smothered by the Kensington stitch. Among the inventions patented and exhibited by women, may be mentioned a few that seem to indicate a clear knowledge of what is wanted and the wit and skill to supply the want. A trunk with a tray has the objection that, if a dress is laid in the tray and it does not fill it to the top of the cover, the garment will not stow well, and if the trunk is turned over it will be injured. To obviate this, an improved tray is shown, having a canvas bottom with straps and pockets, and arranged in such a way that it can be placed in any position in the trunk and securely fastened there. The garment is placed in the tray and pinned to the canvas or fastened by the straps, and then, if the trunk is turned over, it cannot get out of place nor be thrown about, even if the trunk is half empty. In furniture three exhibits are made by women. One of these is a

bedstead with the space under the mattress utilized as a bureau, a number of drawers being provided on each side, the exhibit showing considerable skill in designing cabinet work. Allied to this is a large arm-chair for school-teachers, with smaller chairs arranged under the seat in the manner of drawers, and designed to be drawn out to give seats for children who, in the discipline of school life, must "sit with teacher." A bureau is shown, having apparently two sets of drawers. One of these is false and opens as a cupboard door. Within is a shelf that may be drawn out, and is intended to support a washing-bowl, while the space below is for the water-jar. These three exhibits clearly indicate the pressing necessity for economy of space in domestic life in city tenements and apartments, and will, no doubt, fill a want and find a market. The most profitable patents are often those that seem the most simple and commonplace. Perhaps the most promising design by a woman is an adjustable book-cover. Every one is familiar with the art of covering books with paper, but no one before seems to have hit upon the happy thought of a locking device that will keep the paper shield always firmly in position without the aid of paste. The idea was plainly suggested by the many forms of locking paper boxes, and it will, no doubt, prove quite as valuable in a commercial sense. An improved stove-grate, unfortunately not shown in position, a new oil-stove showing a clear understanding of the theory of this class of stoves, a new glaze for pottery, a new life-preserver, and a new plastic material that may be used as a substitute for clay are also exhibited by women. In practical scientific work there is also a creditable display of chemicals and dye-stuffs, all by women. These are only a few of the exhibits made by women that depart in any degree from the conventional needle-work, and they are worthy of notice for two reasons: they indicate an effort to grasp the wants of the world and a right understanding of means to ends; and they also show that there is a steady widening of the field in which women may find profitable employment.

The increasing attention given to outdoor life and sports has naturally led to the introduction of improved appliances for comfort or convenience in fields and woods. In boats, tents, and camping facilities this is specially noticeable. American canoes and traveling boats have exhibited several new types, some of which have been described in this magazine. Of late, attention seems to be given more to camping facilities. Among these is a tent of the common A shape, having rounded ends completely closed, and movable sides, which may be raised so as to make it by day in good weather into a large dining or shelter tent, fully open to the air; while at night or in rough weather one or both of the sides may be let down, closing the tent either partially or completely, one loose corner making a door when required. Another device consists of a lawn seat with a canopy or sun-shade, that may be turned into a single bed with a small, low tent over it for camp use. In camp furniture a new outfit, consisting of six chairs, two beds, and one table, may deserve attention, as all these pieces are designed to be packed into one trunk of medium size. The outfit examined seemed to be strong and well made, and very neatly and compactly fitted to the trunk.

An invention has just been brought out in this country as a substitute for stained glass. In stained glass, each piece of glass, in the mosaic that forms the design or picture, must be inclosed in the lead sash or "leads." These lines of leads cross the window in every direction, and often greatly mar the effect of the design. In the new method of treating window glass there are the same leads, but they are used in a manner that is not possible in stained glass, and for a wholly different reason. The method of preparing the glass is quite simple. A suitable design is prepared in colors, and in its treatment there may be the greatest freedom, as the leads that follow the main lines of the design or picture are merely the divisions between the colors. Over the pattern is laid a sheet of clear glass. A composition that melts only at a high temperature is then placed in a tube having a cone at the lower end and a small opening at the point. The heated composition flows through this, like paint from a color tube, and is allowed to fall on the glass over the pattern, where it leaves a raised line that instantly hardens and clings firmly to the glass. With this fluid pencil the main lines of the pattern are drawn on the glass, making the leads of the future work, and marking the divisions of the colors. It is plain that, in the hands of the designer, a picture, pattern, or geometrical design can thus be drawn directly in free-hand on the glass, which is a wholly novel method of treatment. The lines of the pattern having been drawn in the hot composition, the next step follows at once. Each of the spaces between the leads is then filled in with a colored composition that sets quickly and forms a transparent or translucent adherent film on the glass. In about forty-eight hours this coloring material is dry and hard, and when varnished will stand washing and all ordinary temperatures. The finished work examined appeared to give a closer imitation of stained glass than anything yet produced. The colors are pure and strong, and the designs showed a degree of freedom not before obtained in any decorative treatment of glass. The invention is worthy of examination chiefly on account of this very freedom, as any design or picture can be drawn on the glass and reproduced in transparent colors. The cost is said to be about one half that of the cheaper forms of stained glass.

Charles Barnard.

Free Trade with Canada.

IN the July number of *THE CENTURY* appeared an interesting article from the pen of Mr. Watson Griffin on the above subject. For us Canadians it possessed a peculiar value, indicating as it did the opinion of a well-informed and thoughtful American on the trade relations between the two countries. In a certain degree it was also flattering to Canada, Mr. Griffin freely recognizing the boundless resources of the Dominion and the rapid strides toward prosperity made in the past few years. Dealing with the question of reciprocity, Mr. Griffin has presented us with an American view—how widely entertained I know not—of the trade relationship between Canada and the United States. He urges on his fellow-countrymen to turn their attention to the land so rapidly

gaining in wealth and strength immediately on their borders, and before it is too late to secure better terms with a market which would repay them a hundred-fold. He readily sees the immense advantages which would accrue to the United States were the "tariff wall" removed, and the corresponding injury done to Canadian trade, and he candidly acknowledges that Canada would suffer as the United States would gain by a reciprocity treaty. Winnipeg would be forced into competition with Chicago, St. Paul, and Minneapolis, and, in Mr. Griffin's own words, a certain blow would be struck at its future greatness. Continuing, he confesses that the growth of eastern Canada would be greatly retarded, and that were free trade established between the two countries the United States would reap the lion's share of the advantages. But Mr. Griffin has a most peculiar view of "the eternal fitness of things," to use an Americanism. He coolly discusses the probabilities of the Canadian people agreeing to reciprocity, and, without showing any adequate results to be gained by them, concludes that they would accept it! No new markets opened up to us, no impetus to our manufactures, no demand for our products, our rising industries crushed in the bud, and our country sacrificed on the altar of a pure and disinterested affection. But we are an eminently practical people, and without some corresponding gain would hardly be inclined thus to lay bare our markets and expose our industries. Once on a time, not so very long ago either, we would gladly have accepted reciprocity, but the Federal Government at Washington saw fit to reject our advances. It was the best thing the United States ever did for us—the most fortunate event which has happened to Canada since confederation. In self-defense we were forced to retaliate; but what was once a mere means of protection has now become to us a tower of strength. Under the National Policy, the "tariff wall" of which Mr. Griffin writes, Canada has suddenly sprung from youth to young and sturdy manhood. Self-dependence has been taught her; she gives employment to her own youth—no longer annually sending them away; industries that were never dreamt of have come into existence, and she is on the opening of a career bright with every promise. We are not a particularly visionary people, but we have faith in our country. Perhaps it lies not on the surface and is not readily seen, but it is implanted deep and strong in the hearts of the people. Despite Mr. Griffin's opinion to the contrary, the Canadians have every trust in their National Policy. Since its introduction in 1879, Canada has made unexampled progress. A land rich and fertile to the verge of unbelief, of which Canadians themselves knew but little, has been opened up, trade with foreign countries has increased to an enormous extent, the people of the different provinces have been drawn into closer connection, and a new impetus has been given the varied interests of the country.

Canada, on the whole, gladly accepted the Reciprocity Treaty in 1854, throwing open her priceless fisheries in return for the manufactured products of her neighbor. But even then there was disappointment and grumbling in the provinces by the sea. And when the treaty expired, and the United States refused all offers of renewal, among those who looked into the future and saw the destiny awaiting the young

nation there was a feeling of relief. And how that foresight has been verified needs but a glance at the Canada of to-day. In 1881 her trade in proportion to her population exceeded that of the United States, and her shipping likewise in proportion was more than four times as great, while the volume of trade had increased from \$130,000,000 in 1868 to \$210,000,000 in 1882. The abrogation of the treaty forced her to find new markets, and to-day she enjoys the best of trade relations with the commercial countries of the globe. Her trade demanded new outlets; direct steam communication has been opened with France and Brazil; her products find a ready sale in South America, and the business done with the West Indies has more than quadrupled. The increase of immigration in 1882 was one hundred and ninety per cent. over that of 1880, and sixty-five per cent. over that of 1881, while the increase in the United States in 1882 was only three and a half per cent. more than the previous year. And while these statistics give us every encouragement as a growing people, still they show us our youth as a nation, being barely sixteen years of age, alongside the one hundred and six which have elapsed since the signing of the Declaration of Independence. The growth of Canada has been rapid since confederation, the intellect of the Dominion keeping pace with its progress as a State. In a speech recently made by Lord Dufferin at the Empire Club, London, he stated that, in his opinion, the population of Canada at the close of the next century would be forty millions. That, however, is but a moderate estimate.

Mr. Griffin writes that in the recent elections, in which the National Policy was the question at issue, many of those who voted for it did so merely with a view of forcing the United States, by retaliation, to entertain the idea of reciprocity; that in negotiations for free trade, Americans could rely upon the full support of the Reformers with a liberal sprinkling of Conservatives; and that as many of the Conservative members were elected by small majorities, a slight change in public sentiment might make a great change in parliamentary representation. This is certainly a surprising statement from one apparently so well informed as Mr. Griffin. Does he imagine that the Reformers would readily play into the hands of the Americans—cheerfully throw open the markets of their country for the surplus products of the United States? He should know that our political institutions are sufficiently democratic to allow the people to have something to say in such matters. It is they who say whether we shall have free trade or protection. And Mr. Griffin's notions of our political men must indeed be crude. Were the Conservative party defeated tomorrow, there would be but few changes made in their policy by the Liberals. For the policy is not a cast-iron one; it is regulated and moderated as the trade of the country demands, building up our industries, and discouraging all species of monopoly. Many of the Reform party support it as a general measure. But Mr. Griffin makes the greatest mistake when he thinks that a slight change in public sentiment would make a great change in parliamentary representation, and that free trade with the United States would be the result. Fully as many, if not more, Reformers hold their seats by narrow majorities as Conservatives. The

great mass of the people in the Dominion support the Liberal Conservative party. They have a majority not only in parliamentary representation, but also of the entire vote cast in every province but one, and it would take a very powerful and complicated combination of circumstances to oust them from their position. Time alone will solve the question which Mr. Griffin imagines is in the power of the Reform party, and which he considers they are only too eager to effect. The day of reciprocity has gone by; we were taught a severe lesson once, and we have profited by it, and though at some future time the "tariff wall" may be lessened, for the present Canada is content with matters as they are.

J. Fred. Harley.

Joseph Jefferson as "Caleb Plummer."

THE actor who permits himself to become identified with one impersonation imperils his artistic fame, however excellent as a work of art that impersonation may be. The reason of this is obvious. The public, which never looks below the surface, first learns to imagine that the man who plays only one part can play no other, and then, having studied and enjoyed each look, gesture, and vocal modulation which made the original characterization famous, is prompt, when the actor appears in a new guise, to recognize everything, however insignificant, which is familiar, and consider it evidence of his lack of versatility, without giving him credit for the many instances wherein that very gift of versatility is shown most clearly. Shallowness of this kind is to be expected on the part of the general mass of theatergoers, who never think of the means so long as the result is pleasing, and care more for the personality of the player than for his art; but is surprising when exhibited in the judgment of persons professing themselves to be thoughtful observers. And yet there is nothing more common in the current dramatic criticism of the day than the tendency to pronounce general condemnations of the work of even the most competent actors on the score of their "mannerisms," without vouchsafing any consideration to artistic merits which atone handsomely for many minor defects.

It is plain that in many cases the word "mannerism" is used without the least comprehension of the only meaning which it can have legitimately in dramatic criticism. An actor, being after all only a man, cannot be blamed because he does not possess supernatural attributes. It is manifestly impossible for him to change at will the physical characteristics which nature gave him to distinguish him from his fellow mortals. His figure, his carriage, his speech, his features, although they may be greatly disguised by theatrical device, impose certain arbitrary limitations in the way of impersonation; and to hold him artistically responsible for these would be just as reasonable as to denounce him for not having been born somebody else. The reproach of "mannerism" is not, therefore, necessarily applicable to the actor who fails to conceal his own identity (for that identity may be, and often is, exquisitely appropriate to the stage character; but to the actor who, through ignorance, incapacity, or conceit, is the slave of violent, absurd, and inartistic habits, which are foreign to his natural behavior, and

are displayed in every character he undertakes, from *Romeo* to *Caliban*.

There have been few more delightful examples of the art of the skilled comedian in this generation than that furnished in the *Caleb Plummer* of Mr. Joseph Jefferson, witnessed in the Union Square Theater. Nevertheless, many of the critics of the daily press, while admitting its charm and its effect upon the spectators, found fault with it because it reminded them at times of *Rip Van Winkle*, and reproduced certain little tricks of Mr. Jefferson's own manner. It would have been almost miraculous if it had not; and yet, as a matter of fact, this performance is no less remarkable for the versatility which it displays than for its extraordinary mastery of theatrical resource. That in it Mr. Jefferson occasionally awakens reminiscences both of *Rip* and of himself is indisputable; but what then? No actor ever did or ever will attain artistic eminence, without embodying in his best impersonations some of his own personal characteristics, for the simple reason that only men of strong individuality (in one direction or another) and with marked personal or mental traits can ever hope to comprehend or express the emotions, whether of joy or sorrow, which impart life and reality to the dramatic fiction. It does not follow at all that the great actor, either in tragedy or comedy, should be dominated by the emotions which he simulates,—this, indeed, is not commonly the case,—but simply that there must be in his own nature a chord which is capable of stirring in response to the feigned joys or woes to be portrayed. If any one, after witnessing Mr. Jefferson's *Caleb*, will take the trouble to read carefully Dickens's beautiful little story of "The Cricket on the Hearth," he will find a striking illustration of the truth of this theory in the radical difference between the author's conception of the old toy-maker and the actor's exposition of it. There is not a trace in Mr. Jefferson's *Caleb* of the dull, vacant, hopeless depression which the novelist paints with so pathetic a touch. He has not the dull eye and vacuous manner which tell of a spirit crushed by perpetual and remediless misery, because there is not in the comedian himself any sympathy with this particular phase of human nature. His own temperament is buoyant, hopeful, placid, and sunny, and he naturally—it might be said, necessarily—invests *Caleb* with some of his own brightness and humor. He effects this, too, without robbing the part of any of its exquisite pathos. He even heightens the color of the picture by the artistic employment of contrast. The scene with the blind *Bertha* and *Tackleton* would not be half so touching and suggestive as it is, if the pitiful anxiety and wistful tenderness of *Caleb* at this juncture were not emphasized by the memory of the childlike mirth and simple gayety of his meeting with *Peerybingle*, in the preceding scene. This old man, so ragged, cold, and timid, with his grateful appreciation of a kind word,—his bustling, nervous efforts to be of some assistance,—his beaming smile, playing around the pinched and drawn old lips,—his bright eye, now beaming with merriment, now eloquent with love or commiseration,—is a creation so absolutely human and real that, for the moment, all sense of the wonderful skill which creates the illusion is lost.

The full extent of that skill may be appreciated best by comparing this study of *Caleb* with that of

Rip, and noting, not the occasional intonation, the curious little gasp, and other trifling points common to both impersonations, but the radical differences which exist between them. These are to be found, not in the variety of costume only,—the only pretense of versatility afforded by the ordinary hack-actor of the day,—but in the man himself, in his walk, in his gestures, in his carriage, in his address, in his voice, and in his laugh. The only constant point of resemblance between the two men is in the matter of age. In all other respects they are as opposite as the poles. There is nothing in common between the reckless and shameless, if fascinating, jollity of *Rip* and the sweet, unselfish, indomitable cheerfulness of *Caleb*, or between the methods which throw a glamour of poetry and romance about the forlorn and forgotten reveler and those which are so infinitely pathetic in the case of the old toy-maker. On the one hand, a detestable character is endowed with irresistible charm by the sheer force of poetic imagination; and on the other, a nature of a type at once the simplest and the highest is portrayed with a truth which is as masterly as it is affecting. There is nothing in “*Rip Van Winkle*” more touching than those scenes where *Caleb* listens while *Dot* reveals to *Bertha* the story of his noble deceit, and where he recognizes the son whom he deemed lost in “the golden South Americas.” The play of emotion on Mr. Jefferson’s face at the moment of recognition, as wonderment, doubt, and hope are succeeded by certainty and rapturous joy,—his deprecatory, spasmodic action as he turns away from what he evidently fears is a delusion of the senses,—and his final rush into the arms of his son,—are triumphs of the highest kind. Here the actor is lost in the fictitious character, and the simulation becomes an actual impersonation, which is the highest possible dramatic achievement.

It would be easy to dilate, if space permitted, on the beauty of the merely mechanical as opposed to the spiritual part of this performance. The fineness of the finish, noticeable in all Mr. Jefferson’s creations, is equally remarkable in this. The minutest “business” is transacted with a neatness and precision which could not easily be surpassed. Nowhere is there a sign of premeditation or design; all is done simply, naturally, and without strain. The methods employed are those of comedy, and he never once permits himself to fall into extravagance except in his manner of kissing *Tilly* at the fall of the curtain. The indiscretion here is small perhaps, but it is a blot on a most delightful picture, which ought not to remain. It is only in works of the rarest excellence that the smallest blemishes are serious.

This impersonation would place Mr. Jefferson at the head of contemporary comedians if he had never been seen in other parts, and is an unanswerable proof, if any were needed, of the great range of his powers. It would be pleasant to say something of other recent achievements of the player who is now renewing the victories of a quarter of a century ago—of his *Bob Acres* and his *Golightly*; but the time does not serve, and nothing remains but to express the hope that it will not be long before he introduces some more portraits from his unrivaled gallery.

J. Ranken Towse.

Jefferson Davis and General Holt.

IN THE CENTURY for November is an article, “The Capture of Jefferson Davis,” by Mr. Burton N. Harrison. The following phrases and sentences are to be found in this article: In a note by the author, on page 136 of the magazine: “* * * The scheme of Stanton and Holt to fasten upon Mr. Davis charges of a guilty foreknowledge of, if not participation in, the murder of Mr. Lincoln.” And in the text, on page 145: “Stanton and Holt, lawyers both, very well knew that Mr. Davis could never be convicted on an indictment for treason, but were determined to hang him anyhow, and were in search of a pretext for doing so. * * * To have been a prisoner in the hands of the Government of the United States, and not to have been brought to trial upon any of the charges against him, is sufficient refutation of them all. It indicates that the people in Washington knew the accusations could not be sustained.”

Now, I can safely leave the defense of Secretary Stanton to abler pens than mine. But I hold—contrary, I know, to the usual opinion—that the dead, whose time of action is past, stand less in need of vindication than the living. Therefore, I wish to speak as to the charges made by Mr. Harrison against General Holt; yet not with my own mouth; for it strikes me that the fitting answer to them is found in General Holt’s own statement concerning another matter, published within the month, but before Mr. Harrison’s paper was given to the public.

General Holt, in this statement (a reply, in the form of a letter published in the “Philadelphia Press,” under the date of October 8th, to an attack upon him by the ex-conspirator, Mr. Jacob Thompson), speaks as follows concerning the actions of a certain Sanford Conover, first known to the General and the public as a witness in the trial of the assassins of President Lincoln (though Conover’s testimony concerned not those conspirators executed for that crime, but others who were never brought to trial):

“In July, after the trial, Conover addressed a written communication to me from New York, of which the following is the opening paragraph:

“‘NEW-YORK, July 26, 1865.

“‘BRIG.-GEN. HOLT:

“‘*Dear Sir*: Believing that I can procure witnesses and documentary evidence sufficient to convict Jeff. Davis and C. C. Clay of complicity in the assassination of the President, and that I can also find and secure John H. Surratt, I beg leave to tender the Government, through you, my services for these purposes. * * *

“On the second of August following,” General Holt continues, “another letter to the same effect, but more urgent, was received from him [Conover], and, after a conference with the Secretary of War, with his full approval the proposal was accepted, and Conover entered on the fulfillment of his engagement. Some six or seven months were occupied in this, and after all the witnesses produced by him—none of whom were known to me—had been examined, and their depositions filed in the Bureau of Military Justice, Conover, under the supervision of the Secretary of War, was allowed a compensation, which, with what he had previously received, was deemed just, and no more, for his services,—such sums as were required for the attendance of the witnesses themselves having been before paid out from

time to time. Conover himself gave no deposition. In this there was no departure from the course habitually pursued by all the departments of the Government. * * * At this time, nothing had occurred to excite the slightest suspicion of Conover's integrity in all that he had done, or in the credibility of his witnesses. Some time afterward, two of these witnesses, conscience-stricken, came and confessed that they had sworn falsely, having been suborned to do so by Conover. Investigation satisfied me that they were sincere in their avowals, and without delay appropriate action was taken. A prosecution was set on foot against Conover, and he was convicted and sent to the penitentiary for perjury and subornation of perjury, and on the margin of all the reports made by me on the depositions of the witnesses he had produced, an indorsement was made, stating that the depositions were withdrawn and had been discredited. * * * Fortunately, this most guilty deception was discovered so soon that neither the reputation nor the sensibilities of anybody had suffered by the temporary credit given to it."

Had General Holt been maliciously determined to have the life of any one, would he have acted thus? Of course not. He showed himself in this affair, as always, a most honorable, high-minded, and just man.

The Secessionists will never forgive him, because, being a "Border man,"—a Kentuckian by birth,—he chose rather to remain true to the Union than to join them. But no loyal person will make this a ground of complaint against him.

Loyalist.

The Influence of Christ.*

WHO, after the Evangelists, will venture to write the Life of Jesus? This deprecatory question of Lessing has not prevented, during the last three or four decades, the composition of numerous biographies of him whose career is depicted inimitably by the Four Evangelists. Germany has been most prolific of these works. France has produced one excellent book of this class, "The Life of Jesus," by Pressensé, and another famous writing, of a critical and distinctive cast, the "Vie de Jésus" of M. Renan. Even Scotland, where the abstract discussions of theology have still the strongest fascination, has made its contributions to this species of biographic writing. It is easy to see how the minds of men are drawn away from the problems of dogmatic theology, such as predestination and free will, and fastened on the wonderful personality of the Founder. The attention is drawn away from the circumference to the center. It is remarkable that this vivid interest in the question, "What think ye of Christ?"—this concentration of thought on the Person who gives to Christianity its being,—is simultaneous with a widespread tendency, rife in all the empirical schools, to make little of personality and personal force, and to make everything of general causes and impersonal forces as determining the current of history. The one-sided character of this

last tendency, in its undervaluing of the significance of persons, and of the mysterious personal agency which is not to be resolved into anything merely physical or distinct from itself, is specially manifest when the attempt is made to explain the origin of the Christian religion. Here the great originating cause is a Person. Nothing in his environment suffices to explain him. Nothing in his antecedents or circumstances accounts for the appearance, then and there, of an individual so transcendently gifted, and predestined to exert so transforming an influence on human society.

Akin to the tendency which leads men to dwell on the history of Jesus, and to gather up all that can be ascertained respecting him, is the disposition to trace the stream of consequences which have flowed from his life, teaching, and death. In the mist of critical conjecture which is thrown over certain portions of the Evangelical narratives, and the doubts which afflict many minds, it is a relief to contemplate the verifiable results of the work of Jesus among men. Not a few derive their profoundest impressions of his ineffable power and excellence from a close survey of the history of Christendom. The growth of the grain of mustard-seed, the spread of the leaven, have a reality and impressiveness which the most skeptical minds are capable of recognizing. It is one of the best services which a work like the "Gesta Christi" of Mr. Brace renders that it gives the reader a fresh idea of the energy, the beneficent energy, that resides in the religion of Christ, and emanates from him, account for it as one may. Mr. Brace's work confines itself to the various forms of philanthropy in which the influence of Christ is directly traceable. He dwells on the mitigation of the excessive paternal authority which prevailed in the ancient world; the elevation of woman under the benign and pure teaching of the Gospel; the sanctity thrown around marriage and the domestic hearthstone; the melting of the chains of the bondman; the abolition of cruel and brutal sports, like the contests of the arena; the increased tenderness for children, compared with the practice and spirit of antiquity; the abandonment of the private wars which prevailed in the feudal ages; the discarding of torture and the reform of criminal jurisprudence; the substitution of arbitration for war, and the astonishing mitigation of the horrors of war which the spirit of humanity in modern times has introduced, etc. The effect of such a discussion depends, of course, on the interest that belongs to the illustrative facts. One sees from such a broad survey that there has been steadily operating a subtle and powerful influence which, when followed back, leads to the Cross of Christ. The truth of the sacredness of humanity, of the dignity and worth of every human soul, be its outward condition never so humble, obtained then a permanent lodgment in the human heart. There it has been living and acting with an increasing efficiency. Thus human society becomes more and more Christian. Christ is seen, not in visible form, but in his spirit, incorporated into men's thoughts and lives.

* *Gesta Christi*; or, A History of Human Progress under Christianity. By Charles Loring Brace. New York: A. C. Armstrong.

George P. Fisher.

BRIC-À-BRAC.

An Evening with Burns.

Suggested by a lecture on Burns by the Rev. Principal Grant,
of Queen's University, Kingston, Jan. 23, 1880.

WITHOUT, the "blast of Janwar wind"
About the building seemed to linger,
That, on a wintry night "lang syne,"
"Blew hansel in" on Scotland's singer.

Within, we listened, soul attent,
To tones attuned by tenderest feeling;
The music of the poet's soul
Seemed o'er our pulses softly stealing.

We saw again the plowman lad,
As by the banks of Ayr he wandered,
With burning eyes and eager heart,
And first on Song and Scotland pondered;

We saw him, as from Nature's soul
His own drew draughts of joy o'erflowing:
The plower's voice, the brier-rose,
The tiny harebell lightly growing,

The wounded hare that passed him by,
The timorous mouse's ruined dwelling,
The cattle cowering from the blast,
The dying sheep her sorrows telling,—

All touched the heart that kept so strong
Its sympathy with humbler being,
And saw in simplest things of life
The poetry that waits the seeing!

We saw him, 'mid the golden grain,
Learning the oldest of romances,
As first his boyish pulses stirred
"A bonnie lassie's" gentle glances.

We saw the birk and hawthorn shade
Droop o'er the tiny, running river,
Where he and his dear Highland maid
Spoke their farewell—alas, forever!

There be the poet's wish fulfilled,
That summer ever "langest tarry,"—
For all who love the singer's song
Must love his gentle Highland Mary!

Alas! that other things than these
Were written on the later pages
That made that tortured soul of his
A by-word to the after ages.

For many see the damning sins
They lightly blame on slight acquaintance,
But *not* the agony of grief
That proved his passionate repentance.

'Twas his to feel the anguish keen
Of noblest powers to mortals given,
While tyrant passions chained to earth
The soul that might have soared to heaven.

'Twas his to feel in one poor heart
Such war of fierce conflicting feeling
As makes this life of ours too sad
A mystery for our unsealing;—

The longing for the nobler course,
The doing of the thing abhorrent,—
Because the lower impulse rose
Resistless as a mountain torrent,—

Resistless to a human will,
But not to strength that had been given,
Had he but grasped the anchor true
Of "correspondence fixed wi' heaven."

Ah well! he failed. Yet let us look
Through tears upon our sinning brother,
As thankful that we are not called
To hold the balance for each other!

And never lips than his have pled
More tenderly and pitifully
To leave the erring heart with Him
Who made it, and will judge it truly.

Nay, more, it is no idle dream
That we have heard a voice from heaven:
"*Behold, this heart hath loved much,
And much to it shall be forgiven!*"

Agnes Maule Machar.

The Summer Girl.

No more she'll stroll by moonlight this year upon
your arm;
She's gone to study Latin in a spot well fenced
from harm.

How cool her muslins somehow seemed,—she always
brought a breeze;
And how short she made the evenings in those
walks beneath the trees!

I must say it to her credit that she never lost her heart,
Nor in any piece of acting ever failed to know her part.

For she laughed at jokes, no matter how old and
stale and bad,
And she thought the present company the best she'd
ever had.

Then she gave us all her photograph, each the first
she ever gave:
"Would the recipient please be silent on the sub-
ject as the grave?"

But her art was quite transparent, and as harmless
as the sun,
And the misanthrope who shunned her did but lose
a heap of fun.

So, old fellow, ere we separate to join the winter
whirl,
Let's drink a parting bumper to that jolly summer
girl.

W. H. A.

The Way of It.

THE wind is awake, little leaves, little leaves,
Heed not what he says—he deceives, he deceives :
Over and over
To the lowly clover
He has lisped the same love and pledged himself
true,
As he'll soon be lisping and pledging to you.

The boy is abroad, dainty maid, dainty maid,
Beware his soft words—I'm afraid, I'm afraid :
He's said them before
Times many a score,
Ay, he died for a dozen ere his beard pricked
through
As he'll soon be dying, my pretty, for you.

The way of the boy is the way of the wind,
As light as the leaves is dainty maid-kind :
One to deceive
And one to believe—
That is the way of it, year to year,
But I know you will learn it too late, my dear.

John Vance Cheney.

I Wonder what Maud will Say !

DEAR Harry, I will not dissemble,
A candid confession is best ;
My fate—but alas, how I tremble !—
My fate I must put to the test :
This morning I gathered in sadness
A strand from my locks slightly gray ;
To delay any longer were madness—
I wonder what Maud will say !

The deed it were well to do quickly,—
Macbeth makes a kindred remark :
I wonder if Mac felt as sickly
When he carved the old king in the dark !
The fellows who marry all do it,
But what is the usual way ?
Heigho ! don't I wish I were through it !
I wonder what Maud will say !

Pray advise. Would you fix up a letter
With rhymes about roses and trees ?
To tell it perchance would be better :
Alas, must I get on my knees ?
No ; kneeling is now out of fashion
Except in a novel or play.
Ah, love is a Protean passion !
I wonder what Maud will say !

Would you give her a pug or a pony,
A picture or only a book ;
A novel—say Bulwer's "Zanoni,"
Or a poem—"Lucile," "Lalla Rookh" ;
Bonbons from Maillard's, or a necklace
Of pearls, or a mammoth bouquet ?
By Jove ! I am perfectly reckless—
I wonder what Maud will say !

Shall I speak of the palace at Como
Which captured the heart of Pauline ?
There's a likeness of Claude in a chromo ;
Would you buy it and practice the scene ?
But no ! I'm no Booth, nor an Irving ;
My fancy has led me astray.
To a lover so true and deserving
I wonder what Maud will say !

Could I warble like Signor Galassi,
In passionate song I would soar,—
I recall she applauded him as he
Serenaded the fair Leonore ;
My strain should resound love-compelling,
Far sweeter than Orpheus' lay ;
Already my bosom is swelling—
I wonder what Maud will say !

Shall I tell her my love very gravely,
Or propose in a moment of mirth,
Or lead to the subject suavely,
And mention how much I am worth ?
Old fellow, I know I shall blunder ;
When she blossoms as bright as the day,
My wits will be dazzled. Oh, thunder !
I wonder what Maud will say !

Samuel Minturn Peck.

Good-bye.

WE say it for an hour or for years ;
We say it smiling, say it choked with tears ;
We say it coldly, say it with a kiss ;
And yet we have no other word than this,—
Good-bye.

We have no dearer word for our heart's friend,
For him who journeys to the world's far end,
And scars our soul with going ; thus we say,
As unto him who steps but o'er the way,—
Good-bye.

Alike to those we love and those we hate,
We say no more in parting. At life's gate,
To him who passes out beyond Earth's sight,
We cry as to the wanderer for a night,—
Good-bye.

Grace Denio Litchfield.

Apophisms from the Quarters.

DE price ob your hat aint de medjer ob your brains.
Ef your coat-tail cotch a-fire, don't wait tell you kin
see de blaze 'fo' you put it out.

De grave-yard is de cheapes' boardin'-house.
Makin' new law-books don't swell de natchul hon-
esty in folks.

Dar's a fam'ly coolness 'twix' de mule an' de s'in-
gle-tree.

It pesters a man dreadful when he git mad an' don't
know who to cuss.

Buyin' on credit is robbin' nex' 'ear's crop.
Chris'mas widout holiday is like a candle widout a
wick.

A fat tramp better change his bizniss.
A bull-dog is a po' jedge o' coat-tails.
De craw-fish in a hurry look like he tryin' to git dar
yistiddy.

'Tis hard for de bes' an' smartes' folks in de wul' to
git 'long widout a little tech o' good luck.

Lean houn' lead de pack when de rabbit in sight.

J. A. Macon.

Strephon and Sardon.

"YOUNG Strephon wears his heart upon his sleeve,"
Thus wizened Sardon spake with scoffing air :
Perhaps 'twas envy made the gray-beard grieve,
For Sardon never had a heart to wear.

HEAD OF A MAN, BY REMBRANDT.

ENGRAVED BY T. JOHNSON, AFTER A PHOTOGRAPH, BY AD. BRAUN & CO., PARIS, OF PART OF A PAINTING IN THE MUSEUM OF THE HERMITAGE, ST. PETERSBURG.

THE CENTURY MAGAZINE.

VOL. XXVII.

FEBRUARY, 1884.

No. 4.

GUSTAVE COURBET, ARTIST AND COMMUNIST.

It is a lovely, unvisited region,—unvisited by Americans and English at least,—the ancient province of Franche-Comté. Lying upon the eastern limits of France, its hills divide the streams of the through-routes, the travel toward the Rhine going to the north, the travel to Switzerland passing by on either hand; so that the greater part of the region still remains unknown to the tourist,—a sort of water-shed of travel. But the new railway from Besançon to Locle will soon change that. Already, from the sweet valley of the Doubs, the parting genii have been sent, and construction trains are rolling to and fro upon the very face of those romantic precipices. As yet, however, the only tourist who has made a book about this region is Miss Betham Edwards, with her pleasant "Holidays in Eastern France." Two summers ago I found a new route into this land of hills. From New York I took the new and in every way excellent line of steamers direct to Bordeaux; and thence, a cross-lot route through central France, stopping overnight, or longer, at Périgueux, Tulle, Clermont-Ferrand, Paray-le-Monial, and Bourg, and so to Besançon, the ancient capital of the ancient province.

Province, of course, it has not been for many a year, at least administratively and cartographically. The old division is still convenient for several purposes; but the modern maps of France do not often mark other political divisions of the country than those of 1792 into departments. The ancient Franche-Comté is distributed into three—the Haute-Saône and the Doubs, named from their rivers, and the Jura, named from its mountains. The two last-named departments border upon Switzerland; from the nearest point of the French boundary, in the Jura, Geneva is distant scarcely twice the range of modern

cannon-shot. These four thousand square miles of mountain, valley, meadow, and forest form one of the most beautiful regions in France or in Europe. The Jura and the Doubs are Courbet's country.

Ornans, in the Doubs, was the painter's birthplace. The little stone-built village stands in the valley of the Loue, a stream that slips down between grassy banks to the Doubs, and so to the Saône, and so to the Rhone, and so to the Mediterranean. What an inland place is Ornans! what woodland glades are there, what still haunts and romantic *combes*,—small deep valleys, walled in by green turf on three sides, and without water-courses. It is a region of magical beauty. Ornans is a place for Keats to have been born in, or Claude. Victor Hugo was born a few miles away, under the citadel of Vauban, in Besançon. But it was quite out of keeping for the rude-striding figure of Gustave Courbet, the iconoclast artist, to appear in that vale of Rasselas, Ornans in the Doubs.

There, however, with nature's too frequent disregard of the proprieties, Courbet was born (June 10th, 1819), and there still reside the survivors of his father's family and his oldest friends. Among the latter his name is not yet "rehabilitated." For them, and indeed for most Frenchmen, Courbet is less an artist than a vandal. After the events of the Commune, his friends turned upon him. A painter notorious rather than distinguished in France, and little known outside of France, an agitator and a Communist, he achieved infamy by destroying works of art when he found that he could not win fame by creating them,—this, or something like it, is the substance of the judgments you will hear from his countrymen to-day. Ornans is visited by many artists, who seek to fix the visionary

beauty which generally eluded the sturdy, realistic art of Courbet; but his birthplace is not a shrine for his countrymen, who more than most other people seek to do honor to the memory of those whom they consider worthy.

Let us ask how much of his countrymen's censure is deserved by the painter of Ornans; and for the better answering, let us not take sides in the quarrel which still goes on respecting his merits as a painter and as a man. It is the vice of criticism to reduce itself to terms of praise and blame. Is it not better to study Courbet neither as a praiseworthy nor a blamable, but simply as an interesting person?

Courbet's father was an independent farmer, and an uneducated man except in his own business. He had a relative in the University of Paris, a law professor; but Courbet *père* was chiefly acquainted with the soil, the changes of crops, the spots where the wine and the fruit would ripen best; he had personal acquaintance, after the pottering way of French farmers, with every quince and peach in his orchard. He was well to do; and, like most French farmers, he was contented; he was satisfied with his life and his position. If, now, he could only have been induced to take interest in the affairs of the rest of the world,—say in European politics or in American progress! But the French farmer is painfully narrow; he persists in understanding his own things, in caring for his own things, and in caring but little for the things of other people. He is content to be prosperous and happy at home; and he shows a sad apathy to the claims of politics and literature. That eminent critic of Bœotia, Dr. Samuel Johnson, used to say that the Athenians were "brutes" because they had no newspapers. The French farmer has his newspaper, but he cares less for the news than for the regular installments of the *feuilleton*. Love of the soil and of the home is his deepest feeling,—a narrowness for which he is commiserated by most of my countrymen. Yes, it is a sad thing to be contented and happy! Yet we may remark that the French farmer has at least this much of good fortune: he does not spend his life in merely hoping to be, at some future time in this world or the next, contented and happy.

From such stock came Gustave Courbet,—himself a man of quite different qualities. He inherited one trait, of which I have not spoken,—a certain willfulness that had stood more than once in the way of his parents' own interests, and came in part from their possession of independent means. On the Courbet farm one may see, or might have seen last September a year, an unusual thing in

thrifty France; to wit, a large pile of fire-wood decaying in the open air. The nearest neighbor of the Courbets, Dr. C——, told me that years ago the old farmer had cut the wood to sell, offering it at a certain figure. No one would give his price; and when some of the neighbors offered less, Courbet *père* was nettled. "My price or none," said he. But, the neighbors having their own mind about it too, the wood has lain there rotting ever since,—a Declaration of Independence that is years older than the French Republic.

The young artist thus came of a self-willed stock; and his own self-will was shown in a very early and a very resolute bent toward painting. He began with caricature while at school in Ornans (his first teacher was the Abbé Gousset, since a well-known cardinal). In school and out of it, he caricatured everybody—teachers, comrades, family and friends. The wife of my informant just mentioned, Dr. C——, was one of his involuntary sitters. At church he caricatured the priests and the choir-singers; he was getting his hand in for the coarse but telling assaults upon the priesthood which are among the best known of his later pictures.

As the boy grew up, his parents sent him to the college at Besançon. Here there were brief studies and long rambles among those beautiful hills and along the Doubs. When his course was finished they found him a teacher in mathematics, a Mr. Delby; but the amiable Delby secretly favored his inclination for painting. While ostensibly struggling with co-sines and other disagreeable things of that sort, he was doing the first art-work of which I have been able to find any trace; and it is curious enough. M. Auguste Castan, the accomplished librarian of the great library in Besançon, showed me, a year ago, a little book of poems, excessively rare, by Max Buchon, the first publication by that author, who became famous in his country before his death: and Buchon's venture was illustrated by his friend Courbet's first engraved work, four small vignettes. The title-page reads: "Essais poétiques, par Max B. Vignettes par Gust. C. Besançon, 1839." The vignettes are quite boyish and commonplace. "Both the pictures and the verses are bad enough to break your heart," says Max Claudet, the gifted sculptor of Salins, and an old intimate of both Buchon and Courbet. But they show the strong story-telling bent of the artist—the dominating impulse, as we shall see, in all of Courbet's work outside of pure landscape; and they show, too, his dominating trait as a man, his egotism. These distracting little vignettes (I wish they were

THE FAIR DUTCHWOMAN.

worth reproducing here) are signed in full. Other bad vignettes have been made before and since, but I doubt whether an equally intelligent artist has often set his name to work as poor as this. M. Paul Mantz, in the "Gazette des Beaux-Arts," compares Courbet to Vacca, an artist of the sixteenth century, whose epitaph, composed by himself, may still be read in the Pantheon at Rome: "Here lies Flaminus Vacca, a Roman sculptor, who satisfied himself in none of his works." The inscription supplies a contrast rather than a comparison. The fitting epitaph of the painter of Ornans would read as follows: "Here lies Courbet, a painter who more than satisfied himself in all his works."

School and college ended, what was to be done with the energetic youth? His father, as we have seen, had a learned cousin in Paris; and thither young Courbet was sent, in the year 1839, to study the learned cousin's profession of law. But law was not for Courbet, neither in books nor in art nor in life. He abandoned himself to painting and to the pleasures for which in our country Paris is chiefly reputed. He tried his hand at figure-drawing and at landscape: his first efforts in landscape date from 1841,—views in the forest of Fontainebleau. In 1842 he painted his own

portrait, and for several successive years he sent it to the Salon. Each time it was refused. But portraits of himself, more or less flattered, appear more than a few times in the course of his work; as in "The Lovers in the Country," and, notably, in "The Man with the Leather Girdle" (*L'Homme à la Ceinture de Cuir*), now No. 424 in the Luxembourg gallery. In this powerful portrait the head is too ideal for Courbet's at any time, unless, possibly, for the year or two during his college life when he studied Goethe, and even painted a scene from the "Walpurgis Night." But Courbet had as little of poetry or of the dramatic gift in his nature as any painter who ever painted; and in later years, looking on this scene as treason to his rigid doctrine of realism, he obliterated it by painting another picture over it.

Courbet's first exhibited pictures, portraits of himself and of his dogs (1844), attracted little attention. But before long his work began to tell upon the public and the critics. The "After Dinner at Ornans," in 1849, was especially noticed. In 1850 Courbet awoke and found himself famous. Two of his most important works were upon the Salon walls that year: "A Burial Scene at Ornans" (*Un Enterrement à Ornans*), and *Les Casseurs*

de Pierres ("The Stone-Breakers"). These works placed him at once among the men who cannot be put aside; right or wrong, here was a new force in European art. De Maistre says: "He who has not conquered at thirty years will never conquer." Is not the aphorism a little too stringent, a little too brilliant? Doubtless; yet Courbet's first pictures illustrated the aphorism. When he conquered he was not yet thirty-one.

These are strong pictures; they have great faults, too, if one judge them by any canons of perfection. Certainly I do not; I am content to take them, as other works of art, for their own merits and defects, for what they are in themselves and in their expression of their time. It is better to judge a picture by what is in it than by what is out of it. And these pictures are at least full of truth after their own kind.

The "Burial Scene at Ornans" (now in the Salle des Colonnades at the Louvre) is a "stunning stroke" of realism. Into a canvas ten feet by twenty-two are hustled nearly fifty heads and figures of life-size: you can count forty-nine and a dog. They are hustled upon the canvas, as I say. There is no composition there, no beauty of expression in the faces; but there is severe truth in the greater part of the picture, even in the details of the background landscape. The overhanging cliffs of the valley of the Loue, for instance, will recall the country to any one who knows it well. The picture is truthful, yet not wholly true:

are still living; and the portraits are quite the reverse of flattered. And one might say that even in the technique of the handling there was a pugilistic spirit. The delicate French criticism complained of a "brutality in some of the dark tones and in some of the reds"; but, on the other hand, a certain tenderness of sentiment cannot be denied to the group of women mourners who stand toward the right. This unwonted note of gentleness was welcomed by Courbet's critics; it led some of them to hope that Courbet might come to value and to reproduce in his art more delicate things than the "paint-slinger," as in their equivalent phrases they called him, had theretofore chosen to render,—some such tender beauty as that which his birth-mate in years, Édouard Frère, was already producing. But nature loves to make opposites of her twins. Frère she consecrated to tenderness and poetry, Courbet to "brutality"—so far, at least, as relates to his dealing with human sentiment. Courbet was a realist, but a narrow realist in spite of his power; for to him emotion was merely a sentimentalism, instead of a prime truth with which art is concerned. He excluded the fruitful emotions from his pictures; and this deficiency is their main demerit.

But, as if in compensation for this, Courbet had great sympathy with animals. This you feel, for instance, in that spirited "At Bay" (*L'Hallali du Cerf*). How ardently the dogs bound upon the scene, breaking out from

A BURIAL SCENE AT ORNANS.

there is a strong note of caricature in the portraits of the priests and beadles, whom Courbet hated; he has made their faces radiant with vulgarity. They, and the rest of the group, are portraits of actual persons, many of whom

every copse and cover; in what a rapture of excitement they tremble between fear of the master huntsman, who towers over them with his long whip, and dread of the wounded stag, who has already sent one of the pack to

bite the snow. Never was such a tempest of the chase, such a stirring tumult of hounds. The life and action of the work are extraordinary; the picture, in spite of more than a little bad drawing, is a fascinating one, because it is full of vitality; it thrills; its errors of execution are overlooked because it tells a story with extraordinary vividness and power.*

In the "Hallali" our sympathies go with the chase, with that excited and intelligent democracy of hunting-dogs. There is a companion picture, the antithesis of this, "The Doe Run Down in the Snow" (*La Chevrete forcée à la Neige*). It is the end of the chase; the poor creature can run or stand no longer; she has fallen breathless on her track. The hunter blows a strong blast, the horn rings out the fatal *hallali*; all four feet in the air at once, the dogs are bounding down the hill-side like demons; in a minute they will be upon her. For those last few seconds she takes her tranquil rest there in the snow.

A companion piece, "The Quarry" (*La Curée du Chevreuil*), an interesting work, in spite of faulty drawing and an inexplicable perspective, was exhibited in the same Salon (1857), and was bought by the Allston Club of Boston.

But I am a little in advance of the record. At the Salon of 1850-51, beside the "Burial Scene," another of Courbet's chief works appeared, "The Stone-Breakers" (*Les Casseurs de Pierres*). This, too, is transcribed from the life; and the figures are portraits and life-size, as if Courbet feared to lose any detail of the scene. A hard, laborious scene it is,—the true presentation of men outworn, *swinked*, in Chaucer's phrase, with labor and travail. The painting was held by the susceptible critics of the Salon to have a message, an extra-æsthetic significance. Proudhon declared that "The Stone-Breakers" signified *morality in action*; he said that certain good peasants had wished to see the painting used for an altar-piece,—in the church of the agnostics, I presume. The active intelligence of the French is continually detecting and, it must be in fairness added, continually expressing meanings in art that lie quite outside of the pictorial or technical values of the work. But through his art Courbet did not discourse as a preacher; he raised the laugh as a satirist.

During the few years immediately after 1851 Courbet painted much that seemed done less in neglect than in actual defiance of natural beauty; he created what one of his biographers calls, and not unjustly, "types of reasoned ugliness." The only exception that

I know is a portrait, "The Fair Dutchwoman" (*La Belle Hollandaise*). In this picture is presented the most refined type of beauty that Courbet ever painted. "The Spanish Lady" (*La Dame Espagnole*) has a certain degree of distinction, though the subject is not attractive. But most of his studies were made from peasant girls and women, as the *Demoiselles de Village* (1852), the *Baigneuses* (1853), and many others.

Portraits and landscapes were not wanting during this period; nor were critics wanting to labor with him in behalf of the ideal. They sought to reclaim him to a more poetical treatment of life and nature; they expounded to him the idea of archetypal beauty, etc., etc. To all of which Courbet made answer, as also to his friends who urged him to marry and to become a pillar of society, by exclaiming "*Quelle balançoire!*"*

About the year 1854 Courbet gave exhibitions of his works in Besançon, Dijon, Munich, and Frankfort,—everywhere dismaying the critics, and awaking a moderate degree of popular interest. In Munich he made the acquaintance of an artist named Leibl. Courbet could not speak a word of German, Leibl could not speak a word of French; but the two men were united by a deep love of painting and of beer. They admired each other and each other's works; and they made the round of the Munich galleries together. Neither of the comrades tried to learn the first phrase of the other's language; but they gazed admiringly together upon the great pictures, and slapped each other's backs by way of genial criticism, these interpretations being helped out by the circumstance that Leibl was a skillful mimic and pantomimist. But it was over the beer of Munich that the boon companions came to their first understanding of Munich's art. Both the Frenchman and the German were mighty drinkers; and each was no less astonished than delighted at the prowess of the other. Neither of the men had dreamed that such great qualities could exist outside of his own country. Here was true communion. Not a word was exchanged during Courbet's visit; but the two artists parted eternal friends.

In Omans I went to Courbet's favorite *café*. "Many an afternoon has he passed in that corner," said the tidy woman who kept the place; many a *bock* of beer had she brought him there; and as she mentioned Courbet's name, a sitter at another table, apparently an *habitué*, said to his companion,

* It is not my fault that this slang is not elegantly translatable. "Don't tear your shirt" is, I fear, what a New York or Chicago Bohemian would say under corresponding provocation.

* This picture, too, is in the Louvre; it is eleven by sixteen feet, and cost the government 33,900 francs.

"Courbet used to drink forty glasses at a sitting." Here, too, he would put in from time to time, like a ship in distress, to mend his tackle—a bit of twine serving to repair some accident to the contrivances of his "original" apparel. There was a boyishness in his character to the last, as in that of many another old bachelor.

At the Universal Exposition of 1855, in Paris, Courbet hung eleven pictures, and made a private exhibition of thirty-eight more. A noticeable profession of Courbet's art-creed appears in the preface to his catalogue of this private exhibition; the document, however (so his reviewers say), was touched by a friendly critic's hand before the printers saw it. He says: "I have studied ancient art and modern art, and without committing myself to any system or party. Nor have I imitated the old or copied the new. I have simply sought to nurture, through a complete knowledge of the record of art, my own intelligent and independent individuality. To know in order to achieve,—such has been my aim."

An admirable purpose; the words, too, are admirable. "Through a complete knowledge of the record of art." Alas! of that particular thing, the record of art, our egotist had least of all a sufficient knowledge; and if his knowledge had been sufficient, his temperament would scarcely the less have held him to his limited range of work.

Meanwhile, Courbet was getting well talked about,—not always quite as he would like, but still talked about; a good thing for one's immediate necessities of vanity, and a form of ambition which is common and perennial among both painters and writers. My courteous informant, Dr. C——, once asked him if he liked being abused as he was. "All those people advertise me well," was Courbet's answer. The desire to be talked about, or, as he would have put it, to be "original," was a leading trait of Courbet's character. He would not even dress well, lest he should be taken for a commonplace citizen. More than one of his old acquaintance have described to me his "original" wardrobe: two shirts, one on his back, and two pairs of socks; as for outer clothes, he seldom had any others than those he wore. "In 1864," says Max Buchon, "when cold weather came, he bought a bed-quilt from a Jew; he made a hole in the middle of it for his head; that was his winter overcoat." This was all for oddity's sake, for Courbet had abundant means to dress decently. These manners naturally gave him an odd reputation among the critics. Champfleury writes: "It is believed by some that Courbet is a wild creature, who has studied painting in the interests of his toil as a swine-herd." It

is true that Courbet had about him a good deal of the bucolic rudeness of the mountaineer and the peasant. Courbet did not *Osricize*. Even his affectations were forcible. But on the other hand, he purposely accented his own tricks and affectations, as this of rude simplicity, of playing the *montagnard*. He made himself more of a peasant than he really was. Most men have their affectations. It was Courbet's affectation to be natural. That charming man and artist, my friend M. Paul Franceschi, of Besançon, another of Courbet's old acquaintances, thus expressed the thought to me: "*C'était sa coquetterie de n'être pas coquet.*"

I have noticed Courbet's chief work of 1857. In 1858 he visited the south of France and the Mediterranean, and in the following year went to Belgium. It was a time of reserve with the artist; he put forth no work which distracted the critics. In 1861 he had them all by the ears again. The cause was his important picture, the "Stags Fighting" (*Rut du Printemps* or *Combat de Cerfs*)—a title which I would paraphrase "The Struggle for Existence." A stirring scene, an *arcnum* of nature, is revealed upon this spacious canvas; but much of its merit is necessarily lost in the engraving. All painting does not lose in engraving, but most paintings do; the paintings of Courbet lose more than most others. His strongest point, technically, was color; his weakest points were drawing and composition; it must be added, however, that he professed at least to despise composition. Engraving, then, necessarily reproduces not the essential merit, but the essential faults of his work. As an apostle of realism, Courbet did not hesitate to make the leading lines in the "Fighting Stags" fall into an arrangement of rhomboidal figures; one cannot avoid remarking the parallel lines, the equal acute angles that are formed by the legs of the animals. But in the painting you scarcely notice this; you are deep within the ancient wood, the dark green forests of the Jura deepen beyond, the cool stream flows down from the heart of the glade; and, in contrast, the fury of the conflicting stags is given, and the flight of the mortally wounded creature that tosses up its head in agony. We are present at a woodland mystery, and far more really present than when we read the poets and essayists who falsely tell us that the "spirit of nature" is a spirit of rest and peace.

There are great faults of handling in the work; there is also great power. The mere critic sees nothing but its handling. But what, for instance, would Blake's art be if we looked to the handling only? In every feature of his technique Blake was cruder than Courbet, and Martin was more accom-

THE MUSICIAN.

(ENGRAVED BY T. COLE, FROM THE PAINTING BY COURBET IN THE POSSESSION OF ERWIN DAVIS.)

plished than either; but Martin's "Belshazzar" and all other extant Martins are forgotten, because Martin did not build on truth. Blake and Courbet must be remembered for their truth—for the spiritual realism of the one, for the material realism of the other.

I may add that Courbet has not neglected to paint repose. "The Hay-makers' Noonning" (*La Sieste*) is one of his best examples of a pastoral scene.

In 1862 Courbet was urged to admit students to his studio. He declined to do this; it would have been too conventional a thing, at least to open his studio formally. For a short time, however, he gave "advice" to students, and a cow was quartered in his studio for a model. Except for the advantage of this cow, it is hard to make out the difference between Courbet's advising and the routine privileges of any other master's studio. During the following year Courbet exhibited at his studio, because it was refused at the Salon as a libel upon religion, the work by which I dare say he is better known than by any other—the "Priests Returning from the Conference" (*Retour d'une Conférence*). The satire of it is extremely coarse and telling, and all the more so in Courbet's country because the story is substantially a true one; the figures depicted are portraits of which I could name the originals. Several of them, indeed, are still living. It is the custom of the clergy to meet at stated times at one another's houses, both for social and professional purposes; and in this case there was a good cellar, and the genial *cures* drank too much. One does not often see tipsy folk in France, least of all among the clergy. Thirty years ago, both in Europe and in America, it was the fashion to drink more than is drunk now; but even then the occurrence was rare enough to cause scandal, which Courbet remembered as such and caricatured in his painting. One of the *convives* was too "mellow" to walk, and the rest of the company actually propped him upon a donkey, as set forth in the picture. It is full of telling points. One remarks especially the peasants at the left of the consecrated oak-tree; the husband is convulsed with laughter, but his wife, though in dismay at the scene, has fallen on her knees from the old habit of reverence to the priest. Courbet painted three companion scenes to this picture, still more vulgar caricatures of the priests and their failings. Their injustice is the common injustice of caricature of manners—the effort to make an unusual incident or accident appear as the usual course of things.

I have mentioned the best known of Courbet's paintings; but we need not try to follow in detail the long catalogue of this prolific

artist's work. We have now reached the most fortunate period of his life, his culminating time,—from 1860 to the year of the Commune. Let us follow him back from his Paris studio into his beloved Franche-Comté on his summer tours. He made frequent visits to Ornans. The son of one of my informants lived directly opposite to his studio; the two houses are the first that you come to on entering Ornans by the road from Besançon. The young man was very fond of music; the father, Dr. C——, intended him to study medicine; Courbet urged him to give up all for music: "You have a talent for music, as I have for painting; give up all for music." "But my father?" said the young man. "Your father is a *vieille ganache*" (an old imbecile), said Courbet. Dr. C——'s eyes twinkled as he told me this. I asked him, "What did your son do?" "He studied medicine," said Dr. C——. But art was not forgotten in the doctor's house. The open piano is still in the parlor; and every summer painters come for his permission to paint the hills of Ornans from his balcony.

The gifted sculptor of Salins shall describe one of these summer episodes of artist life. Max Claudet was the youngest of the joyous trio who wandered in the deep valley of the Lison. I translate from his brochure, "Souvenirs de Courbet" (Besançon, 1880):

"One day in 1864 Buchon said to me, 'They tell me that Courbet is at Nans. You ought to go and find him, and bring him down to spend a few days with us.'

"It was the end of September; and September is the finest month in our mountains of the Jura. The country was alive with a swarm of vintagers.

"I set out at ten A. M. with one companion. We went afoot; it would be sacrilege to ride through a country so unspeakably lovely that you have to pause at every other step to admire great nature.

"Nans is a wonderful place; it is a corner of Switzerland strayed into the French Jura. The road finds its way thither through a wood; first the village appears, with its beautiful houses; then the Saracen's Grotto, a niche among the rocks, worthy of the Lago di Maggiore; then the source of the Lison, and the Creux-Billard, the wildest of cascades. It is the region that now is full of artists during the season of good weather; Courbet, indeed, in good part set them the fashion.

"We found him at the inn, just finishing his dinner.

"'You have come for me, then?' said he. 'The diable! but I have a picture to paint this afternoon,—the source of the Lison. You want us to leave at five o'clock? Well, there is time enough, but I can't fool around any. You sit down and eat; I will go on ahead with Jerome, and you shall come on after me!' Jerome was a handsome donkey that Courbet had provided, with a little wagon, to carry all his artist 'traps' when he went on his painting excursions near Ornans.

"I confess that I was somewhat incredulous as to the birth of a landscape which should be begun at two o'clock and finished by four. However, we lost no time in following Courbet. It is two kilometers from the inn to the outpouring fountain of the river. There we found the painter installed upon a level spot,

facing the torrent-spring; the canvas was upon the easel; Jerome was grazing philosophically by his side.

"A high wind was blowing. Just as we arrived upon the scene the easel blew over; and, to make matters worse, one of the forks of the easel was forced through the canvas.

"That's nothing!" said Courbet. He set up his apparatus again; he smeared some pigment upon the torn place; he stuck on a piece of paper, and said: 'You won't see anything.'

"We were standing before a great cliff of many-colored rock; a forest crowned its summit. A vast cavity, like the nave of a church, opens in this cliff; its roof is sustained by rock pillars. From the depths of the chasm pours a stream of blue water, as cold as that which flows from glaciers. It falls in a cascade to the base of the cliff, and thence takes its way down the valley, bathing the foundations of the houses in Nans, the scene of the first love of Mirabeau and Sophie.

"Courbet stood before this beautiful scene, a black canvas at his side; it was still untouched, except for the torn place. We secured his easel as well as we could, with a wagon-frame and with heavy stones, so that the master could begin without fear of further mishap.

"It surprises you that my ground is black?" said he. 'Nature is dark without the sun. I do as the sun does. Bring out the lights, and the picture is done.'

"He had a box containing tumblers filled with colors,—white, yellow, red, blue. With his knife he mixed them upon his palette; then, still with his knife, he began to cover the canvas; his strokes were firm and sure.

"Let me see you paint rocks like those with a brush," said he,—'rocks rusted in long veins from top to bottom by time and flowing water!'

"He painted in the water in the same way; the *ensemble* of the picture began to appear. 'A few trees here, some green grass in the foreground, and we shall soon be done,' said he; and his knife was running constantly over the canvas.

"At four o'clock the picture was actually complete: the hand of the master was in it, and his strong inspiration. We were stupefied by this swiftness of execution. Hardly two hours to cover a canvas more than a yard square!

"Now," said Courbet, 'en route for Salins!'

"All the traps were put into the little wagon; the picture was firmly secured behind; Jerome, who appeared vexed at this interruption of his dinner, was harnessed up, and we started. At the village we brought another donkey to the aid of Jerome, because the road is up-hill for nearly four miles. We followed on foot, watching the donkeys, who did not behave very well.

"When we got to the top of the hill we sent back the duplicate donkey. We had now an equal distance down-hill before us, and Courbet said, 'Now let us ride.'

"You should have seen us three in that wagon. We were crowded like herrings, for Courbet filled a good large place. Our donkey trotted along slowly; night fell; we were nearly in sight of Salins. The road is constructed upon giddy ground; the mountain rose up straight on our left hand; on our right was the profound gulf of a ravine.

"In this situation we met an ox-cart, weighted with an immense tun of the new vintage. We kept to the right, the outside, in order to get by. To our horror, Jerome took fright, and set off at full gallop.

"Courbet pulled the reins violently. The left rein broke. The right rein pulled the donkey's head over the precipice. Donkey, painter, passengers, wagon, and all, began to go over; it was an awful moment. Happily, the two hind wheels of the machine caught upon the stone parapet of the road, and held us hang-

ing. We scrambled out; we hauled back the donkey, the wagon, and the picture. Long after night-fall we got safely back to Salins. But none of us got into that wagon again!

"That picture remained with Buchon until his death. Then Courbet took it. Where is it now? I do not know. If its owner chances to read these lines, he will know the history of it."

It is a charming episode; and M. Claudet adds that Courbet, who came to Salins to remain a week, was still there after three months had passed away.

Here is another picture from those fortunate years before the trouble came,—a scene near Paris this time. Max Claudet will let me borrow once more, I am sure, from his charming "Souvenirs":

"I shall never forget a dinner that we had together one beautiful spring day, in the country near Paris.

"Our party met at the railway station at half-past one. Max Buchon and I were among the first on the ground; then came Champfleury with Castagnary and Courbet. The latter brought a spectacled young man with him, armed with a large umbrella, whom he introduced as M. Vermorel.

"We got off at Chatou, and walked to Bougival; there Courbet decided that we should get a better dinner at a hostelry on the Seine, opposite to the charming islet of Croissy; so we walked thither by the river-side, following a path that was traced lightly on the green grass. Courbet talked about painting.

"Arrived at our inn, he ordered dinner. We sat down. In the midst of our *festa* Gambetta came in. The future minister chatted a moment with us, then returned into the neighboring room.

"It was a merry dinner. Courbet told the funniest stories of Franche-Comté. The afternoon sped quickly in such company; in the evening we returned to Paris.

"To wind up the day properly, we went to a *braserie*. There we met Chaudey, the advocate, who argued, with his usual fire, that the artists were all fools,—men who hadn't enough wit to associate themselves for their mutual benefit, as even the shoe-makers do. Vermorel, as great a ranter as he, opposed him; Courbet fretted at being prevented from talking about his beloved painting; and Buchon stroked his mustache,—his habit whenever he was wearied of a discussion.

"Alas! what somber days were to come between these companions, then so droll and so merry!

"If a voice had spoken to us then and there, designating each one of the company: 'You, Chaudey, you will be shot by your own partisans! You, Vermorel, you will die upon a barricade in the midst of Paris, the city blazing and running with blood, and a hundred thousand Germans applauding! You, Courbet, will bid farewell to the arts, and go to die in exile! You, advocate of Cahors, you are to be Minister of War; you are to struggle in vain against the enemy, and to escape from Paris in a balloon [and, we may now add, to die prematurely, a full generation before your time]! And you, Buchon, who are so strong, so robust, always ready to sing the old songs of the Franche-Comté, you will not see all that—you will be dead the first!'—Ah, well; if a prophet had said that to us on that day, we should have dined less gayly, and even Courbet would have had an indigestion."

Then came the war, the invasion of Courbet's country; the German troops made of Courbet's studio a stable for mules, and kicked

their boots through his pictures on the walls. Let us glance at the later scenes of this active life. Courbet was no less a radical in politics than in religion, and from a similar love of oddity; but radicals of this cast are never devoted reformers. Reform implies reconstruction; but destruction is an easier work, and Courbet's most famous act was the destruction of the Vendôme Column.

In France and out of it the act provoked a storm of criticism. Why did he pull down

GUSTAVE COURBET. FROM A PHOTOGRAPH BY CARJAT & CO.

the Column? "In the interest of European peace," was Courbet's own professed defense. "In the interest of high art, to which the Column was a flagrant offense," said Courbet's friends. But I fear that Courbet did not have either the interest of the arts or of humanity very deeply at heart. There were other motives; the desire of notoriety, even the desire of money, was not absent. I am able to contribute something to the story of the destruction of this Column,—a story that has been discussed at great length, and with great heat, never fully told.*

* M. Castagnary has recently sought to rehabilitate his old friend in the esteem of the French. He argues that Courbet was not responsible for the destruction of the Column, by pointing out that he was not a member of the Communist committee who

It was no new idea of Courbet's. During the Commune he posted placards invoking destruction upon the Column, because it perpetuated the memory of so many French victories. Why record in eternal brass the humiliation of Germans, Italians, Spaniards, Swiss, and other good people? The Column, in short, he said, was a standing offense to the good-fellowship of European nations. This appeal was surprisingly humanitarian, considering the moment—that of the profound humiliation of his own country, his *patrie*; and it was, in any case, a little out of keeping, one would think, as addressed to the men of the Commune—a class of persons not eminent for humanitarian sentiment.

After the Column was pulled down, his friends took the other line of defense, as already noted. They said that the Column was a bad work of art; never was more atrocious taste; the sight of it galled the delicate sensibility of Courbet, and of other similarly organized persons. It was, in short, in a righteous rapture of iconoclasm that he threw it down; it was the logical consummation of his love of high art, and is not the love of high art an excellent thing?

Doubtless; yet this claim, again, seems a little inconsonant with what we have seen of the man who scorned the ideal, and whom his best friends described as a *montagnard*, a "mountaineer."

A more genuine clew to Courbet's motives in destroying the Column was given me by Max Claudet. Though a younger man by some fifteen years than Courbet, he was one of his intimate associates during many years, and they were much in each other's studios; and years before the Franco-German war Courbet used to talk about the Vendôme Column. "You can quote me for the fact," said Claudet to me in his mountain studio in September, "that Courbet repeatedly told me, as much as ten years before the war, that he would like to destroy the Colonne Vendôme."

"And why?" I demanded. "Was it because of his devotion to high art, as his friends said? or because he regarded the Column as an offense against the friendship of nations, as he said himself?"

"For neither reason," answered the sculptor. "What Courbet more than once said to me was this: 'It took a vast quantity of bronze to build the Colonne Vendôme; it is very valuable. How I should like to pull it

ordered it to be thrown down until some days after the thing was actually done. He was none the less the inspiring spirit of the affair. It will be hard to prove that Courbet was not Courbet.

down for the sake of the bronze that it contains!' Would you believe," said Claudet, "that Courbet actually supposed that the Column was made of massive bronze?"

On the 16th of May, 1871, at a quarter after four in the afternoon, the Vendôme Column, previously undermined by the masons, yielded, but only after many efforts and slowly, to the strain of powerful windlasses. It came down with a great crash, filling the adjacent streets and squares with dust. An immense crowd was in attendance; they saw Napoleon's statue roll headless in the débris. The Commune was suppressed; all of its leaders who had saved their lives were brought to trial. On the 3d of the following September, Courbet was duly sentenced to six months' imprison-

ment for destroying the Column, and to restore it at his own expense. The heavy cost of this was paid in part, and on Courbet's death his devoted sister, who had the Gallic dread of pecuniary dishonor to her family, assumed the remaining debt; which, however, was canceled by the Government. They restored the Column: they could not restore to the French mind the idea which fell with it,—that military glory is the first glory of a nation. Courbet unbuilded better than he knew when he threw the Column down. But his good time was over. Then followed sickness, neglect, the horror and aversion of his friends and countrymen, and voluntary exile to Switzerland. Courbet went to a little place near Vevay, Tour-de-Peil by name; it is not far from the bound-

PULLING DOWN THE VENDÔME COLUMN.

ary of the Jura; he painted a little there, but not much. November 18, 1877, his pictures were sold in Paris, or "slaughtered" rather, toward the payment of his fine; they brought only twelve thousand one hundred and ten francs. On the 31st of December following Courbet's troubled life had ended.

An exhibition of nearly two hundred of Courbet's works was held in the summer of 1882 in the *École des Beaux-Arts*, in Paris. There it was to be seen that in one important sense Courbet was a born painter. He had the unappeasable instinct of creation; he would paint anything, down to a broomstick, and call it good. Let us be thankful for the

"natural truthfulness" of his landscapes and his animals.

But in another sense he was not a painter at all, at least outside of his landscapes. In all his other work he was a story-teller. He did not paint for the sake of painting; neither for beauty's sake, nor even for the sake of the unbeautiful, like so many of our young realists, American and English, who are sated with beauty, and so devote themselves to Our Lady of Ugliness. Courbet cared for neither; he was a born story-teller and satirist, and he painted to tell stories and to satirize. As he once said, he was the "preappointed historian of the priests." He told stories of all kinds with the

brush. As pure art, his works have little value outside of their color. But they have a sturdy material verity. They are free from self-consciousness, and they tell us much about the French country and country life of our time. It is unfortunate that he took up, as over-willful men are apt to do, with a coarse theory, in his case the theory of a narrow realism in painting.

He had one of the characteristics of dilettante art: he never learned to draw thoroughly well. But, in its spirit, in its results, his work was virile, not dilettante. Dilettante and amateur work in general tells us more about the artist than about the object represented; it even describes the whims of his inner consciousness, which are dearer to many contemporary painters and poets than anything in the outer world, the world in which the true artist mainly lives. But it was egotism, and not dilettantism, which appeared in Courbet's work throughout. His faults as a painter were those of his temperament—coarseness of nerve-fiber, and consequent egotism. Courbet was in love with himself to a degree seldom exemplified. "As a matter almost of consequence, he had little sentiment or poetry in him, and that little he sought to exclude from his work. M. Silvestre says well of his landscapes: "They are true, but they express only the material truth of nature. They do not express her vast and mysterious aspects." Even of his own works his criticism was coarse; he could not tell his better from his poorer work. "*Il n'avait pas conscience* [critical insight] *sur ce qu'il avait fait*," said one of his old friends to me, speaking with the frankness which the truest friends permit themselves to use in France.

Courbet's art, of course, was the outcome of his character; not indeed of the visible traits only—but the art and the character hung together. A rude, masculine energy, a

ruling egotism, were at the foundation of his nature; but his abounding animal spirits made these traits more tolerable than they are in less abundant natures. He had an overflowing physical life, warmth and vivacity of feeling, energy of mind and body, and a sort of boyish freshness about him. Was he a good companion? Not always; that excessive self-love stood in the way. He was anything but catholic as regarded his intellectual companionships. He avoided his superiors; he did not get along very well with his equals; his inferiors were more to his taste,—a sure mark of deficient intellectual nobility. Courbet lived in a time of superior men, but he numbered few of them among his friends. Ste. Beuve was one of the few; it was the friendship of the sturdiest and one of the subtlest minds in France. They were drawn together by the frequent attraction of entirely opposite temperaments; they enjoyed each other's natures, and profited by each other. But in general Courbet did not show in his friendships any faculty of ascending fellowship; he preferred the descending fellowship with his flatterers. Of these, in Paris, a body-guard of some twenty or thirty was commonly in his train. He was like the chess-player who refuses to learn from an opponent stronger than himself. This egotism led him to the exhausting life of the *cafés*; too much beer and his heavy troubles broke that doughty form and rude mind at last. We may look upon him more gently than his countrymen can do. "*Comme homme, il n'a pas laissé un souvenir très regretté*" ("As a man, he is not very kindly remembered"), said one of his old fellows to me in the Jura. But with all his errors, he was an original and interesting figure in a passionately interesting time and society. With all his faults, and with all the faults of his work, it was still worth while for Courbet to have lived and painted.

P. H. Miercand

LIEUT.-GENERAL SHERIDAN.

HANNIBAL, having been sent into Spain, from his very first arrival drew the eyes of the whole army upon him. And there never was a genius more fitted for the two most opposite duties of obeying and commanding, so that you could not easily decide whether he were dearer to the general or the army; and neither did Hasdrubal prefer giving the command to any other when anything was to be done with courage and activity, nor did the soldiers feel more confidence and boldness under any other leader. LIVY, B. xxi.

PHILIP HENRY SHERIDAN was born March 6, 1831, in the village of Somerset, Perry county, Ohio. He lived there continuously until he was seventeen years of age. His father was a contractor for the construction of various important roads at the West, and spent most of his time away from home. Young Sheridan lived with his mother and went to the village school, where he learned reading, writing, spelling, English grammar, arithmetic, and geography. This was all the education he received until he entered the Military Academy at West Point. He was, however, an attentive student of history, and especially of military history and biography; military matters indeed filled his mind, and his dream was always to become a soldier. There seemed, however, little prospect of this, and as soon as he was able to do anything for himself he entered the country "store" of Mr. John Talbot, in Somerset, at a salary of twenty-four dollars a year, his home being still with his mother. In due course he was promoted to a situation in another "store," where his pay was sixty dollars, and finally arrived at the point where his services were worth one hundred and twenty dollars a year. For this sum he acted as book-keeper, and managed what, for the time and region, constituted an extensive trade. He had never been ten miles from the place of his birth until he was sixteen years of age; then he was sent occasionally, for his employers, distances of sixteen and eighteen miles, but this was the extent of his travel.

During all this while the future general-in-chief had not neglected his books, and he was well up in all the English studies already mentioned; but he still kept his mind bent on a military career. A vacancy occurring at West Point when he was seventeen, Sheridan applied to the member of Congress from his district for the appointment. The answer inclosed his warrant as cadet, and directed him to report at West Point, June 1, 1848. He brushed up his spelling and grammar, and passed his preliminary examinations without trouble. When he entered the Academy he knew nothing of algebra, geometry or any of the higher branches of study. But cadet

Henry W. Slocum, since major-general of volunteers and member of Congress from New York, was his room-mate. Slocum was an industrious, hard-working student, and from him Sheridan derived much assistance, especially in the solution of knotty points of algebra. The two boys were very much in earnest, and after taps, when the lights were put out and every cadet was expected to remain in bed, Slocum and Sheridan were in the habit of hanging a blanket over the window, and then lighting their lamp and pursuing their studies. At the first examination Slocum went up toward the head of the class, and Sheridan stood several files higher than he had expected with his disadvantages.

In 1852, in his graduating year, he had some trouble of a belligerent sort with another cadet, which resulted in his suspension. He thought at the time the punishment was unjust, but riper experience convinced him that the authorities were right and he was wrong. He was suspended for a year, after which he joined the class of 1853, and in this he was graduated. He was at first assigned to the First Infantry, but soon afterward was transferred to the Fourth.

He was not long in developing the traits which have since made him famous. In 1856 he was stationed in Washington Territory, and while there was engaged in defending the Cascades of the Columbia River against Indians. At one point the enemy were posted on an island, and the troops were obliged to land under heavy fire; but Sheridan took a little force down the stream unperceived by the Indians, crossed the river, and got around in their rear, and by this maneuver rendered the success of his command practicable. He was especially commended in orders by General Scott for this achievement, which not only foiled the savages in their own strategy, but was the exact device he afterward employed in several of his most important battles on a very much larger scale.

When the war of the Rebellion broke out, Sheridan was on the Pacific coast, but found his way eastward as soon as possible; for he snuffed the battle from afar, and was from the

first heart and soul for the Union. In May, 1861, he became a captain, and in December was appointed Chief Quartermaster and Commissary in Southwest Missouri, on the staff of Major-General Curtis. The service at that time and in that region was, in some respects, in a deplorable condition. Many officers of high rank were concerned in dealings not at all creditable. Valuable property of the region was regarded as a private prize, and much that was ostensibly taken for the use of the quartermaster's department was really secured in the private interest of high officers. Sheridan, as chief quartermaster, determined to put a stop to these proceedings. He prohibited the use of government wagons for private purposes whatsoever, and required that all horses and mules taken from the country should be immediately branded U. S. This brought him into collision with many officers, and he was directed to rescind the instructions he had given his subordinates. He protested, but in vain; and feeling that his usefulness would be impaired by a course which tended to demoralize the officers of his department, he applied to be relieved from duty with General Curtis's army. This request was shortly afterward complied with, and, reporting at St. Louis, he was assigned by General Halleck to another field.

In April, 1862, Halleck assumed command in person of the army in Tennessee, taking Sheridan with him on his staff. Shortly afterward the colonelcy of one of the Michigan regiments fell vacant, and the Governor of the State wrote to Halleck to name a good man for the post; it was immaterial whether he was from Michigan or not, so that he was an educated soldier. Halleck at once nominated Sheridan, who thus received his first command, as colonel of the Second Michigan Cavalry. He participated in several engagements during the advance on Corinth, and on the 2d of June was given command of the Second Cavalry Brigade of the Army of the Mississippi.

On the 1st of July he was attacked at Booneville by a force at least forty-five hundred strong, and at once displayed the qualities of steady determination and fertility of resource in emergencies for which he was afterward so preëminent. After a stiff resistance he fell back to an advantageous position on the edge of a swamp, where he could hold the assailants at bay. Finding, however, that the enemy was passing around his left and threatening his camp, he determined to make a bold dash on the right and convert the defense into an offensive movement. Selecting four of his best saber companies, he sent them several miles around the enemy's left to attack

in rear and flank, while he was to make a simultaneous charge in front.

The plan worked admirably. The four companies appeared suddenly in the enemy's rear, not having been seen till near enough to fire their carbines, and, having emptied these, they charged with drawn sabers on the astonished enemy, who doubtless took them for the advanced guard of a very much larger force; for it was not to be supposed that so small a body would have the audacity to throw themselves against a force of forty-five hundred men without the promise of speedy support.

Before the enemy could recover from the confusion of this attack they were fiercely charged by Sheridan with his remaining handful of men, and, utterly routed, fled from the field. This engagement, in which two small regiments of cavalry defeated nine, won for Colonel Sheridan his first star,—his commission as brigadier-general dating from the battle of Booneville. Those who study his after career will find numerous examples of the same peculiarities so strikingly illustrated in this his earliest independent fight.

The reputation he acquired by this affair made Sheridan known to all his superiors at the West. Halleck, Rosecrans, H. G. Wright, and Gordon Granger all recommended his promotion. Several expeditions in which he was engaged still further developed his powers; and when Halleck was transferred to Washington, leaving Grant at the head of the Western army, the new commander fully appreciated his subordinate. In September, 1862, the situation of Buell in Kentucky was such that Grant was ordered to reënforce him. Grant selected some of his best troops for the purpose. He was superintending the movement himself when he perceived Sheridan at the head of his command, about to march. "What!" exclaimed Grant, "are you here, Sheridan? I did not intend that you should leave this army." He had not remembered that the colonel commanding a brigade in reality belonged to the Second Michigan Cavalry, and had purposed to keep a man whose ability he so highly esteemed in his own command. But Sheridan had no desire to remain. He had been ordered to the field where fighting was most imminent, and he said nothing to Grant to induce him to change his destination. Grant was a little touched at this indifference, and Sheridan went on to join Buell. Neither suspected then how close and intimate their relations would become in the wider spheres that awaited them.

Arriving at Louisville, Sheridan was assigned to the command of a division, and with this force constructed in a single night the whole series of rifle-pits from the railroad

station in Louisville to the vicinity of Portland, a distance of five or six miles. In October he accompanied Buell in his advance against Bragg, and on the 8th of that month he bore a conspicuous part in the battle of Perryville, holding the key-point of the position, and successfully defending it against several attacks of the enemy. Hardee repeatedly charged him with fixed bayonets, but was invariably driven back in disorder from the open ground in front of the heights where Sheridan was posted.

He remained in command of a division in the Army of the Cumberland until the battle of Murfreesboro, in which he sustained four separate attacks, and four times repulsed the enemy, when his ammunition became exhausted, and he was compelled to fall back from his original position. Even after this he engaged the advancing enemy, recapturing two pieces of artillery, and absolutely routing the force that had driven him. For his conduct in this battle he was made major-general of volunteers, on the recommendation of Rosecrans.

He participated in the march on Chickamauga, and on the 2d of July arrived at the Elk River, but found the stream so swollen by recent and heavy rains as to be impassable. He thereupon turned the head of his column and marched it parallel with the river till he discovered what seemed to be a practicable ford. But the enemy was guarding it with a cavalry regiment; the stream was waist deep, and the current was quite too impetuous for infantry to pass unaided; it would have separated and swept away his column. In this emergency Sheridan's invention came to his aid, and a device worthy of Hannibal indicated the genius of the Union commander. He first drove the enemy from the opposite shore, and after a sharp skirmish crossed his cavalry. A cable was next stretched across the river, by the aid of which the weak men of the division were passed. The remainder of the command was then formed in solid phalanx to resist the stream. With muskets and cartridge-boxes on their shoulders, and their hands resting on the knapsacks of the rank in front, they went in with a cheer, supporting each other, and the entire division crossed the deep and rapid stream without the loss of a man.*

In the battle of Chickamauga, Sheridan shared the terrible fighting and the disasters of the army. He was on the extreme right on the second day, and entirely disconnected

from the remainder of the command. At eleven o'clock he was directed to move to the left to the support of Thomas; and, while marching at the double quick to carry out the order, he received an overwhelming assault, and was driven back three hundred yards. In the meantime he was receiving the most urgent orders to throw in his entire command; and, rallying his men, he drove the enemy in his turn, inflicting immense slaughter, and regaining the line he had originally held; but the enemy had strong supports and Sheridan none, and he was driven back again. But the assailants showed no disposition to follow up their advantage, and Sheridan had learned positively that the divisions on his left had also been driven, so that he was completely cut off. He therefore determined to connect himself with Thomas by moving back on the arc of a circle until he was able to form a junction. But the enemy moved parallel with him, and arrived first at the point at which he was aiming. Sheridan then moved quite around in the rear of Thomas, and at last came in on his left flank. Shortly after, the whole command was retired.

Sheridan's part of this disastrous battle was fought under the most disadvantageous circumstances. No time was given to form line of battle, he had no supports, and one division contended against four or five. His command numbered four thousand bayonets, and he lost ninety-six officers and one thousand four hundred and twenty-one private soldiers. He did his best to beat back the furious storm which so nearly destroyed the army, and never displayed more stubborn courage or military skill in a subordinate sphere than on this terrible day.

Hitherto his fighting had all been on the defensive. He had served under unsuccessful soldiers, and his ability was directed rather to efforts to repel and resist than to those more congenial to his nature—to assault and advance. These were to find their scope and opportunity under Grant.

The battle of Chattanooga, two months later, redeemed that of Chickamauga, and in this it fell to Sheridan to lead a division in the famous charge on Missionary Ridge. The situation at Chattanooga was simple, and can be understood by the most unmilitary reader. The town lies on the south bank of the Tennessee, with a vast plain extending toward the hills in front and on either side. On the right is Lookout Mountain, rising abruptly two thousand feet, while the southern limit of the plain is Missionary Ridge, so called by the Indians, who allowed the missionaries to pass no farther. Grant was in possession of Chattanooga, and the enemy held Missionary Ridge

* The Spaniards, without making any difficulty, having put their clothes in bags of leather, and themselves leaning on their bucklers placed beneath, swam across the river.

and Lookout Mountain. On the 24th of November Sherman carried the hills at the end of the ridge on the left, and Hooker stormed the works on Lookout Mountain. Thomas had already moved out from Chattanooga to a point in front of the center of the ridge. Sheridan held the extreme right of Thomas's command. Grant's plan was to move Sherman and Hooker simultaneously against the enemy's flanks, and, when Bragg was weakened or distracted by these attacks on right and left, to assault his center on the ridge. The movements on either flank occurred. Sherman's attack was very vigorous, but the enemy were obliged to maintain the point in his front, for it commanded their trains and their only possible line of retreat. Bragg, therefore, reinforced heavily from the center, and when Grant perceived this movement he ordered Thomas to assault.

Thomas's command consisted of four divisions, with Sheridan, as already stated, on the extreme right. The center of his division was opposite Bragg's head-quarters on Missionary Ridge. The ground in his front was, first, open timber; then, a smooth and open plain, the distance across which, to the first line of the enemy's rifle-pits, varied from five hundred to nine hundred yards; next, a steep ascent of about five hundred yards to the top of the ridge, the face of which was rugged and covered with fallen timber. About half-way up the ridge was a partial line of pits, and, last of all, the works on the crest of the mountain.

While Sheridan was making his dispositions to attack, the enemy's regiments could be plainly seen moving to the still unoccupied rifle-pits on the summit, their blue battle-flags waving as they marched. As he rode in front of his line to examine the works, which looked as if they would prove untenable if carried, a doubt arose in his mind as to whether he had understood his order, and he sent an officer to ascertain if it was the first line only that was to be carried, or the ridge itself. Grant had intended to carry the works at the foot of the ridge, and, when this was done, to reform the lines in the rifle-pits, with a view to carrying the top. But Sheridan's aide-de-camp had scarcely left his side when the signal was given, and the division rushed to the front under a terrific burst of shot and shell. Nevertheless, it moved steadily on, Sheridan in front of the line, and, emerging from the timber, took up the double-quick step and dashed over the open plain and at the enemy's first line with a mass of glittering bayonets that was irresistible. Many of the enemy fled; the remainder threw themselves prostrate before the assaulting line and were either killed or captured, and the national

troops rushed over. The three brigades had reached the first line of pits simultaneously. The enemy's fire from the top now changed from shot and shell to canister and musketry.

At this moment Sheridan's officer returned and brought word that it was the first line only that was to be carried. He first reached the left of Sheridan's command; and one brigade on the left was accordingly withdrawn to the rifle-pits which they had already crossed. The officer then rode up to Sheridan himself with the order, but the attack had by this time assumed a new and unexpected phase. Sheridan saw that he could carry the ridge, and he could not order officers and men who were already gallantly ascending the hill, step by step, to return. He rode from the center to the left, and saw disappointment on the faces of the men who had been withdrawn; he told them to rest for a few moments, and they should "go at it" again.

Meanwhile the right and right center were nearly half-way up the hill, and approaching the second line of pits, led by twelve sets of regimental colors. First, one flag would be advanced a few feet, then another would come up to it, each vying with the other to be foremost, until the entire twelve were planted on the crest of the second line of works. Now came another aide-de-camp to say that the original order had been to carry the first line; but that if, in Sheridan's judgment, the ridge could be carried, he was to take it. Sheridan's judgment was that Missionary Ridge could be carried, and he gave the order. "When I saw those flags going up," he said to me, in describing the fight, "I knew we should carry the ridge, and I took the responsibility." The men obeyed with a cheer.

Thirty pieces of artillery now opened on the assailants with direct, plunging, cross, and enfilading fire, and a tempest of musketry from the still well-filled rifle-pits on the summit; but the men put their faces to the breast of the mountain to avoid the storm, and thus worked their way up its front, till at last the highest crest was reached. Sheridan's right and right center were the first, being nearest. They crossed at once to Bragg's head-quarters, but the rebel chief had fled. The contest, however, was maintained for several minutes, when the enemy was driven from his artillery, and guns and supports were captured together. Whole regiments threw down their arms, others fled headlong down the further slope, the national soldiers not waiting to reload their pieces, but driving the enemy with stones. Before the entire division had reached the crest, the disorganized troops of Bragg could be plainly seen, with a large wagon-train and several pieces

of artillery, flying through the valley below, within a distance of half a mile.

Sheridan, however, had no idea of resting upon his laurels. The victory was gained, but the results must be secured. He at once directed two of his brigades to press the flying rear-guard and capture their wagon trains and artillery. Nine guns were speedily taken; but, about a mile beyond the ridge, the road ran over a high and formidable crest on which the enemy had posted eight guns, supported by a large infantry force. Sheridan at once rode to the front with a couple of regiments, and found the advance contending against greatly superior numbers, the men clinging to the face of the hill, as they had done a few hours before on Missionary Ridge. It was dusk, but he determined to flank the enemy with the fresh regiments he had brought. In order to accomplish the flanking movement, a high bluff, where the ridge on the left terminated, had to be carried. When the head of the column reached the summit of this hill, the moon was rising from behind, and a medallion view of the column was disclosed as it crossed the moon's disk and attacked the enemy, who, outflanked on right and left, fled hurriedly, leaving two pieces of artillery and many wagons behind. "This," says Sheridan in his report, "was a gallant little fight."

One hundred and twenty-three officers and eleven hundred and seventy-nine men of the division bathed Missionary Ridge with their blood. For one and one-eighth miles, emerging from the timber, and crossing the open plain, the troops were subjected to as terrible a cross fire of artillery and musketry as any in the war.

It was Sheridan's conduct during this battle and the pursuit, which inspired Grant with the supreme confidence he always afterward felt in his great subordinate. This was the first time that Sheridan had fought immediately under the eyes of Grant, who has often told me of the impression made on him by Sheridan's determination to advance up the mountain, his gallantry in leading the charge, and, quite as much as either, the remorseless energy with which he pursued the routed enemy. This last trait is most uncommon even with brilliant soldiers; for many are apt to sit contented with an incomplete victory. In this very battle more than one of Sheridan's superiors displeased or dissatisfied the chief by a willingness to rest before the fruits of success were all secured; but Sheridan never displayed this fault; and on this occasion he earned the advancement which he afterward received, and which gave him the opportunity to achieve what has made him world-re-

nowned. At Chattanooga he really did as much as in any other battle to earn the generalship of the army.

Only two or three months later, Grant was made general-in-chief of the armies, and determined to take command in person at the East. He was dissatisfied with the results accomplished by the cavalry in Virginia, and was talking with the President and the Secretary of War of his designs. "I want," he said, "an active, energetic man, full of life, and spirit, and power." Halleck, who was present, inquired: "How would Sheridan do?" "The very man I want," said Grant, and telegraphed for him that hour.

But, with the ignorance of the future that besets us all, Sheridan was unwilling to leave. He had won his laurels at the West; he had fought only with Western troops; success at last seemed opening there, and he was loth to change his sphere and come to untried men and unknown theaters. Of course, he was too good a soldier to express unwillingness, but the honors pressed on him by Grant were all unwelcome; and he left the West with regret to enter upon those fields where he was destined to gather so splendid a harvest of renown.

When Sheridan took command of the cavalry of the Army of the Potomac, it numbered from ten to twelve thousand effective men, and was employed to encircle the infantry and artillery with a picket line which, if continuous, would have stretched out nearly sixteen miles. This was a use of the force which Sheridan disapproved. It was shortly after dispensed with, and the horses instead were nursed for the coming campaign. It was Sheridan's idea that cavalry should fight the enemy's cavalry, and infantry the enemy's infantry. He thought, too, that he perceived a lack of appreciation of the power of a large and well-managed body of horse. This power he was destined himself to display in a striking manner in the events of the following year.

He participated in the battle of the Wilderness, opening a way for the movement of the various columns, crossing the Rapidan in advance, and guarding the trains and the left of the army. This battle was fought on the 5th and 6th of May, 1864; on the 7th Sheridan again led the way to Spottsylvania, fighting the battle of Todd's Tavern to clear the road for the infantry. On the 8th he was sent for by Grant, and received orders to go out and engage the rebel cavalry; and when out of forage, of which *he had half rations for one day*, he was to proceed to the James River, sixty miles away, and replenish from Butler's stores at Bermuda Hundred. This was carry-

ing out Sheridan's own idea that cavalry should fight cavalry. The details of the movement were left to himself, and he at once determined to march around the right of Lee's army, and put his command, before fighting, in a region where he could find grain. There he believed that the enemy's infantry would not molest him, and he felt fully able to contend with Lee's cavalry.

This plan was executed. He moved his three divisions on a single road, making a column thirteen miles long; "for," he said, "I preferred this to the combinations arising from separate roads—combinations rarely working as expected, and generally failing, unless subordinate officers are prompt and fully understand the situation": a maxim which, coming from a master of the art, is worthy commemoration. He soon came into a green country where, as he expected, he found supplies, and also destroyed immense quantities of grain and ammunition intended for Lee.

The enemy's cavalry, under Stuart, at once started in pursuit, and threw themselves between the national forces and Richmond; but their leader unwisely divided his command, sending a large party to attack Sheridan in rear. He, on the contrary, threw his principal strength against the force which attacked him in front, and fought the remainder with a small rear-guard. He was completely successful; the enemy were beaten front and rear. Stuart was killed, and Richmond itself exposed to the victorious troops. A reconnoitering party indeed dashed over the outer works of the town.

It was no part, however, of Grant's design that Sheridan should enter Richmond at this time. He could not possibly have held the place, and though Jefferson Davis and his Congress were greatly alarmed, the cavalry leader obeyed his orders and turned his column eastward. He was now between the Chickahominy and the James, and as soon as the enemy ascertained that Sheridan had no intention of attacking Richmond, they came out in force to assail him. The bridges on the Chickahominy were destroyed and had to be rebuilt under fire, while the enemy were advancing on the other side from Richmond. But the opposition in front was repelled while the work on the bridges continued, and a severe encounter in the rear also resulted favorably for Sheridan, who then proceeded to the James River and went into camp. After resting three days he set out to return to Grant. The enemy molested him again, and at a point on the York River he once more found the bridges burned. But he sent out mounted parties, each man to

bring back a board, and made the river passable in a day. In sixteen days from leaving the army he rejoined it at Chesterfield.

The skill and pluck he had displayed in this expedition, eluding the enemy when it was necessary, attacking and beating him at the right moment, destroying stores, burning and building bridges with almost equal facility, greatly delighted Grant, and amply justified that general in the choice he had made of a cavalry commander.

During the remainder of the Wilderness campaign, the cavalry was engaged in the battles of Hawe's shop, Totopotomoy, and Cold Harbor, and always satisfied the expectations of the general-in-chief, whether in active battle, or on the march, or in the strategic maneuvers of the campaign.

On the 6th of June Sheridan was ordered to proceed with two divisions to cut the Virginia Central Railroad near Charlottesville, and, if possible, unite with General Hunter, at that time moving up the Valley of Virginia. Another object of the maneuver was to entice the enemy's cavalry from the Chickahominy during Grant's contemplated passage of the James. The latter part of the scheme was entirely successful, for the greater portion of Lee's cavalry set out to follow Sheridan, and the Army of the Potomac achieved its difficult passage of the James without molestation or hinderance. Eight or ten miles of the railroad were also destroyed by Sheridan, after a smart battle at Trevillian's station, in which the enemy was driven off in a panic; but at this time Sheridan learned that Hunter had moved in a different direction from that proposed, and the junction between the two commands became impracticable. He accordingly returned to Grant. When near the James River, a cavalry force attempted to obstruct him, but he placed his trains at the rear, and threw out his troops toward the enemy, fighting heavily in front, while the trains under cover of the battle marched safely by.

In July Sheridan took part in the movements around Deep Bottom, preliminary to the explosion of Burnside's famous mine. He was sent to the north bank of the James with Hancock, to distract the attention of the enemy while the real movement against Petersburg took place on the opposite side of the river. His force was attacked by a large body of infantry, and at first he was driven back over a ridge; but he made his men lie quickly down in line of battle about fifteen yards behind the crest, and, when the enemy reached this crest, he opened fire with his repeating carbines, and the assailants gave way in disorder. The cavalry followed them over the plain, capturing two hundred and fifty men,

besides those that they killed and wounded. In this affair, which is known as the battle of Darbytown, the cavalry repulsed a superior force of infantry, a circumstance most unusual in recent war.

The enemy, as Grant had hoped, was completely deceived by the long front presented by Hancock and the cavalry, and supposed that nearly the entire army had been moved to the north side of the James. Lee therefore transferred a large body of his own troops to oppose them, thus leaving a way open for the national advance on the southern side.

The object of the movement being accomplished, Hancock was moved back to the river, near the bridge-head; but, to continue the deception of the enemy, Sheridan during the night sent one of his divisions to the opposite bank of the James, first covering the bridge with moss and grass to prevent the tramp of horses being heard, and at daylight marched it back again on foot in full view of the enemy, to create the impression that a large and continuous movement to the north side was still going on. On the second night Hancock was withdrawn to take part in the engagement expected to follow the mine explosion. Sheridan was directed to follow and withdraw by brigades from the right, successively passing them over the bridge. This movement was one of extreme delicacy, as, after Hancock had crossed, the space at the mouth of the bridge, occupied by Sheridan, was so circumscribed that an attack by the enemy in force might have resulted in the annihilation of his entire command. The whole operation, however, was successfully executed, and every point made; but it was attended with such anxiety and sleeplessness as to prostrate nearly every officer and man in the command.

From May to August Sheridan had lost between five thousand and six thousand men, killed, wounded, and missing; but he captured more than two thousand prisoners. In his marches he had been obliged to live, to a great extent, off the country; his hardships were great, but the men endured willingly under a leader who shared alike their dangers and their toils. He had already made them know that he led them to victory, and had aroused that feeling which enables a commander to take his troops whithersoever he accompanies them. His cavalry had indeed fought the enemy's cavalry. He had always been the attacking party, and had achieved almost constant success. The enemy's force he believed superior to his own; but their spirit diminished daily, while that of his command increased. All this was apparent to Grant, who was now in want of a commander

for one of his independent and most important armies.

After the advance of Early upon Washington in 1864, the greatest alarm and confusion prevailed at the national capital. The Government was disturbed, the people of the North mortified, and apprehensions for the safety not only of Washington and Baltimore, but even of Philadelphia, were rife. Grant was in front of Richmond, and Halleck, the ranking officer at Washington, declined positively to take any responsibility. At no time during the war did the prospect of disaster seem closer or more imminent. Grant had been for weeks urging that a single and competent commander should be opposed to Early; but his suggestions were unnoticed, and he finally started himself for the north, having previously ordered Sheridan with two divisions of cavalry to the same field. He went directly to the front, not stopping at Washington on the way, and then, without consulting the Government, put Sheridan in command.

His orders were to protect the capital, to drive Early back, and to hold and strip the Valley of Virginia, which had afforded supplies so long to the enemy, so that it never again should be a base or a granary for Lee's soldiers. "Put yourself south of the enemy," said Grant, "and follow him to the death." After laying down these general aims, he added: "I feel every confidence that you will do the best, and will leave you as far as possible to act on your own judgment, and not embarrass you with orders and instructions."

For nearly six weeks the new commander moved cautiously about at the entrance to the Valley. He was unwilling to fight until he could get Early at a disadvantage, and till he should receive whatever reinforcements Grant could allow him. His operations, besides, were a part of the great strategy in which all the armies were involved, and he was sometimes obliged to move in accordance with necessities hundreds of miles away. Still, the general control of his army was his own. He corresponded daily with the general-in-chief, and the two were in perfect accord. The country meanwhile was impatient, and the enemies of the Government at the North made the most of the delay. Sheridan was pronounced another failure, and the capital was said to be still in danger. But Sheridan was not to be forced inopportunely or while unready into battle.

Finally, Grant paid him another visit, near Winchester, to decide, after conference with his lieutenant, what order should be made. As before, he went direct from his own army to Sheridan, without consulting the Government. Sheridan he found ready for battle. The

enemy were weakening their force, and he felt able to contend with the remainder. He had, however, never commanded so large a body before, and in fact had never been at the head of an independent army, and he says in his report: "I was a little timid about this movement until the arrival of General Grant, who indorsed it." Grant, on the other hand, informed the writer of this article that he had a plan of battle for Sheridan in his pocket; but he found him so ready to advance, so confident of success, and his plans so matured, that he gave him no orders except the authority to move, and hurried away lest the credit should be given to him for the success he foresaw, and not to Sheridan. On Friday he asked Sheridan if he could be ready by Tuesday, and Sheridan replied he would be ready by daylight on Monday.

On the 17th of September Early unwisely divided his command, sending two divisions to Martinsburg, twenty-two miles away. Sheridan at once detected this blunder, and determined to attack the enemy in detail. Early, however, learned that Grant had been with Sheridan, and therefore concluded that he would be speedily attacked, and ordered back his detachment. Sheridan nevertheless proceeded with his plan. This was to assault with the greater part of his force, holding one division in reserve to be used as a turning column when the crisis of the battle occurred. The cavalry were on the right and left of the infantry. The attack was made as proposed; but Early's detachments had now returned, and after a serious fight the national center was first forced back and then regained its ground. Sheridan now brought forward the reserve under Crook, and directed it to find the rebel left and strike it in flank and rear, while he himself made a left half wheel of his main line in support. The maneuver was executed with complete success; the reserve advanced with spirit, forcing the enemy from their position, and the cavalry on the right at the same moment came sweeping up, overlapping the enemy's left and driving their cavalry in confusion through the infantry. Sheridan now advanced himself, and the rout of the enemy was complete. Crowded in on both flanks, their lines were broken in every direction, and, as Sheridan said in his famous dispatch, he "sent them whirling through Winchester." Early lost four thousand five hundred men, of whom two thousand two hundred were prisoners. "The result," said Grant, "was such that I have never since deemed it necessary to visit General Sheridan before giving him orders." This battle was fought September 19th.

Sheridan, however, was not content with

victory. He pushed rapidly after Early, twenty or thirty miles, and came up with him on the night of the 20th at Fisher's Hill, where the Valley is only three miles wide; and here, behind a stream called Tumbling River, the enemy had erected a line. Early, indeed, felt so secure that he unloaded his ammunition boxes and placed them behind his breastworks. But he did not know his antagonist.

On the 21st the eager Sheridan determined to use Crook's command as a turning column again, and strike the enemy in left and rear, while the remainder of the army made a left half wheel in his support. This maneuver, however, demanded secrecy, and Crook was concealed in the forest till the main line had moved up in front of the enemy's position. Before daylight on the 22d, Crook was massed in the heavy woods on the face of the mountain on the west of the Valley, and the main line moved ostentatiously forward toward Early's right and center. When the enemy's attention was thus attracted on the east, Crook suddenly burst from the hill-side on the west, striking them in flank and rear, doubling up their line, and sweeping down behind the breastworks. The main line at once took up the movement in front; the works were everywhere carried, and the enemy again completely routed. Many threw down their arms, abandoning their artillery, and sixteen guns with eleven hundred prisoners fell into the national hands, though Early reported a loss of only two hundred and forty killed and wounded. It was dark before the battle was ended, but the flight was continued during the night and on the following day. Sheridan pursued, and drove his antagonist completely out of the main valley into the gaps of the Blue Ridge, while his own infantry took possession of the country as far as Staunton and Waynesboro, and advanced a hundred miles from Harper's Ferry. "Keep on," said Grant, "and your good work will cause the fall of Richmond."

The effect of these double victories was startling upon the army and the people of the North, and even greater on the Southern soldiery and the population behind them. The troops of Early were disheartened; he himself reported a panic, and was directly censured by Lee; while the Richmond mob painted on the fresh artillery ordered to his support: "General Sheridan, care of General Early."

Till October 1st Sheridan was occupied in carrying out Grant's directions for the destruction of crops and mills; and having accomplished this most thoroughly, he himself recommended that his command should be

duced and his troops distributed elsewhere. "The Valley of Virginia," he said, "can now be held with a small force." But Lee was not yet ready to abandon the important region beyond the Blue Ridge, and determined to make one more effort to recover what had been lost. He sent reinforcements to Early of ten thousand men, and a new commander for his cavalry, and when Sheridan fell back Early advanced. At Tom's Brook, however, Sheridan deemed it best to delay one day, "to settle," he said, "this new cavalry general." Torbert, with all the national horse, was ordered to engage the enemy's cavalry, and Sheridan reported the result as follows: "The enemy, after being charged by our gallant cavalry, were broken and ran; they were followed by our men on the jump twenty-six miles, through Mount Jackson and across the north fork of the Shenandoah." Early lost eleven guns, with caissons, battery forges, head-quarters' wagons, and everything else that was carried on wheels.

Sheridan, however, had so devastated the valley that it could furnish him no supplies, and he was fifty miles from a base. He therefore continued his retrograde movement as far as Cedar Creek. From this point, on the 15th of October, he was summoned by the Government to Washington for consultation, and during his absence Early determined once more to attack the national army. The plan was well conceived. The enemy advanced in the night, and before dawn surprised and attacked the national forces still in camp. The army was driven back, portions of it in great disorder, six or seven miles. Eighteen guns were captured, and nearly a thousand prisoners, a large part of the infantry not preserving even a company organization.

Sheridan had left Washington on the 18th, and slept at Winchester, twenty miles from his command. Artillery firing was reported early on the 19th, but it was supposed to proceed from a reconnaissance, and at nine o'clock Sheridan rode out of Winchester, all unconscious of the danger to his army. Soon, however, the sound of heavy battle was unmistakable, and half a mile from the town the fugitives came in sight with appalling rapidity. He at once ordered the trains halted and parked, and stretched a brigade of his troops at Winchester across the country to stop the stragglers. Then, with an escort of twenty men, he pushed to the front. The effect of his presence was electrical. He rode hot haste, swinging his hat, and shouting as he passed, "Face the other way, boys! face the other way!" And hundreds of the men turned at once and followed him with cheers.

After reaching the army he gave some hurried

directions, and returned to collect the fugitives. He was in major-general's uniform, mounted on a magnificent horse, man and beast covered with dust and foam; and as he rose in his stirrups, waving his hat and his sword by turns, he cried again and again: "If I had been here, this never would have happened. We are going back. Face the other way, boys! face the other way!" The scattered soldiers recognized their general, and took up the cry: "Face the other way!" It passed along from one to another, rising and falling like a wave of the sea, and the men returned in crowds, falling into ranks as they came. They followed him to the front, and many who had fled, panting and panic-stricken, in the morning, under Sheridan's lead had covered themselves with the glory of heroes long before night. Such a reinforcement may one man be to an army.

A few dispositions, and the battle began afresh. But now all was changed. The enemy advanced, it is true, but were at once repelled, and the national line, in its turn, became the assailant. Sheridan led a brigade in person, and the enemy everywhere gave way. Their officers found it impossible to rally them; a terror of the national cavalry had seized them. The captured guns were all retaken, and twenty-four pieces of artillery besides. Sixteen hundred prisoners were brought in, and Early reported eighteen hundred killed and wounded. Two thousand made their way to the mountains, and for miles the line of retreat was strewn with the debris of a beaten army. Early himself escaped under cover of darkness to Newmarket, twenty miles away.

This battle ended the campaign in the Shenandoah Valley. The enemy made no subsequent attempt to invade the North; Lee withdrew the greater part of Early's troops, and Sheridan's detachments marched when and whither they wished. The whole country south of the Potomac was in his hands. In a short time more than half of his army was restored to Meade's command, for its presence in the Valley was no longer necessary.

Sheridan was made a major-general in the regular army, as he was informed, in Lincoln's own words, "for the personal gallantry, military skill, and just confidence in the courage and gallantry of your troops, displayed by you on the 19th day of October, at Cedar Run, whereby, under the blessing of Providence, your routed army was reorganized, a great national disaster averted, and a brilliant victory achieved over the rebels for the third time in pitched battle within thirty days."

It was just eleven weeks since Sheridan had assumed command in the Valley. In that

time he had taken thirteen thousand prisoners, forty-nine battle flags, and sixty guns, besides recapturing eighteen cannon at Cedar Creek. He must besides have killed and wounded at least nine thousand men, so that he destroyed for the enemy twenty-two thousand soldiers. "Turning what bid fair to be disaster into glorious victory stamps Sheridan," said Grant, "what I have always thought him, one of the ablest of generals."

During the winter he remained near Winchester, but as soon as the roads and the rains allowed, Grant directed him to push once more up the Valley—this time not to return. He was to advance in the direction of Richmond, destroying the railroads in every direction, as well as all stores that could possibly be of use to the enemy. In order to conceal his purpose, Sheridan resorted to one of those ingenious devices in which he was unrivaled since the days of Hannibal. He learned that the people of the neighborhood were fond of hunting, and encouraged his staff to make their acquaintance and talk of foxes and hounds. A pack of hounds was found, and a day set for the chase. The hounds were brought into Winchester, the horses were shod, and all the talk of the country around was of Sheridan's hunt. On the appointed day the whole neighborhood came to the meet, the general and his staff conspicuous. The start was made and the run was good, but the general and staff went further than the Virginians, and the army followed. They rode after the enemy, and never returned. The stratagem had kept all news of Sheridan's intentions secret, as all preparations were attributed to the hunt, and he was far on his way before the wile was discovered. He took rations for only four days in haversacks, and coffee, sugar, and salt for fifteen days in wagons; and with this provision, and thirty pounds of forage for each horse, ten thousand men moved into an enemy's country, already stripped bare, for a campaign whose objective point was two hundred miles away, and expecting to march at least two hundred more.

The weather was bad, the rains and thaws of spring had begun, the streams were too high to ford, and most of the bridges were burned. But they marched sixty miles in two days, swimming the streams and molested by partisan troops. Horses and men could hardly be recognized for the mud that covered them. Early was found at Waynesboro, with his back to the Shenandoah, and here the last battle between the two commanders was fought. The attack was impetuous and irresistible. The troopers charged through the town and over the breastworks, sabering the enemy as

they passed, and forced their way to the rear of Early's command, where they turned with drawn sabers and held the approach to the Shenandoah. Early's entire force threw down their arms and surrendered with a cheer. The leader himself and a handful of officers escaped, hiding in the houses of the town or in the neighboring woods until dark. Sixteen hundred prisoners and eleven guns fell into Sheridan's hands. After his defeat, Early was relieved by Lee of all command. His army and his reputation had both been destroyed by Sheridan.

The victorious general pursued his now unmolested march, and fulfilled his orders literally, destroying railroads and canals, mills, factories, and bridges, and finally determined to join Grant at Richmond, fortunately for himself as well as his commander. The rain and mud again impeded him; but Sheridan replaced his worn-out mules with those he had captured from Early, and set two thousand negroes who had joined him to work destroying the roads. As he approached the Pamunkey River, he was notified that Longstreet intended to dispute the passage. He was still west of Richmond, and at once determined to push toward the city and attack the enemy in that direction, and, when they came out to meet him, to move rapidly round by a circuitous route to a point where the river could be crossed. The feint completely succeeded. A brigade was left to amuse the enemy, and the remainder of the command made haste to White House, whither Grant had sent a force to repair the bridges and await them with supplies.

He had annihilated whatever was useful to the enemy between Richmond and Lynchburg; besides capturing prisoners and munitions of war, he had destroyed forty-six canal locks, five aqueducts, forty canal and road bridges, twenty-three railroad bridges, twenty-seven warehouses, forty-one miles of railroad, and fourteen mills. These are some of the results of war. He had been nineteen days on the march, and had lost only one hundred soldiers; many of these were men unable to bear the fatigues of the road.

His command arrived at the James on the 25th of March, and after halting a few days to shoe his horses and rest both them and the men, he was ordered to take the left of the army with which Grant meant to make his final movement against Lee. That army lay in front of Petersburg, and Grant's plan was to stretch westward until he should turn the enemy's right, while Sheridan was to destroy entirely the two railroads by which alone Lee was now supplied. Lee could not possibly allow these roads to be interrupted, and must either

fight to save them, or fly. Grant read his instructions to Sheridan in person. Toward the close there was a passage directing him in certain contingencies to proceed to North Carolina and join Sherman. Grant perceived that this passage was distasteful to Sheridan, and quickly added: "Although I have provided for your joining Sherman, I have no idea that it will be necessary. I mean to end this business here." Sheridan's face brightened at once, and he replied: "That's what I like to hear you say. Let us end this business here." The instincts of the two were in complete accord, and their natures struck fire from each other in the contact.

The army moved on the 29th of March, and that night Grant sent word to Sheridan, "I feel now like ending the matter, if it is possible, before going back." He therefore modified his order, directing Sheridan to remain with the main army, but to "push around the enemy and get on his right rear."

The rain that night fell heavily, and before morning it became impossible to move anything on wheels. The soil was like quicksand, the frosts were disappearing, and the roads became a soft and shifting mass. The advance of the troops seemed nearly impracticable, and some of those nearest to Grant strove hard to induce him to return. The gloom of the morning penetrated the minds of all, until, like a gleam of light, Sheridan came riding up to confer with Grant about "ending the matter." He was full of spirit, anxious for orders, certain of success if only an attack were made. The officers felt the influence of his magnetic temper, and knew how Grant appreciated the soldierly instinct and judgment of his great subordinate. They urged Sheridan to say the same to the chief that he had said to them. But he, for all his victories and his fame, was modest and subordinate. He thought it his duty to take orders from Grant, not to offer advice. But those who had the right took the great trooper in to Grant, who saw at once that, with such a lieutenant, advance was the wisest course. He sympathized with his ardor for battle, and Sheridan went back with orders to attack the enemy.

He pushed out at once from Dinwiddie Court-House to a point called Five Forks, because of the meeting of so many roads. Grant was to support him by an attack on his right with two infantry corps. Sheridan, however, was separated by eight or ten miles from the left of the army, and Lee, perceiving this isolation, at once sent a large force under Pickett to crush him before he could be reënforced. Sheridan reported this to Grant, who made further dispositions to support the cavalry. These movements occupied the 30th of March.

On the morning of the 31st the enemy had eighteen thousand men in front of Sheridan's ten thousand. The national general, however, moved simultaneously with his opponent, but, being heavily outnumbered, was forced to retire. His line was penetrated, and two entire brigades on the right were isolated from the command. But Sheridan at once ordered this detached force to move still further to the right, and march around to join the reserve in rear. The enemy, deceived by this retrograde maneuver, which they mistook for a rout, followed it up rapidly, making a left wheel, and presenting their own rear to Sheridan. He of course perceived his opportunity, and ordered the remainder of the command to advance; and then, as the enemy went crashing through the woods in pursuit of the detached portion of the cavalry, Sheridan struck them in flank and rear. This movement compelled them to abandon the pursuit and face by the rear rank.

But now the entire force of Pickett, foot and horse, had turned on the national cavalry; and "here," said Grant, "Sheridan displayed great generalship." Instead of retreating with his whole command to tell the story of superior forces, he deployed the cavalry on foot, leaving only mounted men enough to take care of the horses. This compelled the enemy also to deploy over a vast extent of woods and broken country. Thus, holding off the enemy and concentrating his own men, Sheridan fell back to an advantageous position at Dinwiddie, where he repelled every assault until dark. His detached command came up all safe, but the enemy lay on their arms, not a hundred yards from his line.

He had extricated his force for the time from formidable dangers and difficulties, and had displayed extraordinary genius and audacity in all the movements of the day; but he had been driven back five miles, and was confronted by a vastly outnumbering force of infantry as well as cavalry. His danger was still imminent, and he sent word to Grant: "The enemy have gained some ground, but we still hold in front of Dinwiddie. This force is too strong for us. I will hold Dinwiddie until I am compelled to leave." He asked for no help, and made no suggestions, but simply reported the situation, leaving Grant to determine how to aid him. He and Grant were not obliged to explain to each other in detail their necessities or their dangers.

Later, however, an aide-de-camp brought further word to the general-in-chief from his beleaguered subordinate. Sheridan, being driven back and hard beset, naturally, for him, considered the time had come when the enemy should be forced to fight outside of cover,

where the national troops could make their blows decisive. Grant fully sympathized with the feeling, and sent an entire corps of infantry that night to Sheridan, determining to convert his defense into an offensive movement. Still later he dispatched a cavalry force to support the movement.

On the 1st of April the reinforcements had not arrived, but Sheridan nevertheless moved out against the enemy. The rebels, however, had learned of the approach of national infantry, and gave way rapidly, reaching the position of Five Forks before Sheridan was able to intercept them. Warren, who commanded the infantry reinforcements, and Mackenzie, with the cavalry supports, came up; and when his force was all in hand, Sheridan devised a brilliant scheme. It was his old maneuver, a feint upon the enemy's front and right, and suddenly a turning movement to overwhelm the left. But in this instance its application was more felicitous than ever before; for the success of the movement would isolate those of the enemy who might escape, and separate them entirely from Lee. It would thus not only secure victory in the immediate field where Sheridan fought, but break the entire right wing of Lee, and open the way for Grant to destroy the army of Northern Virginia.

These tactics were executed as brilliantly as they had been conceived. It was late before the troops were in position, but at five o'clock the cavalry moved briskly forward on the left and attracted the enemy, while the infantry, marching at right angles, took the rebel line in flank. There was hard fighting in front and flank, and the infantry at first wavered; but Sheridan himself seized a battle flag and plunged into the charge. The man who had borne the flag was killed, and one of Sheridan's staff was wounded; but the fiery enthusiasm of the leader was contagious. The bands were ordered to play, and the division burst on the enemy's left like a tornado, sweeping everything before them, overrunning the works at the bayonet point, breaking the enemy's flank past mending, and capturing one thousand five hundred prisoners.

The cavalry in front advanced simultaneously, and the battle was won. The troopers had been dismounted, but many were now mounted and rode into the broken ranks of the enemy. Pickett himself was nearly captured, and galloped off with a mere remnant of his force; six thousand prisoners were taken, and six pieces of artillery, and the fugitives were driven north and west, miles away from Lee, Sheridan pursuing until long after dark. This was the last battle of the war

in which the enemy fought for victory; after this their struggle was to escape.

As soon as the news reached Grant, he ordered an immediate assault all along the lines. To Sheridan he said: "From your isolated position I can give you no positive directions, but leave you to act according to circumstances." Sheridan accordingly moved up against the right flank of Lee. But the crash had come before he arrived. On the morning of April 2d the works in front of Petersburg were carried. During the day Grant telegraphed to the President: "I have not yet heard from Sheridan, but I have an abiding faith that he is in the right place and at the right time." He had found out his man.

That night the army of Lee fled westward from the defenses of its capital. Lee's object was to reach Burksville Junction, where two railroads meet, and thence either to join Johnston's army in front of Sherman, or, if this proved impracticable, to escape to the mountains of West Virginia. Grant followed with his whole command to intercept the fugitive army. Sheridan, being on the extreme left, and at the head of the cavalry, was ordered to take the advance, and the Fifth Corps of infantry was added to his command. But he replied to Grant: "Before receiving your dispatch, I had anticipated the evacuation of Petersburg, and commenced moving west." Thus it was till the end. Sheridan anticipated Grant, and Grant confirmed Sheridan. The same idea, the same instinct, animated both. They moved with one impulse, like the brain and arm of one strong man.

That day and the next Sheridan moved with superhuman energy, but the enemy fled with the eagerness of despair. At times the cavalry came up with the fugitives in the chase, driving them from fords, picking up thirteen hundred prisoners, and not stopping to count the abandoned cannon. On the 4th Grant got word of a railroad train loaded with supplies on the way from the south for Lee, and at once sent the information to Sheridan. But before receiving the dispatch Sheridan had come up with Lee. At a place called Jetersville, about forty miles from Petersburg, he captured a telegraphic message not yet sent over the lines, ordering three hundred thousand rations immediately to feed Lee's army. He forwarded the message in the hope that the rations would be sent and received by the national army. At this point Sheridan was planted directly across Lee's path, on the only road by which the enemy could obtain supplies; and the unhappy leader halted and sent out his men in every direction to gather what they could for food. The fortunate ones had two ears of Indian corn apiece uncooked,

and others plucked the buds and twigs just swelling in the early spring, and strove with these to assuage their hunger. Half of the artillery was dismissed to relieve the famished horses.

Sheridan had only the Fifth Corps and the cavalry, and was still far inferior to Lee in numbers; but he intrenched across the railroad, and sent word to Grant that he had intercepted the enemy. He had accomplished exactly what Grant intended. The chief, of course, hurried up with his whole command; but, before the army could all arrive and take position, Lee became aware of his danger and marched with the keenness and eagerness of those who fly for life, moving by a circuitous route that brought him a few miles west of Sheridan. Grant at once detected the maneuver, and faced his army about to the left, dispatching Sheridan again in the advance. The fiery trooper struck the flying column of Lee in flank near Sailor's Creek, and then disposed his troops with marvelous skill and celerity. His cavalry was sent around in front of the enemy, and the remainder pushed against the flank. Grant had by this time dispatched the Sixth Corps to reënforce Sheridan, and it was important to detain the enemy until the cavalry could make its detour and appear in front and the Sixth Corps arrive. Sheridan therefore sent a single brigade to make a mounted charge against Lee's line. The daring demonstration accomplished its object and delayed the movement of any large force against the cavalry.

As soon as the Sixth Corps came up, Sheridan advanced in force. The enemy pushed on to the creek, and, facing about, made a stand on the further side. There was a severe fight of some minutes. The stream was muddy and difficult, and the position strong; but the cavalry had now attained the point where they were in rear of the enemy, and a simultaneous attack was made on every side. The national troops closed in, like gates, upon the entire force of the enemy. There was one bewildering moment of fighting on every hand, and then seven thousand men, seven generals, and fourteen guns were surrendered in the open field. The general officers were taken to Sheridan's head-quarters, and shared the supper and blankets of their conquerors, but Sheridan started before daybreak in pursuit of what was left of Lee's army. He sent word to Grant: "If the thing is pressed, I think that Lee will surrender." Grant forwarded the dispatch and an account of the victory to Lincoln, at City Point, and the President replied: "Let the thing be pressed."

There were other battles and other movements after this and simultaneous with it, but

Sheridan always had the advance. He was always on the left to head the fugitives, and the remainder of the army followed on the right and rear. Lee was literally between them. Grant was plotting to drive the enemy into Sheridan's grasp, and Sheridan was striving to outmarch Lee and receive him in his flight.

Sheridan soon learned that supplies were awaiting Lee at Appomattox Junction, the same that had been ordered and driven so often and so far; it was certain, therefore, that Lee would make for that point to obtain the stores. He notified Grant of the news, and the chief ordered up all his columns. The Fifth Corps and the army of the James, under Ord, were now following Sheridan on the south side of the Appomattox, while the remainder of the army of the Potomac came up on the 8th of April within a few miles of Lee, north of the river. That night Custer, with the advance of the cavalry, rode into Appomattox and captured four heavily loaded trains,—cars, engines, and supplies. They were hardly in his hands when a force of the enemy, infantry and artillery, appeared. Twenty-five guns were captured and a large number of prisoners, the advance of a heavy column. Sheridan had headed Lee's army.

At this great news, though he had only cavalry to oppose to all that was left of the army of Northern Virginia, Sheridan held fast to what he had gained, and, at 9.20 P. M., sent word to Grant: "If Gibbon and the Fifth Corps can get up to-night, we will perhaps finish the job in the morning." Gibbon and the Fifth Corps got the message, and moved with terrible speed, marching from daylight on the 8th to daylight again on the 9th, halting only three hours on the road. They reached Sheridan's position just as Lee was approaching in heavy force to batter his way through the cavalry. Ord and Sheridan held a short consultation, and the cavalry leader proceeded to the front, while the infantry was deployed across the valley through which Lee must pass. The cavalry advanced to engage the enemy, and then fell back gradually, so as to give time for Ord to dispose his men in the woods out of sight of Lee. This last ruse of Sheridan succeeded. The enemy, with the energy of desperate men, rushed on, thinking they had only cavalry in front. Sheridan fell back, to deceive them further, and the soldiers of the rebellion gave one more battle yell—when suddenly the infantry emerged from the woods, their line wavered, and Lee sent forward a white flag with a request for a cessation of hostilities.

I have thought the best way to indicate and illustrate Sheridan's traits as a man and a soldier was to tell his story. No reader can

have failed to perceive wherein his greatness consists. From first to last, the same peculiarities are apparent. In his earliest fight, as a second lieutenant, with the Indians, he showed the same determination and the same ingenious readiness of device as in the pursuit of Lee and the final stratagem of Appomattox. He was, indeed, the Hannibal of the American war. Full of the magnificent passion of battle, as every one knows, riding around with his sword drawn, rising in his stirrups, grasping a battle flag, turning disaster into victory, or pursuing the enemy with the terror and speed of a Nemesis, he was also abundant in caution, wily as an Indian, original and astounding in his strategy—always deceiving as well as overwhelming the enemy. It was not only his personal courage and magnetic bearing, his chivalric presence and intense enthusiasm, which produced his great results. He was more than one of Froissart's paladins, although in many traits he recalled the heroes of the ancient chronicler. He was a great commander of modern times; learned in the maneuvers and practice which require intellectual keenness and comprehensive calculation. The combinations which he employed in all his greatest battles are strokes of military genius almost matchless in our time. The daring with which at Dinwiddie he seized the critical moment, and, when the enemy had driven a part of his force, and thus presented their own rear, advanced and compelled the pursuing column, all superior in numbers, to desist and defend itself, was hardly paralleled during the war. The repeated maneuver to which he resorted of attacking with a smaller portion of his force, and, when the enemy's attention was attracted by the feint, hurling an irresistible column upon an unexpected point elsewhere, and that point always a flank which could be turned, is in accordance with the best canons of military science, and the practice of the greatest masters of the art.

His strategy was fully equal to his tactics in battle. The prudent skill with which he delayed in the Valley, not allowing himself to be enticed into attacking Early until he was ready, and the series of evolutions by which he held off the enemy, advancing and withdrawing, and only fighting when it was necessary, till at last the great moment came, are as worthy of study as the brilliant achievements at Cedar Creek and Fisher's Hill; while the keenness with which he detected every movement of Lee in that remorseless chase after Appomattox,—than which the world has never seen an instance of more terrible and consummate energy and power,—and the skill with which he followed and

finally headed Lee, are instances of strategic ability in action unsurpassed since the time of Napoleon.

In that power of skillful and audacious combination in the immediate presence of the enemy, which above and beyond every other trait is highest and most essential in a general, he approached the greatest. His mind was always clearest in emergencies. He never forgot in the turmoil of the fight to consider every possibility; to watch and guard and work and plan, while in the thickest *mêlée*. He was once describing to me the battle of Cedar Creek, and told how at a certain juncture, when the tide had set in favor of victory, Custer came riding up and kissed him on the field. "And so," said Sheridan, "he lost time; he lost time." There could hardly be a better illustration of his self-control, of the steadiness of his intention, of his appreciation of every necessity of the moment. He loved Custer, and understood the enthusiasm which prompted the boyish general to embrace his chief on the instant of victory; but "he lost time."

Among other smaller, though far from unimportant, traits may be mentioned his wonderful knowledge of what the enemy was doing. Livy says of Hannibal: "Nothing which was going on among the enemy escaped him, the deserters revealing many things, and he himself examining by his scouts." The words apply exactly to Sheridan. His scouts were famous throughout the army, and his information was exact. It was always relied upon by Grant as absolute, and it never misled him.

Grant and Sheridan indeed always concurred. It is true that Sheridan was disinclined to stay with Grant at the West or to come with him to the East; but that was before he personally knew his chief,—before he thought that Grant had that intimate acquaintance with his qualities which Sheridan doubtless felt that they deserved,—before their natures were brought into absolute contact. Their friendship was first military, and afterward personal. It continued after the war. Grant sent Sheridan at once to the Rio Grande when the rebellion was over, because he considered the Mexican enterprise of the second Napoleon only a part of the struggle, and in this conviction Sheridan fully shared. So, also, although Sheridan was no politician, he was in complete sympathy with the policy of reconstruction adopted by Congress, and his course at New Orleans was entirely in harmony with the views of Grant. When Andrew Johnson removed him, Grant protested, and the career of Sheridan in Louisiana was one circumstance in the chain which led to the impeachment of Johnson and the first

election of Grant. At the last Republican convention at Chicago Sheridan was present as a spectator; and when he received a single vote for President, he stepped to the front and begged to transfer it to his "best friend, General Grant."

His influence over his men was supreme. He knew just what his troops could do and would do, and when. He led them frequently in person, and they never failed to follow. Every one remembers the famous instance at Cedar Creek, where he changed the whole course of battle by his single presence. But he possessed the same power with individuals as with masses. At the battle of Five Forks a soldier, wounded under his eyes, stumbled and was falling to the rear, but Sheridan

cried: "Never mind, my man, there's no harm done"; and the soldier went on with a bullet in his brain, till he dropped dead on the field.

His career since the war has always been conspicuous for courage, sagacity, and ability. His management of the Indians was singularly successful, and his course after the Chicago fire gained the applause of the country.

His accession to the position of general-in-chief is perhaps the last great military event proceeding from or connected with the war; for Sheridan is, in the direct line of succession, the youngest of the three great generals who came out foremost, not only in rank, but, beyond all question, in the estimation of their countrymen, their enemies, and the world.

Adam Badeau.

A SHADOW.

My Lady paces up the broad oak stair;
Men smile to see her face so soft and fair.
"Look up! She's worth a glance!" does one declare;
"My Lady there."

Tender and fine, from 'neath the cloud of lace
Crowning her hair, gleams forth her clear-cut face,
Its eyes alight, upon its lips the grace
Of smiles so rare

And gay, that those who pass her feel their light
Warm their own smiles until they grow more bright.
"She looks her best," they say — "her best — to-night,
My Lady there."

The music pulses in the rooms below;
Outside, the moon falls on the soft, deep snow;
Inside, the dancers' rhythm seems to flow
Through all the air.

My Lady paces up the broad oak stair,
The smile still on her lips so red, so rare.
"Look up!" she hears, "and smile then an you dare,
My Lady there!"

The music pulses in the room below,
The dancers to its pulsing come and go;
Out from her face is blanch'd all light and glow —
It fronts her there!

"I am thy Grief! I am thy Grief!" it cries,
"The Grief that darkens for thee all thy skies,
That blights thy bright life for thee as it flies!
And dost thou dare

"To smile and wear thy mask and play thy part
As though thy white breast held no broken heart,—
As though it bled not 'neath my stab's fierce smart?
When did I spare?

"I am thy passionate grief, thy bitter pain.
Turn on the world thy light, sweet, cold disdain,
But not on me! Here stand I — here again!
Thy fierce Despair!"

She smiles — her smile more sad, but not less sweet
(She hears the music swell and throb and beat).

"I know thee!" she says gently. "Strong and fleet,
Thou dost not spare!

"Lead me, and I will follow to the last;
Or follow *me* — until the light be past.
May I not pray this from a friend so fast?
'Tis all my prayer.

"Once in the darkness, lying at thy feet,
With lips to bitter dust, as it is meet,
Before thine eyes my breast shall bleed and beat,
Throbbing and bare.

"But here, leave me my mask, my smile, my play;
Thou art my friend by night, my shame by day;
With fiercer pang for all thou grant'st I pay,—
I speak thee fair!"

"Pass on!" the Shadow answers. "Wear thy mask;
Thus do I grant the boon that thou dost ask.
To wear it be thy weary, bitter task,
Thy ceaseless care."

Onward my Lady passes — all the light
Aglow and trembling in her jewels bright.
"She looks her best," 'tis said, "her best to-night,
My Lady there."

The music throbs and surges soft and low;
Amid the dancers threads she to and fro,
And, following close and dark and sure and slow,
Her Grief is there!

* * * * *

My Lady lies upon her dying bed,—
"So bright and fair!" her friends have, weeping, said
"With all youth's flowers upon her golden head
Crowning her hair!"

My Lady meets dark Death with patient grace;
There is a little smile upon her face,—
Within her eyes of fear or pain no trace,
No touch of care.

Before her gaze pass shadows moving slow.
"And you are Youth," she says, "but you may go!
And you are Life—and Hope. Pass by also,
Though you were fair!

"But you, dark Shadow, standing at my feet,
Leave me not lonely now; it is not meet;
Though you were bitter, you were true and sweet.
Nearer — not there!

"Clasp close my hand — lay head upon my breast;
My Grief and I — we bore the bitter test!
Let thy sad lips upon my sad ones rest,
And this too share!

"I loved you better than my joys," she said,
"Better than all my summer skies!" she said;
And, with her sad smile on her lips, lay dead —
My Lady there.

MERINOS IN AMERICA.

THE writer of a recently printed book concerning Americans of royal descent, and all such Americans as come near to being so graciously favored, has neglected to mention certain Americans who are descended from the pets of the proudest kings and nobles of the Old World. For there is such a family here,—one so large that it greatly outnumbers all American descendants of European royal lines, excepting perhaps those of the green isle, almost as prolific of kings as of democrats. They carry their finely clothed blue-blooded bodies on four legs, for they are the famous American Merino sheep.

The Merino sheep originated in Spain, probably two thousand years ago, from a cross of African rams with the native ewes, and in course of time became established as a distinct breed, with such marked character-

istics as to differentiate them from all other breeds in the world.

Different provinces had their different strains of Merinos, which were like strawberries in that, though all were good, some were better than others. There were also two great divisions—the Transhumantes or traveling flocks, and the Estantes or stationary flocks. The Transhumantes were considered the best, as they had a right to be; for their owners were kings, nobles, and rich priests, and they had the pick of the fatness of the whole land, being pastured on the southern plains in winter, and in the spring and summer on the then fresher herbage of the mountains to the northward, from which they returned in the fall. For the accommodation of these four or five millions during their migrations, cultivators of the intervening land were obliged to leave a road,

IN AN OLD PASTURE.

not less than ninety yards wide, as well as commons for the feeding of these flocks—a grievous burden to the husbandman, and for which there was little or no redress. A French writer says: “It was seldom that proprietors of land made demands when they sustained damage, thinking it better to suffer than to con-

the life of their guardians are referred to the interesting essay on Sheep, by Robert R. Livingston, printed by order of the Legislature of New York in 1810.

Of the traveling sheep were the strains known as Escurials, Guadalupe, Paulars, Infantados, Negrettis, and others, all esteemed

A DROVE OF RAMS.

test, when they were assured that the expense would greatly exceed any compensation they might recover.” A Spanish writer complains in a memoir addressed to his king, that “the corps of junadines (the proprietors of flocks) enjoy an enormous power, and have not only engrossed all the pastures of the kingdom, but have made cultivators abandon their most fertile lands; thus they have banished the estantes, ruined agriculture, and depopulated the country.” The transhumantes were in flocks of ten thousand, cared for by fifty shepherds, each with a dog, and under the direction of a chief. Those who wish to learn more of the management of these flocks and

for various qualities, and some of whose names have become familiar to American ears. The stationary flocks appear to have passed away, or at least to have gained no renown.

The Spanish sheep reached their highest excellence about the beginning of this century; but during the Peninsular war the best flocks were destroyed or neglected, and the race so deteriorated that in 1851 a Vermont breeder of Merinos, who went to Spain on purpose to see the sheep of that country, wrote that he did not see a sheep there for which he would pay freight to America, and did not believe they had any of pure blood! But Merinos of pure blood had been brought into France in

PASSING FLOCKS ON A DUSTY ROAD.

the last quarter of the eighteenth century, and there carefully and judiciously bred, and as carefully but injudiciously bred in Saxony, where everything was sacrificed to fineness of fleece.

Less than one hundred years ago the sheep of the United States were the descendants of the English breeds, mixed and intermixed till they had lost the distinctive characteristics of their long-wooled, well-fleshed ancestors, and were known as "natives" (a name they were as much entitled to as their owners), being born here of parents who had not slept or grazed under other skies. For many generations having little care, their best shelter in winter being the stacks their poor fodder was tossed from, and their fare in summer the scant grass among the stumps of the clearings and the shaded herbage of the woods, by the survival of the fittest they came to be a hardy race, almost as wild as deer, and almost as well fitted to withstand the rigors of our climate and to elude capture by wild beasts or their rightful owners. Indeed, so much had they recovered the habits of their remotest ancestors, that to get up the settler's flock for washing or shearing, or the draft of a number for slaughter or sale, was at least a half-day's task, if not one uncertain of fulfillment. All the farm hands, and often the women and children of the household, were mustered for these herdings, and likely enough

the neighbors had to be called in to help. The flocks were generally small, and the coarse, thin, short wool was mostly worked upon the now bygone hand-cards, spinning-wheels, and hand-looms for home use. As the clearings widened, the flocks of sheep grew larger, and wool-growing for market became an industry of some importance. The character of the animals and the quality of their fleeces remained almost unchanged until this century was a half score years old, when the Merinos had become established here, and the effect of their cross with the natives began to be manifest.

Perhaps mention should be made here of the Smith's Island sheep, of unknown origin, but peculiar to the island from which they took their name, which lies off the coast of Virginia, and belonged, about 1810, to Mr. Custis, Washington's stepson, who wrote a pamphlet concerning them, in which he says: "Their wool is a great deal longer than the Spanish, in quality vastly superior; the size and figure of the animal admit of no comparison, being highly in favor of the Smith's Island."

Livingston does not indorse these claims, but says of the wool: "It is soft, white, and silky, but neither so fine nor so soft as the Merino wool." If this breed is not extinct, it never gained much renown, nor noticeably spread

beyond its island borders. I think Randall does not mention it in his "Practical Shepherd." There were also the Otter sheep, said

eight and a half pounds of brook-washed wool, the heaviest fleece borne by any of the early imported Merinos of which I have seen any account."

What was then considered fine form would hardly take that place with our modern

MERINO LAMBS.

to have originated on some island and on our eastern coast, and whose distinguishing peculiarity was such extreme shortness of legs that Livingston says they could not run or jump, and they even walked with some difficulty. And there

were the Arlington sheep, derived from stock imported by Washington, the male a Persian ram, the mothers Bakewell ewes. They seem to have been a valuable breed of long-wooled sheep, but are now unknown.

The first importation of Merino sheep on record is that of William Foster, of Boston, who in 1793 brought over three from Spain and gave them to a friend, who had them killed for mutton, and, if the sheep were fat, I doubt not found it good, and wished there was more of it. In 1801 four ram lambs were sent to the United States by two French gentlemen. The only one that survived the passage was owned for several years in New York, and afterward founded some excellent grade flocks in Delaware. Randall says of him: "He was of fine form, weighed one hundred and thirty-eight pounds, and yielded

breeders, and the then remarkable weight of wool was not more than a quarter that of the fleece of many of the present Americans of the race; these last, however, not brook-washed nor even rain-washed. The next year Mr. Livingston, our minister to France, sent home two pairs of Merinos from the Government flock of Châlons, and afterward a ram from the Rambouillet flocks.

A table given by Livingston in 1810 is interesting in showing the effect of the first cross on the common or native sheep. The average weight of the fleeces of a flock of these was three pounds ten ounces; that of the half-bred Merino offspring, five pounds one ounce. Similar results came of the larger importation, in the same year, by Colonel Humphreys, our minister to Spain, of twenty-one rams and seventy ewes, selected from the Infantado family. In 1809 and 1810 Mr. Jarvis, American Consul at Lisbon, bought nearly four thousand sheep of the confiscated flocks of Spanish nobles, all of which were shipped to different ports in the United States, and in those years, and the one following, from three thousand to five thousand Spanish Merinos were imported by other persons. In 1809 and 1810 half-blood merino wool was sold for seventy-five cents and full blood for two dollars a pound, and during the war of 1812 the latter sold for two dollars and fifty cents a

pound. Naturally, a Merino fever was engendered, and imported and American-born rams of the breed were sold for enormous prices, some of Livingston's ram lambs for one thousand dollars each. But such a sudden downfall followed the Peace of Ghent that, before the end of the year 1815, full-blooded sheep were sold for one dollar each.

Till 1824 the price of wool continued so low that, during the intervening years, nearly all the full-blood Merino flocks were broken up or carelessly bred. Then the enactment of

almost all owners of Spanish sheep crossed them with the Saxon, to the serious injury of their flocks. They held the foremost place in America among fine-wooled sheep for fifteen or twenty years, and then went out of favor, and have now quite disappeared, I believe.

The Spanish Merino now came to the front again, and of them the descendants of the Jarvis and Humphreys importation were most highly esteemed. As has been mentioned, the flocks of Spain had sadly deteriorated, and the American sheep derived from them

HEAD OF MERINO RAM BEFORE AND AFTER SHEARING.

a tariff favoring the production of fine wool revived the prostrate industry, and unfortunately brought about the introduction of the miserable Saxon Merinos, large numbers of which were now imported. In the breeding of these, everything having been sacrificed to fineness of wool, the result was a small, puny animal, bearing two, possibly three, pounds of very fine, short wool. Such was the craze for these unworthy favorites of the hour that

in their best days far surpassed them, if not their own progenitors.

Wool-growing became the leading industry of the Green Mountain State. Almost every Vermont farmer was a shepherd, and had his half hundred or hundreds or thousands of grade sheep or full bloods dotting the ferny pastures of the hill country or the broad levels of the Champlain valley, rank with English grasses. From old Fort Dum-

mer to the Canada line one could hardly get beyond the sound of the sheep's bleat unless he took to the great woods, and even there he was likely enough to hear the intermittent jingle of a sheep-bell chiming with the songs of the hermit and wood thrushes, or to meet

great preparation was made within house and barn. The best the farm afforded must be provided for the furnishing of the table; for the shearers were not ordinary farm laborers, but mostly farmers and farmers' sons, and as well to do as their employer,

SHEEP-SHEARING.

a flock driven clattering over the pebbles of a mountain road; for a mid-wood settler had his little herd of sheep, to which he gave in summer the freedom of the woods, and which took—alas for the owner's crops—the freedom of the meadow and grain patches, and were sheltered from the chill of winter nights in a frame barn bigger than their master's log-house.

In June, when the May-yeaned lambs were skipping in the sunshine that had warmed the pools and streams till the bullfrogs had their voices in tune, the sheep were gathered from the pastures and driven over the dusty roads to the pens beside the pools on the tapped mill-flumes and washed amid a pother of rushing waters, shouts of laughter of men and boys, and discordant, plaintive bleats of parted ewes and lambs.

A fortnight or so later came the great event of the shepherd's year, the shearing, for which

who was likely enough to shear, in his turn, for them. Whoever possessed the skill of shearing a sheep thought it not beneath him to ply his well-paid handicraft in all the country round. For these the fatted calf was killed and the green peas and strawberries were picked. The barn floor and its overhanging scaffolds were carefully swept, the stables were littered with clean straw, the wool-bench was set up, and the reel full of twine was made ready in its place. Those were merry days in the old gray barns that were not too fine to have swallows' holes in their gables, moss on their shingles, and a fringe of hemp, mayweed, and smartweed about their jagged underpinning. There was jesting and the telling of merry tales from morning till night, and bursts of laughter that scared the swallows out of the cobwebbed roof-peak and the sitting hen from her nest in the left-over hay-mow. Neighbors called to get a taste of the fun and the cider, to see how

SHOWING RAMS.

the flock "evridged," and to engage hands for their own shearing. At nooning, after the grand dinner, while the older men napped on the floor, wool-bench, or scaffold, with their heads pillowed on soft places, the young fellows had trials of strength at "pulling stick" or lifting "stiff legs." The skillful wool-tyer was rarer than the skillful shearer, and in much demand in his own and neighboring townships. He tied the fleeces quickly and compactly, showing the best on the outside, but with no clod of dirty locks in the middle; for in those days wool had its place and dirt its place, but the fleece was not their common place. The catcher was a humble but not unimportant member of the force. He must be alert and with a sheep ready for each shearer as wanted, and was never to take up a sheep by the wool, but with his left arm underneath, just behind the fore legs, and his right hand grasping a hind leg. And there was the boy to pick up locks, discarding the dirty ones, which were swept outdoors. One's back aches as he remembers this unpleasant duty of his boyhood, when he was scoffed by shearers and scolded by the wool-tyer, and often had the added labor of carrying the wool to its storage. Fourteen fleeces tied up in a blanket was the load, which, if they had been of nowadays weight, would have bur-

dened a strong man; but a five-pound fleece was a heavy one then. I have never been present at one of the modern public shearings, which come before the swallows do, while winter is still skirmishing with spring, and are celebrated in the local papers; but I doubt if they are such hearty and enjoyable seasons as the old-fashioned shearings were.

The wool-buyers scoured the country at or after shearing time, and drove their bargains with the farmers. The small lots of wool were hauled in bulk to some central point of shipment, while the larger clips were sacked on the grower's premises. The sack was suspended through a hole of its own diameter in an upper floor and a few fleeces were thrown in, when the packer lowered himself into it and placed and trod the wool as it was passed to him till he had trod his way to the top. Then the sacks were lowered, sewed, weighed, marked, and went their way to market.

The "tag-locks" and pulled wool were mostly worked up in the neighboring small factories into stocking-yarn, flannel, and blankets for the farmer's use, and into the then somewhat famous "Vermont gray," which was the common cold-weather outer clothing of New England male farm folk. Readers of Thoreau will remember that he mentions it more than once, and thought it good enough

horn-coroneted dons of the fold change masters at prices rivaling those of blood horses.

The care given these high-bred, fine-wooled sheep is a wonderful contrast to the little received by flocks in the times when wool-growing was the chief object of our sheep farmers; when, though sheep had good and abundant food, and fairly comfortable shelter from cold and storm, they had nothing more. The lambs were dropped in May after the ewes were turned out to grass, and

sheltered from even soft summer rains, that their raiment may suffer no loss of color. The lambs are brought forth when spring has nothing in Vermont of that season but the name, and are fed with cow's milk, or put to nurse with coarse-wooled foster-mothers, more bountiful milkers than Merinos, and have a man to care for them night and day. The old-time rams tilted it out on the field of honor, to the sore bruising of heads and battering of helmets, and sometimes loss of life.

FRIGHTENED SHEEP.

were not looked after oftener than once a day in fine weather, and got only their mother's milk, if the ewe was a good milker and was fond enough of her ungainly yearling to own it and give it such care as sheep give their young. Now the dons and doñas of blue blood have better quarters in winter than many a poor mortal, in barns so warm that water will not freeze in them, and are fed grain and roots as well as hay, and are

But now rams of a warlike turn are hooded like falcons, that they may do no harm to each other and their peaceable comrades. A blow might cost their owner a thousand dollars.

The successful sheep-breeder is up to his knees in clover, but the eastern wool-grower is on barren ground. A friend who lives in the heart of the Vermont sheep-breeding region writes me: "Ordinary rams sell for from \$10 to \$25 a head; ordinary ewes for

\$20. The highest real price any one has known a ram to sell for within two years, \$1100; the same for ewes, \$300. The wool of these sheep sells for twenty cents a pound. The wool itself does not pay for growing in the way in which these sheep are reared and cared for. The *wool* is a secondary object; the *bodies* are what they are bred for. * * * In the way sheep are kept on the large ranches south-west and west, the sheep so soon deteriorate that they are obliged to have thorough-bred rams to keep up their flocks. This is particularly the case in warm climates. Nature gets rid of the superfluous clothing as soon as possible."

It is interesting to compare the portraits of the best Merinos of eighty years ago with the improved American Merinos of the present day, and see what a change has been wrought in the race without change of blood. It is not unlikely that to the uneducated eye the more natural and picturesque sheep of the old time would seem more comely than the bewrinkled, enfolded and aproned product of the many years of careful breeding. As a thing of beauty the modern Merino ram can hardly be called a success, but there are millions in this knight of the Golden Fleece.

Rowland E. Robinson.

HOW EDWIN DROOD WAS ILLUSTRATED.

CHARLES DICKENS's first intention when he projected "Edwin Drood" was to intrust the illustrations to his son-in-law, who had worked for many years in such desultory manner as his delicate health permitted, with both pen and pencil. It was with the pen-

AN OPIUM DEN.

cil that Dickens considered Charles Collins's best success might be made. His literary work, mostly confined to fugitive pieces, but not yet altogether forgotten, was generally distinguished by humor of a charming quality, but rather obviously caught from the quieter manner of his father-in-law. "A Cruise on Wheels," which was the story of a *tête-à-tête* drive through France, took its little place as a prominent example of that chatty literature, with its mitigated good spirits and its gentle ironies, which was less rife in that day than it has since become. For "The Eye Witness" we must generally seek in the old volumes of "All the Year Round," where its discursive banter suggests a shrug of the shoulders peculiar to light essayists, and that ambling mental gait and pace which tire neither writer nor reader. Though Dickens had no lively faith in Charles Collins's ultimate distinction in letters, he had great faith, as has been said, in his artistic future; and it was, no doubt, with the aim of encouraging that art of designing, which seemed in some danger of being set aside or neglected, that Dickens chose to give his last book to the illustrative interpretation of his son-in-law. Charles Collins, however, got no further than the cover—copies of which are now probably rare, as most readers had the separate parts of the novel bound up after its progress was cut short. The artist's health failed so decidedly that the enterprise which was intended as the beginning of a revival of his work in design was, perforce, suddenly abandoned. Before the appearance of the first number, Dickens found himself without an illustrator. It must be taken as a sign of the mobility of his mind that he went in search of a young artist to interpret the work of his own elder years. And his old book was in a sense his youngest; he had changed with the times, and had, moreover, bridged across in his life and career a period of great alteration in English men and manners. Being essentially modern, Dickens was bound to be developed and modified by his times—to be as modern in 1870 as he had been in 1840, for his vitality never failed; and he could not be fitly illustrated by work which reverted to former ways of thought and observation. In his search for an artist he was aided by Mr. Millais and Mr. Frith, and these painters united in emphatic approval of the final choice.

Mr. Luke Fildes was at that time a man of twenty-five, who had struggled, through sheer force of vocation, out of the narrow limitations of provincial conditions in the par-

STUDIES FOR JASPER'S HEAD.

ticularly provincial province of Lancashire. He had no artistic ancestry, and it is not easy to understand how his art found him out; but, as a young boy, he attended a local school with the hope of achieving a moderate distinction, in time, as a designer of carpets and tea-cups. The love of nature drew him to other aspirations, and at the age of nineteen he entered on his course of study at South Kensington, passing afterward into the Royal Academy schools. Then began his career as an artist in black and white, for as yet he had not touched oil-color; but, though he found plenty of employment, he was by no means famous when Charles Dickens engaged him to draw for "Edwin Drood."

Mr. Fildes's first fame synchronized with the original appearance of the "Graphic," on the front page of which appeared the "Casuals." The idea had not been inspired by any word of Dickens's; it was not until five years later, when the author had passed away, and when his illustrator had become an oil-painter, that Mr. John Forster gave to Mr. Fildes that sentence which accompanied the great picture of the "Casuals," in 1874: "Dumb, wet, silent horrors. Sphinxes set up against that dead wall, and none likely to be at the pains of solving them until the general overthrow." The words had been written by Dickens in a

letter descriptive of his night rambles in London, and the dreary scene of outcasts and wanderers waiting outside the work-house for their one night's lodging had impressed the minds of both author and artist, without communication between them; and no wonder that the subject suggested obstinate questionings to the one and a thoughtful and memorable picture to the other. During the years which elapsed between the appearance of the

commonly to be found in a painter of sentiment. His manner was, of course, very unlike that which interpenetrated Charles Dickens's earlier books; the insistent caricature—the art of high spirits—had passed out of date; it belongs to its time, and cannot alter in intrinsic value as a part of that time; but repetition is impossible in any art which is still—like the art of line—in a state of vitality. While derivation is, of course, essential to the

JASPER'S SWOON.

"Casuals" in black and white and that of the "Casuals" in oils, Mr. Fildes had won his entrance to the Academy Exhibition by a figure subject called "Fair, Quiet, and Sweet Rest," showing a group of lotus-eating *jeunesse* of the last century in their boat among the water-lilies and the swans of the Thames. Of his subsequent pictures, "The Widower" and "The Penitent" have shown his powers of observation and of pathos at their best.

But to return to "Edwin Drood." At twenty-five few men have begun to develop their capacity for humor; and though Mr. Fildes was ready to be impressed by his author's tragedy, he doubted greatly whether he could interpret such comedy as might appear in the book. He did himself the injustice—peculiar to his time of life—of thinking that he had no humor in him. But the designer of Sapsea and of Durdles must assuredly be credited with a quality of fun, and with a capacity for the finer burlesque, not

very life of all arts, reversion may be held to be distinctive of those which have passed out of the state of production into that of criticism; and, therefore, reversion belongs properly, in our time, to architecture and to a certain kind of poetry. These do not derive, but revert.

Charles Dickens wrote to Mr. Fildes, in the January of 1870:

"I beg to thank you for the highly meritorious and interesting specimens of your art that you have had the kindness to send me. I return them herewith, after having examined them with the greatest pleasure. I am naturally curious to see your drawing from 'David Copperfield,' in order that I may compare it with my own idea. In the mean while, I can honestly assure you that I entertain the greatest admiration for your remarkable powers."

But the drawing in question contained no female figure, and Charles Dickens told his artist that the forthcoming story was adorned by two pretty heroines. A specimen of Mr. Fildes's power of rendering beauty was therefore required; and this being most satisfactorily

proved, the work went forward. Mr. Fildes read his author, month by month, with an intensity of attention which no incident escaped, and with an alertness of intelligence which missed no point of character. The text of "Edwin Drood" was supplemented by those *vivâ voce* descriptions with which Charles Dickens was wont to impress his meaning and intention, to its very completeness, upon his hearer.

He himself was surprised at the way in which his mind found itself mirrored in that of his artist, both as regards the pictorial exactness of inanimate things and the appreciation of individual human character. The two kinds of exactitude are distinct enough, but Mr. Fildes compassed them both. With regard to the first, he has assured me that he drew the opium-room from description, but that the author recognized it as the very portrait of the place. In the more valuable exactitude to character, his success was such that Charles Dickens exclaimed delightedly that the figures drawn for "Edwin Drood" were like photographs of the characters. Mr. Fildes was evidently as receptive as Dickens was impressive; and who was ever so impressive as he? His power

DURDLES. (A STUDY FROM LIFE.)

of carrying artistic conviction was so great that we wonder, as we read him and read of him, at his ever having consented to abdicate such a force for the sake of triviality or violence. He was able to convince a thousand people by his gesture, a world by his pen; and he convinced his artist so strenuously that author and draughtsman conceived the self-same thing. Vividly as Dickens saw the creatures of his brain, he saw them no otherwise than as they lived by this quick and sympathetic pencil. Over the type of Jasper there was some consultation. Mr. Fildes made three shots, and one of them proved to be a palpable hit. But as to the story itself and the mystery, no confidences were made by Dickens. The often repeated assertion that he told to no one his intentions

as to the intrigue is true in so far as he volunteered no such telling. But a part of the mystery was, as a matter of fact, surprised out of him by Mr. Fildes's keenness and care in taking up a suggestion. It happened in the following way: The artist had taken special note of a change in the description of Jasper's dress. Not only did the fact that Jasper wore in the last scenes a large black silk scarf,

dered body in the cathedral tower, must have been obvious enough to every careful reader. The central crime of the book (and no fictitious wickedness was ever more fraught with powerful and penetrating horror than is this one) can never have been intended by the author to be a mystery; the secret that Charles Dickens intended to keep, and kept in effect, was the manner of the discovery. He

IN ROCHESTER CATHEDRAL.

muffling therewith his throat and keeping his beautiful voice from cold, appear duly in the drawing, but Dickens saw that the thing had been drawn with a kind of emphasis. Mr. Fildes confessed that he had divined its significance, whereupon Dickens was somewhat troubled with the misgiving that he was telling his story too fast. The scarf was, in fact, the instrument of murder. After fostering the notes of the even-song anthem, and hanging lightly about the throat of the murderer as he talked with his victim, it strangled the young breath of Edwin Drood on the night of the great gale. Charles Dickens was probably wrong, however, in supposing that too marked a point would be made of this by the reader; the dreadful use to which the thing was to be put has probably been guessed by few. It was, of course, otherwise with the clew of the ring given by Grewgious to Edwin. That this one indestructible piece of gold was upon the young man's person, unknown to the murderer, who had withdrawn the watch and the pin, and that it was to remain and bear witness after quicklime had destroyed the mur-

derer is a keen reader who has ever found out who and what was Mr. Datchery, and of this Mr. Fildes knows no more than does the public. Some commentators, more enterprising than attentive, hazarded the conjecture that this strange figure was a disguise of Edwin Drood himself, who had escaped death and was on the track of his would-be destroyer. This idea was childish, and might have been corrected by an ordinarily careful reading of the book. But finding that Mr. Fildes knew a great deal, Charles Dickens went on to make the principal revelation which concerned the central figure; he told his illustrator that Jasper was to be brought to justice in the end of the story. A drawing of this originally and most strongly conceived criminal locked up in the condemned cell (which was to have been studied at Rochester) was then planned between the two as one of the final subjects. By means of this design, the "condemned cells" of two generations of artists — Fagin's, as conceived by George Cruikshank, and Jasper's, as conceived by Luke Fildes — would have been

THE NUNS' HOUSE.

brought into interesting comparison. As to the pretty love-stories of the book, their inventor had implied their issues in their beginnings, the only fate left doubtful being that of the brave and unfortunate Neville Landless, whose Little Rosebud is clearly for the sailor. A painful book in its completeness "Edwin Drood" would certainly have been; the poor young hero is real enough—albeit by no means one of the most vital characters—and likable enough for his horrible taking-off to affect the reader with something more than a common fictional sensation. The most solid in construction of all Charles Dickens's stories it would undoubtedly have proved; and, as a character-study, at once intense and restrained, and rich in humor, although it is in a humorous character, that of the Billikin, that the only signs given in "Edwin Drood" of failure and effort are apparent; while the book promised to be free from that determined but doubtful pathos which, to the modern feeling, invests the Little Nell and the Paul Dombey of the old days with something of artistic insincerity. False in intention we would not pronounce these and their like to be, but there must be a growing conviction that they are false in art.

Of Mr. Fildes's work for Charles Dickens's book, our own opinion is that it is the best illustrative interpretation which has ever been made of the author, albeit old and fine reputations belong to the former associations of artists' names with the great series of the

Dickens novels. In addition to all those qualities of appreciation, apprehension, and intelligence, which must distinguish all really worthy work done—as is the work of an illustrator—in admiration of another mind, and which Mr. Fildes's designs possess so fully, these illustrations have a merit which present judgment is less prepared to dispense with than was the opinion of our fathers' time—that of serious and sound draughtsmanship.

In the several accounts which have been written of Charles Dickens's last days, it is noted that at the time of his death he was expecting the visit of his new illustrator, with whom he intended to ramble about the town of Rochester, so that the eyes in which he trusted so much might see what his own had in view as the setting of the scenes of "Edwin Drood." But Mr. Fildes had already made drawings in Rochester. The street and the cathedral were, of course, studied on the spot. The "Nuns' House" was a real house, and was carefully sketched from reality; but that drawing was not preserved, and the accompanying wood-cut is from a photograph. The study of Durdles is the original and happy idea for the best and most characteristic figure among the illustrations. The manner in which the man stands, the construction and expression of his limbs, and the action of his hand, are all passages of truth as subtle and restrained as they are vivid. When Charles Dickens went to see the Marionetti in Rome, he seized with delight the fine and intelligent

A STREET IN ROCHESTER.

merit of that curious performance when he wrote: "So delicate are the hands of the people who move them that every puppet was an Italian and did exactly what an Italian does. If he pointed at any object, if he laughed or if he cried, he did it as never Englishman did it since Britain first at Heaven's command arose," etc. In an equally national way does Durdles slouch; the attitude and habit of his knees and the manner in which he holds his dinner, the slovenliness and lack of precision and neatness of movement and intention, strike us as things impossible to any but an English Durdles, and exquisitely understood to be such by the draughtsman. This completeness shows itself in another way in the weight and abandon-

ment of unconsciousness expressed by the two prostrate figures — that of Jasper in his despair at finding that his murder had been done for nothing, and that of the opium-smoking woman. The drawing of the empty chair in the Gadshill library was afterward introduced by Mr. Fildes into his general study of the room published in the "Graphic." The present writer may be permitted a personal reminiscence in connection with the little bronze figure (a French grotesque) with dogs under its arms, and dogs' heads appearing out of the pockets, which appears in the drawing. It had kept that place on the writing table ever since Dickens, when walking with the writer's father, had been taken with one of his fits of inextinguishable laughter at seeing it in a shop. That evening the little bronze was sent by the shopkeeper to Dickens's hotel (this was, we believe, in Liverpool or Manchester), and the gift was so appreciated that, as has been said, it was one of the objects on his work-table until he died. The companion of his walk bought a duplicate, which he also kept during his life; and thus the fantasy of the modeler, who made the little figure as a caricature, it is said, of himself, has given to more than one household a much-prized remembrance.

DICKENS'S CHAIR.

DR. SEVIER.*

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," "Madame Delphine," etc.

XVIII.

HOW HE DID IT.

RISTOFALO and Richling had hardly separated, when it occurred to the latter that the Italian had first touched him from behind. Had Ristofalo recognized him with his back turned, or had he seen him earlier and followed him? The facts were these: About an hour before the time when Richling omitted to apply for employment in the ill-smelling store in Tchoupitoulas street, Mr. Raphael Ristofalo halted in front of the same place—which appeared small and slovenly among its more pretentious neighbors—and stepped just inside the door to where stood a single barrel of apples—a fruit only the earliest varieties of which were beginning to appear in market. These were very small, round, and smooth, and, with a rather wan blush, confessed to more than one of the senses that they had seen better days. He began to pick them up and throw them down—one, two, three, four, seven, ten; about half of them were entirely sound.

"How many barrel' like this?"

"No got-a no more; dass all," said the dealer. He was a Sicilian. "Lame duck," he added. "Oal de rest gone."

"How much?" asked Ristofalo, still handling the fruit.

The Sicilian came to the barrel, looked in, and said, with a gesture of indifference:

"'M — doll' an' 'alf."

Ristofalo offered to take them at a dollar if he might wash and sort them under the dealer's hydrant, which could be heard running in the back yard. The offer would have been rejected with rude scorn but for one thing: it was spoken in Italian. The man looked at him with pleased surprise, and made the concession. The porter of the store, in a red worsted cap, had drawn near. Ristofalo bade him roll the barrel on its chine to the rear and stand it by the hydrant.

"I will come back pretty soon," he said, in Italian, and went away.

By and by he returned, bringing with him two swarthy, heavy-set, little Sicilian lads, each with his inevitable basket and some clean rags. A smile and gesture to the store-keeper, a word to the boys, and in a moment

the barrel was upturned, and the pair were washing, wiping, and sorting the sound and unsound apples at the hydrant.

Ristofalo stood a moment in the entrance of the store. The question now was where to get a dollar. Richling passed, looked in, seemed to hesitate, went on, turned, and passed again, the other way. Ristofalo saw him all the time and recognized him at once, but appeared not to observe him.

"He will do," thought the Italian.—"Be back few minute'," he said, glancing behind him.

"Or-r igh'," said the store-keeper, with a hand-wave of good-natured confidence. He recognized Mr. Raphael Ristofalo's species.

The Italian walked up across Poydras street, saw Richling stop and look at the machinery, approached, and touched him on the shoulder.

On parting with him he did not return to the store where he had left the apples. He walked up Tchoupitoulas street about a mile, and where St. Thomas street branches acutely from it, in a squalid district full of the poorest Irish, stopped at a dirty fruit-stand and spoke in Spanish to its Catalan proprietor. Half an hour later twenty-five cents had changed hands, the Catalan's fruit shelves were bright with small pyramids—sound side foremost—of Ristofalo's second grade of apples, the Sicilian had Richling's dollar, and the Italian was gone with his boys and his better grade of fruit. Also, a grocer had sold some sugar, and a druggist a little paper of some harmless confectioner's dye.

Down behind the French market, in a short, obscure street that runs from Ursulines to Barracks street, and is named in honor of Albert Gallatin, are some old buildings of three or four stories' height, rented, in John Richling's day, to a class of persons who got their livelihood by subletting the rooms and parts of rooms to the wretchedest poor of New Orleans—organ-grinders, chimney-sweeps, professional beggars, street musicians, lemon-peddlers, rag-pickers, with all the yet dirtier herd that live by hook and crook in the streets or under the wharves; a room with a bed and stove, a room without, a half-room with or without ditto, a quarter-room with or without a blanket or quilt, and with

* Copyright, 1883, by George W. Cable. All rights reserved.

only a chalk-mark on the floor instead of a partition. Into one of these went Mr. Raphael Ristofalo, the two boys, and the apples. Whose assistance or indulgence, if any, he secured in there is not recorded; but when, late in the afternoon, the Italian issued thence—the boys, meanwhile, had been coming and going—an unusual luxury had been offered the roustabouts and idlers of the steamboat landings, and many had bought and eaten freely of the very small, round, shiny, sugary, and artificially crimson roasted apples, with neatly whittled white-pine stems to poise them on as they were lifted to the consumer's watering teeth. When, the next morning, Richling laughed at the story, the Italian drew out two dollars and a half, and began to take from it a dollar.

"But you have last night's lodging and so forth yet to pay for."

"No. Made friends with Sicilian luggerman. Slept in his lugger." He showed his brow and cheeks speckled with mosquito bites. "Ate little hard-tack and coffee with him this morning. Don't want much." He offered the dollar with a quarter added. Richling declined the bonus.

"But why not?"

"Oh, I just couldn't do it," laughed Richling, "that's all."

"Well," said the Italian, "lend me that dollar one day more, I return you dollar and half in its place to-morrow."

The lender had to laugh again. "You can't find an odd barrel of damaged apples every day."

"No. No apples to-day. But there's regiment soldiers at lower landing; whole steamboat load; going to sail this afternoon to Florida. They'll eat whole barrel hard-boil' eggs."—And they did. When they sailed, the Italian's pocket was stuffed with small silver.

Richling received his dollar and fifty cents. As he did so, "I would give, if I had it, a hundred dollars for half your art," he said, laughing unevenly. He was beaten, surpassed, humbled. Still he said, "Come, don't you want this again? You needn't pay me for the use of it."

But the Italian refused. He had outgrown his patron. A week afterward Richling saw him at the Picayune Tier superintending the unloading of a small schooner-load of bananas. He had bought the cargo, and was reselling to small fruiterers.

"Make fifty dollars to-day," said the Italian, marking his tally-board with a piece of chalk.

Richling clapped him joyfully on the shoulder, but turned around with inward distress and hurried away. He had not found work.

Events followed of which we have already

taken knowledge. Mary, we have seen, fell sick and was taken to hospital.

"I shall go mad!" Richling would moan with his disheveled brows between his hands, and then start to his feet exclaiming, "I must not! I must not! I must keep my senses!" And so to the commercial regions or to the hospital.

Dr. Sevier, as we know, left word that Richling should call and see him; but when he called, a servant—very curtly, it seemed to him—said the Doctor was not well and didn't want to see anybody. This was enough for a young man who *hadn't* his senses. The more he needed a helping hand, the more unreasonably shy he became of those who might help him.

"Will nobody come and find us?" Yet he would not cry "Whoop"; and how then was anybody to come?

Mary returned to the house again (ah! what joys there are in the vale of tribulation!) and grew strong—stronger, she averred, than ever she had been.

"And now you'll *not* be cast down, *will* you?" she said, sliding into her husband's lap. She was in an uncommonly playful mood.

"Not a bit of it," said John. "Every dog has his day. I'll come to the top. You'll see."

"Don't I know that?" she responded.

"Look here, now," she exclaimed, starting to her feet and facing him, "I'll recommend you to anybody. *I've* got confidence in you!" Richling thought she had never looked quite so pretty as at that moment. He leaped from his chair with a laughing ejaculation, caught and swung her an instant from her feet, and landed her again before she could cry out. If, in retort, she smote him so sturdily that she had to retreat backward to rearrange her shaken coil of hair, it need not go down on the record; such things will happen. The scuffle and suppressed laughter were detected even in Mrs. Riley's room.

"Ah!" sighed the widow to herself, "wasn't it Kate Riley that used to get the sweet, haird knocks!" Her grief was mellowing.

Richling went out on the old search, which the advancing summer made more nearly futile each day than the day before.

Stop. What sound was that?

"Richling! Richling!"

Richling, walking in a commercial street, turned. A member of the firm that had last employed him beckoned him to halt.

"What are you doing now, Richling? Still acting deputy-assistant city-surveyor *pro tem*?"

"Yes."

"Well, see here! why haven't you been in the store to see us lately? Did I seem a little preoccupied the last time you called?"

"I"—Richling dropped his eyes with

an embarrassed smile — “I *was* afraid I was in the way — or should be.”

“Well, and suppose you were? A man that’s looking for work must put himself in the way. But come with me. I think I may be able to give you a lift.”

“How’s that?” asked Richling as they started off abreast.

“There’s a house around the corner here that will give you some work — temporary anyhow, and may be permanent.”

So Richling was at work again, hidden away from Dr. Sevier between journal and ledger. His employers asked for references. Richling looked dismayed for a moment, then said, “I’ll bring somebody to recommend me,” went away, and came back with Mary.

“All the recommendation I’ve got,” said he, with timid elation. There was a laugh all round.

“Well, madam, if you say he’s all right, we don’t doubt he is!”

XIX.

ANOTHER PATIENT.

“DOCTAH SEVEEAH,” said Narcisse, suddenly, as he finished sticking with great fervor the postage-stamps on some letters the Doctor had written, and having studied with much care the phraseology of what he had to say and screwed up his courage to the pitch of utterance, “I saw yo’ notiz on the noozpapeh this mornin’.”

The unresponding Doctor closed his eyes in unutterable weariness of the innocent young gentleman’s prepared speeches.

“Yesseh. ’Tis a beaucheouz notiz. I fine that w’ritten with the gweatez *accu’acy* of diction, in fact. I made a twanslation of that faw my hant. Thaz a thing I am fon’ of, twanslation. I dunno ’ow ’tis, Doctah,” he continued, preparing to go out — “I dunno ’ow ’tis, but I thing, you goin’ to fine that Mistoo ’Itchlin’ ad the en’. I dunno ’ow ’tis. Well, I’m goin’ ad the —”

The Doctor looked up fiercely.

“Bank,” said Narcisse, getting near the door.

“All right!” grumbled the Doctor, more politely.

“Yesseh; befo’ I go ad the poss-office.”

A great many other persons had seen the advertisement. There were many among them who wondered if Mr. John Richling could be such a fool as to fall into that trap. There were others, some of them women, alas! who wondered how it was that nobody advertised for information concerning them, and who wished, yes, “wished to God,” that such a one, or such a one, who had had his money-bags locked up long enough, would

die, and then you’d see who’d be advertised for. Some idlers looked in vain into the city directory, to see if Mr. John Richling were mentioned there. But Richling himself did not see the paper. His employers, or some fellow-clerk, might have pointed it out to him, but — we shall see in a moment.

Time passed. It always does. At length, one morning, as Dr. Sevier lay on his office lounge, fatigued after his attentions to callers and much enervated by the prolonged summer heat, there entered a small female form closely veiled. He rose to a sitting posture.

“Good morning, Doctor,” said a voice, hurriedly, behind the veil. “Doctor,” it continued, choking, — “Doctor —”

“Why, Mrs. Richling!”

He sprang and gave her a chair. She sank into it.

“Doctor, — oh, Doctor! John is in the Charity Hospital!”

She buried her face in her handkerchief and sobbed aloud. The Doctor was silent a moment, and then asked:

“What’s the matter with him?”

“Chills.”

It seemed as though she must break down again, but the Doctor stopped her savagely.

“Well, my dear madam, don’t cry! Come, now, you’re making too much of a small matter. Why, what are chills? We’ll break them in forty-eight hours. He’ll have the best of care. You needn’t cry! Certainly this isn’t as bad as when you were there.”

She was still, but shook her head. She couldn’t agree to that.

“Doctor, will you attend him?”

“Mine is a female ward.”

“I know; but —”

“Oh — if you wish it — certainly; of course I will. But now, where have you moved, Mrs. Richling? I sent —” He looked up over his desk toward that of Narcisse.

The Creole had been neither deaf nor idle. Hospital? Then those children in Prieur street had told him right. He softly changed his coat and shoes. As the physician looked over the top of the desk Narcisse’s silent form, just here at the left, but out of the range of vision, passed through the door and went downstairs with the noiselessness of a moonbeam.

Mary explained the location and arrangement of her residence.

“Yes,” she said, “that’s the way your clerk must have overlooked us. We live behind — down the alley-way.”

“Well, at any rate, madam,” said the Doctor, “you are here now, and before you go I want to —” He drew out his pocket-book.

There was a quick gesture of remonstrance and look of pleading.

"No, no, Doctor; please don't! please don't! Give my poor husband one more chance—don't make me take that. I don't refuse it for pride's sake!"

"I don't know about that," he replied; "why do you do it?"

"For his sake, Doctor. I know just as well what he'd say—we've no right to take it anyhow. We don't know when we could pay it back." Her head sank. She wiped a tear from her hand.

"Why, I don't care if you never pay it back!" The Doctor reddened angrily.

Mary raised her veil.

"Doctor,"—a smile played on her lips,—
"I want to say one thing." She was a little care-worn and grief-worn; and yet, Narcisse, you should have seen her; you would not have slipped out.

"Say on, madam," responded the Doctor.

"If we have to ask anybody, Doctor, it will be you. John had another situation, but lost it by his chills. He'll get another. I'm sure he will." A long, broken sigh caught her unawares. Dr. Sevier thrust his pocket-book back into its place, compressing his lips and giving his head an unpersuaded jerk. And yet, was she not right, according to all his preaching? He asked himself that. "Why didn't your husband come to see me, as I requested him to do, Mrs. Richling?"

She explained John's being turned away from the door during the Doctor's illness. "But anyhow, Doctor, John has always been a little afraid of you."

The Doctor's face did not respond to her smile.

"Why, you are not," he said.

"No." Her eyes sparkled, but their softer light quickly returned. She smiled and said:

"I will ask a favor of you now, Doctor."

They had risen, and she stood leaning sidewise against his low desk and looking up into his face.

"Can you get me some sewing? John says I may take some."

The Doctor was about to order two dozen shirts instantanè, but common sense checked him, and he only said:

"I will. I will find you some. And I shall see your husband within an hour. Good-bye." She reached the door. "God bless you," he added.

"What, sir?" she asked, looking back.

But the Doctor was reading.

XX.

ALICE.

A LITTLE medicine skillfully prescribed, the proper nourishment, two or three days' con-

finement in bed, and the Doctor said, as he sat on the edge of Richling's couch:

"No, you'd better stay where you are to-day; but to-morrow, if the weather is good, you may sit up."

Then Richling, with the unreasonableness of a convalescent, wanted to know why he couldn't just as well go home. But the Doctor said again, no.

"Don't be impatient; you'll have to go anyhow before I would prefer to send you. It would be invaluable to you to pass your entire convalescence here, and go home only when you are completely recovered. But I can't arrange it very well. The Charity Hospital is for sick people."

"And where is the place for convalescents?"

"There is none," replied the physician.

"I shouldn't want to go to it, myself," said Richling, lolling pleasantly on his pillow; "all I should ask is strength to get home, and I'd be off."

The Doctor looked another way.

"The sick are not the wise," he said, abstractedly. "However, in your case, I should let you go to your wife as soon as you safely could." At that he fell into so long a reverie that Richling studied every line of his face again and again.

A very pleasant thought was in the convalescent's mind the while. The last three days had made it plain to him that the Doctor was not only his friend, but was willing that Richling should be his.

At length the physician spoke.

"Mary is wonderfully like Alice, Richling."

"Yes?" responded Richling, rather timidly. And the Doctor continued:

"The same age, the same stature, the same features. Alice was a shade paler in her style of beauty, just a shade. Her hair was darker; but otherwise her whole effect was a trifle quieter, even, than Mary's. She was beautiful—outside and in. Like Mary, she had a certain richness of character—but of a different sort. I suppose I would not notice the difference if they were not so much alike. She didn't stay with me long."

"Is she—buried here?" asked Richling, hardly knowing how to break the silence that fell, and yet lead the speaker on.

"No. In Virginia." The Doctor was quiet a moment, and then resumed:

"I looked at your wife when she was last in my office, Richling; she had a little timid, beseeching light in her eyes that is not usual with her—and a moisture, too; and—it seemed to me as though Alice had come back. For my wife lived by my moods. Her spirit rose or fell just as my whim, conscious or un-

conscious, gave out light or took on shadow." The Doctor was still again, and Richling only indicated his wish to hear more by shifting himself on his elbow.

"Do you remember, Richling, when the girl you had been bowing down to and worshipping, all at once, in a single wedding day, was transformed into your adorer?"

"Yes, indeed," responded the convalescent, with beaming face. "Wasn't it wonderful? I couldn't credit my senses. But how did you — was it the same —"

"It's the same, Richling, with every man who has really secured a woman's heart with her hand. It was very strange and sweet to me. Alice would have been a spoiled child if her parents could have spoiled her; and when I was courting her she was the veriest little empress that ever walked over a man."

"I can hardly imagine," said Richling, with subdued amusement, looking at the long, slender form before him. The Doctor smiled very sweetly.

"Yes." Then, after another meditative pause: "But from the moment I became her husband she lived in continual trepidation. She so magnified me in her timid fancy that she was always looking tremulously to me to see what should be her feeling. She even couldn't help being afraid of me. I hate for any one to be afraid of me."

"Do you, Doctor?" said Richling, with surprise and evident introspection.

"Yes."

Richling felt his own fear changing to love.

"When I married," continued Dr. Sevier, "I had thought Alice was one that would go with me hand in hand through life, dividing its cares and doubling its joys, as they say; I guiding her and she guiding me. But if I had let her, she would have fallen into me as a planet might fall into the sun. I didn't want to be the sun to her. I didn't want her to shine only when I shone on her, and be dark when I was dark. No man ought to want such a thing. Yet she made life a delight to me; only she wanted that development which a better training, or even a harder training, might have given her; that subserving of the emotions to the" — he waved his hand — "I can't philosophize about her. We loved one another with our might, and she's in heaven."

Richling felt an inward start. The Doctor interrupted his intended speech.

"Our short experience together, Richling, is the one great light place in my life; and to me, to-day, sere as I am, the sweet — the sweetest sound — on God's green earth" — the corners of his mouth quivered — "is the name of Alice. Take care of Mary, Richling; she's a priceless treasure. Don't leave the making and

sustaining of the home sunshine all to her, any more than you'd like her to leave it all to you."

"I'll not, Doctor; I'll not." Richling pressed the Doctor's hand fervently; but the Doctor drew it away with a certain energy and rose, saying:

"Yes, you can sit up to-morrow."

The day that Richling went back to his malarious home in Prieur street, Dr. Sevier happened to meet him just beyond the hospital gate. Richling waved his hand. He looked weak and tremulous. "Homeward bound," he said, gayly.

The physician reached forward in his carriage and bade his driver stop. "Well, be careful of yourself; I'm coming to see you in a day or two."

XXI.

THE SUN AT MIDNIGHT.

DR. SEVIER was daily overtaken. His campaigns against the evils of our disordered flesh had even kept him from what his fellow-citizens thought was only his share of attention to public affairs.

"Why," he cried to a committee that came soliciting his coöperation, "here's one little unprofessional call that I've been trying every day for two weeks to make — and ought to have made — and must make; and I haven't got a step toward it yet. Oh, no, gentlemen." He waved their request away.

He was very tired. The afternoon was growing late. He dismissed his jaded horse toward home, walked down to Canal street, and took that yellow Bayou Road omnibus whose big blue star painted on its corpulent side showed that quadrooms, etc., were allowed a share of its accommodation, and went rumbling and tumbling over the cobble-stones of the French quarter.

By and by he got out, walked a little way southward in the hot, luminous shade of low-roofed tenement cottages that closed their window-shutters noiselessly, in sensitive-plant fashion, at his slow, meditative approach, and slightly and as noiselessly reopened them behind him, showing a pair of wary eyes within. Presently he recognized just ahead of him, standing out on the sidewalk, the little house that had been described to him by Mary.

In a door-way that opened upon two low wooden sidewalk steps stood Mrs. Riley, clad in a crisp black-and-white calico, a heavy, fat babe poised easily in one arm. The Doctor turned directly toward the narrow alley, merely touching his hat to her as he pushed its small green door inward, and disappeared, while she lifted her chin at the silent liberty and dropped her eyelids.

Dr. Sevier went down the cramped, ill-paved passage very slowly and softly. Regarding himself objectively, he would have said the deep shade of his thoughts was due partly, at least, to his fatigue. But that would hardly have accounted for a certain faint glow of indignation that came into them. In truth, he began distinctly to resent this state of affairs in the life of John and Mary Richling. An ill-defined anger beat about in his brain in search of some tangible shortcoming of theirs upon which to thrust the blame of their helplessness. "Criminal helplessness," he called it, mutteringly. He tried to define the idea — or the idea tried to define itself — that they had somehow been recreant to their social caste by getting down into the condition and estate of what one may call the alien poor. Carondelet street had in some way specially vexed him to-day, and now here was this. It was bad enough, he thought, for men to slip into riches through dark back windows; but here was a brace of youngsters who had glided into poverty, and taken a place to which they had no right to stoop. Treachery — that was the name for it. And now he must be expected, — the Doctor quite forgot that nobody had asked him to do it, — he must be expected to come fishing them out of their hole, like a rag-picker at a trash barrel.

— "Bringing me into this wretched alley!" he silently thought. His foot slipped on a mossy brick. Oh, no doubt they thought they were punishing some negligent friend or friends by letting themselves down into this sort of thing. Never mind! He recalled the tender, confiding, friendly way in which he had talked to John, sitting on the edge of his hospital bed. He wished, now, he had every word back he had uttered. They might hide away to the full content of their poverty-pride. Poverty-pride; he had invented the term; it was the opposite pole to purse-pride — and just as mean, — no, meaner. — There! Must he yet slip down? He muttered an angry word. Well, well! this was making himself a little the cheapest he had ever let himself be made. And probably this was what they wanted! Misery's revenge. Umhum! They sit down in sour darkness, eh! and make relief seek them. It wouldn't be the first time he had caught the poor taking savage comfort in the blush which their poverty was supposed to bring to the cheek of better-kept kinsfolk. True, he didn't know this was the case with the Richlings. But wasn't it? Wasn't it? And have they a dog that will presently hurl himself down this alley at one's legs? He hopes so! He would so like to kick him clean over the twelve-foot close plank fence that crowded his right shoulder. Never mind! His anger became solemn.

The alley opened into a small, narrow yard, paved with ashes from the gas-works. At the bottom of the yard a rough shed spanned its breadth, and a woman was there busily bending over a row of wash-tubs.

The Doctor knocked on a door near at hand, then waited a moment, and, getting no response, turned away toward the shed and the deep, wet, burring sound of a wash-board. The woman bending over it did not hear his footfall. Presently he stopped. She had just straightened up, lifting a piece of the washing to the height of her head, and letting it down with a swash and slap upon the board. It was a woman's garment, but certainly not hers. For she was small and slight. Her hair was hidden under a towel. Her skirts were shortened to a pair of dainty ankles by an extra under-fold at the neat, round waist. Her feet were thrust into a pair of sabots. She paused a moment in her work, and, lifting with both smoothly-rounded arms, bared nearly to the shoulder, a large apron from her waist, wiped the perspiration from her forehead. It was Mary.

The red blood came up into the Doctor's pale, thin face. This was too outrageous. This was insult! He stirred as if to move forward. He would confront her. Yes, just as she was. He would speak. He would speak bluntly. He would chide sternly. He had the right. The only friend in the world from whom she had not escaped beyond reach — he would speak the friendly, angry word that would stop this shocking —

But, truly, deeply incensed as he was and felt it his right to be, hurt, wrung, exasperated he did not advance. She had reached down and taken from the wash-bench the lump of yellow soap that lay there, and was soaping the garment on the board before her, turning it this way and that. As she did this she began, all to herself and for her own ear, softly, with unconscious richness and tenderness of voice, to sing. And what was her song?

"Oh, don't you remember sweet Alice, Ben Bolt?"

Down drooped the listener's head. Remember? Ah, memory! The old, heart-rending memory! Sweet Alice!

The song caught up the tender name again.

"Sweet Alice, whose hair was so brown?"

Yes, yes; so brown — so brown!

"She wept with delight when you gave her a smile,
And trembled with fear at your frown."

Ah! but the frown is gone! There is a look of supplication now. Sing no more! Oh, sing no more! Yes, surely, she will stop there!

No. The voice rises gently — just a little — into the higher key, soft and clear as the note

of a distant bird, and all unaware of a listener. Oh! in mercy's name ——

"In the old church-yard in the valley, Ben Bolt,
In a corner obscure and alone,
They have fitted a slab of granite so gray,
And sweet Alice lies under the stone."

The little toiling figure bent once more across the wash-board and began to rub. He turned, the first dew of many a long year welling from each eye, and stole away, out of the little yard and down the dark, slippery alley, to the street.

Mrs. Riley still stood on the door-sill, holding the child.

"Good evening, madam."

"Sur, to you." She bowed with dignity.

"Is Mrs. Richling in?"

There was a shadow of triumph in her faint smile.

"She is."

"I should like to see her."

Mrs. Riley hoisted her chin. "I dunno if she's a-seein' comp'ny to-day." The voice was amiably important. "Wont ye walk in? Take a seat and sit down, sur, and I'll go and infarm the laydie."

"Thank you," said the Doctor, but continued to stand. Mrs. Riley started and stopped again.

"Ye forgot to give me yer kyaird, sur." She drew her chin in again, austere.

"Just say Dr. Sevier."

"Certainly, sur; yes, that'll be sufficiend. And dispinse with the kyaird." She went majestically.

The Doctor, left alone, cast his uninterested glance around the smart little bare-floored parlor, upon its new, jig-sawed, gray hair-cloth furniture, and up upon a picture of the Pope. When Mrs. Riley in a moment returned, he stood looking out the door.

"Mrs. Richling consints to see ye, sur. She'll be in turreckly. Take a seat and sit down." She readjusted the infant on her arm, and lifted and swung a hair-cloth arm-chair toward him without visible exertion. "There's no use o' having chayers if ye don't sit on um," she added affably.

The Doctor sat down, and Mrs. Riley occupied the exact center of the small, wide-eared, brittle-looking sofa, where she filled in the silent moments that followed by pulling down the skirts of the infant's apparel, oppressed with the necessity of keeping up a conversation and with the want of subject matter. The child stared at the Doctor, and suddenly plunged toward him with a loud and very watery coo.

"Ah-h!" said Mrs. Riley, in ostentatious rebuke. "Mike!" she cried, laughingly, as

the action was repeated. "Ye rowdy, air ye go-un to fight the gentleman?"

She laughed sincerely, and the Doctor could but notice how neat and good-looking she was. He condescended to crook his finger at the babe. This seemed to exasperate the so-called rowdy. He planted his pink feet on his mother's thigh and gave a mighty lunge and whoop.

"He's go-un to be a wicked bruiser," said proud Mrs. Riley. "He"—the pronoun stood, this time, for her husband—"he never sah the child. He was kilt with an explosion before the child was barn."

She held the infant on her strong arm as he struggled to throw himself, with wide-stretched jaws, upon her bosom; and might have been devoured by the wicked bruiser had not his attention been diverted by the entrance of Mary, who came in at last, all in fragrant white, with apologies for keeping the Doctor waiting.

He looked down into her uplifted eyes. What a riddle is woman! Had he not just seen this one in sabots? Did she not certainly know, through Mrs. Riley, that he must have seen her so? Were not her skirts but just now hitched up with an under-tuck, and fastened with a string? Had she not just laid off, in hot haste, a suds-bespattered apron and the garments of toil beneath it? Had not a towel been but now unbound from the hair shining here under his glance in luxuriant brown coils? This brightness of eye that seemed all exhilaration, was it not trepidation instead? And this rosiness, so like redundant vigor, was it not the flush of her hot task? He fancied he saw—in truth he may have seen—a defiance in the eyes as he glanced upon, and tardily dropped, the little water-soaked hand with a bow.

Mary turned to present Mrs. Riley, who bowed and said, trying to hold herself with majesty while Mike drew her head into his mouth: "Sur," then turned with great ceremony to Mary, and adding, "I'll withdrah," withdrew with the head and step of a duchess.

"How is your husband, madam?"

"John?—is not well at all, Doctor; though he would say he was, if he were here. He doesn't shake off his chills. He is out, though, looking for work. He'd go as long as he could stand."

She smiled; she almost laughed; but half an eye could see it was only to avoid the other thing.

"Where does he go?"

"Everywhere!" She laughed this time audibly.

"If he went everywhere I should see him," said Dr. Sevier.

"Ah! naturally," responded Mary, playfully. "But he does go wherever he thinks there's work to be found. He doesn't wander clear out among the plantations, of course, where everybody has slaves and there's no work but slaves' work. And he says it's useless to think of a clerkship this time of year. It must be, isn't it?"

The Doctor made no answer.

There was a footstep in the alley.

"He's coming now," said Mary; "that's he. He must have got work to-day. He has an acquaintance, an Italian, who promised to have something for him to do very soon. Doctor,—” she began to put together the split fractions of a palm-leaf fan, smiling diffidently at the while,—“I can't see how it is any discredit to a man not to have a *knack* for making money?"

She lifted her peculiar look of radiant inquiry.

"It is not, madam."

Mary laughed for joy. The light of her face seemed to spread clear into her locks.

"Well, I knew you'd say so! John blames himself—he can make money, you know, Doctor, but he blames himself because he hasn't that natural gift for it that Mr. Ristofalo has. Why, Mr. Ristofalo is simply wonderful." She smiled upon her fan in amused reminiscence. "John is always wishing he had his gift."

"My dear madam, don't covet it! At least don't exchange it for anything else."

The Doctor was still in this mood of disapprobation when John entered. The radiance of the young husband's greeting hid for a moment, but only so long, the marks of illness and adversity. Mary followed him with her smiling eyes as the two men shook hands, and John drew a chair near to her and sat down with a sigh of mingled pleasure and fatigue.

She told him of whom she and their visitor had just been speaking.

"Raphael Ristofalo!" said John, kindling afresh. "Yes; I've been with him all day. It humiliates me to think of him."

Dr. Sevier responded quietly:

"You've no right to let it humiliate you, sir."

Mary turned to John with dancing eyes, but he passed the utterance as a mere compliment, and said through his smiles:

"Just see how it is to-day. I have been overseeing the unloading of a little schooner from Ruatan island, loaded with bananas, cocoa-nuts, and pine-apples. I've made two dollars—he has made a hundred."

Richling went on eagerly to tell about the plain, lusterless man whose one homely gift had fascinated him. The Doctor was entertained. The narrator sparkled and glowed as

he told of Ristofalo's appearance, and reproduced his speeches and manner.

"Tell about the apples and eggs," said the delighted Mary.

He did so, sitting on the front edge of his chair seat, and sprawling his legs now in front and now behind him as he swung now around to his wife and now to the Doctor. Mary laughed softly at every period, and watched the Doctor to see his slight smile at each detail of the story. Richling enjoyed telling it; He had worked; his earnings were in his pocket; gladness was easy.

"Why, I'm learning more from Raphael Ristofalo than I ever learned from my schoolmasters; I'm learning the art of livelihood."

He ran on from Ristofalo to the men among whom he had been mingling all day. He mimicked the strange, long swing of their Sicilian speech; told of their swarthy faces and black beards; their rich instinct for color in costume; their fierce conversation and violent gestures; the energy of their movements when they worked, and the profoundness of their repose when they rested; the picturesque and grotesqueness of the negroes, too; the huge, flat, round baskets of fruit which the black men carried on their heads, and which the Sicilians bore on their shoulders or the nape of the neck. The "captain" of the schooner was a central figure.

"Doctor," asked Richling, suddenly, "do you know anything about the island of Cozumel?"

"Aha!" thought Mary. So there was something besides the day's earnings that elated him.

She had suspected it. She looked at her husband with an expression of the most alert pleasure. The Doctor noticed it.

"No," he said, in reply to Richling's question.

"It stands out in the Gulf of Mexico, off the coast of Yucatan," began Richling.

"Yes, I know that."

"Well, Mary, I've almost promised the schooner captain that we'll go there. He wants to get up a colony."

Mary started.

"Why, John!" She betrayed a look of dismay, glanced at their visitor, tried to say "Have you?" approvingly, and blushed.

The Doctor made no kind of response.

"Now, don't conclude," said John to Mary, coloring too, but smiling. He turned to the physician. "It's a wonderful spot, Doctor."

But the Doctor was still silent, and Richling turned.

"Just to think, Mary, of a place where you can raise all the products of two zones; where health is almost perfect; where the

yellow fever has never been; and where there is such beauty as can be only in the tropics and a tropical sea. Why, Doctor, I can't understand why Europeans or Americans haven't settled it long ago."

"I suppose we can find out before we go, can't we?" said Mary, looking timorously back and forth between John and the Doctor.

"The reason is," replied John, "it's so little known. Just one island away out by itself. Three crops of fruit a year. One acre planted in bananas feeds fifty men. All the capital a man need have is an axe to cut down the finest cabinet and dye-woods in the world. The thermometer never goes above ninety nor below forty. You can hire all the labor you want at a few cents a day."

Mary's diligent eye detected a cloud on the Doctor's face. But John, though nettled, pushed on the more rapidly.

"A man can make—easily!—a thousand dollars the first year, and live on two hundred and fifty. It's the place for a poor man."

He looked a little defiant.

"Of course," said Mary, "I know you wouldn't come to an opinion"—she smiled with the same restless glance—"until you had made all the inquiries necessary. It must—it must be a delightful place, Doctor."

Her eyes shone blue as the sky.

"I wouldn't send a convict to such a place," said Dr. Sevier.

Richling flamed up.

"Don't you think," he began to say with visible restraint and a faint, ugly twist of the head—"don't you think it's a better place for a poor man than a great, heartless town?"

"This isn't a heartless town," said the Doctor.

"He doesn't mean it as you do, Doctor," interposed Mary, with alarm. "John, you ought to explain."

"Than a great town," said Richling, "where a man of honest intentions and real desire to live and be useful and independent—who wants to earn his daily bread at any honorable cost, and who can't do it because the town doesn't want his services, and will not have them—can go——" He ceased, with his sentence all tangled.

"No!" the Doctor was saying meanwhile. "No! No! No!"

"Here I go, day after day," persisted Richling, extending his arm and pointing indefinitely through the window——

"No, no, you don't, John," cried Mary, with an effort at gayety; "you don't go by the window, John; you go by the door." She pulled his arm down tenderly.

"I go by the alley," said John. Silence followed. The young pair contrived to force a little laugh, and John made an apologetic move.

"Doctor," he exclaimed, with an air of pleasantry, "the whole town's asleep! sound asleep, like a negro in the sunshine! 'There isn't work for one man in fifty!' He ended tremulously. Mary looked at him with dropped face but lifted eyes, handling the fan, whose rent she had made worse.

"Richling, my friend,"—the Doctor had never used that term before,—“what does your Italian money-maker say to the idea?"

Richling gave an Italian shrug and his own pained laugh.

"Exactly! Why, Mr. Richling, you're on an island now—an island in mid-ocean. Both of you!" He waved his hands toward the two without lifting his head from the back of the easy-chair, where he had dropped it.

"What do you mean, Doctor?"

"Mean? Isn't my meaning plain enough? I mean you're too independent. You know very well, Richling, that you've started out in life with some fanciful feud against the 'world.' What it is I don't know, but I'm sure it's not the sort that religion requires. You've told this world—you remember you said it to me once—that if it will go one road you'll go another. You've forgotten that, mean and stupid and bad as your fellow-creatures are, they're your brothers and sisters, and that they have claims on you as such, and that you have claims on them as such.——Cozumel! You're there now! Has a friend no rights? I don't know your immediate relatives, and I say nothing about them——"

John gave a slight start, and Mary looked at him suddenly.

"But here am I," continued the speaker. "Is it just to me for you to hide away here in want that forces you and your wife—I beg your pardon, madam—into mortifying occupations when one word to me—a trivial obligation not worthy to be called an obligation, contracted with me—would remove that necessity and tide you over the emergency of the hour?"

Richling was already answering, not by words only, but by his confident smile:

"Yes, sir—yes, it is just; ask Mary."

"Yes, Doctor," interposed the wife. "We went over——"

"We went over it together," said John. "We weighed it well. It is just—not to ask aid as long as there's hope without it."

The Doctor responded with the quiet air of one who is sure of his position:

"Yes, I see. But, of course—I know without asking—you left the question of health out of your reckoning. Now, Richling, put the whole world, if you choose, in a selfish attitude——"

"No, no," said Richling and his wife. "Ah, no!" But the Doctor persisted.

"—A purely selfish attitude. Wouldn't it,

nevertheless, rather help a well man or woman than a sick one? Wouldn't it pay better?"

"Yes, but——"

"Yes," said the Doctor. "But you're taking the most desperate risks against health and life." He leaned forward in his chair, jerked in his legs, and threw out his long, white hands. "You're committing slow suicide."

"Doctor," began Mary; but her husband had the floor.

"Doctor," he said, "can you put yourself in our place? Wouldn't you rather die than beg? *Wouldn't* you?"

The Doctor rose to his feet as straight as a lance.

"It isn't what you'd rather, sir! You haven't your choice! You haven't your choice at all, sir! When God gets ready for you to die, he'll let you know, sir! And you've no right to trifle with his mercy in the meanwhile. I'm not a man to teach men to whine after each other for aid; but every principle has its limitations, Mr. Richling. You say you went over the whole subject. Yes; well, didn't you strike the fact that suicide is an affront to civilization and humanity?"

"Why, Doctor!" cried the other two, rising also. "We're not going to commit suicide."

"No," retorted he, "you're not. That's what I came here to tell you. I'm here to prevent it."

"Doctor," exclaimed Mary, the big tears standing in her eyes, and the Doctor melting before them like wax, "it's not so bad as it looks. I wash—some—because it pays so much better than sewing. I find I'm stronger than any one would believe. I'm stronger than I ever was before in my life. I am, indeed. I *don't* wash *much*. And it's only for the present. We'll all be laughing at this, some time, together." She began a small part of the laugh then and there.

"You'll do it no more," the Doctor replied. He drew out his pocket-book. "Mr. Richling, will you please send me through the mail, or bring me, your note for fifty dollars,—at your leisure, you know,—payable on demand?" He rummaged an instant in the pocket-book, and extended his hand with a folded bank-note between his thumb and finger. But Richling compressed his lips and shook his head, and the two men stood silently confronting each other. Mary laid her hand upon her husband's shoulder and leaned against him, with her eyes on the Doctor's face.

"Come, Richling," the Doctor smiled; "your friend Ristofalo did not treat you in this way."

"I never treated Ristofalo so," replied Richling, with a smile tinged with bitterness. It was against himself that he felt bitter; but

the Doctor took it differently, and Richling, seeing this, hurried to correct the impression.

"I mean I lent him no such amount as that."

"It was just one fiftieth of that," said Mary.

"But you gave liberally, without upbraiding," said the Doctor.

"Oh, no, Doctor, no!" exclaimed she, lifting the hand that lay on her husband's near shoulder and reaching it over to the farther one. "Oh! a thousand times no. John never meant that. Did you, John?"

"How could I?" said John. "No." Yet there was confession in his look. He had not meant it, but he had felt it.

Dr. Sevier sat down, motioned them into their seats, drew the arm-chair close to theirs. Then he spoke. He spoke long, and as he had not spoken anywhere but at the bedside scarce ever in his life before. The young husband and wife forgot that he had ever said a grating word. A soft love-warmth began to fill them through and through. They seemed to listen to the gentle voice of an older and wiser brother. A hand of Mary sank unconsciously upon a hand of John. They smiled, and assented, and smiled, and assented, and Mary's eyes brimmed up with tears, and John could hardly keep his down. The Doctor made the whole case so plain and his propositions so irresistibly logical that the pair looked from his eyes to each other's and laughed. "Cozumel!" They did not utter the name; they only thought of it, both at one moment. It never passed their lips again. Their visitor brought them to an arrangement. The fifty dollars were to be placed to John's credit on the books kept by Narcisse, as a deposit from Richling, and to be drawn against by him in such little as necessity might demand. It was to be "secured"—they all three smiled at that word—by Richling's note payable on demand. The Doctor left a prescription for the refractory chills.

As he crossed Canal street, walking in slow meditation homeward at the hour of dusk, a tall man standing against a wall, tin cup in hand,—a full-fledged mendicant of the steam-boiler explosion, tin-proclamation type,—asked his alms. He passed by, but faltered, stopped, let his hand down into his pocket, and looked around to see if his pernicious example was observed. None saw him. He felt—he saw himself—a driveling sentimentalist. But weak, and dazed, sore wounded of the archers, he turned and dropped a dime into the beggar's cup.

RICHLING was too restless with the joy of relief to sit or stand. He trumped up an errand around the corner, and hardly got back before he contrived another. He went out to

the bakery for some crackers—fresh baked—for Mary; listened to a long story across the baker's counter; and when he got back to his door found he had left the crackers at the bakery. He went back for them and returned, the blood about his heart still running and leaping and praising God.

"The sun at midnight!" he exclaimed, knitting Mary's hands in his. "You're very tired. Go to bed. Me? I can't yet. I'm too restless."

He spent more than an hour chatting with Mrs. Riley, and had never found her so "nice" a person before; so easy comes human fellowship when we have had a stroke of fortune. When he went again to his room, there was Mary kneeling by the bedside with her head slipped under the snowy mosquito net, all in fine linen white as the moonlight, frilled and brodered, a remnant of her wedding glory gleaming through the long, heavy wefts of her unbound hair.

"Why, Mary——"

There was no answer.

"Mary?" he said again, laying his hand upon her head.

The head was slowly lifted. She smiled an infant's smile and dropped her cheek again upon the bedside. She had fallen asleep at the foot of the Throne.

At that same hour, in an upper chamber of a large, distant house, there knelt another form, with bared, bowed head, but in the garb in which it had come in from the street. Praying? This white thing overtaken by sleep here was not more silent. Yet—yes, praying. But, all the while, the prayer kept running to a little tune, and the words repeating themselves again and again—"Oh, don't you remember sweet Alice—with hair so brown—so brown—so brown? Sweet Alice, with hair so brown!" And God bent His ear and listened.

XXII.

BORROWER TURNED LENDER.

It was only a day or two later that the Richlings, one afternoon, having been out for a sunset walk, were just reaching Mrs. Riley's door-step again, when they were aware of a young man approaching from the opposite direction with the intention of accosting them. They brought their conversation to a murmurous close.

For it was not what a mere acquaintance could have joined them in, albeit its subject was the old one of meat and raiment. Their talk had been light enough on their starting out, notwithstanding John had earned nothing that day. But it had toned down, or we, might say, up to a sober, though not a som-

ber, quality. John had in some way evolved the assertion that even the life of the body alone is much more than food and clothing and shelter; so much more, that only a divine provision can sustain it; so much more, that the fact is, when it fails, it generally fails with meat and raiment within easy reach.

Mary devoured his words. His spiritual vision had been a little clouded of late, and now, to see it clear—— She closed her eyes for bliss.

"Why, John," she said, "you make it plainer than any preacher I ever heard."

This, very naturally, silenced John. And Mary, hoping to start him again, said:

"Heaven provides. And yet I'm sure you're right in seeking our food and raiment?" She looked up inquiringly.

"Yes; like the fowls, the provision is made for us through us. The mistake is in making those things the *end* of our search."

"Why, certainly!" exclaimed Mary, softly. She took fresh hold in her husband's arm; the young man was drawing near.

"It's Narcisse!" murmured John. The Creole pressed suddenly forward with a joyous smile, seized Richling's hand, and, lifting his hat to Mary as John presented him, brought his heels together and bowed from the hips.

"I wuz juz coming at yo' 'ouse, Mistoo 'Itchlin'. Yessseh. I was juz sitting in my 'oom afteh dinneh, envelop' in my '*obe de chambre*, when all at once I says to myseff, 'Faw distwaction I will go and see Mistoo 'Itchlin'!'"

"Will you walk in?" said the pair.

Mrs. Riley, standing in the door of her parlor, made way by descending to the sidewalk. Her calico was white, with a small purple figure, and was highly starched and beautifully ironed. Purple ribbons were at her waist and throat. As she reached the ground, Mary introduced Narcisse. She smiled winningly, and when she said, with a courtesy: "Proud to know ye, sur," Narcisse was struck with the sweetness of her tone. But she swept away with a dramatic tread.

"Will you walk in?" Mary repeated; and Narcisse responded:

"If you will pummit me yo' attention a few moment'." He bowed again and made way for Mary to precede him.

"Mistoo 'Itchlin'," he continued, going in, "in fact you don't give Misses 'Itchlin' my last name with absolute co-ectness."

"Did I not? Why, I hope you'll pardon——"

"Oh, I'm glad of it. I don't feel lak a pusion is my frien' whilst they don't call me Nahcisse." He directed his remark particularly to Mary.

"Indeed?" responded she. "But, at the same time, Mr. Richling would have——" She had turned to John, who sat waiting to catch her eye with such intense amusement betrayed in his own that she saved herself from laughter and disgrace only by instant silence.

"Yessseh," said Narcisse to Richling, "'tis the tooth."

He cast his eye around upon the prevailing hair-cloth and varnish.

"Misses 'Itchlin', I muz tell you I like yo' tas'e in that pawlah."

"It's Mrs. Riley's taste," said Mary.

"'Tis a beacheouz tas'e," insisted the Creole, contemplatively, gazing at the Pope's vestments tricked out with blue, scarlet, and gilt spangles. "Well, Mistoo 'Itchlin', since some time I've been stipulating me to do myseff that honoh, seh, to come at yo' 'ouse; well, ad the end I am yeh. I think you fine yo'-seff not ve'y well those days. Is that nod the case, Mistoo 'Itchlin'?"

"Oh, I'm well enough." Richling ended with a laugh, somewhat explosively. Mary looked at him with forced gravity as he suppressed it. He had to draw his nose slowly through his thumb and two fingers before he could quite command himself. Mary relieved him by responding:

"No, Mr. Richling hasn't been well for some time."

Narcisse responded triumphantly:

"It stwuck me — so soon I pe'ceive you — that you 'ave the ai' of a valedictudina'y. Thass a ve'y fawtunate that you ah 'esiding in a 'ealthsome pawt of the city, in fact."

Both John and Mary laughed and demurred.

"You don't think?" asked the smiling visitor. "Me, I dunno, — I fine one thing. If a man don't die fum one thing, yet, still, he'll die fum something. I 'ave study that out, Mistoo, 'Itchlin'. 'To be, aw to not be, thaz the queztion,' in fact. I don't ca'e if you live one place aw if you live anotheh place, 'tis all the same — you've got to pay to live!"

The Richlings laughed again, and would have been glad to laugh more; but each, without knowing it of the other, was reflecting with some mortification upon the fact that, had they been talking French, Narcisse would have bitten his tongue off before any of his laughter should have been at their expense.

"Indeed you have got to pay to live," said John, stepping to the window and drawing up its painted paper shade. "Yes, and ——"

"Ah!" exclaimed Mary, with gentle disapprobation. She met her husband's eye with a smile of protest. "John," she said, "Mr.——" she couldn't think of the name.

"Nawcisse," said the Creole.

"Will think," she continued, her amusement climbing into her eyes in spite of her, "you're in earnest."

"Well, I am, partly. Narcisse knows as well as we do that there are two sides to the question." He resumed his seat. "I reckon ——"

"Yes," said Narcisse, "and what you muz look out faw, 'tis to git on the soff side."

They all laughed.

"I was going to say," said Richling, "the world takes us as we come, 'sight-unseen.' Some of us pay expenses, some don't."

"Ah!" rejoined Narcisse, looking up at the whitewashed ceiling, "those egspenze'!" He raised his hand and dropped it. "I *fine* it so *diffycul'* to defeat those egspenze'! In fact, Mistoo 'Itchlin', such ah the state of my financial emba'assment that I do not go out at all. I stay in, in fact. I stay at my 'ouse — to light' those egspenze'!"

They were all agreed that expenses could be lightened thus.

"And by making believe you don't want things," said Mary.

"Ah!" exclaimed Narcisse, "I nevvah kin do that!" and Richling gave a laugh that was not without sympathy. "But I muz tell you, Mistoo 'Itchlin', I am aztonizh at *you*."

An instant apprehension seized John and Mary. They *knew* their ill-concealed amusement would betray them, and now they were to be called to account. But no.

"Yessseh," continued Narcisse, "you 'ave the gweatez o'casion to be the subjec' of congwatulation, Mistoo 'Itchlin', to 'ave the poweh to *accum'late* money in those hawd time' like the pwesen'!"

The Richlings cried out with relief and amused surprise.

"Why, you couldn't make a greater mistake."

"Mistaken! Hah! W'en I ged that memo'andum f'om Dr. Seveeah to paz that fifty dollah at yo' cweedit, it burz f'om me, that egscclamation! 'Acchilly! 'ow that Mistoo 'Itchlin' deserve the 'espect to save a lill quantity of money like that!'"

The laughter of John and Mary did not impede his rhapsody, nor their protestations shake his convictions.

"Why," said Richling, lolling back, "the Doctor has simply omitted to have you make the entry of ——"

But he had no right to interfere with the Doctor's accounts. However, Narcisse was not listening.

"You' compul' to be witch some day, Mistoo 'Itchlin', ad that wate of p'ogwess; I am convince of that. I can deteg that indisputably

in yo' physio'nomie. Me—I *can't* save a cent! Mistoo 'Itchlin', you would be aztonizh to know 'ow bad I want some money; in fact, exceb that I am *too* pwoud to dizclose you that state of my condition!"

He paused and looked from John to Mary, and from Mary to John again.

"Why, I'll declare," said Richling, sincerely, dropping forward with his chin on his hand, "I'm sorry to hear ——"

But Narcisse interrupted.

"Diffyculty with me—I am not willing to baw'."

Mary drew a long breath and glanced at her husband. He changed his attitude and, looking upon the floor, said: "Yes, yes." He slowly marked the bare floor with the edge of his shoe sole. "And yet there are times when duty actually ——"

"I believe you, Mistoo 'Itchlin'," said Narcisse, quickly, forestalling Mary's attempt to speak. "Ah, Mistoo 'Itchlin'! *if* I had baw'd money ligue the huncle of my hant!" He waved his hand to the ceiling and looked up through that obstruction, as it were, to the witnessing sky. "But I *hade* that—to baw'! I tell you 'ow 'tis with me, Mistoo 'Itchlin'; I nevvah would consen' to baw' money on'y if I pay a big inte'es' on it. An' I'm compel' to tell you one thing, Mistoo 'Itchlin', in fact: I nevvah would leave money with Doctah Seveeah to invez faw me—no."

Richling gave a little start, and cast his eyes an instant toward his wife. She spoke.

"We'd rather you wouldn't say that to us, Mister ——" There was a commanding smile at one corner of her lips. "You don't know what a friend ——"

Narcisse had already apologized by two or three gestures to each of his hearers.

"Misses 'Itchlin'—Mistoo 'Itchlin',"—he shook his head and smiled skeptically,— "you think you kin admiah Doctah Seveeah mo' than me? 'Tis uzeless to attempt. 'With all 'is fault' I love 'im still.'"

Richling and his wife both spoke at once.

"But John and I," exclaimed Mary, electrically, "love him, faults and all!"

She looked from husband to visitor, and from visitor to husband, and laughed and laughed, pushing her small feet back and forth alternately and softly clapping her hands. Narcisse felt her in the center of his heart. He laughed. John laughed.

"What I mean, Mistoo 'Itchlin'," resumed Narcisse, preferring to avoid Mary's aroused eye,— "what I mean—Doctah Seveeah don't un'stan' that kine of business co'ectly. Still, ad the same time, if I was you, I know I would 'ate faw my money not to be makin' me some inte'es'. I tell you what I do with

you, Mistoo 'Itchlin', in fact: I kin baw that fifty dollah f'om you myseff."

Richling repressed a smile. "Thank you. But I don't care to invest it."

"Pay you ten pe' cent. a month."

"But we can't spare it," said Richling, smiling toward Mary. "We may need part of it ourselves."

"I tell you, 'eally, Mistoo 'Itchlin', I nevvah baw money; but it juz 'appen I kin use that juz at the pwesent."

"Why, John," said Mary, "I think you might as well say plainly that the money is borrowed money."

"That's what it is," responded Richling, and rose to spread the street-door wider open, for the daylight was fading.

"Well, I 'ope you'll egscuse that libbetty," said Narcisse, rising a little more tardily, and slower. "I muz baw fawty dollah—some place. Give you goodsecu'ty—give you my note, Mistoo Itchlin, in fact; muz baw fawty—aw thutty-five."

"Why, I'm very sorry," responded Richling, really ashamed that he could not hold his face straight. "I hope you understand ——"

"Mistoo 'Itchlin', 'tis baw'd money. If you had a necessity faw it, you would use it. If a fwend 'ave a necessity—'tis anotheh thing—you don't feel that libbetty—you ah 'ight—I honoh you ——"

"I *don't* feel the same liberty."

"Mistoo 'Itchlin'," said Narcisse, with noble generosity, throwing himself a half step forward, "if it was yoze you'd baw it to me in a minnit!" He smiled with benign delight. "Well, madame,—I bid you good evening, Misses 'Itchlin'. The bes' of fwen's muz paw, you know." He turned again to Richling with a face all beauty and a form all grace. "I was juz sitting—mistfully—all at once I says to myseff, 'Faw distwaction I'll go an' see Mistoo 'Itchlin'.' I don't *know* 'ow I juz appen'!—Well, an' 'evoi', Mistoo 'Itchlin'."

Richling followed him out upon the doorstep. There Narcisse intimated that even twenty dollars for a few days would supply a stern want. And when Richling was compelled again to refuse, Narcisse solicited his company as far as the next corner. There the Creole covered him with shame by forcing him to refuse the loan of ten dollars—and then of five.

It was a full hour before Richling rejoined his wife. Mrs. Riley had stepped off to some neighbor's door with Mike on her arm. Mary was on the sidewalk.

"John," she said, in a low voice, and with a long, anxious look.

"What?"

"He *didn't* take the only dollar of your own in the world?"

"Mary, what could I do? It seemed a crime to give and a crime not to give. He cried like a child; said it was all a sham about his dinner and his '*robe de chambre*.' An aunt, two little cousins, an aged uncle at home—and not a cent in the house! What could I do? He says he'll return it in three days."

"And"—Mary laughed distressfully—"you believed him!" She looked at him

with an air of tender, painful admiration, half way between a laugh and a cry.

"Come, sit down," he said, sinking upon the little wooden buttress at one side of the door-step.

Tears sprang into her eyes. She shook her head.

"Let's go inside." And in there she told him, sincerely, "No, no, no; she didn't think he had done wrong"—when he knew he had.

(To be continued.)

A FIRST LOVE-LETTER.

BY THE AUTHOR OF "GUERNDALE."

IT was a warm day in the bush. There was no wind; and the atmosphere was in successive layers, superposed, shimmering with the heat. The canvas-topped carts of the detachment were clumped together in a circle. On three sides the level, gray-green plain, broken in its sandy sameness only by an occasional clump of sage-bush or of prickly pear, stretched as far as one could see. On the fourth side was a low, apparently insignificant, but wholly impenetrable African thicket of indefinite extent. Trackless, tangled, arid, it was fit only to be the lurking-place of tigers and snakes, or Zulus. How much of a lurking-place it might be for the latter was a present and interesting question. Most of the company in the little camp were thinking of it. Captain Philip Haughton, in his private and particular tent, had ceased thinking about it.

There are many rapid transitions in modern life—changes of scene and *décor*—but probably even Americans know few extremes more startling than Piccadilly and Zululand. As much as the Captain's somewhat inactive mind was occupied with anything, it was busied with this reflection. It did not particularly surprise, much less excite him, this change. The young stoic of Belgravia probably takes—he certainly affects to take—about the same interest in such changes that he does in those of scenery in a theater; they are sometimes amusing, but more likely to be bores. However, there was uncommonly little affectation in Captain Phil's case. He had no reason whatever to regret leaving Piccadilly. It was after the season; and at such times St. James's street was a desert hardly more frequented, and infinitely less amusing, than South Africa. The only people you saw at the clubs were men you would avoid, even in

South Africa. The regular round of country visits had begun; but as there was only one person whom Haughton particularly desired to meet, and she was, at the same time, one whom it was very important he should not meet,—in brief, he did not much regret the loss of his various weeks in the shires. As for shooting, the partridges were mostly drowned, and black game scarce, he was told. And the Zulus were perhaps a more exciting and better preserved black game than either. "By Jove, I should think so," he thought, lazily, in applause of his own epigram. "Battues are nothing to it." The Captain was always ready to laugh at little or nothing. And he now smiled again, sweetly, as he reflected more precisely upon the position in which he found himself.

He was sitting upon a shawl, which he had doubled upon the sand. The shawl was in front of a tent; and the tent was in a sort of arena, surrounded by a circle of white-covered carts, their rear and open ends facing inside—some of them still filled with stores, others serving as temporary shelter. Close outside, and around them all, was a rampart of wattled underbrush. Between each two was a practicable loophole, through which was thrust a rifle; beside each rifle rested the owner, in the enjoyment of a short clay pipe. Outside, at a distance of a few hundred yards, was a circle of pacing sentries, who marched as if they were trying to pretend it was all an unusually warm review in the Park, knowing their commanding officer liked style, in South Africa or elsewhere. They were fond of their commanding officer. Inside again, at the shady end of the arena (while there was a shady end), a number of long-horned, gaunt cattle were picketed; near them, the few remaining horses of the command.

Behind the Captain, in the interior of the tent, stood the Captain's servant, engaged in polishing the tops of the Captain's boots. This he did with much attention and solicitude. He knew, with all the rest of the little command — with the corporals, the lieutenants, the buglers, and almost the poor, jaded horses themselves — that the Captain and his company were in a nasty mess. And in common with the rest of them, he sometimes took the liberty of wondering how they were to get out of it; that is, supposing that they were to get out of it.

Captain Haughton, however, had got away beyond that question. It was an idle habit of his to give up problems too difficult for immediate solution. Besides, his orders left him positively no option. He was to repair to a certain position, and hold it until the main body came up, keeping the Zulus in check. It had been supposed that the Zulus to be kept in check numbered only a thousand or so; but the orders applied equally well to the checking of any amount of them. As his servant gave the last careful rub to the upper rim of his boots, the Captain was, in fact, thinking not at all of the Zulus, but of the last ball he had gone to in London. He remembered particularly the heat of the conservatory. The very scents and dead sweetness of the place seemed to be still in his nostrils. He could see it now: the black coats and white shoulders; the gleam of diamonds against the shiny background of green leaves. "Like the eyes of snakes in a Zulu thicket," thought the Captain; "only not so frank in their malice," he added, gloomily. Haughton was a heavy, straightforward fellow by nature; and perhaps his attempts at cynicism were clumsy.

It was hotter than ever, and there was a drowsy noise of insects in the air. The Captain's servant came forward, just then, with the Captain's boots. He hesitated a moment, and looked at his master, the boots in one hand. He was uneasy; he had rarely seen Captain Philip so quiet.

"Any orders, sir?" touching his hat.

"No — or, stop, — yes," said the Captain. "Ask private Fairlie to come to me."

Saying which, the Captain leaned back as if overcome with the exertion of speaking, drew an embroidered tobacco-pouch from his pocket, and rolled a cigarette. As he looked at the tobacco-pouch, he became conscious of a tingling sensation in the bridge of his nose, which, having been very much sunburned, had begun to peel. This tobacco-pouch bore the initials *A. M.—P. H.*, and was a favorite trinket of his. Out of it, it had been his custom (being always a lazy man) to tease

his fair friends into rolling cigarettes with their own white fingers.

"I am a damned fool," he remarked, with more emphasis than the occasion seemed to require. It was perfectly natural that his sunburned nose should tingle. Lighting his cigarette, he puffed a moment vigorously; but it was badly made, and the tobacco soon escaped from a seam at the side. Before he had time to roll another, a stout, blue-eyed countryman in the garb of a soldier stood before him; and the Captain became aware that private Fairlie had saluted him, and was looking at him with an expression of unmistakable affection in his simple countenance.

"Private Fairlie?"

"Yes, your honor," said Fairlie, with another salute.

"You are the man whose horse was shot under him, and who rode behind me into camp from the skirmish yesterday?"

"Oh, your honor —" began Fairlie, with yet another salute; but this attempt at military discipline did not conceal a most undoubted blubber.

"There, there!" said the Captain, "enough of that. You were nearly senseless when I picked you up, and you said something about Kate. If I mistake not, that name, which I take to be feminine, was several times repeated during our ride. Now you will overlook my curiosity, but I should really like very much to know: Who is Kate?"

"Kate, your honor? Why, Kate — Kate? I don't mind telling your honor — she — your honor knows, she lives near father's farm — and she said as how she'd — leastwise, she wouldn't *then*, your honor — but she said as how she'd have me if so be as I comes back from the wars alive; and you see, your honor, when I got under that there horse, sir, it come kind of natural to think of her, and —"

"Private Fairlie, you're a fool."

"Yes, your honor."

The conversation ended, as it had begun, with a salute. The Captain rubbed his nose with his handkerchief, which caused the upper part of that organ to tingle as before. Fairlie having no handkerchief, scraped the sand with the inner edge of his right boot. The heat was really terrific, and both men were dazzled with the glare of the white tent. There was a smell of dust and horses; the camp was so still that the cattle could be heard striking the earth at the opposite end of the arena. The Captain rose and looked through the end of his tent between two of the carts. There was a double force of sentries on duty, and they were intently watching the low edge of bush that rimmed the plain. There was noth-

ing to show that the bush was occupied. He returned to Fairlie.

"Private Fairlie, do you suppose Kate would care if you lost your precious skin?" The Captain spoke gruffly. Fairlie stared at him stupidly. At first he seemed disposed to tears again. Finally he grinned.

"Private Fairlie," said the Captain, more quietly, "I wish you to carry some dispatches back to Colonel Haddon at the general headquarters. You will take my horse, and start at dusk. He will carry you over the sixty miles before dawn. Of course, you must escape unseen. There is no moon, and you must be within call of the sentries at headquarters before daybreak. You will deliver the dispatches to Colonel Haddon himself. It is a chance if you get there with the dispatches; but if you do, there will be among them a letter asking for a furlough for yourself. When you have got it, you will return to England, and take a letter I shall give you to the person to whom it is addressed. Mind, you must insist on putting it into her own hands." Fairlie saluted. "When you have done this, you will go back to Derbyshire, and I strongly advise you to stay there. I will give you money to purchase your discharge. You understand?"

Private Fairlie was a stupid man; but, after some moments' hesitation, he replied, huskily: "Yes, your honor."

"Good, my man. You can go."

Fairlie touched his hat mechanically, and turned away. He had hardly got beyond the door of the tent when he turned, rushed back, grasped the Captain's hand, and then, with a "*Beg pardon, sir,*" strode off to his mess. Meantime the Captain, it being an hour before sunset, closed the curtain of his tent and wrote two letters. The first was brief, and has been printed in army reports and in the newspapers as the last authentic report from his command:

"CAMP DERBYSHIRE, May 20, 1879.

"SIR: I have the honor to report a large force of Zulus in the front, estimated at over four thousand. It will be impossible for us to sustain a general attack. It therefore seems advisable that we should be reënforced at the earliest possible date, or the position we now hold reoccupied with much greater force. I have the honor to be,

"Your most obedient servant,

PHILIP HAUGHTON, Captain.

"Lieut.-Col. Haddon, C. B."

The second was longer, and has never been printed:

"To Miss ALICE MANNERS,

Axe-edge Moor, Derbyshire, England.

"I love you, Alice, and have always loved you. I have sometimes thought you knew it. If you did not know it, I write to tell you; if you did, to forgive you.

"O my darling! you will pardon my telling you this now, will you not? You have given me no right to send you a love-letter, dearest; but this is one; yet do not be angry until you have read it all. Let me think, now, that perhaps you love me now, and now only, and that I would kiss you if you were here. My love—darling, do not throw the letter down. I wanted to tell you that I loved you—how much, you will never know; but you might have learned from others that I loved you, and I wanted to tell you myself before I died.

"I am here at an outpost in Africa, with half a company. The orders are to hold our camp at all hazard, and we shall certainly be attacked before dawn. If I thought there was any hope of our escaping, I should not write to you thus; but you will pardon me, dear, for we cannot retreat, and there is no chance of defense or reënforcement. Indeed there is not.

"My men all know it, too; but they are very quiet. They are brave fellows, and I think they like me. Perhaps it is wrong in me to send one of them away to carry this letter to you; but he is a Derbyshire man, and was crying to-day over his sweetheart, and I could not help it. I wanted him to get home to her; and one less to be killed here makes little difference. I should like you to help him a little when he gets to England.

"I hope that you are very happy. You must forgive me for telling you. You will not think it wrong for me to write so—now?"

"Good-bye, dear Alice.

"PHILIP HAUGHTON."

It was some months after the date of this letter that the guests at Carysbridge Hall, in Derbyshire, were awaiting dinner. It is a nuisance, waiting for dinner; particularly when you are standing before the fire, as was Major Brandyball, and supporting a portly person in patent-leather pumps a trifle small. Dinner was a formal affair at Carysbridge. There were many guests for the pheasant shooting and Sir John was entertaining largely in honor of his young wife. But a man had come just before dinner, and had insisted on seeing Lady Cary personally; and she had now been gone nearly half an hour.

"I wonder who it can be?" said the Countess Dowager to Brandyball. The Countess Dowager liked to know everything; that is, everything about her friends. "The servant said the man seemed to be a soldier."

"I think," said the Major, "I think Lady Cary used to have some friends in the army—when she was Miss Manners."

Further conversation was checked by Lady Cary's return. She was a beautiful woman, Sir John's wife; and she never looked better than on that night. The Major noticed that she held a letter crumpled in one hand; and her haste had given her a heightened color. She must have been gone over half an hour.

"Forgive me for keeping you all so long," she said, with her sweet smile. "Lord Arthur, will you take the Countess Dowager in to dinner?"

J. S., of Dale.

THE CRUISE OF THE "ALICE MAY."

EVERY one has heard of the Gulf of St. Lawrence, but few are aware of the variety and beauty of the attractions it offers to the tourist and the artist. Even to such as have given it some thought it generally appears to be a region of mists, snow, and storms, and more or less enveloped in hyperborean glooms. But recently sportsmen and yacht sailors have begun to visit the western shores of the gulf, and a suspicion is dawning on the mind of the summer Rambler that this part of the world has been maligned, and that during the summer solstice it offers a variety of attractions up to this time all but unknown.

Anxious to see for ourselves the truth of the matter, and to view some of these points of interest before the tide of summer travel had worn away the novelty, we prepared a cruise round the Gulf of St. Lawrence and the adjacent waters.

The point of departure was Charlottetown, Prince Edward Island. Through the kindness of a friend residing there, a suitable schooner was chartered. But when the day for taking possession arrived, the schooner failed to put in an appearance. Here, at the very outset, we encountered one of the most common annoyances which a punctual man and a Yankee is forced to endure in the maritime provinces. Punctuality or appreciation of the value of time is scarcely understood there. Without delay, we threw out scouts in every direction to report on the matter of available

schooners. Long search was attended by many pleasant incidents. It gave us an opportunity to see much of this charming island, and to enjoy the genial hospitality of its people, especially the kind folk of Charlottetown. This is a quiet but attractive place of some ten thousand inhabitants. On the outskirts, especially in the neighborhood of the Governor's mansion, there is much beauty in the residences, which are surrounded by shrubbery and situated by the water-side.

Tuesdays and Fridays are the days when Charlottetown shows the most evidence of

OFF PASPEBIAC.

BEACH AT TRACADIE.

activity and commercial prosperity. The market-house occupies a prominent place in the square where the Government buildings are situated. On these days it is crowded by both the city and country folk, the latter including a few Indians. An active barter in provisions takes place between the townspeople and the farmers, while that part of the city bears the appearance of a gala day.

Two causes have recently produced great commercial depression on the island. These are the failure of the Prince Edward Island Bank, through the — what shall we call it? — of the directors, and the decline in ship-building, which, until the primeval forests had been cut down, was a great source of revenue to the island. The failure of the fisheries and the absence of American fishermen from the Gulf, partly caused by the short-sighted policy of the Dominion Government, have also affected the prosperity of this province. In summer time Prince Edward Island enjoys a delightful temperature: the mercury ranges for three months from sixty to seventy-six degrees, rarely varying from those figures. The air is dry and free from fogs, and, as the wind invariably comes off the sea, the island is exceedingly healthful. The advantages for summer visitors are increased by the abundance of fresh meat and other provisions, the cheapness of living, and the loveliness of the drives in every direction over a country that is gently undulating, verdurous, and always in sight of the sea. The rivers, notably the

Dunk, the Hunter, and the Morell rivers, abound with fine salmon and trout fishing, and the long reaches of sand along the easterly shore are frequented by snipe, plover, and duck. Everywhere a pastoral peace pervades the farms on the edge of the forests. Fine droves of horses enliven the fields, and remind

one of Thessaly, the land of fleet-footed steeds.

It is not singular that these attractions have begun to draw the attention of summer tourists, who find comfortable accommodations at the farm-houses or at the hotels erected at such charming resorts as Rustico and Tracadie. Houses may also be rented by the season on very moderate terms. It is to the influx of such visitors, with pockets popularly supposed to be lined with gold, that the island may reasonably look for a return of some of its vanished prosperity. The facilities for observing the scenery of Prince Edward Island are greatly aided by a narrow-gauge railroad, which is always sure to be used, as the Dominion agreed to keep it going when the island entered into the confederation; but no one expects it ever to pay its expenses. The lobster-canning business, which has also assumed great dimensions in Prince Edward Island, might likewise be considered a powerful means of driving the wolf from the door, if but the uncertain crustaceans could be depended upon. But they take no interest whatever in the designs of capitalists and fishermen to ship them to the markets of the world in elegantly labeled tin cases, and, declining to coöperate in these schemes when the season comes around, may take a notion to forsake their haunts for parts unknown. Then the canning factory is closed, and the fisherman's dory lies bleaching on the shore while he anxiously smokes his pipe and talks of emigrating to the United States, maligning the day when the island entered the Dominion. In default of any better cause, the people generally agree in tracing their ills to this union; but the sequence is by no means self-evident.

Gazing over these pleasant landscapes and breathing the soft southern breeze, it is difficult to realize that for many months the island is not only covered with snow to

an enormous depth, but also well-nigh shut out from the rest of the world by a tremendous barrier of ice. From January until May, at least, Northumberland Strait is frozen over. The mails are carried across at the narrowest part, near Cape Tormentine, or Jourimain, a distance of nine miles. The carriers drag a boat over the hummocks of ice which is provided with runners like a double keel. When they come to open water they cross in

solitude and hazard. In the spring of 1882 the *Northern Light* was three weeks making this brief passage, fast locked in the ice-packs. Sometimes she was carried close to the shore, but no one could bring aid to the starving passengers, owing to the threatening condition of the ice. It was only after burning all the woodwork in the cabin for fuel, and being reduced to the last biscuit, that the worn-out and hopeless passengers reached the destined

THE MAIL-BOAT AT PRINCE EDWARD ISLAND.

the boat. It is a dangerous and arduous journey, and few undertake it besides the hardy mail-carriers. For two or three winters past the passage has been made sometimes by the steamer *Northern Light*, constructed especially for this service. She has a frame of enormous strength, somewhat of a wedge form, with a solid shoe of iron at the bow; everything about her was planned to enable her to crush her way through the ice, which is often from two to four feet thick. Her course is from Pictou to Georgetown, a distance of some eighty miles, although she often has to go over two or three times that distance to reach her port. In all the annals of steam navigation there is no such packet service recorded as this of the *Northern Light*. Sometimes the ice is so dense that she can make no headway, but is jammed fast for days and weeks, or carried to and fro by the combined fury of ice and storms. The passenger who starts in her for Prince Edward Island in March has before him the horrors of polar

port. Think of a civilized and enlightened people, in this age, shut off from the rest of the world by such a frightful siege of ice and tempest and snow! Nor is this an occasional thing. As regularly as the winter comes around, the islanders look forward to this long hibernation and isolation. Were it not for this drawback, the island might be a paradise. During the long winter the people contrive to exist with some comfort, and find compensations for their solitude. Sleigh-rides and skating are followed with much zest, and there is a good deal of merriment and festivity.

Charlottetown is, of course, the center of life in Prince Edward Island, but the social distinctions are drawn with considerable and, perhaps, unneces-

sary emphasis. Lying as it does on an arm of the sea which extends east and west some forty miles like a river, this city enjoys fine facilities for aquatic sports, while the drives in the neighborhood are, during the

Catholic. There are, however, many Protestant Scotch mingled with the others, and, with the exception of the annually recurring public school question, they appear to live together very peaceably.

THE STEAMER "NORTHERN LIGHT" CROSSING FROM THE MAINLAND TO THE ISLAND.

summer, very agreeable. Everything here is, however, on a reduced scale, except the land and water, and the ideas of the country people are on a level with their environment. They tell a good story of a country lout who had never seen any larger place than Souris, at the eastern end of the island, not even Charlottetown. Souris has about two thousand inhabitants. One of his companions made a trip to New York, and on his return expatiated on the vastness of that great city. "And now, and is't as large as Souris, then?" inquired the former, incredulously.

Money goes far here, because it is scarce, and time and provisions, the chief commodities, are cheap. The people are mostly of Scotch descent. The remnants of a tribe of Micmacs, civilized almost out of existence, still occupy a reservation on Indian Island, in Richmond Bay, and sell baskets and beadwork at the weekly market. Descendants of the original Acadian French yet farm the lands about Rustico and Ingonish. They have a convent at the latter place. By far the most numerous people on Prince Edward Island are the Highland Scotch. They came here originally from the Hebrides, driven from home, it is said, by the religious oppression of the lairds. They have increased and multiplied, and, with the addition of the French habitants, nearly half the population is Roman

The Scotch have a Caledonian Club at Charlottetown, and once a year there is a great gathering of the clans, with a corresponding display of plaids. The same clan names reappear so constantly that, in order to avoid confusion, curious sobriquets are often attached to a person's name; as, for example, a certain McDonald is called Red Angus McDonald, to distinguish him from White Angus McDonald. One of the most prominent families of Prince Edward Island is that of James Yeo, who accumulated a very large fortune in ship-building. His sons are members of the Dominion Parliament. He came from England as a cabin-boy, and the rough school in which he was bred always marked his character. Many curious stories about him are current. When annoyed by any family jar, he would secrete himself in the cuddy of an old schooner with a keg of rum and remain there until it was exhausted. He once lost a brig, and three of the crew also perished; when alluding to the misfortune he exclaimed, "Poor things! two souls and an Irishman!"

Prince Edward Island was first discovered by Cabot, who called it St. John's Island, which name it retained till 1800; and the French still call it Isle St. Jean. Verrazzano took possession of it for France in 1523, and the French at once established a number of fishing stations there. But the island was ceded

A FISH-BOY.

to England by the treaty of Fontainebleau, and Lord Egmont was appointed to draw up a form of colonial government. Assuming that the Micmac Indians were ferocious savages, instead of the inoffensive beings they proved to be, he laid out an absurd plan to divide the 2,000,000 acres at his disposal into fifty parts, called baronies, of which forty were to be granted to as many colonists, bearing the

title of lords of hundreds. They were to owe allegiance to him as lord paramount. The baronies were in turn to be subdivided into manors. Fairs were to occur four times yearly in each barony, and markets twice weekly. Feudal castles were to be built likewise to protect the colonists in a place of which it was said, "The settler can scarce straggle from his habitation five hundred yards, even in

OUR COOK.

ON DECK.

times of peace, without risk of being intercepted, scalped, and murdered."

This was indeed a narrow escape from a preposterous attempt to import to the New World an

exploded system of the past. But, although Lord Egmont's plan was finally rejected, a scarcely less objectionable one was adopted, by whose provisions the island was divided into sixty-one lots. One of these went to the Crown, and the others were sold in one day to the highest bidders. It is only recently, and after a long struggle, that Prince Edward Island has become independent of this system.

While picking up these notes by the way, we were pursuing our indefatigable search for a schooner, as the season was well advanced, and the time to cruise in those waters is before the September equinoctial. At last we heard of a desirable craft at Miminegash, an obscure port but little known to fame. A bargain was closed after much chaffering with the owner, an owre canny Scot, and the vessel was brought around to Charlottetown to be manned and provisioned. The *Alice May*, of Miminegash, was fifty-nine feet long and sixteen feet wide, and with a full set of ballast drew seven feet aft. She registered fifty-six tons, and, being intended for a freighter, had a flat floor and could hardly be called a clipper. But she was very strong and reasonably safe. Being heavily sparred for a coaster, and carrying sail well, she was properly fitted to grapple with the variable weather we expected to encounter.

The *Alice May* had no fore-castle for the crew, but only a small cuddy aft, with bunks

for four men. This also served for a galley, after the manner of small coasters. We therefore turned the hold into a cabin, and a very comfortable and spacious place it proved to be. By fixing two bulkheads of deal fore and aft, we obtained a "saloon" eighteen feet long by sixteen feet wide, exactly amidships. A small trunk or booby-hatch with a slide was arranged over the main hatch for a companion-way. Plain bunks were fixed to each side, ample as a divan, thus serving alternately for berth, sofa, or lounge, as circumstances might suggest. Our table was at the after end, and a cylindrical stove, which is indispensable for a cruiser in those waters, even in midsummer, was at the opposite end. Under the bunks were lockers for our stores. Numerous cleats, nails, and shelves were soon festooned with coats, caps, sou'westers, storm-boots, spy-glasses, charts, fowling-pieces, water-jugs, pipes, fishing-rods, and the indispensable looking-glass and barometer. There was no paint anywhere except such as we daubed in artistic dabs during the cruise, with the palette knife when cleaning a palette. But the general effect was not by any means unattractive. It certainly suggested comfort, and preparation for any emergency that might occur.

Our crew consisted of a captain, a mate, and one man before the mast. It was thought this would be sufficient with the cook, who might bear a hand on occasion; and we were able, in case of need, to stand a watch in bad weather ourselves. These coasters generally get along with one man on deck in good weather to steer and to keep a lookout. Sometimes even he falls asleep at the wheel, and everything is left to chance. It is a happy-go-lucky way, which works very well until something happens. A majority of the accidents to coasting vessels from collision or squalls are the result of gross laziness or culpable carelessness.

Captain Welch had in his day been master of square-rigged vessels, but, being now well along in years, was forced to put up with fore-and-afters. It requires a special experience to sail a schooner well; but still the sailing of a square-rigged vessel is more complicated, and is, at any rate, considered a grade higher in seamanship. The captain's white beard, the far-off look in his wrinkled eyes, the poetic speech in which he indulged, and his nervous temperament, easily elated or depressed, would far more easily have made him pass for a Celtic bard than an old man of the sea. John, the mate, was a Frenchman, short, quick, and of mercurial

disposition. Bill, who in his single person represented the crew, was every inch a sailor, large, lithe, powerful, and efficient if well commanded; he had the real seaman's grip that would enable him to hang on to a foot-rope

waves have rendered as sensitive as the needle of a compass. He must also understand how to make eatable bread, and take his duff out of the kettle on Sunday as light as cotton and as delicate as sponge-cake. Besides this, he

AMATEUR COOKING.

with his eyelids, and the nonchalant recklessness or stupid dare-devilry which made him careless of dangers with which he was familiar, while cowardly in the presence of new forms of peril. Fond he was, too, of his grog, and of handling his knife when half seas over, and was never without the everlasting quid pressing out his cheek like a walnut in a squirrel's mouth. In a word, Bill was a representative blue-water sailor.

It is needless to go into the details of the provisions stored in the schooner for a cruise of two months. Everything was ready, the rigging overhauled, the last nail pounded in; the winds were favorable; and yet we were detained at Charlottetown day after day, unable to sail. It was a cook that we waited for: what was the use of having provisions, fuel, or galley, without a cook? A sea cook is a peculiar character, requiring a special training. He must know how to prepare a sea hash out of salt horse flavored with onions, incrustured with the variegated browns of polished mahogany, and savory enough to create an appetite in a stomach that the tossing

must know how to economize in the use of water and provisions; and, more difficult yet, he must contrive to keep the crew satisfied with the mess he cooks for them, while at the same time he looks out sharply for the interests of his employer and the captain. He must also be proof against the worst weather, and undeviatingly punctual to the hours of meals. It goes without saying that it is not an easy thing to find such a paragon in the galley; but when he is there, he is, next to the captain, by far the most important character on board. We had made up our minds that it would be difficult to find a cook in Charlottetown combining such exalted qualifications, who would be willing to go for such a brief cruise, and were prepared to take up almost anyone that offered. But we were not prepared to meet such a gang of shiftless, shuffling, vacillating, prevaricating, self-complacent, exorbitant, and utterly good-for-nothing varlets as those who applied for the position, or whom we discovered after chasing through the lanes, sailors' boarding-houses, and purlieus of Charlottetown. Over and over again we

thought we had engaged a man ; but when the time came to sail, he was not to be found. At last, out of all patience with the whole business, we telegraphed to a friend in St. came to anchor, and went on shore to learn if there was any telegram regarding a cook. To our intense relief, we learned that we should find one at Point du Chêne waiting for us.

BURNING REFUSE FROM THE LUMBER MILLS.

John, New Brunswick, to send us a cook, and that we would pick him up at Point du Chêne. No reply had arrived to the telegram when we sailed, and thus we started without a cook, in a sort of vain hope of stumbling across one at some port.

A group of our good friends at Charlotte-town came down to the wharf to give us a send-off. Healths were exchanged, the canvas was spread, and we shoved off. As the little vessel gathered way before the southerly breeze, they gave a parting hurrah, and we returned the salute by emptying our revolvers and dipping the red colors and jack of old England, which flew at the mast-head.

With light and variable winds, we reached Summerside the next afternoon. There we

Here we also made some of those final purchases of stores which are likely to be forgotten on starting. Then we hurried on board and made sail. There was really but little to detain us at Summerside. It is a new place, which sprang up mushroom-like, and soon threatened with its bustling prosperity to overtop every other port in the island. But its growth stopped before it could become beautified by the slow growth of verdure, and it is now a mere naked cluster of warehouses and uninteresting, cheaply constructed dwellings. But it is situated on Bedecque Bay, a lovely estuary into which empties the Dunk River, whose waters are the delight of the disciples of the gentle craft. Midway in the bay lies Park Island. Some years ago a cap-

THE CRUISE OF THE "ALICE MAY."

italist of Summerside conceived the idea of making this island a summer resort. He purchased it, and in its center built a commodious hotel, the largest in Prince Edward Island. Charming walks and drives were cut through the groves, bathing-houses were put up on the beach, and numerous other attractions were offered to guests. A small steamer was bought expressly to carry them over, and it seemed as if the place ought to bring a profit to the enterprising proprietor who had such confidence in the charms of his native isle. But he sunk all his fortune in this ill-starred enterprise, and his anxieties brought him to an early grave. The hotel, standing on the islet, empty and deserted, adds a tinge of dreariness to an otherwise pleasing picture.

As we ran up the strait that evening, we had an exciting race with a schooner bound the same way, having a number of boisterous workmen on board going to the mines. She

was close alongside, and as we gained on her and were passing, she luffed up, being able to shave the wind a little closer than the *Alice May*, and tried to run us down. We escaped a collision by putting the helm down quickly. Then keeping away, we passed her as a strong puff gave us increased headway; and as we left them astern, they gave a wild mocking peal of laughter that had in it a touch of devilry as it rang over the sea. It blew fresh that night, with squalls, and we took in the kites. We found the schooner stiff and able to carry sail hard. That night, as the previous night, we stood our watch on deck. But this was interesting, compared with the responsibility of preparing meals. There were four of us in the main saloon, as we styled it, or three besides the writer of this log. The junior member of the party, a youth of sixteen, was nicknamed the Infant. Pendennis, the tallest of the party, went by the affectionate

sobriquet of the Cherub, probably because of the remoteness of the resemblance. Then there was my companion Burns, who was already familiar with sea life. We took turns in preparing the meals, one of the crew being delegated to light the fire. We found it convenient to cultivate a taste for ham and eggs or plain boiled eggs, little art being required to cook them. The cook for the time being was expected to get his wages in chaff, of

finished her. We got out the boat, carried an anchor well out to starboard, and bowsed on it for two hours with no result. Meantime, the wind had shifted into nor'-west and was blowing a perfect screecher. By keeping canvas up, the vessel was finally pressed well over on her side, tending to move the keel and float her, and at length she suddenly started. Then it was, "Heave away, boys; be smart, now!" in order that she might not overrun

MILLSTONE QUARRIES.

which he received an unlimited amount from the others. Fortunately, we all knew how to brew a good cup of tea, not so easy an accomplishment as some might imagine.

It began to blow hard after midnight, from the south-west. The morning broke with a very wild offing and the promise of a stormy day. But we were near to Point du Chêne, the line of the long, low shore blending with the scurrying scud and a yeast of white caps flashing angrily in the fierce rays that shot through a rift in the clouds. Lying well over to the blasts, the *Alice May* beat up toward the land, and there was every prospect of soon reaching a snug anchorage, when with a violent shock she struck on a shoal. The first thought that flashed on us was, Can it be that the cruise is going to end just as it begins? But the emergency called for instant action rather than for deliberation. The tide had yet a foot to rise, and we must float her then or perhaps never, because she lay in a very exposed position, and a shift of the wind to south-east would have

the anchor as she slued into deep water and began to gather way like a bird released from its cage.

We now ran up and anchored at Point du Chêne, and went ashore to get the cook. But no cook was there. We learned that he had arrived, but, not finding us, had unwisely gone on in the boat the previous day to Charlottetown, and could not return until Monday. Disappointment is a feeble word to express our chagrin. Point du Chêne, with its neighbor Shediac, offers few attractions to the tourist. It is merely the terminus of the railroad, where the steam-boat plying to Prince Edward Island comes during the summer. But we procured some fresh meat, took in a little more ballast to counteract a list to starboard, and shipped another hand, who proved to be Tom, the son of Captain Welch, who was there in a schooner. We were now able to have two men in a watch, which relieved us from the necessity of passing the night on deck. Monday morning we rowed in the boat up the

OUR FIRST FISH.

river to Shediac, a delightful sail. There we found the tide so low we could not come within a hundred yards of the beach, even with our sixteen-foot yawl. Seeing our predicament, a crowd of bare-legged urchins, about the age and shape of cupids, floated a miniature punt off to us; then, seizing the painter with great glee and noisy splashing, they towed us one by one to the shore. The air rang with peals of laughter from the bystanders; and it was indeed a merry sight, and comical also, for the punt was in constant danger of spilling out its occupant.

At one o'clock we were all on the lookout for the arrival of the steamer from Summer-

side. The burning question of the hour was to cook or not to cook. Would the cook be on board? Was he white, black, or yellow, and would he know his business if he actually came? The excitement grew as the hour approached. The steamer hove in sight; she ranged up to the pier; the passengers stepped ashore, and after a brief interval our boat was seen coming off with a third man in the stern sheets. It must be the cook. As he drew nearer, his sable complexion not only settled the question, but also added a strong probability, amounting almost to certainty, that he was a good cook. Our surmises proved to be correct in just one minute after

OUR CREW AT SUPPER.

he stepped on deck. It had already struck eight bells.

"Have you had your dinner yet, sir?" he inquired.

"No; we have been waiting for you."

"All right, sir; you shall have dinner right away."

Stepping into the galley in a trice, he stripped off his coat, rolled up his sleeves, and in half an hour we sat down to the best meal that had ever been seen on board the *Alice May* since she left the stocks. From that day to the hour we landed again in Charlottetown, Henry Richards proved himself a capital cook, provided with no end of inventive culinary resources; he was indefatigable in the discharge of his duties, sober and faithful to the interests of his employers. Happy the ship that sails with such a cook, and happy the diners who batten on his beefsteak and onions, hash, roly-poly, and tea.

At sea, action and reflection go hand in hand. One minute after he boarded us Henry was getting dinner, and three minutes later the crew manned the windlass, hove the anchor short, made sail, and we put to sea. We had a staving breeze from south-east and by south, and bowled away merrily for Miramichi. After night-fall the sky became very dark, and it blew heavily. We flew before sea and wind, and made the Escumenc light in the middle watch, but could not run in with

such weather without a pilot. We hove to with a tremendous sea running, the darkness aflame with flashing phosphorus, and the little schooner pitching her jib-boom under and knocking passengers and furniture about the cabin without ceremony. It does not take long to raise a high, wall-like swell in the Gulf of St. Lawrence, owing to the shoal water. The lights of other vessels in our neighborhood, bobbing like will-o'-the-wisps in the gloom, and, like us, waiting for dawn, suggested a sharp lookout. At intervals the long, melancholy cry of the loons floated down the wind like the wail of lost spirits,—a sign of east wind, in the opinion of some; which led Captain Welch to observe the next morning: "The loons was a-crying for the east wind all night."

A dapper little pilot schooner left a pilot with us at daylight, and we ran across the bar, where a vessel was lost with all on board a year or two ago in a gale. It was a long but delightful beat up the Miramichi River that day. After leaving the broad entrance, we found the river winding, and closed in with lovely overhanging cliffs, crested with verdure which festooned the caves that honeycomb the rocks. Picturesque farms on the slopes, surrounded by natural groves of pine and spruce, and fishermen's huts and boats under the cliffs, gave life to what is really an enchanting stream.

Thirty miles from the sea, we at last anchored at Chatham, the wind blowing in violent squalls, which terminated in a tremendous thunder-storm, attended by terrific gloom. When the clouds cleared away, the glow of the setting sun illumined the wet roofs and shipping of this bustling little place with wonderful splendor. Chatham, as well as Newcastle, two miles farther up on the opposite bank, was once a great ship-building port. This business has left it; but a great lumber trade has sprung up instead, which brings profit to the neighborhood, while it is rapidly stripping the noble primeval woods of New Brunswick. Upward of three hundred square-rigged vessels arrive there during the summer for lumber, chiefly for the foreign market. The appearance of the town is therefore very animated, with its rafts of logs, its stagings and saw-mills, and wharves lined with large vessels two or three abreast. In 1881 the feet of lumber brought down the south-west boom of the Miramichi reached 140,000,000. At night-time, the river front of the town is lurid with the vivid flames of refuse wood burning in brick-lined furnaces along the river. Another large business here is the salmon fishery. Chatham is on the railroad, and the fish, packed in ice, are sent directly to the United States. Six car-loads have been forwarded from this place alone in one day. The time for catching the fish is from May 1st to August 15th. Every farmer by the river spreads his own nets in the water opposite his land, and owns a dug-out to land the fish. During the winter large numbers of smelts and bass are also caught through the ice, and sent by rail to our markets.

July 12th we filled our water-casks, and, in company with a fleet of Swedish and Norwegian lumber-laden barks, started down the river. The beauty of the shores induced us to land where a gang of laborers was engaged in cutting out mill-stones, which are an important source of profit at Miramichi. They were at work in a romantic spot under a cliff, and the click of their mallets rang musically with the plashing of the dashing current. A little farther on, our boat glided into a fairy-like cove. A farmer was just returning from his nets with some very fine salmon. If we were like some fishermen, we might say we caught salmon ourselves on this river. But truth compels the more prosaic statement that all the salmon we caught on the Miramichi we bought from this farmer. He asked us to climb the cliff to his house, which we found superbly situated on the brow of a noble lawn, terminating at the river in a precipice. The chubby, flaxen-haired children, bareheaded and barefooted, gath-

ered round to stare at us, with their hands uneasily clasped behind them, as we sat in the "best room." The venerable grandmother brought us a large jug full of fresh milk in her shaking hand. While drinking it, we could see the upper sails of the lumber fleet above the cliff as they glided close by the land. It reminded me of many a similar and familiar scene on the Bosphorus. I could not but marvel that some of our people in search of summer resorts, who are willing to go to the River St. Lawrence, do not build or hire houses for the summer on this charming spot, the air being delightful, the scenery exceptionally attractive, salmon and trout abundant, and the cost of living moderate. "It would do us a great deal of good, sir, if some of your folks in the States who have money would but come here and buy our lands and provisions," remarked the old grandmother, with a twinkle in her gray eyes, as we bid her good-bye.

With a leading wind, we sailed down the tortuous channel of the Miramichi and crossed the bar, with a rosy light of evening flushing the sails of the lumber fleet. One of them we left behind. She grounded in the channel at high water, and probably had to throw over part of her cargo. We headed now for the Bay of Chaleurs. The weather being fine, the crew began this evening the habit of taking their meals on deck, which they did after this whenever the weather permitted. It was an interesting sight to watch them clustered around the dishes, which were placed on the after part of the trunk. The captain had a separate seat at the head of this unique table, where he presided with patriarchal dignity, entertaining the crew with yarns from his own varied experience. There is not much attempt at discipline on these down-east coasters, but the crew are controlled by a sort of family arrangement. The captain gives the orders in an easy fashion, and the men sometimes give suggestions regarding the working of the ship which would procure them a broken head if attempted on a square-rigged vessel. Captain Welch and the mate had an animated and by no means amiable discussion one day regarding the course to be followed, without any other result than a continuous muttering on both sides, until eight bells called all hands to supper. The south-west wind prevails in the Gulf of St. Lawrence during the summer time. This is favorable to yachts cruising northward, but must be taken into calculation when they shape a course for home. This wind is generally quite steady, freshening up at night; but sometimes it increases to a gale, followed by a strong westerly wind for a day or two. But no depend-

ence whatever can be placed upon the Gulf weather after the last of August. Favored by this southerly wind, we flew northward all night, and the tight little schooner put in her "best licks," as her speed was tested better with a free wind. The wake was a mass of gleaming foam interwoven with magical green, white, and red sparkles that seemed to come up like stars from the black, mysterious depths below. The galaxy, or "milkmaid's path" as sailors call it, and the northern lights gleamed at the opposite poles. It fell calm beforebreakfast, and we caught a number of cod. The low shore of New Brunswick was on the port beam, and numerous fishing boats were out. As we passed near one of them laden with lobsters, we hailed her crew in French, and threw them ten cents fixed in the split end of a stick. In return they hurled a shower of lobsters on board, which came so fast on deck that we were forced to duck our heads below the rail to avoid being hit by the ugly monsters. We thus obtained many more lobsters than we could possibly eat. Never have I seen lobsters cheaper or fresher than these.

At noon of July 12th, we passed the octagonal light-house on the low, sandy point at the northern end of Shipagan Island, and were fairly in the Bay of Chaleurs. Twenty miles across loomed the lofty northern shores of the bay, beautiful ranges of mountains with jagged peaks melting dreamily into the thunderous clouds brooding ominously in the north. The southern shores of the bay are much lower and less interesting, and offer only one safe harbor, Bathurst; and that is exposed to northerly gales. Caraquette is only good for light-draught fishing craft. The glass was now falling, and the baffling winds indicated a blow by night-time. The Bay of Chaleurs is ninety miles long, and is a dangerous sheet of water in easterly winds. But it is free from shoals, and has a good bottom excepting near the southern entrance, and there is good holding ground everywhere near to the northern coast. The famous Restigouche River, coming from the gorges of Gaspé county, empties into the bay at its western end, near Dalhousie. A number of other streams, such as the Charlot, the Bass, and Tête à Gauche, also find an outlet here. They abound in fine trout and salmon—a fact which renders this region important for sportsmen, who are already beginning to flock thither during the summer. The bay has also been a noted resort of American fishermen on account of its mackerel. But the fish are now scarce, which, together with the restrictions of the treaty laws, has drawn away the American fishing schooners which once resorted to these waters by hundreds. Owing to its size, it has been a

disputed question between the two governments whether the Bay of Chaleurs should be considered a bay or part of the open sea—a matter of importance in the sea fisheries. The bay was discovered by Jacques Cartier, who probably suffered from the heat there, judging from the name he gave it. It was the scene of the defeat of a French fleet by the English in 1760.

The weather became very thick after sunset, with a strong easterly breeze. We kept a good lookout, and had a narrow escape from collision with a French schooner. As they swept by they hailed us in French, and our mate flung a few choice French epithets in return. At midnight the wind shifted into the nor'-west and blew a fresh gale, with a nasty sea. The *Alice May* beat up against it nobly. It was now a clear starlight, and it was exciting to see the little vessel bending over to her scuppers in the gray sea and flinging sheets of spray over her cat-heads.

A magnificent dawn succeeded this variable night, and as the sun burst above the sea, it revealed a truly remarkable scene. A slope of extraordinary regularity, as if it had been smoothed with a roller, was discovered extending some fifteen miles along the sea, where it terminated in an unbroken line of red cliffs from forty to one hundred feet high. This fine slope was covered with a carpet of a vivid emerald hue. At the base of the red, cavern-hollowed cliffs rolled the sea, deep-purple and blue. This slope was outlined against a distant range of violet-tinted mountains limned against an opalescent sky. It was indeed a noble and exhilarating prospect. But it was rendered yet more remarkable by a line of houses extending for nearly six miles along the crest of the slope. The rising sun smote full on these dwellings, and, at the distance we were from them, they looked like the tents of an army encamped there; and, indeed, I thought at first it might be the camp of militia taking their summer exercises. But when the sun struck the windows of these houses, they flashed like stars over the sea or like beaten gold.

As we drew nearer to the land, we made out a long, low point, covered with white buildings and terminating in a light-house, the effect being that of a sea-walled town in the Mediterranean. Then we knew that we were off the French town of Paspébiac. It had all the rapture of a surprise for us, because never before that morning had I heard of the place. It really seemed as if it might be an exhalation from the sea, a vision of the morning, doomed to fade away as the sun rose higher in the heavens. But the keen gusts off the land, singing through the

rigging of our bending barkie, soon brought us so near there was no longer any room to doubt that we had hit upon an important and beautiful town. We anchored off the spit, but soon slipped around to the other side, where we again anchored in a roadstead protected from easterly winds, and reasonably safe in summer from winds blowing in other quarters. With our usual expedition, we immediately had the boat put into the water and went on shore. The light-house and an old wreck bleaching near to it on the sandy beach first impressed us as being artistically available, as the genial editor would say regarding a manuscript upon which he is disposed to bestow the smile of acceptance. Having sketched these objects, we adjourned to the Lion Inn to dine. This quaint little hostel is on the point, with water close on either hand. A one-time much gilded lion, but now somewhat rusty, wagged his tufted tail ferociously over the door, and a green settle on either side invited the guest to an out-of-door seat overlooking the bay. The buxom landlady was a fair-complexioned, tidy, blue-eyed dame from the isle of Jersey. Wearing a huge sun-bonnet, she was feeding her chickens in the road as we approached. She served us a simple but savory repast in a cozy, low-roofed dining-room resembling a ship's cabin; through the open windows the sea-breeze wafted the roar of the sea, and we could look on the blue of the ocean fading away to distant lands.

MAP OF THE TRIP FROM CHARLOTTETOWN TO PASPEBIAC.

Everything was delightfully unexpected and charming. Sea life is made up of such contrasts. But a few hours before, we were groping in fog, grappling with a storm and shortening sail; and now we were enjoying this peaceful hour in a tranquil haven.

(To be continued.)

S. G. W. Benjamin.

A SONG OF LOVE.

HEY, rose, just born	Sweet eyes that smiled,
Twin to a thorn;	Now wet and wild;
Was't so with you, oh Love and Scorn?	O Eye and Tear,—mother and child.

Well: Love and Pain
Be kinsfolk twain;
Yet would, oh, would I could love again!

Sidney Lanier.

THE HERMITAGE.*

THE present Gallery of the Hermitage at St. Petersburg was built by Nicholas to show his taste for all the arts; it did not exactly do that, but it certainly showed his taste for architecture. It not only houses his paintings, it almost kills them as well: you cannot help looking away from the works to the walls. It is too splendid—simple Greek in form, but in substance a heap of piled riches in marbles and precious stones, in gilding and inlaid

* [The present sketch of the art treasures of the famous Hermitage has been suggested by a new series of photographs of a high order, published by Braun, of Paris. The frontispiece engraving of a head from one of the Hermitage Rembrandts will give our readers some idea of the excellence of this great collection of paintings.—Ed.]

woods. It requires a considerable effort of concentration to keep your eyes on the pictures; and, now and then, the stranger, especially, is tried altogether beyond his strength by the wealth of ornament in porphyry and lapis lazuli, or by some monumental vase in malachite. The work of mental dissipation begins with a huge double flight of marble stairs running from the great hall and overpowering in its majestic beauty. We have had nothing like it, even in fancy, since Martin painted the stairways of Babylon. There is one incidental merit in the structure: it will not burn; all that is not marble or stone, with the exception of the inlaid floors, is of iron. It was designed by Klenze, a German architect, and it is on the site of a small gallery which the Empress Catherine set up as a retreat next door to the Winter Palace. There is still a covered passage between the two buildings. Catherine wanted to get away from the noise and bustle of the court, and she took some of her pictures with her to help furnish the place. From this sprang the present Gallery of the Hermitage. Other rulers bought more pictures, often buying them by entire galleries, after the fashion set by Peter the Great in his wholesale introduction of civilization into his empire. There was no time to lose, if Russia was to be placed on a level with other nations in arts as well as in arms. In 1779 the imperial buyers came in for rich paintings by the dispersal of the incomparable Walpole collection, which, if it had been kept at home, would have made England to-day absolutely the richest country in the world in the masterpieces of painting. To this acquisition the Czars added, later on, a Spanish collection bought of an Amsterdam banker for £8,700; then the gems of the Malmaison collection, formed by the Empress Josephine,—thirty-eight pictures for one hundred and eighty-eight thousand dollars,—and again, thirty pictures from the collection of Queen Hortense. The death of William II. of Holland gave the imperial collectors another opportunity of which they were not slow to take advantage. William II. was a sort of monomaniac of taste: he lived in a poor palace himself, but he had a magnificent one built for his pictures, and watched it slowly rising day by day and year by year while adding to his treasures. At length it was finished and stocked; and, when this operation was fairly completed, William II. died, and his successor sold off his artistic effects. On this occasion England was one of the largest buyers, in tardy redemption of the Walpole loss.*

In theory these pictures at the Hermitage still form the Gallery of the Czar; in fact they are, to some extent, the gallery of the nation. The other imperial palaces are fairly well stocked, but the sixteen or seventeen hundred canvases in the Hermitage form the pick of the imperial collections.

Nicholas showed his usual thoroughness in everything connected with this pet work. When his new palace of art was finished, he sent for the well-known Dr. Waagen of Berlin, the first historic art critic of his time, to put it in order, and, in consequence, no gallery in the world is more systematically arranged. Dr. Waagen had to contend with one great difficulty; the architect had thought first of the palace, and only in the second place of the pictures; the rooms are not all well lighted, and most of them are far too lofty for convenient display. It is the common complaint of visitors that you cannot escape from a tour of the Hermitage without a stiff neck and sore eyes, due to the straining for a sight of the many paintings far above the line. In all else Dr. Waagen worked entirely on his own conditions; he arranged the works by schools and subdivisions of schools; and you have only to take them in his order to have something like a fair history of the development of art. There is the Italian school in its epoch of formation, then in its perfection of strength and beauty in the Florentine painters. Following these you have the Lombard school, the Florentine decline, the Venetian school, with the second great epoch when the Eclectics brought about a *renaissance* of the art, and next the final decay. In the Spanish schools, Valencia, Seville, and Madrid are richly represented; in the German, Flemish and Dutch, there is another orderly exposition of growth, maturity, and decline. Eight pictures constitute the only exhibition of the English school known to exist on the Continent. The French school, following a classification just as applicable to the French literature as to the French art of to-day, is in two sections—the Idealists, from Poussin to Mignard and Le Brun, and the Realists, from Clouet, Lancret, and Watteau, to Vernet. There is even a Russian school, a mark of high imperial favor considering how little Russian prophets in either art or literature used to be honored in their own country; but this, with the exception of the English, is the smallest of the whole collection. There are nearly a thousand Flemish, Dutch, and German paintings, more than three hundred Italian, and over a hundred Spanish, almost every one a master-piece. The Spanish and Flemish collections are among the finest in the world; and the gallery would be worthy

* The "Immaculate Conception," by Murillo, from this collection is now in New York in the possession of the family of the late William H. Aspinwall.

a pilgrimage for its forty-one Rembrandts alone, to say nothing of the twenty Murillos, and the innumerable pictures by Wouvermans, Rubens, Ruysdaels, Snyders, and the like. The thirty-four Vandykes should not be forgotten; the grandest of them, the Charles I., booted and cuirassed for the field, with one hand on his baton of command, and the other on his sword, was painted for the sum of one hundred and twenty-five dollars in the currency of to-day! A picture of Queen Henrietta Maria forms a pendant to this work.

It is difficult to select examples for notice where all deserve the closest attention. In the Italian series there is a "Descent from the Cross," by Sebastian del Piombo, which must be named whatever others are left out; so too must the "Perseus and Andromeda" of Tintoretto, and, if only as a curiosity, the same painter's sketch copy of his immense "Resurrection" at Venice. Then there is a superb Ludovico Caracci, the "Entombment of Christ," and a "Death of Christ," by Paul Veronese. Most of the Rubenses and Vandykes are the spoils of the Walpole gallery; and among the Vandykes are portraits of the Wartons, of Lord Danby, Sir Thomas Challoner, and many other English worthies of the time, with a copy, by the artist's own hand, of the famous Pembroke family at Wilton. It would be all the better for the pictures if certain "candelabra and vases in violet jasper of Siberia" were taken out of this room. Murillo's incomparable "Dream of Jacob" is hard by. An "Assumption" of immense interest, as being evidently but another idea for the work at Madrid, gives you a glimpse of Murillo's method; but I hesitate to theorize about it, as I have nothing on my notes to show which is the earlier work. Velasquez has a whole series of portraits, including the Minister Olivares and Innocent X. The nine frescoes of Raphael in another room were on the walls of a Roman villa less than thirty years ago, and with them is one of Raffaele's favorite works, a "Rape of Helen," that might be traced in its growth, from the first moment of invention to the last, with the help of the original sketches that Oxford and Chatsworth still possess. The "St. George and Dragon" was painted by order of the Duke of Urbino as a present to Henry VII. in return for the Garter. It formed part of the collection of Charles I.; and when it came to Russia it hung for a long time in the Winter Palace as a holy image, a continual reproach to Russian sacred art. Among the Titians are a "Mary Magdalene" and a "Danaë," the last a copy by the master's own hand from a work at Naples.

Paul Potter's "Farm" is one of the glories

of the Hermitage. It is an attempt to put a chapter of the history of human institutions into a picture frame. Farm life is there in full and perfect representation, or very nearly so; you have sheep, goats, oxen, pigs, cows at the milking, cows at the pasturage, a woman stitching, a man frightening a dog who is frightening the baby, yet all in a wonderful harmony, and with a suggestion of perfect repose. Here and there are signs of weariness in the painter; one of the cows, according to a critic, is a direct crib from another Paul Potter at the Hague. The sewing-woman, if adroitly cut out of the canvas, would make a Peter de Hooghe. The most considerable English work is a Reynolds, the "Infant Hercules Strangling the Serpents." This was painted for Catherine, and it was a delicate allegory of the courtier-artist. Young Hercules is young Russia; the serpents are the difficulties that stood in her way. With this work Reynolds sent his two volumes of "Discourses." Catherine, in acknowledgment, ordered her ambassador at St. James's to call upon the painter:

"The two productions equally reveal an elevated genius. I beg of you to hand to Sir Joshua, with my thanks, the snuff-box I send in recognition of the great pleasure I have derived from his 'Discourses' — perhaps the best work hitherto written on the subject. My portrait on the lid of the box has been done at the Hermitage, where we are now paying considerable attention to work of this kind. I hope you will be able to give me news of the grand picture which I mentioned in another letter.
(Signed)

"CATHERINE."

The grand picture in question is supposed to be a "Contenance of Scipio," now in the collection, but in an unfinished state. Scipio's arms and the hands of another figure are yet to be, at least, in their full perfection of rich color, as in other parts of the work.

But how describe the Rembrandts? To begin with, there are a good half dozen portraits of the very first order, though one of them which you feel sure must deserve to be in this category is wretchedly hung. The portrait of an old woman is worth whole chapters of writing on the nature of true finish in art. The hand has never been better painted than in this work. As for the "Benedicite," a peasant man and woman saying grace before meat, we must pass over whole centuries of painting to our own time, to Millet and perhaps to Israëls, before we come to anything approaching it for beauty of feeling. It is one of the great pictorial poems of the life of the poor. Did Rembrandt definitely anticipate the mind of our age on this subject, or was he merely true to all possible sentiment by being simply true to

this fact in art? Probably: from what we know of him, there is little to encourage the belief that this noble thing was in any sense a tendency picture; he only saw the beauty as beauty—that dim interior, with its deep shadows and its mere accidents of light, and the figures of the praying pair half effaced in the gloom. His finest “Holy Family,” and he painted many of them, is without question in this gallery. Mary, reading in the chimney corner of such a room as may be imagined, turns to lift the cover of the cradle for a peep at her sleeping child; Joseph is at work; and six angels, whose presence might be dispensed with, are in the air. Blot out the angels, and it is of incomparable simplicity and force. In the “Descent from the Cross” there is the same perfection of tender human interest, and the heads of the Christ and Mary are painted as few heads have been painted since. Then there are more portraits, —half of them mere portraits of a gentleman, in respect of their present want of a name. In one, adepts in such matters point out to you a curious example of work with the brush-handle instead of the brush. “Peter Denies his Lord” is a powerful night scene: the glare of a lantern held by the servant thrown full upon the disciple, and nearly all the rest—the wondering, or indifferent, or angry figures, and the tipling men-at-arms—in shadow.

For a foreigner the Hermitage is essentially a collection of pictures; for native students it is much more—a museum of antiqui-

ties, a museum of sovereigns. There is a whole Peter the Great gallery filled with the hero's swords and walking-sticks, his lathes and turning tools, the models of his ships, the engravings of his battles and triumphs done to order by Dutchmen of the time, and corrected in proof for the minutest detail of the uniform of a regiment or the fall of a pennon. Add to this, a museum of precious stones, perfectly appointed, and the largest in the world, a great numismatic collection,—everything, in fact, a national museum should have. The picture galleries have had less effect than might be supposed on Russian art, probably because they have never been easily accessible to the Russian masses. The conditions of admission still resemble those of a private gallery. You do not often meet the Russian peasant there or the Russian workman—for one reason, perhaps, because he might be afraid of the inlaid floors. The sacred art of the country is still irredeemably conventional; and the fact that it should be so, in face of all these specimens of the sacred art of Italy, is really one of the minor mysteries of the Greek faith. The German and French schools seem to have had most influence on the secular art; half the Russian artists work from Munich as a center, and the other half from Paris. The very latest, with Vereschagin at their head, are inexorable Realists, but with a realism that affects the facts of the social and political life of the day far more than the mere facts of nature.

Richard Whiteing.

THE PHŒBE-BIRD.

YES, I was wrong about the phœbe-bird.
Two songs it has, and both of them I've heard:
I did not know those strains of joy and sorrow
Came from one throat, or that each note could borrow
Strength from the other, making one more brave
And one as sad as rain-drops on a grave.

But thus it is. Two songs have men and maidens:
One is for hey-day, one is sorrow's cadence.
Our voices vary with the changing seasons
Of life's long year, for deep and natural reasons.

Therefore despair not. Think not you have altered,
If, at some time, the gayer note has faltered.
We are as God has made us. Gladness, pain,
Delight, and death, and moods of bliss or bane,
With love, and hate, or good, and evil—all,
At separate times, in separate accents call;
Yet 'tis the same heart-throb within the breast
That gives an impulse to our worst and best.
I doubt not when our earthly cries are ended,
The Listener finds them in one music blended.

George Parsons Lathrop.

THE BUTCHERS' ROW.

WE wandered down the Butchers' Row
In old Limoges, the fair;
My love was dressed like May or snow
Under her ruddy hair;
It happened to be St. Maura's fête,
And all the bells rang out,
And through the ruinous English gate
There streamed a merry rout.

The butchers' shops were black as night,
The flags were blue and red;
My love walked on in laughing white,
And a merry word she said;
And down the Row to the river-shore
She passed, so pure and gay,
The people took her for St. Maure,
And crossed themselves to pray.

Edmund W. Gosse.

IMPRESSIONS OF SHAKSPERE'S "LEAR."*

THERE is a certain tremor of the mind that always overcomes me when I resolve to write of the noblest creations in dramatic literature, and of the interpretations given by me to the work of that acute and profound diviner of the human heart—William Shakspeare.

I am aware that no new thoughts are to be found in all that I have written concerning my rendering of "Hamlet," "Macbeth," and "Othello"; indeed, after nearly three hundred years of analysis and discussion, it would be difficult to say anything new about Shakspeare. But, if my thoughts have lacked originality, at least they have been frankly expressed. That they will fall and die and leave no trace behind is absolutely certain. The field a thousand have sown before me already bears a fruitful harvest; and my poor grain of mustard seed can but spring up unnoticed there, to count for nothing.

My own inclination would lead me to be known only as an interpreter of the stage; but circumstances have driven me, almost obliged me, to write, and I have written; but I write more to please my friends than to please myself, more in a compliant humor than in a vain one. With this statement, made in self-defense to dull a little the keen edge of criticism, I can now throw myself into the dangerous current with a stouter heart, trusting for some generous hand to encourage the untrained swimmer who ventures, it may be, far beyond his depth.

As all the world may easily ascertain, a Gallic chronicle relates that Lear, the son of Bladud, reigned for sixty years, and died about the year 800 B. C. Lear is said also to have founded the city known to-day as Leicester. It is therefore with some bewilder-

ment that we find the poet linking to a period so remote names of countries and of persons, degrees of rank, modes of punishment, manners and customs of far later origin. The titles lord and duke, prince and king, the feudal castle and the chase, the rule of knight-hood, and the law of arms combine to give the play a mediæval atmosphere, and it would seem to be erroneous to attempt in representation the coloring of an earlier age.

Shakspeare's genius is "liberal as the air"; to him, if to no other, allowance must be made when his flight leads on from one anachronism to another, disregarding details; especially in this tragedy, where the lesson conveyed is clearly one with which historical accuracy has nothing whatever to do.

"Lear" is a study of ingratitude. As "Hamlet" deals with the power of thought over action, "Othello" with that of malignity over a noble mind, "Macbeth" with the sins of boundless ambition, so the purpose of "Lear" is to show how far the force of human ingratitude may go.

There comes before us the figure of an "old, kind king," oppressed with cares of state, at the solemn moment when he divides his kingdom into three parts to confer upon each daughter a dower suited to her rank, retaining for himself only his royal name and its "additions." This act, that has been often deemed a proof of mental alienation, seems to me rather the outgrowth of a generous heart and a natural trust in filial love. If it be set down as irrational, the baseness of the elder daughters is thereby palliated, since the thwarting of an insane will carries no injustice with it. But what element of insanity enters into the old king's purpose? In our

* See "Impressions of Some of Shakspeare's Characters" (*Hamlet, Macbeth, and Othello*), by Signor Salvini, in *THE CENTURY* for November, 1881.

day, unhappily, it might give rise to censure, since the liberal, perhaps too liberal, education of our children tends to lessen the regard and respect paid by them to their parents; but in a time of rigid discipline, when parental will was held to be Heaven's will, and when filial affection was assumed to be akin to that due the Creator, it is inconceivable that the mind of a father—above all, a royal father—could tolerate one thought of ingratitude and of open resistance to his judgment. And this judgment of the octogenarian king has no unreason in it. He but yields his burden up to "younger strengths"; the honor stays with him. His one condition, the reservation of a hundred knights to be sustained by his successors, is not extravagant; and the exchange of grave pursuits for the pleasures of the chase and the playful satire of his fool seems to me no more than his due. I shall be asked: If the king is rational, how are we to justify his resolve to disinherit *Cordelia* solely because her love cannot find expression in the glib, flattering phrase of her sisters? In my opinion, the formal education of the time is still his ample justification. *Lear*, challenging his daughters' love in presence of the court, knew but the answer he had heard a thousand times repeated through real affection, through submission, or through a sense of duty. *Cordelia*, truer than her sisters and about to be betrothed, replies, with the sense of "a divided duty," that she loves her father as nature bids her, according to her bond,—terms directly opposite to those that *Lear* awaited from his favorite child. From her, more than from the others, he longed for demonstrative warmth, for a word that should express infinity of love. Hence the bitterness of a lost illusion; hence the shame at an open injury to his feelings; hence, finally, the reaction of a spirit, proud, impetuous, autocratic, violent, knowing no bounds when moved to anger. Therefore, let us call him inconsiderate and choleric, but in no degree demented.

As I have already noted, *Lear's* age is "fourscore and upward"; viewed from a modern point of view he might therefore be judged a man broken with the weight of years. I would compare him rather to some historic oak, shorn of its leaves by the fury of wind and storm, but with limbs and trunk still vigorous, unshaken. And here I may quote to the purpose from a well-known New York journal, "Il Progresso Italo-Americano":

"We should consider that, in the time of *Lear*, old men were stronger and more robust than in our day; that, instead of sipping their coffee at ten in the morning, they rose with the sun to make a substantial repast off huge slices of beef and mutton. We must re-

member that the early Saxons, living, as it were, in the saddle and in constant muscular exertion, preserved their health and strength even to the greatest age.

"Why is *King Lear* to be made senile, when he still delights in the chase and calls for his horse, as the tragedy obliges him to do? And how is a weak, tottering man to undergo all the violent scenes, all the mental excitements of the drama? Would Shakspeare have given his protagonist line after line of anger, of grief, of fury, and of imprecation, if he conceived him to be bowed and broken? A man of eighty, were he not robust to the last degree, drawing near the verge of madness, as does *Lear* in the first act, would surely fall dead in a fit before reaching the final scene. No prolonged conflict of the emotions would be needed to dispatch him."

In support of my opinion, which is shared by the Italian critic, let me now cite certain expressions that are Shakspeare's own. At the opening of Act III., that is, after the great scene where *Goneril* and *Regan* turn *Lear* out upon the heath to "run unbanned," without food, without shelter from the raging of the storm, to *Kent's* question, "Where's the king?" the *Gentleman* replies:

"Contending with the fretful elements:
Bids the wind blow the earth into the sea,
Or swell the curled waters 'bove the main,
That things might change or cease."

And in Act IV., scene 4, *Cordelia* says to the *Physician*:

"Why, he was met even now
As mad as the vex'd sea."

While *Lear* himself, when he is surprised by *Cordelia's* messenger, and fears to be made prisoner, exclaims:

"I will die bravely, like a smug bridegroom:
. . . there's life in it."

And this, after wild scenes of wrath with his ungrateful daughters, after combating and mocking the utmost fury of the tempest, and after undergoing the greatest physical privation! Surely, thus to contend "with the fretful element," to be "mad as the vex'd sea," and to "die bravely, like a bridegroom," a man's sinews must be strong and active even at "fourscore and upward."

But let us now regard him from an artistic point of view, considered merely as a personage of the stage. If he is to be discovered to the audience as a puny little dotard, paralytic, asthmatic and infirm, senile and feeble at his first entrance, what room is left for contrast? He has far more claim to sympathy as a man who, happy at the outset, feels keenly the bitterness of misfortune, than as one who, injured to suffering, only undergoes it in new forms. The first commands respect because

he battles courageously with the unforeseen calamities of life; the second, powerless to resist them, is a pitiable object, and can but arouse a wish for quick-coming death to put him out of pain. Finally, the first is interesting and pathetic; the second, tedious and painful; and this latter effect must inevitably be produced upon the spectator (as numerous examples prove) by those representations of the part that follow the beaten track, and are based upon the pernicious system of imitation; imitation all too recent, since what we are told of the great American artist, Edwin Forrest, proves that this invention of a weak and doting *Lear* was assuredly not his,—not his, whose ringing tones and thrilling gestures, whose majestic presence and heroic conceptions won for him a name that is deservedly remembered and honored.

To my thinking, the audience should be made to understand first how *Lear*, even in his generosity, is always the royal autocrat, noble, august, irascible, and violent in the first act; in the second, how, feeling bitterly the ingratitude that has doubled upon itself, he becomes more a father than a king; and, finally, in the third act, how, worn with troubles of the body, he forgets for a season those of the mind, and, more than father, more than king, stands forth a man reacting upon rebellious nature.

These three phases of *Lear's* character are precisely those that save the part from monotony, and that make it interesting, I repeat, and not distressing. Hence, another need of representing him hale and vigorous in the first instance, next disquieted and sympathetic, thereafter affecting and enfeebled.

It is no exaggeration to say that all the difficult problems of the player's art are contained in these three acts. I do not mean difficulties of conception, but of execution. A well-known canon of the stage prescribes a gradual growth of effect, in accordance with the development of the action, that the catastrophe, or issue, if that be the better word, may prove impressive, telling, strong. Every actor should spare himself at first, and reserve his natural resources to that end. In "King Lear" it is impossible to follow this law without some sacrifice of truth; the very reverse of it is needed. Instead of working out a result by an increase of power, the effect must be made to grow as the power decreases,—*must*, I say, if we are to preserve the true conception; for *Lear's* strength, though apparent at first, should yield somewhat in the second act to the stress of his emotions, and still more to the nervous excitement in which he supports and defies the

storm; and to this condition the mental disorder of the fourth act succeeds.

Some actors choose to make *Lear* an imbecile: this is a mistake; others would have him a demoniac, but this also is a misconception. To me it seems that his mind is warped by a sense of ingratitude in nature; and that this feeling grows upon him with the persecution of the warring elements, till, at the degradation of man revealed in *Edgar's* counterfeiting, it becomes all-absorbing. And, indeed, all those scenes of malediction, of metaphor, and of self-dissection, with their profound conclusions, their scraps of wisdom and philosophy, do but turn upon this very concentration of thought, that has for its root ingratitude. Were it not so, the mere sight of *Cordelia* would not so speedily bring back his reason. An imbecile is far more difficult to cure than a madman; and a madman cannot be restored by so simple a remedy. His unsoundness is but that of a monomaniac, who recovers his normal health when *Cordelia's* tenderness soothes the troubled spirit and supplies the healing balm of reverent, filial love.

Beyond this point, little remains to note of *Lear* except in the final scene, sublimely imagined to suggest the last glimmer of a dying flame.

The great difficulty, then, lies in discovering how to heighten the effect according to the laws of art, and, at the same time, to decline in physical power.

Every audience has its intelligent proportion to note and appreciate the artist who, with the scheme of his part determined, regardless of vulgar effect, is content to follow where truth leads; but the actor in his skill must also strive to interest the mass of his public and to maintain ascendancy over all, still walking in truth's level field. And how shall this be done? I think it impossible to explain; it is a question of judgment, and that cannot be prescribed. The course to be pursued may be pointed out, but he who would win the goal without stumbling must commend himself to his own inspiration.

And for this inspiration I forced myself to wait five years, perhaps to no purpose; for it is by no means certain that I have been able to make an audience comprehend my own conception. I will not deny that the time is too long; that, if the study of every difficult character were to consume so vast an interval, the artist's round of parts would prove circumscribed indeed. But I was confronted with this difficulty at the very outset of my labor, and the more I labored the mightier it became, till it seemed so nearly insurmountable that I could but resign myself to await the moment when all my energies and all

my senses should combine in definite shape. Every conscientious actor will concur in my opinion that all moments are not apt for the choice of colors wherewith to reproduce the finished picture of the author's imagination. And how many of us are often *obliged to play a part with a sense of disability to reveal its hidden beauties! As a sunset may supply the painter with a tint undreamed of for his landscape, so a woman's glance may teach us some new way to express affection; a visit to the mad-house, some strange phase of mental alienation; a shipwreck brings us its peculiar forms of anguish, an earthquake its varied aspects of horror and despair; and all must be noted, pondered, anatomized, appropriated with a keen discrimination. To do this, time is needed; with time, experience; and with experience, genius! But I perceive that I have strayed a little from my subject, and I turn back for one moment more into the direct road.

If I persist in my opinion that *Lear* at

first must be vigorous in his old age, I do not therefore admit that at the end he must so retain his vigor as to bear lightly in his arms the dead body of *Cordelia* after the prevailing fashion. May my brother actors forgive me for asking how such Herculean strength is conceivable in a man broken by a host of misfortunes, drawn near to giving up his soul to God? The critics, too, should recognize this inaccuracy, rating, as they do, their protagonist decrepit at his first entrance. To me it seems that, never permitting others to touch his beloved burden, *Lear* should stagger under its weight, without disguising the effort it occasions; this, as I cannot help believing, is not only truer to nature, but also more interesting and more effective.

And now I leave this generous, noble, and unhappy king in peace, bidding farewell to my readers with the wish that *Lear* may rise again to life by the animating breath of some actor of greater power than mine, to make him pathetic and admirable.

Tommaso Salvini.

DANTE.

THE POET ILLUSTRATED OUT OF THE POEM.

It is a grave if not a formidable undertaking to treat of that soldier, statesman, philosopher, above all poet, whom successive generations reverence under the musical name of Dante Alighieri. Fifty-six years sufficed him to live his life and work his work: centuries have not sufficed to exhaust the rich and abstruse intellectual treasure which the world inherits from him. Still, acute thinkers abide at variance as to his ultimate meaning; and still able writers record the impressions of wonder, sympathy, awe, admiration, which—however wide and manifold his recondite meanings may be—he leaves even on simple hearts so long as these can respond to what is lovely or is terrible. "*Quanti dolci pensier, quanto desio*" ("How many sweet thoughts, how much desire"), has he not bequeathed to us!

If formidable for others, it is not least for-

midable for one of my name, for *me*, to enter the Dantesque field and say my little say on the Man and on the Poem; for others of my name have been before me in the same field, and have wrought permanent and worthy work in attestation of their diligence. My father, Gabriele Rossetti, in his "*Comento Analitico sull' Inferno di Dante*" ("Analytical Commentary upon Dante's Hell"), has left to tyros a clew and to fellow-experts a theory. My sister, Maria Francesca Rossetti, has in her "*Shadow of Dante*" eloquently expounded the *Divina Commedia* as a discourse of most elevated Christian faith and morals. My brother Dante has translated with a rare felicity the "*Vita Nuova*" ("New Life") and other minor (poetical) works of his great namesake. My brother William has, with a strenuous endeavor to achieve close verbal

accuracy, rendered the Inferno into English blank verse. I, who cannot lay claim to their learning, must approach my subject under cover of "*Mi valga . . . il grande amore*" ("May my great love avail me"), leaving to them the more confident plea, "*Mi valga il lungo studio*" ("May my long study avail me").

It is not out of disrespect to Mr. Longfellow's blank-verse translation of the *Divina Commedia*, a translation too secure of public favor to need my commendation, that I propose to make my extracts (of any importance) not from his version, but from Mr. Cayley's. The latter, by adhering to the *terza rima* (ternary rhyme) of the original poem, has gone far toward satisfying an ear rendered fastidious by Dante's own harmony of words; with a master hand he conveys to us the sense amid echoes of the familiar sound. My first quotation (Paradise, canto 1), consisting of an invocation of the Spirit of Poetry, befits both Dante and his translator, while, as it were, striking one dominant note of our study:

"O good Apollo, for this last emprise
Render me such a vessel of thy might
As to the longed-for laurel may suffice.
Till now hath sped me one Parnassian height,
But on my last arena now, beneath
The double safeguard, I must needs alight.
Do thou into my bosom come, and breathe,
As when thou drewest Marsyas of old
Out of his body's perishable sheath."

Dante or Durante Alighieri, Alighieri, or Aldighieri—for in all these forms the names are recorded—was born a noble citizen of Florence on the 8th of May, 1265, the sun being then in the sign of Gemini, an auspicious sign according to popular opinion of that day. And a meaning has been found for "Alighieri" apposite to him who so eminently bore the name: it has been turned (by a process I attempt not to analyze) into Aligero (winged), when at once we recognize how suitable it is to the master spirit that fathomed Hell and ascended through Purgatory to the heights of Heaven. Nor need "Dante, Durante," remain without an appropriate gloss. Dante (giving) befits one who has enriched the after ages; Durante (enduring) suits no less that much-enduring man who (writing after the event) puts an apparent prophecy of his own banishment into the mouth of one of the personages of his poem (Paradise, 17):

"Thou shalt leave all things, which thou long ago
Hast loved most dearly, and I've herein said
What dart is soonest shot from exile's bow.
Thou shalt experience how another's bread
Is salt upon our palate, and what bale
'Tis up and down another's stairs to tread."

Boccaccio in his "Life of Dante" traces back his hero's family to a certain Eliseo of the noble Roman house of Frangipani, who,

toward the date of the rebuilding of Florence by the Emperor Charlemagne, settled in that city. In course of time the descendants of Eliseo, dropping their original cognomen, renamed themselves as Elisei. Prominent among them in the days of the Emperor Conrad III. arose Cacciaguida, knight and crusader, who married a lady of the Aldighieri of Ferrara, or perhaps of Parma; her birthplace seems uncertain. This lady bestowed her patronymic on one of her sons, Dante's ancestor in the direct line; and he becoming a man of note, his descendants adopted his name as their own surname; thus permanently distinguishing as Alighieri their branch of the house of the Elisei.

On his pilgrimage through Paradise, Dante encounters in the fifth heaven, that of the planet Mars, the spirit of his venerable forefather Cacciaguida, who discourses with him at considerable length, and after describing the happy thrift and simplicity of Florence in his own day—in Dante's day become a hot-bed of luxury and extravagance—briefly narrates some circumstances of his birth and after life (Paradise, 15):

"To a civic life thou seest how goodly, how
Reposeful, fellow-citizens how leal,
How sweet a homestead Mary, with loud vow
Solicited, gave me, and of Christ the seal
I took within your ancient Baptistère,
As Cacciaguida for His Commonweal.

The camp of Emperor Conrad then I sought,
And by him was I girded for his knight,
So well I pleased him, for I bravely wrought.
I followed him, yon wicked faith to fight,
Whose votaries by your Shepherd's fault despoil
Your jurisdiction of its native right.
By this unholy people from the coil
Of the false world obtained I my release
(Ah, World, whose love doth many a spirit soil),
And entered out of Martyrdom this Peace."

If, as we have seen, mutation of name and residence characterizes that dignified stock from which Dante sprang, no less conspicuously did mutability of faction and fortune, and a bandying of names, now one in the ascendant and now another, characterize that beautiful Florence which called him son. Her citizens were divided into Guelphs and Ghibellines: these names, in their primitive form, having been the battle-cries on a far-off field where, more than a century before Dante's birth, a crown was lost and won between two contending princes. The crown in dispute was the imperial crown of the Holy Roman Empire: the aristocratic party of Imperialists attached to the victorious Conrad of Hohenstaufen became known as Ghibellines, the overthrown opposition as Guelphs. And as the standing opponent of the Empire was the Popedom, the Papalist party in Italy, equally

definable as National or as Democratic, was styled Guelph.

Here already were sufficient grounds for strife. Yet, as if insufficient, private rancor heaped fuel and explosives on the public flame. First, a feud between the Florentine families of Buondelmonte and Amideo widened and confirmed the political breach; secondly, a brawl among the children of one Florentine citizen by two successive wives split the Guelph party into subdivisions distinguished respectively as Black and White.

Nor were words and names, orations and counter orations, the chief political weapons of those days. Sword and fire, confiscation and banishment, made and left their mark on either side, in accordance with the ever-shifting preponderance of this or that faction. The elder Alighieri, a lawyer by profession, a Guelph by party, was along with his party living in exile at the time of his son Dante's birth; but in the year 1267 the Guelphs returned to Florence, and the banished man rejoined his family.

Let us with that absence and that reunion connect such thoughts of home-longing and (in a figure) of home contentment as breathe in the following lines (Purgatory, 8; Paradise, 23):

"It was that hour which thaws the heart and sends
The voyagers' affection home, when they
Since morn have said Adieu to darling friends;
And smites the new-made pilgrim on his way
With love, if he a distant bell should hear,
That seems a-mourning for the dying day."

"As when the bird among the boughs beloved,
Keeping beside her darlings' nest her seat,
By night, when things are from the view removed,
That sooner she the dear ones' looks may meet,
And that by which she feeds them to purvey,
Counting for them her anxious labor sweet,
Forestalls the hours upon the unsheltered spray,
And waits the sun with burning eagerness,
Poring with fixed eye for the peep of day."

Not long did the elder Alighieri survive this renewal of happiness. Yet our hopes follow him out of sight into the veiled and better land, there to behold him awaiting the restitution of all things, even as Dante, in his *Divine Comedy*, represents a congregation of elect souls as yearning after the resurrection of the body (Paradise, 14).

Despite so irreparable a loss, the young Dante received, under his widowed mother's protection, a refined and liberal education. His taste was for study rather than for amusement, and to such a taste, allied to perseverance and wedded to a preëminent intellect, the treasures of knowledge lay open and accessible. His mother's circumstances, though not opulent, were easy. Thus she was able

to intrust her son's education to Brunetto Latini, a notary by profession, by occasional office an ambassador of the Florentine Republic, an attractive man of the world; moreover, a scholar and a poet. Between him and his pupil a tender affection grew up, as Dante himself assures us (Hell, 15) when he encounters his master's shade.

Dante also studied at the universities of Padua and Bologna, and in mature life augmented his stores of knowledge in learned and polite Paris. According to an uncertain tradition, he visited England, and in particular Oxford.

In a period of broils, heart-burnings, rivalries, Dante was not the man to observe a tepid neutrality. He bore arms on the field of Campaldino and at the siege of Caprona, and on one or both occasions with credit to himself and to his cause. The battle of Campaldino was followed by a storm—the stirring up of which storm is attributed to diabolical agency by the shade of Buonconte, a noble Ghibelline who fell on the losing side, and who accosts Dante in the Ante-Purgatory (Purgatory, 5).

Yet, though a soldier, Dante was not primarily a soldier; rather, it may be, a statesman, a ruler, a legislator.

From the highest civil dignity, however, that of the Priorato, or chief magistracy of Florence, Dante found himself excluded by a circumstance which at once dignified his social position and threatened to impede his public career. Giano della Bella, Prior of Florence in 1292, had ordained that such families as counted a cavaliere (knight) among their ancestry should be reckoned noble, while for that very reason they should lose certain civic privileges. Thus Cacciaguida the Crusader, by ennobling his descendants, cut them off from sundry more substantial honors. To rehabilitate him, as we may suppose, for public office, Dante's name is found inscribed among the *Medici e Speciali* (Leeches and Druggists), their "art" standing sixth in the list of principal arts; and documents still extant in the archives of Florence show that he did actually take part in the councils of several years, commencing with the year 1295.

On June 15th, 1300, Dante, supported by five less noted colleagues, was created Prior. The Black and White broils were at this time raging with such virulence that the Papal Legate, Cardinal Matteo d'Acquasparta, sent to Florence for purposes of pacification, failed in his mission, finally (though at a period considerably later) laying the rebellious city under an interdict. In such troublous times Dante assumed the command; nor was he one to rule with a tremulous hand. By

him and his colleagues was enacted a law which banished chiefs and adherents of both parties into separate exile; to Corso Donati, Dante's brother-in-law, with his "Blacks," a spot in the Tuscan mountains was assigned for residence; the Whites, among whom was Dante's dearest friend, Guido Cavalcanti, were dispatched into the baneful Maremma.

They went, but they returned; and divided as they went, so they returned, the Blacks keen for vengeance. This faction now denounced the Whites as Ghibellines, anti-papalists, foes of France; and, invoking foreign aid, induced Charles of Valois, then on his road to Rome, to countenance their machinations. Dante, his tenure of office as Prior being expired, was hereupon sent by his successors, as one of four ambassadors, on a counter embassy to the Roman court. Like the turbulent factions he had helped to banish, he also went; but, unlike them, he returned no more.

Charles of Valois occupied the oltr' Arno (beyond the river Arno). Corso Donati raised the Black standard, and, by the help of the French prince, gained a crushing victory. Fire and sword devastated Florence; one Podestà (magistrate or mayor) was expelled, another appointed; a multitude of Whites were exiled and doomed to beggary. Well might Dante choose Fortune for his theme (Hell, 7):

"This Fortune whom thou namest: What is she?

He, whose high wisdom all beside transcends,
Has made the spheres, appointing one that might
Rule over them, whence every part extends
To each, in tenor uniform, its light;
So to the glories of the world He did
One common regent and conductress plight,*
Who might from time to time, from seed to seed,
And place to place, their empty riches shake,
Beyond forestalling by your wit and heed.
She doth one people raise, and one doth make
To languish, by the allotment of her hand,
Which is concealed, as by the sward the snake.
Your wisdom can against her make no stand;
She judges and foresees, and aye pursues
Her sway, like every god in his command.
Her revolutions have no pause nor truce;
Her swiftness from necessity is wrong;
So many be they who for change have use.
And she it is who should on cross be hung,
As many tell, who blame her much amiss,
Where they should praise, with foul and wicked
tongue.
But she is happy, hearing naught of this,
Among the glad first-born of God attending
To turn her sphere about, and bide in bliss."

Dante was fined, was banished for two years from Tuscany, was permanently excluded from office. This in January, 1302. In the following March he was condemned to

* I have ventured to replace a rhyme.

fagot and stake should he ever again set foot in Florence. Yet in 1316 this sentence was conditionally reversed. The state of Florence published an amnesty, whereby, on payment of a fine and performance of public penance, Dante, among others, would be free to return. Such an alternative, however, only served to double-bar the gates of his city forever against him. Harken to the thunder of his indignation at the humiliating overture: *

"Is this, then, the glorious fashion of Dante Alighieri's recall to his country, after suffering exile for well-nigh three lusters? Is this the due recompense of his innocence manifest to all? This the fruit of his abundant sweat and toil endured in study? Far from the man of philosophy's household this baseness proper to a heart of mire, that he . . . should endure, as a prisoner, to be put to ransom! Far from the proclaimer of justice that he, offended and insulted, to his offenders, as to those who have deserved well of him, should pay tribute! This, father, is not the way to return to my country; but if, by you or by another, there can be found another way that shall not derogate from Dante's fame and honor, readily will I thereto betake myself. But, if by no honorable way can entrance be found into Florence, there will I never enter. What? Can I not from any corner of the earth behold the sun and the stars? Can I not, under every climate of heaven, meditate the all-sweet truths, except I first make myself a man of no glory, but rather of ignominy, in the face of the people and city of Florence?"

That Florence which could neither break nor bend the spirit of her mighty son had, meanwhile, wrought in him a far different transformation. Under sentence of banishment, confiscation of goods, contingent death, Dante the Guelph had changed into Dante the Ghibelline: the Papal temporal power became the object of his outspoken abhorrence, the Imperial sway, of his devoted advocacy. A passage (abridged) from Dante's prose treatise, "*De Monarchiâ*," sets before us his theory of world-government:

"Only Man among beings holds mid place between things corruptible and things incorruptible. Therefore that unspeakable Providence proposed to man two ends: the one the beatitude of this life, which consists in the operations of his own virtue; the other the beatitude of eternal life, which consists in the fruition of the Divine Countenance. To these two beatitudes by divers means must we come. Wherefore by man was needed a double directive according to the double end; that is, of the Supreme Pontiff, who, according to Revelation, should lead mankind to eternal life; and of the Emperor, who, according to philosophic teachings, should direct mankind to temporal felicity. And whereas to this port none or few, and those with over-much difficulty, could attain, unless mankind, the waves of enticing cupidity being quieted, should repose free in the tranquillity of peace; this is the aim to be mainly kept in view by the Guardian of the Globe,

* I need not even wish to excel my sister's translation of this passage, which I extract, word for word, from "*A Shadow of Dante*." The original occurs in a private letter from Dante to a religious.

who is named Roman Prince, to wit, that in the garden-plot of mortals freely with peace men may live." *

The Whites, exiled while Guelphs, sought to regain their citizenship under Ghibelline auspices. In 1304 they attempted to re-enter Florence by force of arms, and failed. Years later their hopes revived under the Emperor Henry of Luxemburg, but received in his sudden death their own death-blow.

In fact, though not at once in appearance, Dante's efficient public life was well-nigh ended when Florence cast him out. Yet not so, if we look beyond his active services and the brief span of his mortal day. For, taught by bitter experience in what scales to weigh this world and the things of this world, he bequeathed to future generations the undying voice of his wisdom,—a wisdom distilled in eloquence, modulated to music, sublimed by imagination, or rather subliming that imagination which is its congruous vehicle and companion.

Disowned by his mother city, Dante thenceforward found a precarious refuge here or there, chiefly in the petty courts of Ghibelline potentates. Thus he sojourned with Count Guido Salvatico in the Casentino, with Uguccone della Faggiuola in the mountains of Urbino; afterward under the protection of Moroello della Spina in the Lunigiana, to whom the Purgatory is said to have been dedicated, and to whose hereditary and personal hospitality the following lines, addressed to the shade of his father Conrad, refer (Purgatory, 8):

"The fame, which nobly of your house doth tell,
Proclaimeth hamlet, and proclaimeth peer,
That those who have not been there note her well.
And as I would arrive aloft, I swear,
Your honorable house the adorning prize
Of arms or largess doth not cease to bear.
A privilege in their kind or custom lies."

As foremost among Dante's friendly hosts may perhaps be reckoned Can Grande della Scala, Lord of Verona. Yet from Can Grande's court he was driven (as the story goes) by an insult from a privileged buffoon. Nevertheless, we find the praises of this eminent noble, preceded by those of an elder head of the same house, put into the mouth of Cacciaguida, and thereby perpetuated (Paradise, 17).

Ravenna became the exiled poet's final refuge, Guido da Polenta his last and generous earthly protector. For him Dante undertook a mission to Venice; and this failing, he seems to have lost heart. His homeward journey lay through the malarious lagoons: no marvel is it that he contracted a fever, and at length found a sure resting-place in

Ravenna, where he died on the 14th of September, 1321, and where he was buried.

Looking back for a moment to that crisis in Dante's life as a patriot, when from a Guelph he became a Ghibelline,—that is (as at the first glance might appear), when, from having been champion of an Italian Italy, free and sole mother and mistress of her own free children, he became, whether from personal disgust or sheer despair or from whatever other motive, as ardent a champion of that Imperial power which aspired to rule over her,—we may feel disposed to wonder at the transformation, perhaps to condemn the citizen. Not so, I would plead, until we have studied in his writings and have pondered over his own lofty view and exposition of a world-wide political theory; until we have striven to realize how the Italy before his eyes had in part become a field of mutual destruction, and therefore of self-destruction; until by virtue of reverent, compassionate sympathy we have hungered with him on the bitter bread of exile, and have trodden the wearisome, dusty roads of his wandering banishment. At its best our judgment may be erroneous; only let us not suffer it to settle down into stagnant and contented shallowness. By the mouth of St. Thomas Aquinas, Dante himself cautions us against rash judgment, and elsewhere, by one multitudinous, harmonious utterance of unnumbered glorified souls combined into the semblance of an eagle, sets forth the impartiality of God's final, irreversible sentence (Paradise, 13-19):

"And let not folk in judging trust their wit
Too fast, as one who counteth up the corn
In 's field before the sun has ripened it;
For I have all through winter seen a thorn
Appearing poisonless and obdurate,
Which then the rose upon the sprig hath borne:
And I have seen a ship, that swift and straight
Has run upon the mid-sea all her race,
And perished, entering at the harbor gate.

... As the stork in circles flies
Above that nest wherein she feeds her young,
And as those fed attend her with their eyes,
So moved (and so mine eyes upon him clung)
That figure blest, whose movement of each plume
Was on such numbers of free counsels hung.
Circling he chanted, 'As to thee, by whom
They are not understood, my notes be, so
To mortals is God's everlasting doom.'
Then went on one and every flaming glow
Of God's own spirit, in that sign enmailed,
Which made to Roman arms the World bend low.
'This kingdom,' he began, 'was never scaled
By mortal that had not believed in Christ,
Before, or after, He on Cross was nailed.
But look, there's many calleth Christ, O Christ,
That shall, for meeting Him in judgment, want
Much more than such a one as knew not Christ.
The Æthiop shall judge, and cry, Avaunt
Such Christians, when those congregations two
Part, one for Wealth eterne, and one for Want.'"

* Maria F. Rossetti.

Hitherto we have contemplated Dante mounted, as it were, on a public pedestal. We have recalled his career mainly according to that aspect under which it forms a portion of the history of his age and nation. The man among men, the leader or the victim of his fellow-countrymen, has engrossed our attention.

But thus we have beheld only half a Dante. We have not looked, or even attempted to look, into that heart of fire which burned first and last for one beloved object. For, whatever view we take of Beatrice, unless indeed we are prepared wholly to set aside the poet's own evidence concerning himself, either she literally, or else that occult something which her name was employed at once to express and to veil, must apparently have gone far to mold her lover; to make him what he was, to withhold him from becoming such as he became not.

On Dante's own showing (in his "*Vita Nuova*" and elsewhere), this object, fruitlessly beloved on earth, but to be attained to and enjoyed in the heavenly communion of saints, was Beatrice, daughter of Folco Portinari, beautiful, gracious, replete with virtue, courteous, and humble. Not, it may be, that when first they met she shone, even in farthest-seeing poetic eyes, with her full luster; for at that first meeting they were both but children of nine years old, he somewhat the elder. She at her father's house, he brought thither by his own father on a holiday occasion—thus they met whom love was to unite by an indissoluble, because by a spiritual, bond. For no courtship, as it would seem, ensued. Not a hint remains that Beatrice even guessed her boy-friend's secret. He sought her company, and felt the ennobling influence of her presence—so noble an influence that love (he avers) ruled him not contrary to the dictates of reason. With equal emphasis Boccaccio dwells on the intact purity of both lover and beloved in this absorbing passion; for absorbing it was on Dante's side, whether or not it was returned.

And we may well hope that it was neither returned nor so much as surmised by its object; for, at the age of twenty, Beatrice Portinari became the wife of Simon de' Bardi. Of Dante's consequent grief we find no distinct mention, although one passage in the "*Vita Nuova*" may refer to it. Of his bitter grief when, in the year 1290, at the still youthful age of twenty-four, she died, he has left us an ample record.

It is narrated, but I know not whether on trustworthy authority, that, in this period of bereavement, Dante donned the Franciscan habit as a novice in the monastery of San

Benedetto in Alpe among the Apennines, and some writers of the same order have laid claim to him as wearing their affiliating cord and dying in their habit. However this may have been, tonsure and cowl were not for him, as an early day declared.

Boccaccio thus describes Dante in his desolation:

"He was, indeed, through tear-shed, and through the affliction felt within his heart, and through his neglect of all outward personal care, become well-nigh a savage creature to behold: lean, bearded, and almost wholly transformed from his previous self, inasmuch that his aspect, not in his friends only, but no less in such others as beheld him, by its own virtue wrought compassion; he withal, this tearful life subsisting, seldom suffering himself to be seen by any but friends. This compassion, and apprehension of worse to come, set his kindred on the alert for his solace. They, marking the tears abated and the consuming sighs according some truce to the wearied bosom, with long-lost consolations set themselves to reconsole the unconsoled one, who, although up to that hour he had obstinately stopped his ears against every one, began not merely somewhat to open them, but willingly to entertain comforting suggestions. Which thing his kindred beholding, to the end that they might not only altogether withdraw him from anguish, but might lead him into joy, they proposed among themselves to bestow upon him a wife; that, even as the lost lady had caused his grief, so the newly acquired one might become to him source of gladness. And, having found a maiden of creditable condition, with such reasons as appeared to them most influential, they declared to him their intention. Whereupon, after long conflict, without further waste of time, to words succeeded effects, and he was married."

This marriage, contracted about a year after the death of Beatrice, proved more or less unhappy; so we deem on indirect evidence. Gemma Donati, sister of that Corso Donati who subsequently, at the head of the Black faction, overran Florence with fire and sword,—Gemma Donati was the chosen bride, the accepted wife. Seven children she bore to her husband, surely a dear and binding link between them; yet, from the moment of his exile, he and she met no more. When, he being already and, as the event proved, finally absent, his Florentine house was burnt, she saved his manuscripts, which were afterward restored to his own keeping. This suggests, though it does not prove, affection on her side. But while some, if not all, of his children rejoined him after a time, his wife never. Perhaps no living woman of mere flesh and blood could have sufficed to supersede that Beatrice whom Dante terms "this youngest angel" long before death had (as we trust) exalted her to the society of all her blessed fellows, whether elect angels or beatified spirits. If so, Gemma is truly to be pitied in her comparatively thankless and loveless lot; nevertheless, such hope remained to her as, of old, Leah may have cherished when altogether

eclipsed by Rachel,—such hope as removes from earth to heaven. Nor could Dante himself have denied her that hope, for thus he writes (Purgatory, 27):

“Sleep over me
Came, even sleep, which oftentimes doth know
The tidings of events before they be.

My dreams did, young and beautiful, present
A lady to me, that by lawny lands
Was gathering flowers, and singing as she went:
‘Now know ye, whosoe’er my name demands,
That I am Leah, that about me ply,
To make myself a chaplet, my fair hands;
That I may in the mirror please mine eye
I deck me; but my sister Rachel, she
Is ne’er uncharmed, and sits all day thereby.
She hath as lief her goodly eyes to see,
As I have with my hands to deck me here;
So study pleaseth her, and labor me.’”

Yet it seems hard to accept as full and final such an explanation, because Dante, on his own showing, lapsed from pure, unbroken faith to his first love into unworthy pleasure. Hear how, even amid the peace and bliss of the Terrestrial Paradise, Beatrice, with veiled countenance and stinging words, addresses him, “*Guardami ben; ben son, ben son Beatrice*” (“Look on me well; yes, I am Beatrice”), and, despite his overwhelming shame, resumes the thread of her discourse by speaking no longer *to*, but *at* him (Purgatory, 30):

“Some while at heart my presence kept him sound;
My girlish eyes to his observance lending,
I led him with me on the right way bound.
When, of my second age the steps ascending,
I bore my life into another sphere,
Then stole he from me, after others bending.
When I arose from flesh to spirit clear,
When beauty, worthiness upon me grew,
I was to him less pleasing and less dear.
He set his feet upon a path untrue,
Chasing fallacious images of weal,
Whose promise never doth result pursue.
It helpt me nought, to make him my appeal
In sleep, through inspirations that I won,
Or otherwise; so little did he feel.
So far he fell adown, that now not one
Device for his redemption could bestead,
Except by showing him the souls undone.”

It is of course possible that the one woman whom Dante could not—or, rather, would not—love was that only woman who had an indefeasible claim upon his heart. Whatever the explanation may be, it remains for the present hidden. Time has not shown; eternity, if not time, will show it. Meanwhile let us, by good wishes, commend him, after the prolonged disappointment of life, to that satisfying peace whereunto he consigns Boethius—a philosopher whose writings had aforetime cheered him under depression, and whose spirit he places in the sun among the

lovers of true wisdom, where his fellow-sage, St. Thomas Aquinas, thus sums up his history (Paradise, 10):

“Now, if the eye-beam of thy mind proceed
From light to light, the follower of my praise,
To know the eighth already thou wilt need.
There, blessed from beholding all good, stays
That soul untarnished who the treacherous lease,
If well perused, of worldly joys displays.
That body, whence hier violent decease
She made, Cieldauro covers, and she ran
From pangs and exile into th’ endless peace.”

If the master Boethius was wise, wise also must we account Dante the disciple. Some students speak of hidden lore underlying the letter of our poet’s writings: in Beatrice they think to discern an impersonation rather than a woman, in the Divine Comedy a meaning political rather than dogmatic,—or, if in any sense dogmatic, yet not such as appears on the surface. So obscure a field of investigation is not for me or for my readers; at least, not for them through any help of mine: to me it is and it must remain dim and unexplored, even as that “*selva oscura*” (dark wood) with which the Cantica of the Hell opens.

What then, according to the obvious signification, is in few words the subject or plot of the Divine Comedy?

Dante, astray in a gloomy wood and beset by wild beasts, is rescued by the shade of Virgil, who, at the request of Beatrice, already an inhabitant of heaven, has left his proper abode in a painless region of hell, for the purpose of guiding Dante first of all through the nether-world of lost souls, that, by their irremediable ruin, he may learn to flee from evil as from the face of a serpent, retrieving his errors and amending his ways. Over Hell gate an awful inscription is placed (Hell, 3):

“Through me you pass into the city of woe;
Through me you pass eternal woes to prove;
Through me among the blasted race you go.
’Twas Justice did my most high Author move,
And I have been the work of Power divine,
Of supreme Wisdom, and of primal Love.
No creature has an elder date than mine,
Unless eternal, and I have no end.
O you that enter me, all hope resign.”

Immediately beyond this gate swarms a throng of despicable souls, refuse even in hell, mere self-seekers; the “spued-out, lukewarm” ones, so to say. These left behind, and the river Styx passed over, a painless, hopeless region is entered,—the permanent home of Virgil, with all other virtuous heathens who lived and died before our Lord Christ was born: painless, because their lives were good; hopeless, because they lacked faith. Beyond

this point of our pilgrims' journey peace, even hopeless peace, finds no place. A furious, whirling storm is the first torment they encounter. Thenceforward, from agony to agony they plunge deeper and deeper into the abyss of Hell, meeting sinner after sinner whose ghastly story is told at more or less length, until they reach the visible, abhorrent presence of Lucifer, who from "perfect in beauty" has by rebellion become absolute in hideous horror.

Mid-Lucifer occupies the earth's center of gravity. Virgil, with Dante clinging to him, clammers down the upper half of Lucifer and climbs up the lower half, whereby the twain find themselves emerging from the depth of Hell upon the Mountain of Purgatory.

This Purgatory is the domain of pain and hope,—finite pain, assured hope. Again a number of episodes charm us while we track the pilgrims along the steep ascent, until, on the summit, they reach the Terrestrial Paradise; and here, the shade of Beatrice assuming in her own person the guidance of her lover, Virgil vanishes.

Under the guardianship of Beatrice, Dante mounts through eight successive Heavens to that ninth which includes within itself all blessedness. In each of them he encounters jubilant souls grown loquacious by impulse of charity, delighting to share with him their edifying experiences, to resolve his doubts, to lighten his darkness. All culminates in an unutterable revelation of God made Man and the All-Holy Trinity in Unity.

Chief among Dante's works, and in itself complete, the Divine Comedy yet requires an introduction if we would fully understand its starting-point. Our poet's earlier work, the "Vita Nuova," composed of alternate prose and verse, supplies that introduction. There we read an elaborate continuous exposition of his love for Beatrice, interspersed with ever-renewed tribute of praise from his lowliness to her loftiness; interspersed, too, with curiosities of structure and perhaps of style which some may deem pedantic. In the following passage Dante relates how, by means of a dream, he experienced beforehand what

anguish should befall him on the death of Beatrice ("Vita Nuova"):

"In myself I said, with sick recoil:
'Yea, to my lady too this Death must come.'

Then saw I many broken hinted sights
In the uncertain state I stepp'd into.
Meseem'd to be I know not in what place,
Where ladies through the street, like mournful
lights,

Ran with loose hair, and eyes that frighten'd you
By their own terror, and a pale amaze:
The while, little by little, as I thought,
The sun ceased, and the stars began to gather,
And each wept at the other;
And birds dropp'd in mid-flight out of the sky;
And earth shook suddenly;
And I was 'ware of one, hoarse and tired out,
Who ask'd of me: 'Hast thou not heard it
said?

Thy lady, she that was so fair, is dead.'

"Then lifting up mine eyes, as the tears came,
I saw the angels, like a rain of manna,
In a long flight flying back heavenward;
Having a little cloud in front of them,
After the which they went and said, 'Hosanna';
And if they had said more, you should have heard.
Then Love said, 'Now shall all things be made
clear:

Come and behold our lady where she lies.'

"These 'wondering phantasies
Then carried me to see my lady dead.
Even as I there was led,
Her ladies with a veil were covering her;
And with her was such very humbleness
That she appeared to say, 'I am at peace.'"

(D. G. Rossetti.)

Such readers as would fully enter into the mind of Dante—as fully, that is, as ordinary intelligences can hope to explore the extraordinary—must not limit themselves to the Divine Comedy and "Vita Nuova," but must study also the "Convito" (Banquet), a philosophical work, besides minor poems, epistles, and Latin compositions. On the threshold of such studies, I bid them good-bye in our great author's own words:

"Se Dio ti lasci, lettor, prender frutto
Di tua lezione."

(May God vouchsafe thee, reader, to cull fruit
From this thy reading.)

Christina G. Rossetti.

THE nobly descriptive poem of Thomas W. Parsons is a fit introduction to what we have to say of the portraits of Dante, and no apology is needed for giving it entire. These lines were prefixed to Dr. Parsons's translation of seventeen cantos of the *Inferno*, published in 1865, on the occasion of the six hundredth birthday of Dante:*

"ON A BUST OF DANTE.

"BY THOMAS WILLIAM PARSONS.

"See, from this counterfeit of him
Whom Arno shall remember long,
How stern of lineament, how grim
The father was of Tuscan song!
There but the burning sense of wrong,

Perpetual care and scorn abide—
Small friendship for the lordly throng,
Distrust of all the world beside.

"Faithful if this wan image be,
No dream his life was, but a fight;
Could any Beatrice see
A lover in that anchorite?
To that cold Ghibelline's gloomy sight
Who could have guessed the visions came
Of Beauty, veiled with heavenly light,
In circles of eternal flame?

"The lips as Cumæ's cavern close,
The cheeks with fast and sorrow thin,
The rigid front, almost morose,
But for the patient hope within,
Declare a life whose course hath been

* Boston : printed by John Wilson & Son.

Unstilled still though still severe,
Which through the wavering days of sin
Kept itself icy-chaste and clear.

"Not wholly such his haggard look,
When wandering once, forlorn, he strayed,
With no companion but his book,
To Corvo's hushed monastic shade;
Where, as the Benedictine laid
His palm upon the pilgrim guest,
The single boon for which he prayed
The convent's charity was rest.

"Peace dwells not here—this rugged face
Reveals no spirit of repose;
The sullen warrior sole we trace,—
The marble man of many woes.
Such was his mien when first arose
The thought of that strange tale divine,
When hell he peopled with his foes,
The scourge of many a guilty line.

"War to the last he waged with all
The tyrant canker-worms of earth;
Baron and duke, in hold and hall,
Cursed the dark hour that gave him birth;
He used Rome's harlot for his mirth;
Plucked bare hypocrisy and crime;
But valiant souls of knightly worth
Transmitted to the rolls of Time.

"O Time! whose verdicts mock our own,
The only righteous judge art thou!
That poor old exile, sad and lone,
Is Latium's other Virgil now.
Before his name the nations bow:
His words are parcel of mankind,
Deep in whose hearts, as on his brow,
The marks have sunk of Dante's mind."

Dante Alighieri died A. D. 1321. In 1884 there are few more familiar or more easily recognized faces than his, and yet of the almost innumerable so-called portraits of him that now exist there are but two that can be called authentic—the two from which all the others must have been derived. To the first of these, which was painted by Giotto, the verses of Dr. Parsons do not apply, for it was made before the struggle with life's exigencies had begun; the beautiful features show the triumphant security of youth, and of a youth endowed with singular powers.

"The poet in a golden clime was born
With golden stars above;
Dowered with the hate of hate, the scorn of scorn,
The love of love."

But the hate of hate, the scorn of scorn, had not as yet been awakened.

Giotto was the greatest painter of his time, and the intimate friend of Dante. This portrait is in fresco on the walls of the chapel in the palace of the Podestà of Florence, now called the Bargello. It was a grand religious picture. The figure of Christ in the upper part was supported by saints and angels, and below were kings and great people of the city of Florence, among whom Dante stood with

a pomegranate in his hand, the face in profile; and the features, as yet unchanged by time and suffering, by care and contention, are noble and gracious. This picture has a strange history. Painted by the first artist of that time, on the chapel wall in one of the chief public palaces of the city of Florence, it ought to have been safe from destruction. In Vasari's "Life of Giotto," published in 1550, is this account of the picture:

"Giotto became so good an imitator of nature, that he altogether discarded the stiff Greek manner, and revived the modern and good art of painting, introducing exact drawing from nature and living persons, which, for more than two hundred years, had not been practiced, or if, indeed any one had tried it, he had not succeeded, very happily, nor anything like so well as Giotto. And he portrayed, among other persons, *as may even now be seen* in the chapel of the palace of the Podestà, in Florence, Dante Alighieri, his contemporary and greatest friend, who was not less famous as a poet than Giotto as a painter in those days."

This picture is supposed to have been painted when Dante was about twenty years old; and according to the above extract from Vasari, it was still to be seen in 1550. Professor Charles Eliot Norton, in his work on the original portraits of Dante (Cambridge, 1865), gives this account of the loss of the picture:

"One might have supposed that such a picture as this would have been among the most carefully protected and jealously prized treasures of Florence. But such was not the case. The shameful neglect of many of the best and most interesting works of the earlier period of art, which accompanied and was one of the symptoms of the moral and political decline of Italy during the sixteenth and seventeenth centuries, extended to this as to other of the noblest paintings of Giotto. Florence, in losing consciousness of present worth, lost care for the memorials of her past honor, dignity, and distinction. The palace of the Podestà, no longer needed for the dwelling of the chief magistrate of a free city, was turned into a jail for common criminals, and what had once been its beautiful and sacred chapel was occupied as a larder or store-room. The walls, adorned with paintings more precious than gold, were covered with whitewash, and the fresco of Giotto was swept over by the brush of the plasterer. It was not only thus hidden from the sight of those unworthy indeed to behold it, but it almost disappeared from memory also, and from the time of Vasari down to that of Moreni, a Florentine antiquary in the early part of the present century, hardly a mention of it occurs. In a note found among his papers, Moreni laments that he had spent two years of his life in unavailing efforts to recover the portrait of Dante and the other portions of the fresco of Giotto in the Bargello, mentioned by Vasari; that others before him had made a like effort, and had failed in like manner; and that he hoped that better times would come, in which this painting, of such historic and artistic interest, would again be sought for and at length recovered. Stimulated by these words, three gentlemen, one an American, Mr. Richard Henry Wilde, one an Englishman, Mr. Seymour Kirkup, and one an Italian, Signor G. Aubrey Bezzi, all scholars devoted to the study of Dante, undertook new researches in 1840; and after many hindrances on the part of the

government, which were at length successfully overcome, the work of removing the crust of plaster from the walls of the ancient chapel was intrusted to the Florentine painter Marini. This new and well-directed search did not fail. After some months' labor the fresco was found, almost uninjured, under the

THE DEATH-MASK.

THE other authentic portrait is the well-known "Death-Mask." I call it authentic because, although its history is obscure, it

BRONZE BUST OF DANTE, IN THE MUSEUM OF NAPLES.

whitewash that had protected while concealing it, and at length the likeness of Dante was uncovered.

"But," says Mr. Kirkup, in a letter published in the "Spectator" (London, May 11th, 1850), 'the eye of the beautiful profile was wanting. There was a hole an inch deep, or an inch and a half. Marini said it was a nail. It did seem precisely the damage of a nail drawn out. Afterward . . . Marini filled the hole and made a new eye, too little, and ill designed; and then he retouched the whole face and clothes, to the great damage of the expression and character. The likeness of the face, and the three colors in which Dante was dressed, the same with those of Beatrice, those of young Italy, white, green, and red, stand no more; the green is turned to chocolate color; moreover, the form of the cap is lost and confounded.

"I desired to make a drawing; . . . it was denied to me. . . . But I obtained the means to be shut up in the prison for a morning, and not only did I make a drawing but a tracing also, and with the two I then made a facsimile, sufficiently careful. Luckily, it was before the *rifacimento*."

"This facsimile afterward passed into the hands of Lord Vernon, well known for his interest in all Dantesque studies, and by his permission it has been admirably reproduced in chromo-lithography, under the auspices of the Arundel Society. The reproduction is entirely satisfactory as a representation of the authentic portrait of the youthful Dante, in the state in which it was when Mr. Kirkup was so fortunate as to gain admission to it."*

* C. E. Norton, "Original Portraits of Dante."

carries authenticity in its face. The portrait by Giotto gives us the poet in his youth, and there can be no doubt that all the later portraits are taken from the mask. The solemnly grave warrior head we see in the bronze bust at Naples, and the three heads by Raphael (one in the fresco of the Disputa in the Stanze of the Vatican, one in the Parnassus in the same room, and one in the School of Athens) are all of this graver and grander type. So also in a drawing by Raphael, probably a study for one of these, in the collection at Vienna. Raphael used the traditional features, but expressed them in grandiose poetic forms, and these again have been used as master types for succeeding portraits. These two portraits—the first being Mr. Kirkup's precious rescue from the destructive restorer, which gives the pure and beautiful outlines of youth, the second being the wonderfully expressive death-mask which has brought down to us not only the dead features of the poet but the expression stamped upon them in that supreme hour when, before abandoning the clay, the spirit takes entire possession of it—express the history of a life, and bring

HEAD OF DANTE.

FROM THE "DISPUTA" OF RAPHAEL, IN THE VATICAN.

this distracted, this stormy and suffering pilgrimage together into a coherent and most impressive whole.

The history of the mask I will give in Mr. Norton's words :

"There exists also a mask concerning which there is a tradition that it was taken from the face of the dead poet, and which, if its genuineness could be established, would not be of inferior interest to the early portrait. But there is no trustworthy historic testimony concerning it, and its authority as a likeness depends on the evidence of truth which its own character affords. On the very threshold of the inquiry we are met with the doubt whether the art of taking casts was practiced at the time of Dante's death. In his life of Andrea del Verocchio, Vasari says that this art began to come into use in his time, that is, about the middle of the fifteenth century; and Bottari refers to the likeness of Brunelleschi, who died in 1446, which was taken in this manner, and was preserved in the office of the works of the cathedral at Florence. It is not impossible that so simple an art may have been sometimes practiced at an earlier period; and if so, there is no inherent improbability in the supposition that Guido Novello, the friend and protector of Dante at Ravenna, may, at the time of the poet's death, have had a mask taken to serve as a model for the head of a statue intended to form part of the monument which he proposed to erect in honor of Dante. And it may further be supposed that, this design failing, owing to the fall of Guido from power before its accomplishment, the mask may have been preserved at Ravenna, till we first catch a trace of it nearly three centuries later. There is in the Magliabecchian library at Florence an autograph manuscript by Giovanni Cinelli, a Florentine antiquary who died in 1706, entitled '*La Toscana letterata, ovvero Istoria degli Scrittori Fiorentini*,' which contains a life of Dante. In the course of the biography, Cinelli states that the Archbishop of Ravenna caused the head of the poet, which had adorned his sepulcher, to be taken therefrom, and that it came into the possession of the famous sculptor Gian Bologna, who left it at his death, in 1606, to his pupil Pietro Tacca. One day Tacca showed it with other curiosities to the Duchess Sforza, who, having wrapped it in a scarf of green cloth, carried it away, and God knows into whose hands the precious object has fallen, or where it is to be found. . . . On account of its singular beauty, it had often been drawn by the scholars of Tacca. It has been supposed that this head was the original mask from which the casts now existing were derived.

"Mr. Seymour Kirkup, in a note on this passage from Cinelli, says that 'there are three masks of Dante at Florence, all of which have been judged by the first Roman and Florentine sculptors to have been taken from life (that is, from the face after death),—the slight differences noticeable between them being such as might occur in casts made from the original mask.' One of these casts was given to Mr. Kirkup by the sculptor Bartolini, another belonged to the late sculptor Professor Ricci, and the third is in the possession of the Marchese Torrigiani. . . .

"In the absence of historical evidence in regard to this mask, some support is given to the belief in its genuineness by the fact that it appears to be the type of the greater number of the portraits of Dante executed from the fourteenth to the sixteenth century, and was adopted by Raphael as the original from which he drew the likeness which has done most to make the features of the poet familiar to the world. The character of the mask itself, however, affords the only really satisfactory ground for confidence in the truth of the tradition concerning it. It was plainly

taken as a cast from a face after death. It has none of the characteristics which a fictitious and imaginative representation of the sort would be likely to present. It bears no trace of being a work of skillful and deceptive art. The difference in the fall of the two half-closed eyelids, the difference between the sides of the face, the slight deflection in the line of the nose, the droop of the corners of the mouth, and other delicate, but none the less convincing indications, combine to show that it was in all probability taken directly from nature. The countenance, moreover, and expression are worthy of Dante; no ideal forms could so answer to the face of him who had led a life apart from the world in which he dwelt, and had been conducted by love and faith along hard, painful, and solitary ways to behold

"'*L'alto trionfo del regno verace.*'"

"The mask conforms entirely to the description by Boccaccio of the poet's countenance, save that it is beardless, and this difference is to be accounted for by the fact that, to obtain the cast, the beard must have been removed.

"The face is one of the most pathetic upon which human eyes ever looked, for it exhibits in its expression the conflict between the strong nature of the man and the hard dealings of fortune—between the idea of his life and its practical experience. Strength is the most striking attribute of the countenance, displayed alike in the broad forehead, the masculine nose, the firm lips, the heavy jaw, and wide chin; and this strength, resulting from the main forms of the features, is enforced by the strength of the lines of expression. The look is grave and stern, almost to grimness; there is a scornful lift to the eyebrow, and a contraction of the forehead as from painful thought; but, obscured under this look, yet not lost, are the marks of tenderness, refinement, and self-mastery, which, in combination with the more obvious characteristics, give to the countenance of the dead poet an ineffable dignity and melancholy. There is neither weakness nor failure here. It is the image of the strong fortress of a strong soul, 'buttressed by conscience and impregnable will,' battered by the blows of enemies without and within, bearing upon its walls the dints of many a siege, but standing firm and unshaken against all attacks until the warfare was at an end.

"The intrinsic evidence for the truth of this likeness, from its correspondence, not only with the description of the poet, but with the imagination that we form of him from his life and works, is strongly confirmed by a comparison of the mask with the portrait by Giotto. So far as I am aware, this comparison has not hitherto been made in a manner to exhibit effectively the resemblance between the two. A direct comparison between the painting and the mask, owing to the difficulty of reducing the forms of the latter to a plain surface of light and shade, is unsatisfactory. But by taking a photograph from the mask in the same position as that in which the face is painted by Giotto, and placing it alongside of the facsimile from the painting, a very remarkable similarity becomes at once apparent. . . . The differences are only such as must exist between the portrait of a man in the freshness of a happy youth and the portrait of him in his age, after much experience and many trials. Dante was fifty-six years old at the time of his death, when the mask was taken; the portrait by Giotto represents him as not much past twenty. There is an interval of at least thirty years between the two. And what years they had been for him!

"The interest of this comparison lies not only in the mutual support which the portraits afford each other, in the assurance each gives that the other is genuine, but also in their joint illustration of the life and character of Dante. As Giotto painted him, he is the lover

of Beatrice, the gay companion of princes, the friend of poets, and himself already the most famous writer of love verses in Italy. There is an almost feminine softness in the lines of the face, with a sweet and serious tenderness well befitting the lover and the author of the sonnets and *canzoni* which were, in a few years, to be gathered into the incomparable record of his new life. It is the face of Dante in the May time of youthful hope, in that serene season of promise and joy which was so soon to reach its foreordained close

Dr. Theodor Paur, in his paper on the Dante portraits in the "Jahrbuch der Deutschen Dante Gesellschaft" (Leipzig, F. A. Brockhaus, 1869), speaks of a fourth death-mask said to have been found in Ravenna more recently by L. C. Perucchi of Florence. It is a profile raised in rilievo on a marble slab, and is spoken of as now in Rome at San Pietro in

GIOTTO'S PORTRAIT OF DANTE, FROM TRACING BY SEYMOUR KIRKUP, ESQ. (BY PERMISSION OF ARUNDEL SOCIETY.)

in the death of her who had made life new and beautiful to him, and to the love and honor of whom he dedicated his soul and gave all his future years. It is the same face with that of the mask, but the one is the face of a youth 'with all triumphant splendor on his brow,' the other of a man burdened 'with the dust and injury of age.' The forms and features are alike; but, as to the later face,

"That time of year thou may'st in [it] behold
When yellow leaves, or none, or few, do hang
Upon those boughs which shake against the cold,
Bare ruined choirs where late the sweet birds sang."

"The face of the youth is grave as with the shadow of distant sorrow; the face of the man is solemn, as of one who had gone

"Per tutti i cerchi del dolente regno."

"The one is the young poet of Florence, the other the supreme poet of the world,—

"che al divino dall' umano
All' eterno del tempo era venuto."

Vincoli. Perucchi asserts that this is the first authentic one. A frontispiece to the same volume is a profile likeness of Dante, engraved from a portrait in the Munich collection, said to be by Masaccio. The cast of the features is not very unlike that of Giotto's portrait; that is to say, in the way in which the face is put together, which more than identity of feature makes likeness. In this vital point the many portraits vary; and if we take the Giotto portrait and the death-mask, which are alike in this respect, we have a standard which will exclude many of the portraits of Dante which are supposed to be of some authority. A greater difference between these two and most of the others that I have seen is the difference in expression. In both of these is to be seen a calm serenity which marks the strong man, the man strong in all his intellectual faculties, in his clear

PROFILE OF DANTE, IN RELIEF, ON THE MAUSOLEUM AT RAVENNA.

moral sense, and his unvarying strength of will, which sustains all the higher powers in their work. The Masaccio portrait seems weak, though not varying much from the original type. This may be through fault of the engraver.

There is an interesting portrait in Rome, an old painting in oils, owned by Mr. Morris Moore, which appears to have been copied by a skillful artist from the work of Giotto. It has the same facial angle, the same beautiful profile, the same serene, composed expression of a harmonious and happy existence before the peace was broken. Mr. Moore believes this to be a copy by Raphael. It has a laurel crown above the cap, wanting in the Giotto, and the vest has three peculiarly shaped buttons, in this point also differing from the Giotto portrait, but resembling the Dresden bust.*

Professor Theodor Paur, in his learned paper on the portraits of Dante, enumerates many of earlier date than the present century. As, however, they may be traced to the two sources already indicated, we will not here give their catalogue. One of these was a me-

dallion owned by Goethe, which he believed to have been made during the poet's life-time.

The description of Dante's person in Boccaccio's life is interesting:

"Our poet was of middle stature, and had a long face and aquiline nose; jaws prominent, and the under lip projecting so that it was as much advanced as the upper; shoulders somewhat bent, and the eyes rather large than small; complexion dark, hair and beard thick, crisp, and black, and his countenance always sad and thoughtful. For this reason it happened, one day in Verona, the fame of his work being already spread everywhere, and his person known to many men and women, that, in passing before a door where several women were sitting, one of them, speaking softly, but not so that it was not audible to himself and to those who were with him, said to the other women, 'Behold the man who goes into the Inferno, and returns when he pleases, and brings news of those who are down there!' To which one of the others answered, simply, 'Truly it must be so. See how brown he is, and how his beard is scorched, through the heat and smoke!' It is said that Dante, seeing that she spoke in good faith, passed on, smiling. He was always decently dressed, and in clothing suited to his years. His bearing was grave and gentle, and, whether at home or in public, wonderfully composed and courteous. He was temperate in eating and drinking, was greatly inclined to solitude, and, though eloquent in speech, he rarely spoke unless when addressed."

At the end of a manuscript of the *Divina Commedia* of the fourteenth century are two short poems in honor of Dante. The first speaks of his glory and misfortunes, the second gives his physical portrait, which is in strict conformity with that traced by Boc-

* The pedigree Mr. Moore gives of this portrait is that it was painted for Cardinal Bembo, and is of the period of the Entombment in the Borghese gallery. From the Bembo family it passed into another great Venetian patrician family, that of Gradenigo, and from this into the family of the Counts Capodilista of Padua. It came into Morris Moore's possession in 1857.

caccio in his life of the poet, so much so that it is, in nearly the same words, arranged in verse. It has been observed that, although the verbal descriptions of his person all give him a beard, only one of the portraits does so—an old one, painted in the fourteenth century. This is mentioned by Dante's biographer Misserini in 1832. Giotto's portrait has no beard, perhaps because the younger men of that day wore none; the death-mask has no beard, perhaps because it was removed before taking the cast.

I have not mentioned the basso-rilievo at Ravenna, which every traveler sees, or tries to see. The light in that little building is so imperfect that, looking through the grated door, one but just sees that there is something of the kind there. A cast of this head shows something more, and, though it is crude in treatment, both likeness and expression are

there. Of this work the sculptor William W. Story says, in a letter to the writer:

"The photograph of the basso-rilievo in the tomb of Dante at Ravenna, representing the poet himself, is interesting, and, though a little weak, has a good deal of expression and feeling. There is no special authority for it as a likeness other than what it draws from material still at command of any artist. It was executed by Pietro Lombardi in the beginning of the seventeenth century, the same artist who designed the tomb itself. The photograph only represents a part of the figure existing in the basso-rilievo, which is a half figure leaning his arm on a reading stand, on which is an open book, at which the poet is looking. The likeness was undoubtedly made up by the artist from the pictures and mask of Dante then existing."

Of the Naples bust in bronze Mr. Story says:

"It is not only very fine in itself and carefully executed, but was probably made in the fourteenth century, and possibly may be an authentic portrait from life. Of all the likenesses of Dante, this is the best and most characteristic. I mean I think so."

Sarah Freeman Clarke.

A SONG OF HOPE.

THE morning breaks, the storm is past. Behold!
 Along the west the light grows bright; the sea
 Leaps sparkling blue to catch the sunshine's gold,
 And swift before the breeze the vapors flee.

Light cloud-flocks white that troop in joyful haste
 Up and across the pure and tender sky;
 Light laughing waves that dimple all the waste,
 And break about the rocks and hurry by!

Flying of sails and clouds, and tumult sweet,
 And tossing buoys, and warm wild wind that blows
 The scarlet pennon, rushing on to greet
 Thy lovely cheek and heighten its soft rose!

Beloved, beloved! is there no morning breeze
 To clear our sky and chase our clouds away,
 Like this great air that sweeps the freshening seas,
 And wakes the old sad world to glad new day?

Sweeter than morning, stronger than the gale,
 Deeper than ocean, warmer than the sun,
 My love shall climb, shall claim thee, shall prevail
 Against eternal darkness, dearest one!

Celia Thaxter.

THE CONVICT LEASE SYSTEM IN THE SOUTHERN STATES.

A MODEL PRISON.

HERE and there in the United States a penal institution may be found that fairly earns the pride with which it is pointed out by the surrounding community. In the whole country there may be four or five such. The visitor to them admires the fitness of their architecture.

"Yes," the warden replies; "this is not a house of pleasure, and so we have not made it pretty. It is not an abode of crime, and so we have not made it ugly. It is not a place where men *seek* justice, and therefore we have not made it grandiose and majestic. But it is the house of chastisement,—of chastening punishment,—and so it is made solemn, severe, and calm."

The visitor praises the grave and silent decency of all the internal appointments.

"Yes," responds the warden; "the peace and dignity of the State are here asserting themselves over the person of the prisoner who has violated them; there is no more room here for merriment or confusion than for strife."

The visitor extols the perfection of the sanitary arrangements.

"Yes," says the warden; "when the criminal was free and his life at his own disposal, he took no such care of it as this. He probably lived a sort of daily suicide. If he shortened his days, the State was, presumably, not to blame. But if we by malice or neglect shorten his days here, where he is our captive, we bring upon the State both blame and shame. For his life is in our custody, just as the clothing is with which he came here; the State, through its courts, has distinctly declined to tamper with it, and holds it subject to be returned to his own keeping, at the expiration of his confinement, in as good order as that in which it was received, the inevitable wear and tear of time alone excepted. Can a State maintain its peace and dignity as it should, that commits breaches of trust inside its very prisons?"

The visitor remarks that a wise benevolence is necessary even toward bad men.

"But," says the other, "it is not merely benevolence to bad men that puts in these elaborate sanitary appliances; it is the necessity of upholding the integrity and honor of the State."

The visitor shows his surprise at the absence of all the traditional appliances for the correction of the refractory. "Yet be cer-

tain," is the rejoinder, "a discipline, sure, prompt, and effectual meets every infraction of rules. How else could we have this perfection of order? But it is a discipline whose punishments are free from brutalizing tendencies, increasing dispassionately as the culprit's passions increase, and relenting only when he has repented."*

The visitor is impressed with the educative value of the labor performed by the inmates.

"Yes," says the warden; "send a man out from here with knowledge of a trade, and may be he will come back, but the chances are he will not. Send him away without a trade, and may be he will not come back, but the chances are he will. So, for society's sake,—in the community's interest and for its safety,—these men are taught certain trades that they cannot turn to bad account. We do not teach burglars locksmithing."

Yet the visitor takes a momentary alarm.

"You put the housebreaker and the robber, the sneak-thief and the pickpocket into open competition with honest men in the community around them."

"Exactly," responds the other; "trying to live without competing in the fields of productive labor is just the essence of the crimes for which they were sent here. We make a short end of that."

The visitor looks with pleased interest at the statistical records of the clerk's office.

"We could not call our duty done without these," is the warden's response. "These are the keys to the study of the cause and prevention of crime. By these we weigh our own results. By these we uncover not only the convict and his crime, but society's and the State's own sins of omission and commission, whose fruits are these crimes and these criminals."

"After all," at length the visitor says, "tell me one thing more. Here where a prisoner is safe from fire and plague and oppression and temptation and evil companionship, and is taught thrift and skill, and has only to submit to justice and obey right rules, where is his punishment? How is this punishment at all?"

* "Good order and discipline have been maintained during the past year. There has not been one case of insubordination or gross violation of any of the rules of the prison government; not one case that required punishment, either for the purpose of maintaining discipline or as penalty for an offense committed by an individual prisoner."—"Annual Report of the Inspectors of the State Penitentiary, Eastern District, Pennsylvania, 1882," p. 89.

And the warden makes answer with question for question: "Had you a deformed foot, and an iron mold were made to close around it and press it into symmetrical shape and hold it so, would you ask where is the agony? The punishment here is the punishment of a deformed nature forced into superficial symmetry. It is the punishment that captivity is to unrestraint; that subordination and enforced self-control are to ungoverned passion and inordinate vanity and pride; that routine is to the love of idle adventure; that decorum is to the love of orgies; that temperance is to the love of drink; that loneliness is to the social and domestic impulses; that solitude and self-communion are to remorse. It is all the losses and restraints of banishment, without one of its liberties. Nothing tempers it but the repentance and reform which it induces, and these temper it just in degree as they are genuine and thorough."

"And your actual results?" asks the visitor.

"Of those who come here for their first offense, a majority return to honest life."

"You have a model prison."

"No," says the warden, "not yet."

THE THEORY OF SELF-SUPPORT.

Now, the number of such prisons in America, we say, may be counted on the fingers of one hand. Communities rarely allow the prison its rightful place among their investments of public money for the improvement of public morals and public safety. Its outlays are begrudged because they do not yield cash incomes equal to their cash expenses. Legislatures, public schools, courts of justice, and departments of police are paid for by the people in the belief that they will and must be made to yield conditions and results necessary to be obtained, for whose absence no saving of public wealth can atone, and that ultimately, though indirectly, even on their pecuniary side, they are emphatically profitable. But when it is asked by what course of reasoning the prison is left out of this count, there is heard only, as one may say, a motion to adjourn. Society is not ready for the question.

The error is a sad one, and is deeply rooted. And yet it is a glaring one. A glance at the subject is enough to show that unless the money laid out in prisons is devoted to some end far better than the mere getting it back again, then legislatures, public schools, courts, and police all are shortened in their results, and a corresponding part of their expenses is rightly chargeable to the mismanaged prison. The prison is an inseparable part of the system; and the idea that the prison must first of all pay

back dollar for dollar, if logically pushed on through the system, would close public schools, adjourn courts of justice, dissolve legislatures, and disband police. For not one of these could exist on a "self-supporting" basis.

Often, probably, than from any other one source, this mistake springs from the indolent assumption that the call to make prisons what they ought to be is merely an appeal to public benevolence. It was so, in their earlier turn, with public hospitals and public schools; and the effect was similar. For only here and there, if at all, did they find their best efficiency or a true public support, until society rose to the noble modesty that recognized them not as public charities, but as public interests. The management of a State's convicts is a public interest that still waits for the same sort of recognition and treatment. In many directions this has been partly conceded; but there are few, if any, other State executives who would undertake to echo the lately uttered words of that one who said:

"In neither of the penitentiaries of this State has there ever been an attempt yet made to administer them on the vulgar, wicked, unworthy consideration of making them self-sustaining. In neither of them has it been forgotten that even the convict is a human being, and that his body and soul are not so the property of the State that both may be crushed out in the effort to reimburse the State the cost of his scanty food, and, at the end of his term, what then is left of him be dismissed, an enemy of human society."

The two dissimilar motives here implied govern the management of most American prisons. In a few the foremost effort is to make them yield, by a generous, judicious control, every result worth, to society's best interests, the money paid for it; that is, to treat them as a public interest. In a much larger number it is to seek such, and only such, good results as may be got without an appreciable excess of expense over income; that is, to treat them as appeals—and unworthy appeals—to the public charity. One motive demands first of all the largest results, the other the smallest net expense. They give rise to two systems of management, each of which, in practice, has its merits and drawbacks, and is more or less effectively carried out, according to the hands and minds under which it falls. These are known as the Public Accounts System and the Contract System. Each has its advocates among students of prison science, and it is not the province of this paper further to press the contrast between them. It is truly the country's misfortune that in several States there is a third system in operation, a knowledge of whose real workings can fill the mind of any good citizen only with astonishment and indignant mortification.

By either of the two systems already named, the prison remains in charge of State officials, the criminals are kept continually within the prison walls, and the prison discipline rests intact. All the appliances for labor—the workshops, tools, engines, and machinery—are provided by the State, and the convicts labor daily, prosecuting various industries, in the Public Accounts System under their official overseers, and in the Contract System under private contractors. In degrees of more or less excellence, these industrial operations, whether under official directors or contractors, are carefully harmonized with those features of the prison management that look to the secure detention, the health, the discipline, and the moral reformation of the prisoner, the execution of the law's sentence upon him in its closest and furthest intent, and, if possible, his return to the outer world, when he must be returned, a more valuable and less dangerous man, impressed with the justice of his punishment, and yet a warning to evil-doers. It is the absence of several of these features, and sometimes of all, that makes the wide difference between these methods on the one hand and the mode of prison management known as the Lease System on the other.

EVIL PRINCIPLES OF THE LEASE SYSTEM.

Its features vary in different regions. In some, the State retains the penitentiary in charge of its officers, and leases out the convicts in gangs of scores or hundreds to persons who use them anywhere within the State boundaries in the execution of private enterprises or public or semi-public works. In a few cases the penitentiary itself, its appliances and its inmates, all and entire, are leased, sometimes annually or biennially, sometimes for five and sometimes for ten or even twenty years, and the convicts worked within or without the prison walls, and near to or distant from them, as various circumstances may regulate, being transferred from place to place in companies under military or semi-military guard, and quartered in camps or herded in stockades convenient to their fields of labor. In two or three States the Government's abandonment of its trust is still more nearly complete, the terms of the lease going so far as to assign to the lessees the entire custody and discipline of the convicts, and even their medical and surgical care. But a clause common to all these prison leases is that which allows a portion, at least, and sometimes all of the prisoners to be worked in parts of the State remote from the prison. The fitness of some lessees to hold such a trust may be estimated from the spirit of the following letters:

"OFFICE OF LESSEE ARKANSAS STATE PENITENTIARY,
"LITTLE ROCK, ARKANSAS, January 12, 1882.

"DEAR SIR: Your postal of request to hand; sorry to say cannot send you report, as there are none given. The business of the Arkansas State Penitentiary is of a private nature, and no report is made to the public. Any private information relative to the men will be furnished upon application for same.

"Very respectfully,
"ZEB. WARD, Lessee.
"Z. J."

"OFFICE OF LESSEE ARKANSAS STATE PENITENTIARY.
"LITTLE ROCK, ARKANSAS, July 2, 1882.

"DEAR SIR: Yours of — date to hand and fully noted. Your inquiries, if answered, would require much time and labor. I am sole lessee, and work all the convicts, and of course the business of the prison is my private business. My book-keeper is kept quite busy with my business, and no time to make out all the queries you ask for. Similar information is given to the Legislature once in two years.

"Respectfully,
"ZEB. WARD."

The wonder is that such a scheme should not, upon its face, be instantly rejected by any but the most sordid and short-sighted minds. It is difficult to call its propositions less than an insult to the intelligence and humanity of any enlightened community. It was a Governor of Kentucky who, in 1873, justly said to his State Legislature: "I cannot but regard the present system under which the State penitentiary is leased and managed as a reproach to the commonwealth. . . . It is the system, not the officer acting under it, with which I find fault."*

This system springs primarily from the idea that the possession of a convict's person is an opportunity for the State to make money; that the amount to be made is whatever can be wrung from him; that for the officers of the State to waive this opportunity is to impose upon the clemency of a tax-paying public; and that, without regard to moral or mortal consequences, the penitentiary whose annual report shows the largest cash balance paid into the State's treasury is the best penitentiary. The mitigations that arise in its practice through the humane or semi-humane sentiments of keepers and guards, and through the meagerest of legislation, are few, scanty, and rare; and in the main the notion is clearly set forth and followed that a convict, whether pilferer or murderer, man, woman, or child, has almost no human right that the State is bound to be at any expense to protect.

It hardly need be said that the system is not in operation by reason of any malicious public intention. On the part of lessees there is a most unadmirable spirit of enterprise. On the part of State officials there is a very natural eagerness to report themselves as put-

*Quoted in "Transactions of the National Prison Congress, St. Louis, 1874," p. 325.

ting money into the treasury, and a low estimate of public sentiment and intelligence. In the people at large there is little more than a listless oblivion, that may be reprehensible, but is not intentional, unless they are to be judged by the acts of their elected legislators, a rule by which few communities would stand unaccused. At any rate, to fall into the error is easy. Outlays for the maintenance of police and courts are followed with a jealous eye. Expense and danger keep the public on the alert. Since neither police nor courts can pay back in money, they must pay back in protection and in justice. The accused of crime must be arrested, the innocent acquitted and exonerated, and the guilty sentenced to the penalties of the laws they have violated. But just here the careless mind slips into the mistake that the end is reached; that to punish crime is to deter crime; that when broken laws are *avenged* that is the end; that it is enough to have the culprit in limbo, if only he is made to suffer and not to cost. Hence the public resolve, expressed and enforced through legislators and executive officers, to spend no more money on the criminal than will promptly come back in cash—nay, worse, to make him pay in advance; and hence, too, a total disregard of all other results for good or bad that may be issuing from the prison walls. Thus it follows that that arm of the public service by whose workings a large part of all the immense labor and expenses of police and courts must become either profitable or unprofitable is handed over to the system which, whatever else of profound mischief its annual tables may betray or conceal, will show the smartest results on the cash-book. And thus we see, annually or biennially, the governors of some of our States congratulating their legislatures upon the fact that, by farming out into private hands whose single motive is money the most delicate and difficult task in the whole public service, that task is changed from an outlay that might have been made nobly advantageous into a shameful and disastrous source of revenue.

IN TENNESSEE—THE SYSTEM AT ITS BEST.

If, now, we are to begin a scrutiny of this evil, we shall do well to regard it first as it presents itself in its least offensive aspect. To do this, we turn to the State prison, or prisons, of Tennessee. The State holds in confinement about one thousand three hundred convicts. The penitentiary is at Nashville, the capital. On the 5th of December, 1881, its workshops were accidentally destroyed by fire, and those which have taken their place are, if we may accept the warden's judgment,

the finest south of the Ohio River.* An advertisement from the Secretary of State, in a New Orleans paper of June 14, 1883, invites bids for a six years' lease of the "Penitentiary of Tennessee and the labor of the convicts, together with the building, quarry-grounds, fixtures, machinery, tools, engines, patterns, etc., belonging to the State." It is there asserted that the penitentiary has been conducted on this plan already for a number of years. The State's official prison inspectors remark, in their report of December 30, 1882: "The Lease System, during our term of office, has worked harmoniously and without the least scandal or cause for interference on the part of the inspectors. Rentals have been promptly paid, and the prisoners worked in accordance with law and most humanely treated. . . . To our minds there can be no valid objection raised to the Lease System, under proper restrictions, especially if as well conducted as for the past few years." They add the one reason for this conviction, but for which, certainly, there would be none: "A fixed revenue is assured to the State every year under the lease plan, as against an annual outlay under State management." The advertisement shows one feature in the system in Tennessee which marks it as superior to its application in most other States that practice it: the lessees employ such convicts as are retained "in the prison building at Nashville (many of whom are skilled laborers and of long-term sentence) in manufacturing wagons, iron hollow-ware, furniture, etc." The terms of the lease are required to be "not less than one hundred thousand dollars per annum, payable quarterly, clear of all expenses to the State on any account except the salaries of the superintendent, warden, assistant-warden, surgeon, and chaplain, which are to be paid by the State."

Here, then, is the Lease System at its best. Let us now glance in upon it for a moment through its own testimony, as found in the official report of its operations during the two years ending December 1, 1882. At the close of that term the State held in custody 1,336 convicts. Of these, 685 were at work in the penitentiary, 28 were employed in a railway tunnel, 34 were at work on a farm, 89 on another farm, 30 in a coal-mine, 145 in another coal-mine, and 325 in still another. In short, nearly half the convicts are scattered about in "branch prisons," and the facts that can be gathered concerning them are only such as are given or implied in

* Unfortunately for this pardonable boast, the boundary given cuts off all State prisons that exclude the lease management, except one small institution in West Virginia.

the most meager allusions. It appears that they are worked in gangs surrounded by armed guards, and the largest company, at least,—the three hundred and twenty-five,—quartered in a mere stockade. As the eye runs down the table of deaths, it finds opposite the names, among other mortal causes, the following: Found dead. Killed. Drowned. Not given. Blank. Blank. Blank. Killed. Blank. Shot. Killed. Blank. Blank. Killed. Killed. Blank. Blank. Blank. Killed. Blank. Blank.* The warden of the penitentiary states that, "in sending convicts to the branch prisons, especial care is taken to prevent the sending of any but able-bodied men"; and that "it has also been the custom to return the invalid and afflicted convicts from the branch prisons to this prison"—the penitentiary. Yet the report shows heavy rates of mortality at these branch prisons, resulting largely from such lingering complaints as dropsy, scrofula, etc., and more numerously by consumption than by any one thing else except violence: rates of mortality startlingly large compared with the usual rates of well-ordered prisons, and low only in comparison with those of other prisons worked under the hands of lessees.

The annual reports (taken as they could be procured, one for 1880, three for 1881, and one for 1882) of five of the largest prisons in the United States show that, from the aggregate population of those prisons, numbering 5300 convicts, there escaped during twelve months but one prisoner. In all the State prisons of the country not kept by the Lease System, with a population, at dates of reports, of 18,400, there escaped in one year only 63. But in the one year ending December 1, 1881, there escaped, from an average population of about 630 convicts at these Tennessee "branch prisons," 49 prisoners. Or, rather, there were 49 escapes; for some convicts escaped and were recaptured more than once or twice. The following year they numbered 50. If the tables in the report were correct,—it will be shown they are not,—we should know that the recaptures in the *two* years were about forty; but that which is not known is, what public and private expense in depredations on the one hand and the maintenance of police on the other these ninety-nine escaped robbers, burglars, house-burners, horse-thieves, and swindlers, and these forty recaptures, have caused and are still causing. The superintendent of prisons, making exception, it is true, of one small establishment of

less than a hundred population, whence over a third of these escapes were made, says the deputy wardens in charge "deserve credit for the manner in which they have carried out his instructions." Such is one feature of the Lease System under an exceptionally good administration of it. What a condition it had but lately come out of may be inferred from three lines found in the warden's report of the Texas penitentiary in 1880: "I noticed in a recent Tennessee report that, from an average force of less than 600 convicts, there were 257 escapes in two years."

The convict quarters in the main prison, at Nashville, are three separate stone wings, in each of which the cells rise one above another in four tiers. The total number of cells is 352. They are of three sizes. According to modern sanitary knowledge, a sleeping-room should never contain less than 800 cubic feet of air to each occupant; but, of these cells, 120 contain, each, only 309 cubic feet of space; another 120 contain, each, but 175 feet; the remaining 112 contain but 162 feet each; and nearly every one of these cells has two inmates. Thus a majority of the inmates are allowed an air space at night less than the cubic contents of a good-sized grave. The physician of the penitentiary reports that the air breathed in these cells is "almost insupportable." He says of the entire establishment, "No amount of remodeling or tinkering can make it comfortable or healthy." The hospital he and others report as badly constructed and too small. "There is no place for dressing the dead except in the presence of all the sick in the hospital, or in the wing in the presence of more than two hundred convicts." Other details are too revolting for popular reading.

The female department of the prison "overlooks the prison yard in plain view and hearing of the male convicts." "No woman," says the warden, "should be sentenced to the Tennessee penitentiary until the State makes better provision for their care." "Had I the pardoning power, I would relieve every woman now in the penitentiary and those who may be sentenced, until the State can or will provide a place to keep them, in keeping with the age in which we live." The chaplain reports these women as having "abandoned all hope and given up to utter despair, their conversation obscene and filthy, and their conduct controlled by their unrestrained passions." He indicates that he has abandoned all spiritual and moral effort among them; but, it is to be regretted, does not state by what right he has done so.

The discipline of this main prison, as of the "branches," seems to be only such as pro-

* One might hope these blanks were but omissions of ditto marks, although such marks are not lacking where required in other parts of the table; but the charitable assumption fails when it would require us to supply them under "Sunstroke" and opposite the date of December.

vides for efficiency in labor and against insurrection and escape. The warden's report intimates that modes of punishment of refractory prisoners are left "to the discretion of wardens and inspectors." "When the labor is hired out," he says, "the lessee demands punishment that will not cause him to lose the labor of the man." Thus he lays his finger upon the fact that the very nature of the Lease System tends to banish all the most salutary forms of correction from the prison management. "Under the present laws and customs," says this warden, "the Tennessee penitentiary is a school of crime instead of being a reformatory institution. . . . There are now about fifty boys in the penitentiary under eighteen years of age. . . . Nineteenths of them leave prison much worse than when they came. . . . They are thrown into the midst of hundreds of the worst criminals the State affords, sleeping in the same cell with them at night, and working at the same bench or machine in the day. . . . The young and the old, the comparatively good and the vilest and most depraved, are thrown promiscuously together."*

Even that superficial discipline which obtains in the prison, addressed merely against physical insubordination, is loose, crude, and morally bad. The freedom of intercourse among the convicts is something preposterous. The State is actually put into the position of bringing together its murderers, thieves, house-breakers, highwaymen, and abandoned women, and making each acquainted with all the rest, to the number of about five hundred a year. In an intelligently conducted prison, each convict carries his food to his cell and eats it there alone; but in this one the warden recommends that a dining-room be fitted up for 1200 persons. Convicts are given duties connected with the prison management; they are "door-keepers," and "wing-tenders," and "roll-callers." In one year the number of escapes from within its walls, not counting those made during the fire, was more than half as great as the total of escapes for an equal length of time from the State prisons of all New England, with New York, New Jersey, Pennsylvania, Maryland, Ohio, Indiana, and Illinois, where there were over 12,000 convicts. One *woman* escaped twice, and another one three times, both within the same ninety days.

The incapable simplicity of the prison's disciplinarians is pointedly shown again in a list

of no less than 101 convicts recommended for executive clemency, some for having helped to put out the fire in December, 1881, some for holding mutineers in check on the same occasion, and some for running and telling on certain fellow-convicts who were preparing to escape in disguise. Reformatory discipline can hardly be imagined as reaching a lower degree of imbecility.

The chaplain's report is a bundle of crude generalities, marked by a serene ignorance of the badness of affairs, and by a total absence of any tabulated or other form of accurate or useful observation. Some spelling, some reading, regular Sabbath service, Sunday-school, — all is recounted in indefinite quantities, except the 33 admissions into the "prison church." No feature is lacking of that well-meant but melancholy farce which religious prison work always must be, when performed without regard to the unique conditions of life to which it is addressed. During the winter of 1881-'82, the chaplain preached sometimes to the convicts at Ensley's farm, where "they seemed to enjoy the services very much"; and this is all he has to say of the place where men were being "found dead," and "killed," and "drowned," and "——"ed. Nor was his silence a mistaken discreetness; for he writes:

"The objects sought by imprisoning offenders being the security of society and the punishment and reformation of the guilty, I am glad to say that these objects are certainly in a large measure being accomplished in many cases in the management of our State Prison."

Having thus claimed a proprietary share in this rotten institution, he wisely concludes with an expression of timid uncertainty as to how many of his "prison church" membership will finally reach "the haven of eternal repose."

But are these bad conditions necessarily chargeable to the Lease System? No, and yes. They have been dwelt upon to show with what a state of affairs the system will content itself, its inspectors, the State legislators, and the community at large. It has nothing in it to produce a knowledge of and desire for a correct and honorable and truly profitable prison management. Its interests make directly against both individual and institutional reform. The plea of self-support on which it rests, the price it pays for its privileges, whether corruptly intended or not, are a bribe to officials and to public alike to close the ear against all suggestion of better things. For example, see the report of the two inspectors of the Tennessee prisons. Excepting a letter from another hand, quoted by them, their whole biennial report is less than one hundred lines. A little over half tells of the fire and the new workshops. A little less than half is given to the praise of the Lease

* The roll of the Mississippi penitentiary shows, December, 1881, in a total number one-third less, seventy boys to have been received into the prison under eighteen years of age, some of them being but twelve and thirteen, sentenced for life and terms in their probabilities equivalent to a life sentence.

System, upon the lonely merit of cash returns, and to a recommendation for its continuance. For the rest, they content themselves with pointing the Legislature to the reports of the superintendent, warden, physician, and chaplain of the penitentiary, whom, they say, "we indorse most heartily as attentive to their respective duties, and alive to every requirement of the law [which the warden reports as painfully barren of requirements] and the dictates of humanity in the discharge of their duty." However true this may be of the executive officers, it is certainly not true of the inspectors themselves. They do not certify to the correctness of a single roll or tabulated statement, or imply that they have examined any one of them. They do not present a statistical figure of their own, or recommend the taking of a single record among all the valuable registries that should be made, but are not, because the facts they would indicate are either absent or despised. Indeed, their silence is in a certain sense obligatory; for the omitted records, if taken, would condemn the system they praise, and the meager records that are given swarm with errors. It would have been hard for the inspectors to say anything worse for themselves than that they had examined the reports. The physician's is an almost unqualified denunciation of the whole establishment; the superintendent's is three-quarters of a page of generalities and official compliments; and the warden's tabulated statements confusedly contradict each other. Even the numerical counts are incorrect. One convict, distinctly named and described, appears in the list of escapes but once, and among the recaptures three times. One, reported escaped twice, is not once mentioned among the recaptures. Four convicts (one of them serving a nineteen years' sentence) reported among the recaptures are not on the prison roll, nor are they reported as pardoned, discharged, transferred, died, blanked, or in any other way disposed of. A convict, Zach. Boyd by name, under life sentence, expected soon to die of dropsy and recommended by the warden for executive clemency, is enrolled neither among the dead nor the living. The inference is irresistible that the prison's officers do not know how many convicts they have or should have. In the list of "Commutations," names occur repeatedly that are not in any list of inmates on hand or removed or released. Several convicts are reported as white men when they escaped and as colored when recaptured, and one or two pass through two such transformations. All search by the present writer for occasion to lay these errors upon the printer has proved unavailing. The

fault is in the prisons themselves and the system on which they are managed. Such a condition of accounts might be excused in the rosters of a retreating army; but it is not to be believed, while there is room for doubt, that the people of an American State will knowingly accept such stupid and wicked trifling with their State's good name and the safety of society, or even such a ghastly burlesque of net revenue.

IN NORTH CAROLINA.

YET when we pass across the boundaries of Tennessee and enter any adjoining State, excepting only Missouri, we find the same system in operation, operating viciously, and often more viciously than in Tennessee. North Carolina, during the two years ending October 31, 1880, held in custody an average of 1090 convicts. The penitentiary proper and its interior industries were being controlled under public account. Shoemaking, brickmaking, tailoring, blacksmithing, etc., the officers report, were either already profitable or could be made so, and their detailed accounts of receipts and expenditures seem to verify their assertions. The statistics of the prison are given, not minutely or very comprehensively, but intelligently as far as they go, and are valuable.

So much sunshine of right endeavor an unusually restrained Lease System lets in: the Lease System itself exists only without the walls. Only able-bodied convicts may be farmed out. But just at this point the notion bred from a total misconception of the true profits to be sought—the notion that a penal establishment must live upon its income—begins to show its fruit. "Every enterprise that the board of directors," says its president, "have been able to devise for using the labor that was compelled to remain in the prison has been either summarily crushed in its incipency or seriously crippled in its progress by the fact that we had not the means to carry them to a successful issue. Attempted economy, we believe, has proven a waste, and . . . the State has suffered by a niggardly use of its resources. The [permanent] buildings, too, have been carried too far to be now torn down, and less costly ones erected in their stead. They must, therefore, at some time, be completed; and so long as they are permitted to remain in their present unfinished condition, they are subject to damage, from exposure to weather, that will often necessitate work to be redone that would have been saved had they been steadily pressed to completion. There would, too, be incalculable economy in the police of the prison, if the convenient and compact build-

ing in progress of erection could speedily take the place of the scattered and imperfect wooden structures now in use; and the suffering endured by the convicts in extreme cold weather, which is no part of their sentence, but has been unavoidable under the circumstances, would cease to be a source of anxiety to the board of directors and a reflection upon the power whose duty it is to relieve it."

The warden reports these temporary buildings as devoid of all means for warming them, badly ventilated, and entirely unfitted for use. A part, at least, of the inmates were, it seems, congregated in a stockade, which was "liable to tumble at any time." The prison physician pronounced these temporary quarters "the fruitful cause of many deaths." The population *within* this penitentiary was generally about three hundred. About eight hundred, therefore, were scattered about in companies under lessees, and in the two years 1879-80 were at different times at work on six different railways and one wagon road. What their experiences were at these places can be gathered, by one at a distance, only from one or two incidental remarks dropped by the prison officers in their reports and from the tabulated records of the convict movement. There is no hospital record given concerning them, nor any physician's account of their sickness. When they drop off they are simply scored as dead. The warden says of them that many had "taken their regular shifts for several years in the Swannanoa and other tunnels on the Western North Carolina Railroad, and were finally returned to the prison with shattered constitutions and their physical strength entirely gone, so that, with the most skillful medical treatment and the best nursing, it was impossible for them to recuperate."

But such remarks convey but a faint idea of the dreadful lot of these unfortunate creatures. The prison physician, apologizing for the high death-rate within the walls, instances twenty-one deaths of men "who had been returned from the railroads completely broken down and hopelessly diseased." And when *these deaths are left out* of the count, the number of deaths *inside* the walls, not attributable to *outside* hardships, amounted, in 1880, to just the number of those in the prisons of Auburn and Sing-Sing in a population *eight times as large*. Ten-elevenths of the deaths for 1879 and 1880 were from lingering diseases, principally consumption. Yet, year in and year out, the good citizens of Raleigh were visiting the place weekly, teaching Sunday-school, preaching the gospel, and staring these facts in the face.

Now, what was the death-rate among the convicts working at railroad construction? The average number of prisoners so engaged in 1879 and 1880 was 776. The deaths, including the 21 sent back to die in prison, were 178, an annual death-rate of nearly eleven and a half per cent., and therefore greater than the year's death-rate in New Orleans in 1853, the year of the Great Epidemic. But the dark fact that eclipses everything else is that not a word is given to account for the deaths of 158 of these men, except that 11 were shot down in trying to escape from this heartless butchery.

In the light of these conditions, the warden's expressed pleasure in the gradual decrease in prison population since 1877 in North Carolina seems rather ill grounded and not likely to last. It is certainly amazing that men of the sincerest good intentions can live in full knowledge of such affairs, or, at least, within easy reach of the knowledge, and not put forth their protest against the system that fosters and perpetuates it. The North Carolina prison, it may be repeated, is managed, within its walls, on the public account; but it is the Public Account System suffocated under the Lease System and stabbed by the glittering policy of self-support. In 1880 alone the *Lease System, pure and simple*, set free upon the people of North Carolina, from its railroad gangs, 123 escaped criminals. The prison added 12 more. The recaptures numbered 42. Ninety-three remained at large; just 5 more than the *total* escapes for an equal period in every State prison of every State in this country, excepting the other eleven managed in whole or part upon the Lease System. The moral effect of such a prison life on men herded in stockades may be left to the imagination; but one other fact must be noted. In the two years 1879-80 there were turned into this penitentiary at Raleigh 234 youths under twenty years of age, not one of whom was under sentence for less than twelve months.

It only remains to be asked, For what enormous money consideration did the State set its seal upon this hideous mistake? The statement would be incredible were it attempted to give other than a literal quotation. "Therefore it will be seen," says the warden at the bottom of his résumé of accounts, "that the convicts have earned \$678.78 more than the prison department has cost for the two years ending October 31, 1880."

IN KENTUCKY.

IN Kentucky the management of the State prison seems to be in a stage of transition.

Facts that need no mention here* make allusion to it a particularly delicate task. Yet the writer may not assume that any one would desire that the truth be left unsaid. Upon the candor and generosity not only of Kentuckians, but of all the communities whose prisons come under this review, must the writer throw himself, trusting to find his words received in the same spirit of simple good citizenship in which they are offered.

After long experience with the Lease System, there was passed in May, 1880, an "Act to provide for the government, management, and discipline of the Kentucky penitentiary," by which the prison passed back from other hands into those of the State's appointed officers. The Lease System was not discarded; but certain very decided modifications were made in it, leaning toward the Contract System. The report made by the prison officers and board, eighteen months later, bears a general air of the sad confusion that commonly belongs to a late and partial extrication from disaster. It affords a retrospective view of the old system extremely unflattering; but it also gives evidence that certain State officers, conspicuously the Governor, were making an earnest and sagacious effort to reform the entire penal system of their commonwealth. Yet it seems plain again that they are not a little handicapped by that false popular idea of the prison's place in the State's governmental economy, upon which the Lease System thrives while the convict falls into moral and physical ruin and society's real interests are sold for old rags. It may be assumed that there is a reserved determination on the part of those who have taken the matter in hand, to raise the work of reform to the plane it should occupy as soon as the general sentiment can be brought to require it; but, meantime, the State's penal system has risen, from something worse, only to the level of the system in North Carolina.

The officers whom the State, pursuant to its scheme of renovation, placed in charge, put that scheme into practice, to use their own words, "whenever the costs of doing so involved only a small outlay." The building that contains the prisoners' cells, found "infested with all kinds of vermin known to institutions of the kind," with bad ventilation and rat-eaten floors, was purged, by convict labor, with coal-oil, fire, whitewash, and tar. The grounds around the women's quarters, "low and marshy, covered with water, in rainy weather, ankle-deep for days," were filled up. "Long rows of shanties or sheds, . . . unsightly and inflammable in the ex-

treme," long used in the hackling of hemp, were torn away. The hospital and chapel were cleaned and kept clean. Religious services were regularly afforded by an official chaplain and at intervals by a Catholic priest, and Sabbath instruction gradually took shape with (let it be said to their praise) members of the Governor's own family in charge. The diminutive and dilapidated library was put into shape and new books were added. But from here on, the friends of the prison could only pray for aid and relief. The principal industry continued to be, as it had been for many years, working in hemp, under circumstances that made it a distressing and unhealthful hardship. On the 1st of last January, 350 men were working in that department without ventilation or bath, and, says the warden, "the dust so dense that it is frequently impossible to recognize a man twenty feet distant." "It is certainly an act only of common humanity that the evil created should be counteracted by good and ample bathing facilities." In the hospital, as a fit adjunct to the hemp department, there were, in 1881, 144 cases of inflamed eyes and 202 of acute bronchitis. The kitchen was not adapted to the proper cooking of the prisoners' food, and the hospital's response was 616 cases of acute disease of the bowels and 101 of impoverishment of the blood. There was an entire absence of an intelligent *trained* reformatory treatment, in accordance with a knowledge of criminal character, recognition of the criminals' forfeited rights, and proper prison discipline. In this shape stood matters at the beginning of the year 1882, as viewed from without. The inside history can only be conjectured; but we get one glimpse of the convict's sentiment toward his choking, blinding, life-shortening daily task in the fact that, within the eighteen months of the new régime, five men purposely mutilated their hands so as to compel the amputation of fingers, and two others cut off, each, a hand at the wrist. What the fortunes of the convicts leased out upon railroad construction were and are, we are given no clew by which to tell; the report contains no returns from them, and we have only the same general assurance that all is well that is given as to those in Tennessee and North Carolina.

SOUTH CAROLINA.

ANOTHER view of the Lease System under limitations is afforded in the "Annual Report of the Board of Directors of the South Carolina Penitentiary for the fiscal year ending October 31, 1881." The prison is not only under a full corps of State officers, but, like the North Carolina prison, it is conducted

* At Louisville, Kentucky, where the convention before which this paper was read was then enjoying the hospitality of the State.

on public account, the convicts only being leased, and of these only such as are sent beyond the prison's walls. Yet the overwhelming consideration of self-support makes the spirit of the Lease System dominant over all. The reformatory features are crude, feeble, and purely accidental. The records are meager. The discipline is of that poor sort which is vaguely reported as "administered only when necessary," addressed simply to the prisoner's safe custody and the performance of his tasks. The escapes, from an average population of 632, were 36; the recaptures, 21. Most likely, to the popular eye, the numbers are not startling; but, if we look around to compare them with the record of some properly ordered prison of the same population, we see the warden of the Maryland penitentiary, under contract management, admitting with full explanation and apology the escape of one prisoner, the first in ten years. The number of escapes reported from the South Carolina prison would have been forty, had not four escaped convicts been "found drowned" within two or three days after their escape. A report with which such numbers will compare favorably can be found only by turning to other leased prison forces. One reason why it may there be found is that, in South Carolina, almost alone, a penalty attaches to the lessees for each escape. "There is now due the State," says the report, "in penalties for the escape of convicts under contract [meaning leased convicts] about \$25,000." In the chaplain's report, as in all chaplains' reports under the Lease System, and probably in many under better systems, is seen the familiar conjunction of pious intention with a strange oversight of the inadaptability, to the incarcerated criminal, of the ordinary technical methods of religion in society. What response can there be but a weary smile to the complacent announcement that in this prison "there are now about one hundred men and women who can repeat the Ten Commandments, the Lord's Prayer, the Apostles' Creed, and the whole of Capers' Catechism." But the humor fades out when it is added, "We have also a Sunday-school, regularly conducted by *intelligent convicts*." "I regard the State Penitentiary, as designed by its originators, as a great reformatory school, and I am happy to believe, from personal observation, . . . that this prime leading object is . . . being faithfully carried out." So writes this evidently sincere and zealous divine, in the face of the fact that the very foundation principles of reformatory treatment were absent, and that constantly a larger number of convicts were kept beyond his reach than were left for him to preach to.

One of the peculiar temptations which the Lease System holds out to the communities employing it, as such communities are represented in the jury-box, needs a moment's careful notice. The States where this system is in vogue are now, and have been for some years, enjoying a new and great development of their natural resources and of other industries than that colossal agricultural system that once monopolized their attention. There is, therefore, a vigorous demand for the opening and completion of extensive public works,—mines, railways, turnpikes, levees, and the like,—and for ways and means for getting them done as quickly and cheaply as possible. Now, it is with these potent conditions in force that the Lease System presents itself as the lowest bidder, and holds forth the seductive spectacle of these great works, which everybody wants and no one wants to pay for, growing apace by convict labor that seems to cost nothing. What is the consequence? We might almost assert beforehand that the popular sentiment and verdict would hustle the misbehaving, with shocking alacrity, into the State's prison under extravagant sentences or for trivial offenses, and sell their labor to the highest bidder who will use them in the construction of public works. The temptation gathers additional force through the popular ignorance of the condition and results of these penitentiaries, and the natural assumption that they are not so grossly mismanaged but that the convict will survive his sentence, and the fierce discipline of the convict camp "teach him to behave himself."

But there is no need to reason from cause to effect only. The testimony of the prisons themselves is before us, either to upset or else to establish these conjectures. A single glance at almost any of their reports startles the eye with the undue length of sentences and the infliction of penalties for mere misdemeanors that are proper only to crimes and felonies. In the Georgia penitentiary, in 1880, in a total of nearly 1200 convicts, only 22 prisoners were serving as low a term as one year, only 52 others as low a term as two years, only 76 others as low a term as three years; while those who were under sentences of ten years and *over* numbered 538, although ten years, as the rolls show, is the *utmost* length of time that a convict can be expected to remain alive in a Georgia penitentiary. Six men were under sentence for simple assault and battery,—mere fisticuffing,—one of two years, two of five years, one of six years, one of seven, and one of eight. For larceny, three men were serving under sentence of twenty years; five were sentenced each fifteen years; one, fourteen years; six, twelve years; thirty-

five, ten years; and one hundred and seventy-two, from one year up to nine years. In other words, a large majority of all these had, for simple stealing, without breaking in or violence, been virtually condemned to be worked and misused to death. One man was under a twenty years' sentence for "hog-stealing." Twelve men were sentenced to the South Carolina penitentiary, in 1881, on no other finding but a misdemeanor commonly atoned for by a fine of a few dollars, and which thousands of the State's inhabitants are constantly committing with impunity — the carrying of concealed weapons. Fifteen others were sentenced for mere assault and assault and battery. It is to be inferred — for we are left to our inferences — that such sentences were very short; but it is inferable, too, that they worked the customary loss of citizenship for life. In Louisiana, a few days before the writing of this paper, a man was sentenced to the penitentiary for twelve months for stealing five dollars' worth of gunny-sacks.

IN GEORGIA.

THE convict force of Georgia, already more than once alluded to, presents the Lease System under some other peculiarly vicious aspects. For example, the State is bound by, and is now in the fourth year of, a twenty years' lease. The convicts, on October 20, 1880, were 1185 or 1186 in number (the various exhibits of the biennial report differ widely in some of their statements). They were consigned to three penitentiaries in three different counties, each of which had "several branch camps." Thus they were scattered about in eleven camps over at least seven counties. The assurance of the "principal keeper" is that in all these camps they are humanely treated. Every "permanent camp" has a hospital, a physician, and a chaplain. But there are other camps that have none. Reports from other officials and from special committees of citizens repeat the principal keeper's assurance in the same general terms. And yet all these utterances unconsciously admit facts that betray the total unfitness of the management for the ends it ought to have in view and its gross inhumanity. From the "General Notice to Lessees" the following is taken, with no liberties except to italicize:

"In all cases of *severe illness* the *shackles* must be promptly removed." "The convicts shall be turned off of the *chain* on the Sabbath and allowed to recreate in and about the stockade." Elsewhere the principal keeper says, "When a convict is sick, the chains are to be taken off of him." As to the discipline, he reports 35 escapes (7 burglars, 3 house-burners, 9

murderers and would-be murderers, 1 forger, 3 robbers, 7 thieves, and others whose crimes are best unmentioned), with no recaptures; and the surgeon reports nine men killed, three of them by fellow convicts. "You will observe the death-rate to have greatly decreased in the last two years," says the principal keeper; but the death-rate, when observed, was found to have decreased only to about twice the rate of properly planned and managed establishments of the kind. This, he reports, is one-half what it had been. His tabulated statements relating to the convicts, though lamentably scanty, reveal an amount of confusion behind them that is hard to credit. One table, purporting to show the whole 1186 convicts in confinement, classified by the crimes under which they were sentenced, has not a single correct number in it, and is an entire hundred short in its true total. The numbers, moreover, are so far out of the way that they cannot possibly be the true exhibit of some other date substituted in error. They report 184 under sentence for burglary, whereas the roll shows 467, and they entirely omit 25 serving sentence for forgery, and 23 for robbery.

THE PARDONING POWER.

WE have already noticed, in the prison and convict camps of this State, the feature of cruel sentences. Let us look at another; to wit, lavish pardons. It is but typical of the prisons under the Lease System, wherever that is found in unrestrained operation. Here may be seen a group of penal institutions, the worst in the country by every evidence of their own setting forth: cruel, brutalizing, deadly; chaining, flogging, shooting, drowning, killing by exhaustion and exposure, holding the criminal out to the public gaze, publishing him to the world by name and description in its reports when he goes in, every alternate year while he stays in, and when he dies or goes out; putting under foot every method of reform worthy of prison science, mocking such intelligent sense of justice and mercy as he may have, and doing everything that can be done to make his heart and conscience harder than the granite of his prison walls. Yet these prisons are sending forth from their gates a larger percentage of their populations, pardoned, than issues in like manner from all the prisons of the country managed on intelligent reformatory systems. Nor can the fault be confidently imputed, as is often hastily done, to political design or mere pliability in State governors. The horrors of the convict camps, best known to the executive, the absence of

a discipline calculated to show who is worthy of clemency, the activity of outside friends usurping this delicate office, are potent causes; and the best extenuation that can be offered is that a large proportion of these pardons are granted not because the prisoner has become so good, but because the prison is so bad.

IN TEXAS.

THIS is conspicuously the case in Texas. In the two years ending October 31, 1880, the Governor pardoned one hundred State convicts from the Huntsville (Texas) penitentiary. Over one-fourth were *children from ten to sixteen years of age*, and nearly another fourth, says the superintendent, "were hopelessly diseased, blind, crippled, or demented, . . . simple objects of pity, the sight of whom would have excited commiseration in hearts of stone."

For some years past Texas has had in custody about two thousand convicts at once. They are under the Lease System, some of whose features, at least, give dissatisfaction to the State's prison directors and to its Legislature. The working of convicts remote from the prison, though practiced, is condemned, and the effort is being made to bring the management into conformity with a statute that requires as many of the convicts as can be to be employed within the penitentiary walls. Two different reports of the directors, covering a period of four years, impress their reader as the utterances of men of the best disposition, sincerely desiring to promote humanity and the public good, but handicapped, if not themselves in some degree misled, by the error of making self-support the foremost consideration in all their estimates of prison methods. "To provide for their employment, so that they will cease to be a *burden upon the tax-payers of the country*," would be counted a strange proposition to apply to courts, schools, or police, yet is assumed by them, as a matter of course, to be applicable to prison populations, and so becomes the barrier from which they recoil, and which they have allowed to throw them back into the mire of the lease system. "This problem," they say, "has long engaged the attention of philanthropists and statesmen." But they mistake. The real problem that has engaged such is, How to procure the most honorable and valuable results, and to pay for them whatever is necessary and no more. It was, unfortunately, under the shadow of these mistakes that the Texas board went so far as to "consider very seriously as to whether it should not adopt the Public Account or the Contract System," only to reject the one and to fail to get bids on the other. As a result the State

stands to-day bound, for fourteen years to come, by the Lease System, the worst prison system in Christendom, a system that cannot be reconciled with the public honor, dignity, or welfare. The board intimates plainly that this Lease System is not its choice, or at least would not be but for the nightmare of self-support. As it is, they strive to make the best of a bad matter. How bad it has been and is, a few facts will show.

It is said of the Huntsville penitentiary, Texas (an additional one has just been built at Rusk), that it was built "on the old plan, looking altogether to security, and without any regard to proper ventilation or the health or comfort of the inmates, . . . the cell buildings . . . to a considerable extent cut off from light and air, and in constant danger of destruction from fire." The prison board erected a new cell building to take its place, in which each cell has a cubic content of 384 feet, and, says the board, "can comfortably accommodate two men." This gives each occupant an air space one-quarter of the minimum necessary to health. Yet this was a great improvement. It may be mentioned in passing, as an incident very common under the Lease System, that about the same time a lot of machinery, the property of the State, valued on the inventory of one lessee after another at \$11,600, was sold for \$681, and the proceeds laid out in fifty-one breech-loading, double-barreled shot-guns. The following is from the superintendent's biennial report of October 31, 1880: "The most usual mode of punishment practiced at outside camps is by stocks. . . . Most of the sergeants, in order to make it effective, have lifted the convicts on the ball of the foot, or tiptoe, . . . jeopardizing not only health, but life. The [present] lessees . . . abolished the use of stocks at their wood camps, and I rejoice that you [the directors] have determined to abolish them altogether. On many of the farms sergeants have been in the habit of . . . whipping, as well as permitting their guards to do so, without first obtaining an order from the board of directors, as required by law." Of illegal punishments he says: "We have been compelled to discharge sergeants and a great number of guards on account of it. . . . I am satisfied that many escapes have been caused by illegal punishments and by cursing and threats." The spirit of this officer's report does him honor throughout.

One can turn again only to leased prisons elsewhere, to find numbers with which to compare the ghastly mortality of some of these Texas convict camps. Men in large numbers, "who have contracted in the miserable jails

of the State incurable diseases, or whose systems have been impregnated with diseases from having led lives of debauchery and dissipation, are put to the hardest manual labor and . . . soon break down in health." "Sick convicts are crowded into the same building containing well convicts, and cannot have proper nursing and quiet, even if they have good medical attention." "Frequently sergeants, believing that convicts are trying to play off, have kept them at work when, in fact, they were seriously ill, . . . or have tried to physic them themselves." On railroad construction the average *annual* rate of mortality, for 1879 and 1880, was 47 to the thousand, three times the usual death-rate of properly managed American prisons; at plantation labor it was 49; at the iron-works it was 54; and at the wood-cutting camps more than half the entire average population died within the two years. So much as to the rate. The total *number* of deaths in the period was 256, of which only 60 occurred in the prison hospital, the rest in the camps. Nor was any considerable fraction of them by contagious diseases. They were from congestions of the brain, the stomach, and the bowels; from scurvy, dropsy, nervous fever, malaria, chronic diarrhoea, general debility, pneumonia. Thirty-five died of gun-shot wounds, five of "*wounds miscellaneous*." Of three, the cause of death was "not stated." Three were drowned, four were sunstruck, two committed suicide, and two were killed by the explosion of a boiler. And all was reported without a word of apology or explanation. The whole thirty-five who were shot to death were shot in attempting to escape "from forces at work outside the prison walls." "In nearly all these cases the verdict of a coroner's jury has stated that the guard acted in discharge of his duty." As to the remainder, we know not what the verdicts were, or whether there were any; nor do we know how many vain attempts were made to escape; but we know that, over and above the deaths, there were treated in the prison hospital—where so few of the outside sick ever arrived—fifteen others with gunshot wounds and fifty-two with "*wounds miscellaneous*."

We know, too, by the record, that four men did escape from within the prison walls, and three hundred and sixty-two from the gangs outside. In the interest of the Texas taxpayer, from whom the Lease System is supposed to lift an intolerable burden, as well as for society at large, it would be well to know what were the favorite crimes of these three hundred and sixty-six escaped felons (since unreformed criminals generally repeat the same crimes again and again), what moral

and material mischief one hundred and twenty three of them did before they were recaptured, and what the record will be of the two hundred and forty-three remaining at large when the terms they should have served have expired. These facts are not given; we get only, as it were, a faint whiff of the mischief in the item of \$6,900 expended in apprehending one hundred of them.

And yet this is the operation of the Lease System under a Governor who was giving the State prison and its inmates a far more rational, humane, and diligent attention than is generally accorded them by State executives, albeit such officers are not as negligent in this direction as they are generally supposed to be; under a warden, too, who, if we read rightly between the lines of his report, is a faithful and wise overseer; and even under lessees whom this warden commends as "kind and humane gentlemen." We have both the warden's and directors' word for it, that this disciplinary and sanitary treatment of the convicts was "a very decided improvement" on what it had been. The question remains, What may the system do where it is a State's misfortune to have a preoccupied Governor and unscrupulous prison lessees? It is a positive comfort to know that for two years more, at least, the same officials and lessees remained in charge, that a second prison was added to the old one and a third projected, and that the total mortality was reduced by the abolition of the wood-cutting camps.

But it is far otherwise to know by the report for 1881-82 that the Lease System continues; that the death-rate is still enormous, and has increased in the prison and in most of the camps; that the number of men committed to hospital with gunshot and "*miscellaneous*" wounds was fifty-two; that in the mortality lists are three suicides, six sunstrokes, and thirty-six victims of the breech-loading double-barreled shot-guns; that there passed through hospital fifty-one cases of scurvy; and that there were *three hundred and ninety-seven escapes* and but seventy-four recaptures.

It may be enough attention has already been given to chaplains' reports in these so-called penitentiaries, but the one for the Texas prison compels at least a glance. It makes sixteen lines of letter-press. White men's prayer-meeting on Sunday at one hour, colored men's at another, general Sunday-school at another, preaching at another. These services are believed to have been fruitful of good; it is hoped "that some will leave the prison reformed men"; but there is not the record of one positive result, or a single observation registered looking to the discovery of a result,

either intellectual, moral, or religious, concerning hundreds of men whose even partial reformation would be worth to the State—if it must be reduced to money value—tens of thousands of dollars. Two lines of the report are certainly unique: "We endeavor to enlist all the men in this service [the Sunday-school] we can, and try to suppress all differences of opinion which are calculated to engender strife."

A single ten thousand dollars is the State's annual share in what are called the profits of this system of convict control. Were the convicts managed under the Public Account System at an annual loss of a like amount (which need not be), making a difference of twenty thousand dollars, and were the burden lifted from the mass of the one million six hundred thousand inhabitants of Texas and thrown entirely upon the shoulders of one hundred thousand tax-payers, it would be just one dime a year to each shoulder. But it would save the depredations of nearly two hundred escaped convicts per year, whatever they might be; such reprisals as about four hundred others, annually liberated and turned loose upon society, may undertake as an offset for the foul treatment they have undergone in the name of justice, and the attendant increase in the expenses of police; and the expenses of new trials and convictions for the same old crimes committed over again by many who might have been in whole or in some degree reformed, but instead were only made worse. And two things more it would save—the honor of the State and the integrity of the laws and of the courts. For one thing, however, the people of Texas are to be congratulated: that they have public servants ready—let the people but give the word—to abjure the Lease System with all its horrid shams and humiliating outrages, and establish in its place a system of management that shall be first honorable and morally profitable, and then as inexpensive as may be.

IN ALABAMA.

SOMETHING like the same feeling was displayed by the Governor and some others in the State of Alabama in 1882. In the matter of its penitentiary and convict camps, it is not necessary to weary the eye again with figures. Between the dates of the last two biennial reports (1880 and 1882) a change of administration took place in the prison management, affording, by a comparison of the two reports, a revelation that should have resulted in the instant abolition of the Lease plan at any cost. Under date of October, 1880, the penitentiary inspectors reported to the Governor that the contractors (lessees) had "provided

strong prisons for the safe-keeping and comfort of the convicts"; that these prisons had "generally been neatly kept," and that they themselves had "required much attention to be given to the sanitary regulation of them." They admitted the fact of considerable sickness at one or two places, but stated that two of the inspectors had visited the convicts employed there and "found the sick in a comfortable hospital, with medical attendance, nurses, and everything needed for their comfort." They reported their diligent attention to all their official duties, and stated, as from their own knowledge, that during the two years then closing the convicts had "generally been well clothed and fed, and kindly and humanely treated; and that corporal punishment had only been inflicted in extreme cases." They closed with the following remarkable statement: "Notwithstanding our report shows a decrease of one hundred and fourteen convicts, . . . yet we think . . . the future of this institution is brighter than its past." There had been paid into the State treasury forty-eight thousand dollars, and the managers in general were elated. But a change in the prison's administration added a different chapter, and in 1882 a new warden wrote:

"I found the convicts confined at fourteen different prisons controlled by as many persons or companies, and situated at as many different places. . . . They [the prisons] were as filthy, as a rule, as dirt could make them, and both prisons and prisoners were infested with vermin. . . . Convicts were excessively and, in some instances, cruelly punished. . . . They were poorly clothed and fed. . . . The sick were neglected, inasmuch that no hospital had been provided, they being confined in the cells with the well convicts. . . . The prisons have no adequate water supply, and I verily believe there were men in them who had not washed their faces in twelve months. . . . I found the men so much intimidated that it was next to impossible to get from them anything touching their treatment. . . . Our system is a better training school for criminals than any of the dens of iniquity that exist in our large cities. . . . To say there are any reformatory measures used at our prisons, or that any regard is had to kindred subjects, is to state a falsehood. The system is a disgrace to the State, a reproach to the civilization and Christian sentiment of the age, and ought to be speedily abandoned."

Almost the only gleams of light in these dark pictures are these condemnations of the system by those whose official duties require them to accommodate themselves to it, but whose humanity, whose reason, and whose perception of the public's true interest compel them to denounce it. This is again pointedly the case in Virginia. There the State prison has been for a long time managed on Public Account; but the management was only a mismanagement and a neglect; and when this came to be known, those in authority, instead of trying to correct the needless abuses

of a good system, rejected the system itself and adopted the contract system. The report of the prison board for the year ending September 30, 1881, indicates that the change was made mainly, and probably only, on pecuniary considerations, and there seems to be reason to fear that this narrow view is carrying sentiment downward toward the Lease System itself. The board reports itself "pleased to discover, for the first time, that the general agent has reached the conclusion that the 'best way to make it [the prison] self-sustaining would be to lease the convict labor.'" At the date of this report the mischievous doctrine had already made its way through the Legislature and into the convict management; and the prison becoming overcrowded, a large company of prisoners were leased to certain railroad companies, beyond the control of the penitentiary superintendent. A glance at the surgeon's report shows one of the results of this movement. In the population within the prison, averaging about 600, the death-rate was $1\frac{1}{2}$ per cent.; while among the 260 convicts on the Richmond and Alleghany Railroad it was nearly $8\frac{1}{2}$ per cent., even after leaving out of the count certain accidental deaths that legitimately belong to the perils of the work and really should be included in the count. Including them, the rate would be 11 per cent. The superintendent does not withhold his condemnation: "The system of leasing," he says, "as is clearly shown by the statistics of the few governments, State and foreign, where it prevails, is barbarous in the extreme, and should be discountenanced. The dictates of humanity, if no other consideration prevailed, should be sufficient to silence any effort to establish this system of prison management in Virginia."

IN ARKANSAS, MISSISSIPPI, AND LOUISIANA—
THE SYSTEM AT ITS WORST.

EVEN where the system enjoys the greatest favor from the State governments whose responsibilities in the matter it pretends to assume, it is rare that there is not some one who revolts and utters against it his all too little heeded denunciation. Such voices are not altogether unheard even in Arkansas, Mississippi, and Louisiana, where undoubtedly the lessees are more slackly held to account, as they more completely usurp the State's relation to its convicts than elsewhere. It is here may be found a wheel within this wheel; to wit, the practice of sub-leasing. So complete in these regions is the abandonment, by the State, of all the duties it owes to its criminal system, that in two instances, Arkansas and Louisiana, it does not so much as print a report,

and the present writer is indebted entirely to the courtesy of the governors of these two States for letters and manuscript tables imparting the information which enables him to write. "The State," says the clerk of the Louisiana penitentiary, "has no expense except keeping the building in repair." "The State," writes the Governor's secretary in Arkansas, "is at no expense whatever." In Mississippi, the terms of the present lease make no mention whatever of any moral, religious, or educational privilege, or duty. "All convicts sentenced for a period of ten years or less, said lessees may work outside the penitentiary, but within the limits of the State of Mississippi, in building railroads, levees, or in *any private labor or employment*." One of the effects of such a rule is that a convict condemned to thirty or forty years' service, being kept within the walls, has fully three chances to one of outliving the convict who is sentenced to eight or ten years' service, and who must, therefore, work outside. Yet it is not intended to imply that the long-term convict inside the prison is likely to serve out his sentence. While among a majority of commitments on shorter periods, men, women, and children are frequently sentenced for terms of 15, 20, 30, 40, and sometimes even of 50 years, a prisoner can rarely be found to have survived ten years of this brutal slavery either in the prison or in the convict camp. In Alabama, in 1880, there were but three who had been in confinement eight years, and one nine; while not one had lived out ten years' imprisonment. In Mississippi, December 1, 1881, among 77 convicts then on the roll under 10 years' sentence, 17 under sentence of between 10 and 20, and 23 under sentences of between 20 and 50 years, none had served 11 years, only 2 had served 10, and only 3 others had served 9 years.* There were 25 distinct outside gangs, and their average annual rate of mortality for that and the previous year was over 8 per cent.

During the same term, 142 convicts escaped; which is to say that, for every four law-breakers put into the penitentiary, one got away; and against the whole number so escaping there were but 25 recaptures. The same proportion of commitments and escapes is true of the Arkansas prison for the year ending the 30th of last April. In Louisiana the proportion is smaller, but far from small. A surer escape in Louisiana was to die; and in 1881 14 per cent. perished. The means are wanting to show what part of this mortality belongs to the peniten-

* From the nature of the tabulated roll, the time served by those under life sentences could not be computed; but there is no reason to suppose it would materially change the result, were it known.

tiary at Baton Rouge and what to the camps outside; but if anything may be inferred from the mortal results of the Lease System in other States, the year's death-rate of the convict camps of Louisiana must exceed that of any pestilence that ever fell upon Europe in the Middle Ages. And as far as popular rumor goes, it confirms this assumption on every hand. Every mention of these camps is followed by the execrations of a scandalized community, whose ear is every now and then shocked afresh with some new whisper of their frightful barbarities. It is not for the present writer to assert, that every other community where the leasing of convicts prevails is moved to indignation by the same sense of outrage and disgrace; yet it certainly would be but a charitable assumption to believe that the day is not remote when, in every such region, the sentiment of the people will write, over the gates of the convict stockades and over the doors of the lessees' sumptuous homes, one word: *Aceldama*—the field of blood.

CONCLUSIONS.

THERE never was a worse falsification of accounts than that which persuades a community that the system of leasing out its convicts is profitable. Out of its own mouth—by the testimony of its own official reports—what have we not proved against it? We have shown:

1. That, by the very ends for which it exists, it makes a proper management of prisons impossible, and lays the hand of arrest upon reformatory discipline.

2. That it contents itself, the State, and the public mind, with prisons that are in every way a disgrace to civilization.

3. That in practice it is brutally cruel.

4. That it hardens, debases, and corrupts the criminal, committed to it by the law in order that, if possible, he may be reformed and reclaimed to virtue and society.

5. That it fixes and enforces the suicidal and inhuman error, that the community must not be put to any expense for the reduction of crime or the reformation of criminals.

6. That it inflicts a different sentence upon every culprit that comes into its clutches from that which the law and the court has pronounced. So that there is not to-day a single penitentiary convict, from the Potomac around to the Rio Grande, who is receiving the sentence really contemplated by the law under which he stands condemned.

7. That it kills like a pestilence, teaches the people to be cruel, sets up a false system of clemency, and seduces the State into the committal of murder for money.

8. That in two years it permitted eleven hundred prisoners to escape.

Which of these is its profitable feature? Will some one raise the plea of necessity? The necessity is exactly the reverse. It is absolutely necessary to society's interests and honor that what the lease in its very nature forbids should be sought; and that what it by nature seeks should be forbidden.

EXCUSES FOR THE SYSTEM.

THERE are two or three excuses often made for this system, even by those who look upon it with disfavor and protestations, and by some who are presumably familiar with the facts concerning convict management in other States and other countries. But these pleas are based upon singularly unfounded assumptions. One is that the States using the Lease System, in whole or part, have not those large prison populations which are thought to be necessary to the successful operation of other systems. In point of fact, much the largest population belonging to any one prison in the United States, in 1880, was in Texas, under the Lease System. The fourth in numbers is that of Tennessee, also leased. That of Georgia, leased, is more than twice that of Maryland, managed on the Contract System. The smallest State prison population in the United States, that of Rhode Island, numbering, at the close of last year, only eighty-one convicts, showed a loss that year, on the Contract System, of only eleven dollars. Missouri manages a convict population of the same size as that of Georgia, and boasts a cash profit, on the Contract System. Indeed the State prisons under the Lease System are, almost without exception, populous prisons, the average population among the whole twelve so governed being 920, while that of the thirty-three that exclude the system is but 560.

Another unfounded assumption is that the prisons working under the Contract or the Public Account System receive their inmates largely from the ranks of men skilled in trade. The truth is, the strongest argument in favor of teaching trades in prison lies in the fact that men with trades keep out of prison, or appear there only in decided minorities, in any community; and prisons everywhere receive especially but few acquainted with the two or three or five or six skilled industries that happen to be carried on within their walls. It is assumed, again, that the great majority of the inmates of our leased prisons are not only without mechanical training, but without mechanical aptitude. Yet, in fact, there is quite enough skilled work taught to

just this class in just these prisons to make void the argument. Within the walls of the Virginia State penitentiary in September, 1881, under the Contract System, tobacco, shoes, barrels, and clothing were being made with a force of which three-fifths were black men. The whole force of the Maryland prison is engaged, within its walls, under contractors, in marble-cutting and the manufacture of shoes, stoves and hollow iron-ware, and in November, 1881, consisted of five blacks to every three whites, and of the entire number not one in ten was previously acquainted with any handicraft that could be of any service to him in any of these occupations.

Moreover, on the other hand, there is no leased prison that does not constantly receive a sufficient number of skilled convicts, both white and black, to constitute a good teaching force for the training of the unskilled. The Texas penitentiary, in 1880, had on its rolls 39 workers in wood, 20 in leather, 50 in metals and machinery, 20 in stone and brick, 7 engravers and printers, and 11 painters.

The leased prisons, as it happens, have one decided advantage in this regard; the high average term of sentences affords an unusual opportunity for training the convicts to skilled labor, and making the best use, both pecuniary and reformatory, of their occupations. The South Carolina penitentiary is probably an exception; and yet it is in this prison that the manufacture of shoes, say its officers, might easily be carried on with cash profit. In the Georgia penitentiary, in 1880, there were 87 sentenced for life; 104 for terms above ten years and less than twenty; 101 for twenty years; 10 for higher terms up to forty years, and only 22 for as low a term as one year,—in a total of 1185 inmates. In the Texas State prison, in October, 1882, with a population of 2378, only *two* were under sentences of less than two years' length.* To increase the advantage, the long sentences fall with special frequency upon the class that is assumed to require an undue length of training. In the Georgia convict force just noted, for instance, only 15 were whites among the 215 under sentences above ten years.

But why need we linger to show that there is ample opportunity in these prisons to teach the inmates trades, if only the system were such as to permit it? The choice of a better system does not rest upon this. In the Contract and Public Account prisons, it is not at all the universal practice to make the unskilled convict acquainted with a trade. This is done only in a few prisons. Generally,—

much too generally,—he is set to some simple task, some minute fraction of the work of manufacturing some article, a task that he learns to do at most in a few days, becomes skillful in within a few weeks, and continues to do unceasingly from the beginning of his imprisonment to the day of his discharge. He works a lever or pedal that drives pegs into a shoe; or he turns down or up the rims of hats, or varnishes the heels of innumerable boots, or turns a small wheel that bottoms countless tin cans. He is employed according to his physical strength and his intelligence. It is no small misfortune to society that such industries leave the convict at last without a trade; but, comparing them with the tasks of the lessees' camps, it may be said they do not murder him, nor torture him, but are to those tasks what light is to darkness.

After all, these objections to the abandonment of the Lease System, even if they were otherwise well grounded, would fail at last when it comes to be seen that the system does not make good even its one poor profession; it does not, even pecuniarily, "pay." In flush times it hands in a few thousands,—sometimes even a few ten-thousands,—annually, into the State treasury. But its history is a long record of discoveries and rediscoveries on the part of the State that she has been the losing party in a game of confidence, with nobody to blame but herself. How much has thus been lost morally, baffles estimation; suffice it to say, enough ungodly gains have gone into the hands of lessees to have put every leased prison in the country upon a firm basis under Public Account. Every system is liable to mismanagement, but there are systems under which mismanagement is without excuse and may be impeached and punished. The Lease System is itself the most atrocious mismanagement. It is in its very nature dishonorable to the community that knowingly tolerates it, and in its practical workings needs only to be known to be abhorred and cast out. It exists to-day, in the twelve American commonwealths where it is found, because the people do not know what they are tolerating.

But is there any need for them longer to be unaware of it? There is none. Nor is there any need that the system should continue. We have heard one, who could give no other excuse, urge the unfavorableness of the Southern climate to prison confinement. But what have the reports of prisons in this climate shown us? That the mortality outside, among the prisoners selected (as is pretended, at least) for their health and strength, is twice and thrice and sometimes four and five times

* Some idea of the ferocity of these sentences may be got from the fact that 509 of these Texas convicts were under twenty years of age.

as great as among the feebler sort left within the walls. True, some of the leases still have many years to run. What of it? Shall it be supinely taken for granted that there is no honorable way out of these brutal and wicked compacts? There is no honorable way to remain under them. There are many just ways to be rid of them.

Let the terms of these leases themselves condemn their holders. There is no reasonable doubt that, in many States, the lessees will be found to have committed acts distinctly forfeiting their rights under these instruments. Moreover, with all their looseness, these leases carry conditions which, if construed as common humanity and the honor of the State demand, will make the leases intolerable to men whose profits are coined from the flesh and blood of human beings. It is safe to say there is not a lessee in the twelve convict-leasing States who,

were he but held to account for the excesses in his death-roll beyond those of prisons elsewhere in enlightened countries, would not throw up his unclean hands in a moment and surrender to decency, honesty, humanity, and the public welfare. But we waste words. No holder of these compacts need be driven to close quarters in order that, by new constraints, they may be made to become void. They are void already. For, by self-evidence, the very principles upon which they are founded are *contra bonos mores*; and though fifty legislatures had decreed it, not one such covenant can show cause why the seal of the commonwealth and the signatures of her officers should not be torn from it, and one of the most solemn of all public trusts returned to those official hands that, before God, the world, and the State, have no right to part with it.

George W. Cable.

KEATS.

ON the slope of a "peak in Darien," in the shadow of the very ridge where stood the Spaniard,

" . . . when with eagle eyes
He stared at the Pacific, and all his men
Looked at each other with a wild surmise,"

my fellow-traveler captured a superb blue moth, of a species so rare and so difficult to secure that the natives sell one at the price of a day's labor. We took the beautiful creature with us on our transit, and delicately leashed it that night to the jealousies of our veranda on the plaza of the city of Panama. There, far within the old town, a mate was fluttering around it at sunrise,—to me a miracle, yet one predicted by my friend the naturalist. It is just as safe to predict that young poets will chance upon one another, among millions; "there's a special providence" in their conjunction and forgathering; instinct and circumstance join hands to bring this about. The name of Keats is set within a circlet of other names,—those of Clarke, Reynolds, Hunt, Charles Brown, the artists Haydon and Severn,—each of which is brighter for the fact that its owner gave something of his love and help to the poet whose name outshines them all. The name itself, at first derided as uncouth, has become a portion of the loveliness which once he made more lovely; it belongs to an ideal now so consecrate that all who watched with him, if but for an hour, have some part of our af-

fections. Among these, if last not least, Severn, who shut out his own fair prospects, relieved a comrade's agony and want, accompanied him along the edge of a river that each must cross alone, until, as sings the idyllist, the eddy seized him, and Daphnis went the way of the stream.

Cowden Clarke, Keats's earliest companion in letters, son of his head-master at the Enfield school, first put Spenser into his hands. At the vital moment, when the young poet had begun to plume his wings, Clarke also made him known to Leigh Hunt, of all men in England the one it behooved him to meet. Hunt, whose charming taste was almost genius, had become—and largely through his influence upon associates—the promoter of a renaissance; he went to the Italian treasure-house, where Chaucer and Shakspeare had been before him, and also, like them, disdained not our natural English tongue and the delight of English landscape—the greenest idyl upon earth. In many ways, since fortunate guidance will save even genius years of groping, he shortened the course by which Keats found the one thing needful, the key to his proper song. When the youth settled down for a real effort, he went off by himself, as we know, wrote "Endymion," and outdid his monitor in lush and swooning verse. But it was always Hunt who unerringly praised the finest, the most original phrases of one greater than himself, and took joy in assuring him of his birthright.

Shelley, too, Keats met at this time,—the peer who was to sing his dirge and pæan. Meanwhile, his own heroic instinct, the prescience of a muse “that with no middle flight intends to soar,” was shown by his recognition of the greatest masters as he found them,—Chaucer, Spenser, Chapman, Shakspeare, Milton,—and his serious study of few besides. One must have exemplars and preceptors; let these be of the best. Neophytes often are drawn to the imitators of imitators, the catch-penny favorites of the hour, and this to their own belittlement. The blind still lead the blind. Give an aspirant the range of English song, see the masters that attract him, and it is not hard to cast his horoscope.

Pity is akin to love, when not too self-conscious of good fortune and the wisdom that leads thereto. Keats died so young, and so piteously, that some writers, to whom his work has yielded profit and delight, naïvely regard him from the superior person's critical or moral point of view. Lowell, however, pays honor to the “strong sense” underlying his sensibility. When Mr. Lowell said that “the faults of Keats's poetry are obvious enough,” he plainly had in mind the faults of the youth's early work,—extravagances from which he freed himself by covering them in that sculptured monument, “Endymion,” with divine garlands and countless things of worth that beguile us once and again to revisit their tomb. Nor can we take him to task for careless rhymes thrown off in his correspondence. Of their kind, what juvenile letters are better, and who would not like to receive the letters of such a poet at play? Keats is the one metrical artist, in his finer productions, quite without fault, wearing by right, not courtesy, the epithet of Andrea del Sarto. Rich and various as are the masterpieces of the language, I make bold to name one of our shorter English lyrics that still seems to me, as it seemed to me ten years ago, the nearest to perfection, the one I would surrender last of all. What should this be save the “Ode to a Nightingale,” so faultless in its varied unity and in the cardinal qualities of language, melody, and tone? A strain that has a dying fall; music wedded to ethereal passion, to the yearning that floods all nature, while

“ . . . more than ever seems it rich to die,
To cease upon the midnight with no pain.”

Then what pictures, echoes, immortal imagery and phrase! Can a word or passage be changed without an injury, and by whom? The “Ode on a Grecian Urn” is a more objective poem, molded like the cold Pastoral

it celebrates, radiant with the antique light and joy. Could Beauty speak, even thus might she declare herself. We term Keats a Grecian, and assuredly the English lad created, in latest-born and loveliest semblance, the entire breed of “Olympus” faded hierarchy.” But what of “The Eve of St. Agnes”? Is it not the purest mediæval structure in our verse—a romance-poem more faultless, in the strict sense of the word, than larger models of earlier or later date? In proportion, color, exquisite detail, it is comparable to some Gothic hall or chapel of the best period; and just as surely “Isabella” is Florentine, and equally without flaw. These poems are none the less charged with high imaginings, Keats being one of the few whose imagination is not lessened by technical supremacy. The sonnet on Chapman's Homer was, in this respect, a foretaste of the large utterance to which he afterward attained. “Hyperion,” with its Titanic opening and Doric grandeur of tone inviolate from first to last, was a work which the author, with half his power still in reserve, left unfinished, in the loftiest spirit of self-criticism, avowing that it had too many Miltonic inversions. The word “faults” is, in truth, the last to use concerning Keats. His limitation was one of horizon, not of blemish within its bounds.

As regards verbal expression, a close test of original power, he certainly outranks any poet since Shakspeare. Others are poets and something more, or less,—reformers, men of the world, or, like Körner and Chénier, aglow for heroic action. Keats had but one ambition; he was all poet, and I think he would have remained so. However possible the grotesque changes contrived for Byron and Burns in Hawthorne's fantastic draft of “P's Correspondence,” the romancer felt that Keats would never become transformed, and pictured him as still true to the ideal. Shelley worshiped Goodness and Truth in the Beauty to which he vowed that he would dedicate his powers. Of Keats, one may say that his genius was Beauty's other self. In “Wuthering Heights,” Catharine Earnshaw avows: “I *am* Heathcliff! He's always, always in my mind: not as a pleasure, any more than I am always a pleasure to myself, but as my own being.” And Keats *was* Beauty, with the affinity and passion of soul for soul.

It is hard to hold him to account for an early death from inherited phthisis, aggravated by bleeding at the hands of an old-time surgeon, or for the publication, after sixty years, of his turbid love-letters to Fanny Brawne,—letters in which, though probably the recipient flattered herself otherwise, there

THE LIFE-MASK OF JOHN KEATS.

is less of the real Keats than in the most trivial verse he ever wrote. If you would know an artist's true self, you must discover it through his art. It was deplorable that these poor letters should be brought to light; let us at least give them no more than their true proportion in our measure of the writer's strength and weakness. Mr. Arnold is warranted in contempt for those who enjoy the one letter that he quotes, and who profess to consider it a "beautiful and characteristic production." It reveals, as he asserts, "complete enervation," and I own that for the moment Keats appears to be "passion's slave." Nevertheless, why yield one jot or tittle to the implication that the old taunt of Blackwood's is sustained by this letter of a "surgeon's apprentice,"—that anything "underbred and ignoble" can be postulated from even the entire series of these spasmodic epistles? A theory that such a youth as Keats was "ill brought up" cannot be thus deduced; the reverse, all things considered, seems to have been the case. Furthermore, it may be that the evolution of a poet advances quite as surely through experience of the average man's folly and emotion as through a class training in reticence, dignity, and self-restraint. In the first glow of ambition Keats inscribed "Endymion" to the memory of Chatterton, and gladly would have equaled that sleepless soul in fate, so were he equal to him in renown. Afterward, in his first experience of passion, he yielded to morbid sentiment, self-abandonment, the frenzy of a passing hour. It is not out of nature that genius, in these early crises, should be pitifully sensitive or take stage-strides. The training that would forestall this might, like Aylmer's process, too well remove a birth-mark. We can spare, now and then, a gray head on green shoulders, if thereby we gain a poet. Keats was a sturdy, gallant boy at school,—as a man, free from vices patrician or plebeian, and a gentleman in motive and bearing. No unusual precocity of *character* goes with the artistic temperament. It is observed of born musicians, who in childhood have mastered instrument and counterpoint, and of other phenomenal geniuses, that they are not old beyond their years, nor less simple and frolicsome than their playmates. But the heyday in the blood has always been as critical to poets as the "sinister conjunction" was to the youth of the Arabian tale. Shakspeare, Milton, Burns, Shelley, Byron, are not specifically apostles of common sense in their love-affairs, but their own experience scarcely lowered the tone or weakened the vigor of their poetry. Keats's ideality was disturbed by the passion which

came upon him suddenly and late; he clung to its object with fiercer longing and anguish as he felt both her and life itself slipping away from his hold. Everything is extreme in the emotion of a poet. Mr. Arnold does justice to his probity and forbearance, to his trust in the canons of art and rigid self-measurement by an exacting standard; he surely must see, on reflection, that such a man's slavery to passion would be a short-lived episode. Before Keats could rise again to higher things, his doom confronted him. His spirit flew hither and thither, by many paths: across each, as in Tourguéneff's prose-poem, yawned the open grave, and behind him the witch Fate pressed ever more closely. He had prayed "for ten years" in which he might overwhelm himself in poesy. He was granted a scant five, and made transcendent use of them. Had he lived, who can doubt that he would have become mature in character as he was already in the practice of his art? It is to be noted, as regards form, that one of Shelley's most consummate productions was inspired by the works and death of Keats. I doubt not that Keats's sensuous and matchless verse would have taken on, in time, more of the elusive spirituality for which we go to Shelley. As it was, he and Wordsworth were the complements of each other with their respective gifts, and made the way clear for Tennyson and his successors. Impressed by the supreme art and fresh imagination of the author of "Hyperion," not a few are disposed to award him a place on the topmost dais where but two English poets await his coming,—if not entitled there to an equal seat, at least with the right to stand beside the thrones as lineal inheritor, the first-born prince of the blood. His poetry has been studied with delight in this western world for the last half-century. One page of it is worth the whole product of the "aesthetic" dilettants who most recently have undertaken to direct us, as if by privilege of discovery, to the fountain-head of modern song. But

"The One remains, the many change and pass."

This prophesying in the name of an acknowledged leader is old as the Christian era. And even the pagan Moschus, from whom, and from Bion, Shelley took the conception of his starry threnody, declares of a dead poet and certain live and unwelcome celebrants:

"Verily thou all silent wilt be covered in earth, while it has pleased the Nymphs that the frog shall always sing. Him, though, I would not envy, for he chants no beauteous strain."

Edmund C. Stedman.

THE GRAVES OF KEATS AND SEVERN,

[IN May, 1879, Joseph Severn, the artist, was still living in the city where fifty-eight years before he had closed the eyes of the dying Keats. He occupied rooms in the heart of Rome, in that building against the side of which is piled up the florid sculpture of the famous fountain of Trevi. It was here that we had the pleasure of meeting, more than once, the then aged friend of Keats, and of seeing some of the relics he still cherished of the poet. Among these was the original drawing made by Severn himself of Keats in his last illness (see *THE CENTURY* for June, 1883), also a plaster cast of the life-mask of Keats, which was believed by Severn to have been made by Haydon, the painter. The life-mask (an engraving of which is herewith given from a cast now in this country) is the most interesting, as it is the most real and accurate portrait of the poet in existence. It is, of course, much more agreeable than a death-mask would have been; for it not only escapes the haggardness of death, but there is even, so it seems to us, a suggestion of humorous patience in the expression of the mouth. The eyes being necessarily closed, it is the mouth that is especially to be observed in the mask; here will be found a sensitiveness, a sweetness, and a hint of eloquence that one would look for in any true portrait of Keats. In this mask one has the authentic form and shape—the very stamp of the poet's visage. It may be added that the mask bears a striking resemblance to one of Keats's relatives now living in America, and that it especially recalls the features of his niece, Mrs. Emma Keats Speed, of Louisville, Kentucky, who died in the month of September, 1883. At one of our visits, Mr. Severn maintained that Keats's eyes were hazel, and he insisted upon this recollection, though it was contrary to that of some others of Keats's friends. He spoke of the drawing of Keats now in the Kensington Museum, and said that he made it one day when Shelley was present, and "Shelley liked it very much." Mr. Severn, in referring to Washington Allston, said that he brought Keats's poetry to his attention, and to that of seven or eight of his friends, though Allston was the only one among them who appreciated it.

Since the date given above (May, 1879), Trelawney has been laid in the grave, beside that which contains the heart—"cor cordium"—of his friend Shelley, and Severn has been entombed in the neighboring inclosure by the side of Keats. Though apparently in good health at the time of our visits, and humorously boastful of the many years that his physician still promised him, Severn died within a few months—namely, August 3, 1879. There they all lie now, with others of their countrymen and countrywomen, beneath the shadow of the Aurelian wall of Rome, and of that pyramid of Caius Cestius which is to-day rather the monument of the two exiled English poets than of the ancient and well-nigh forgotten tribune for whose tomb it was built. It is pleasant to record (we believe for the first time) that among those who bore the expenses of the carved stone erected to the memory of Severn (and the other necessary costs of the entombment) were several of our American poets, from among whom two—Longfellow and Holland—have since followed into "the silent land." The engraving here presented of the companion graves of Keats and his friend is from a water-color drawing by one of the sons of Severn—namely, Mr. Walter Severn, of London.

As we go to press, an American edition of "The Letters and Poems of Keats" is about to appear, in three volumes (Dodd, Mead & Company, publishers), under the editorship of Mr. John Gilmer Speed, a grandson of George, the brother of the poet. Besides the poems, including a sonnet not before published, and besides the letters already published, are given the letters written by John to George Keats, in America, none of which, it seems, have been hitherto printed complete and unaltered, and many of which "now appear in print for the first time." Among the illustrations are reproductions in color of original paintings by Severn of the three brothers, John, George, and Tom. Mr. Speed's introductions and notes throw new light on the history of the entire family.—EDITOR *CENTURY*.]

SNOW-BORN.

ORIGINAL ENGRAVING BY ELBRIDGE KINGSLEY.

SNOW-BORN.

WITH Autumn's latest breath there came a chill
Of brooding sadness, as o'er pleasures dead ;
And through the sunless day, with silent tread,
There seemed to pass, o'er vale and wooded hill,
The footsteps of some messenger of ill.
Through forest ways with rustling leaves o'erspread,
The pine-boughs whispered low of bodings dread,
And all the air a mystery seemed to fill.
But in the shadows of enfolding night,
From out the bosom of the frosty air,
Fell a baptismal robe of beauty rare ;
And when, at kiss of dawn, awoke the earth,
Each leaf and pine-bough, clad in vesture white,
Told of the peaceful hour of Winter's birth.

Henry R. Howland.

LOVE SONGS.

LOVE 'S EVER AT LOVE'S SIDE.

LOVE, you are in the hills,
And I am by the sea ;
But, ah, I know my loved one thrills
With touch of love and me !
No need to tell her why—
Where she is, there am I.
Whether
Together
Or apart,

I fold you, Love,
I hold you, Love,
Hard to my heart.

Love! Love! Its tears and smiles
Wing wide as sun and rain;
It reckons not the hours or miles
For gift of joy or pain :
Love, you can have no thought
My heart shall answer not.

Whether
Together
Or apart,

I fold you, Love,
I hold you, Love,
Hard to my heart.

Love, you are far away,
But naught my heart shall care ;
This place or that, go you or stay,
Where you are—I am there :
In spite of time or tide,
Love 's ever at love's side.

Whether
Together
Or apart,

VOL. XXVII.—58.

I fold you, Love,
I hold you, Love,
Hard to my heart.

EDEN.

EASTWARD love's garden lay,
In Eden, long ago ;
Eastward, lo, it lies to-day,
Before the gates of dawn.

It rests as still and fair
As the first lovers found it ;
And the flowers are blooming there,
The waters running round it.

The crystal fountains fill,
The golden glories play,
And the silver dews distill,
As on love's natal day.

O Eden, Eden bower—
Love's flower is still in bloom ;
Sweets of love's undying flower
The bower of love perfume !

Eden!—I know it well,
And thither lies my way ;
On my soul I feel its spell,
I see its splendors play.

Lo, one awaits me there,
Wondrous as Adam knew ;
Face and form as strangely fair,
And throbbing heart as true.

John Vance Cheney.

AN AVERAGE MAN.*

BY ROBERT GRANT,

Author of "The Little Tin Gods on Wheels," "Confessions of a Frivolous Girl," etc.

VI.

REMINGTON and Stoughton found it very difficult to avoid burning the candle at both ends; for, with all the excitement of society, their days down-town were by no means idle. Even in the way of law they managed to pick up a little business. An aunt of Remington's, for instance, had employed him to obtain a divorce for one of her deserving poor, who was in straits; and he had so far acquired the interest—the sentimental, not the metallic article—of a money-lender, whose office adjoined his own, as to induce Shylock to intrust him with a small collection suit. This Remington had won,—but rather, as he believed, from the fact that the justice selected to hear the cause was a personal friend of his client than from the merits of the case. In like manner Stoughton managed to obtain an occasional fee toward the defraying of his office rent.

Remington was spending his clientless moments in the preparation of a treatise on Railroad Law, in which he fancied himself much interested. He had felt it necessary to find a substitute for kicking his heels in his office. Besides, it had always been an intention of his to write a book of some kind; and a successful publication in the line of his profession would be likely to give him a start. The subject was engrossing, he found, and he pegged away at it with a good deal of enthusiasm. The necessity of research in connection therewith obliged him to be absent from his office at times, and Stoughton, who was apt to call round to get his friend to lunch, would often find the door embellished with a bit of card-board inscribed: "At the Law Association,—back at 1.30." Stoughton was wont to laugh at this studying law in cold blood, as he called it.

"Why don't you put, 'At the Supreme Court,' Arthur? It would look a great deal better."

"Yes, but nobody would believe it."

"What if they didn't! They'd admire your enterprise. I tell you, my dear fellow, I've come to the conclusion you and I are too devilish conscientious. We don't advertise ourselves enough. There's a Hoosier, now, in

my entry who doesn't know quarter the law I do, and yet he has four times my professional income. I asked him one day how he got his practice, and he told me he began by begging it. He lived in a boarding-house, and interested the lodgers in his briefless condition. Fancy going about asking people to give you law business! Well, it probably never occurred to him that there was any objection to it. I suppose it's our misfortune that we see things differently."

Stoughton had himself been acting to a certain extent on his own theory. As has been said, this text-book writing did not appeal to him. He had had enough of mere study, he felt, for the present, and was ambitious to try his hand in practical fields. A good law-book would not help him on very fast toward either fame or fortune. He still kept up, to be sure, his old voracious habit of reading, but it rarely took the direction of legal inquiry. In one of the bottom drawers of his desk a supply of the latest publications in the line of philosophy, poetry, and fiction was to be found. His new interest, however, was politics, which he conceived might help him toward an introduction to the litigious portion of the community. His own acquaintance he had discovered to be exasperatingly pacific; or, if they ever did get into the meshes of the law, the interests involved were apt to be of the kind that require the services of eminent counsel. Those young lawyers seemed to flourish who had gained the confidence of the small tradespeople and mechanics. Such folks were always getting into difficulties.

Accordingly, he had begun to attend the caucuses in his ward and hobnob with some of the local politicians. He was aware that his manners were against him, so to speak, and that he wore too good clothes to attract the favor of those who handled the wires; but he did not permit himself to become discouraged. He had always been able at college to tell a story with effect, and his songs were still referred to by present undergraduates (he had been told) as something out of the common. A little sociability on his part, he felt sure, would win over those who looked at him askance. He had, of

* Copyright, 1883, by Robert Grant.

course, decided views regarding the necessity of improving political methods, but it would be judicious not to offend the managers at the outset. He tried, therefore, to be cordial with such of his fellow-citizens as he encountered at these gatherings, and to avoid anything that might suggest to them invidious distinctions. He even studied their methods in the way of etiquette, and, in pursuance thereof, invariably removed his glove before shaking hands—which was considered a badge of breeding in municipal circles.

On one occasion he made a speech which had the effect of turning the scale in a close contest for candidates for the Assembly. It happened that Finchley the broker, who was of the same political faith, spoke upon the opposite side, and was so much surprised at such an ebullition of intelligence on the part of one whom he had set down as "a gilded flat" that he greeted Stoughton with distinct cordiality on their next meeting, and gave him a valuable point on the stock market. Finchley was himself an aspirant for political preferment; and his bustling, business-like demeanor stood him in good stead. The knowing heads pronounced him likely to go to the Legislature in a year or two.

It was the habit of Remington and Stoughton to drop in at the broker's after luncheon. That had become quite as much a part of the programme of the day as the meal itself. Who that is familiar with the purlieus of Wall street has not been struck with the change that has come over the appearance and methods of that great money center within the past few years? Wide-spreading, massive buildings, towering with roof ornament, the uttermost parts of which—thanks to that modern invention, the elevator—are available, dwarf the unpretentious structures of yore. An air of exceeding prosperity pervades the throng that pours at noontide along the pavement toward the restaurants,—a throng denser than ever, and scarcely more at leisure than formerly, but better groomed. The traditional gaunt physiognomy is less frequently observable. In its stead, the eye falls on well-built, scrupulously dressed men, strongly allied, save for a freer bearing, to the upper-class Englishman,—on faces foreign in type, suggestive of the German, the Hebrew, and of a blending of the two,—suggestive, in fact, of every variety of nationality.

But, despite its motley composition, there is little of the Old World in the temper of this crowd. With the change of soil, they seem to have imbibed the peculiar restlessness that marks the American character. The feverish rush and hurry of our ancestors is still observable. One takes, to be sure, after the conti-

mental fashion, his coffee upon rising, and eats substantially at midday; but who, pray, lingers more leisurely over the repast because of its greater profusion? The long counter, with its row of high stools, favorite resort of gastronomic minute-men; the dense array of little tables, among which waiters bustle with scurrying slap-dash; the resonance of laughter, the clatter of crockery, and tramp of feet, falling on an atmosphere where the oyster-bed and brewery compete in full-flavored rivalry,—who is not familiar with the economics of a down-town restaurant?

In most of these resorts—which are, however, with all their turbulence, luxuriously furnished—a stock recorder, technically known as the *ticker*, a veritable symbol of Black Care at the horseman's back, plays its spasmodic tune in some conspicuous recess adjacent to the stream of life that comes and goes. It is, indeed, a monument well adapted to mark the temper of the age. Now and again some customer steps aside to pass the tape over his hand with a quick, jerky movement, but the mass move by without swerving. Nor, forsooth, is its presence needful to suggest to the lunching public the existence of a short cut to fortune. What is the use of examining the list where every one can see you, when J. C. Withington & Co. are just around the corner? The grave attorney, who passes this modern guillotine without a wink of the eyelid, has already posted himself regarding the quotations of the day, believing doubt as to the state of one's *margin* to be a poor table companion; and the two clerks who trot by so blithely arm in arm, as if their worry was but second-hand,—their master's business,—are on the way to the broker's.

Remington and Stoughton had each, as has been stated, some four or five thousand dollars; which is a sum ill suited to the purchase of high-priced or, as the envious style them, gilt-edged securities. One can buy outright but a very small interest in safe railroad properties with that amount of cash, and the return on the investment is correspondingly inadequate. Moreover, a man who purchases twenty, or even fifty, shares of stock, and pays for them, makes but a paltry profit in case of a rise of ten dollars in the market price, compared with him who carries a couple of hundred on a twenty per cent. margin. All this argues strongly in favor of the theory that *wild-cat*, and hence cheap, properties are the consolation of the impecunious who visit Wall street. Not only can one get two or three times as much stock with the same amount of money, but the chances for improvement are infinitely

greater; and if you buy on a margin, you can carry enough such stuff to make you comfortable for life in case things turn out as well as you expect. Of course, there are risks,—what is not attended with risk in this world?—and you may come to grief; that is, to quote the parlance of the street, *be sold out*. But, after all, it is nobody's affair if you are. The margin is your own; and so, vulgarly speaking, is the funeral. The broker will look after himself; trust him for that. There is no need troubling one's head on that score.

One cannot, it must be confessed, support this buying what one has not the means to pay for (despite all absence of concern regarding your broker) on any theory of ethics. But then, reasoned Stoughton, it is the custom of the country, and is getting to be the way of the world. In short, everybody does it; and as we grow older, we become much more content to travel in the same boat with everybody else. There is safety in numbers; and, moreover, we have the reflection to console us, in case we go to pieces in the process, that it will be all the same a hundred years hence. That is the *left bower* of our philosophy; and the *right bower* is the undeniable need of growing rich. It is a question of chances simply, and we are ready to take the risk. The steady humdrum road will probably lead us to competency in the end, if we live long enough; but we want the money *now*. He was young, and could enjoy to-day. Thirty years hence would find him nearly bed-ridden. He was prepared to take the risks.

And then, too, after all, will one come to grief? Statistics show, it is said, that ninety-nine out of every hundred men who frequent brokers' shops are ruined. Granted, perhaps; but who is to guarantee that we are not to be the hundredth man? Other fellows are rash and short-sighted, ignorant and unreasoning. They buy at fancy prices, and without careful investigation. It is playing with fire, of course; but if one is prudent, and goes into the thing systematically, there is no reason why one should not make a handsome thing out of it in a quiet way. Study up values, and post yourself on the actual condition of properties, and you have the key to the situation in the hollow of your hand.

Such is a coarse presentation of the reasoning that induced Woodbury Stoughton to sell out the disgustingly safe bonds in which his pittance was invested, and *locate*, as the newspapers delight to say, the proceeds elsewhere. The rumor reached him that Olney and Sageville—a Southern railroad, which, like the decayed genus of that cotton clime, had

known better days—was about to advance. He had the point from an *insider* (at least, his informant declared himself to be one); and a shrewd knowledge of whom to trust was one of the characteristics upon which Stoughton prided himself. He acted at once, and, buying at eighty-five, had the satisfaction of seeing within three days his purchase rise fifteen per cent. Finchley, through whom he had dealt, suggested the advisability of realizing such a handsome profit; but the young speculator thought otherwise. "It will sell at one hundred and fifty. I am advised to *cling on* to it," he remarked knowingly. This had been just after the speech at the caucus, and Finchley felt therefore less disposed to criticise his customer. The result proved the soundness of Stoughton's judgment, as the latter expressed it to Remington. He sold out, at the end of ten days, at one hundred and twenty-five. "Not bad for a *flier*," he remarked, with elation. And indeed it was not. He had bought two hundred shares, and put up his original four thousand dollars as a margin. His property had exactly trebled itself. Previous to this he had already made a few hundreds by his ventures in Northern Pacific and one or two other stocks. But then he had bought outright, and hence been able to hold only a few shares at a time. This other sort of thing was much more satisfactory, and just as safe if one only used judgment.

Remington, on the other hand, had been less fortunate. He had held off entirely for some time, merely sufficing himself with changing his bonds for an eight-per-cent. stock that was almost as unprofitably sound. Speculation was one of those methods that stuck in his ethical crop. He had been brought up with the idea that it was not quite reputable, and altogether unsafe. But then, to be sure, every one did speculate nowadays; and what Stoughton said was true enough, in a sense. The money was his own; and if he was shrewd enough to see a way of increasing it at a little risk, why shouldn't he? All business was attended with more or less risk, and it was the man who had the longest head who usually came out at the top of the heap. As to buying what you couldn't pay for, and selling what you hadn't got, that kind of thing was not confined to stocks. It existed in all departments of trade, —in grain, cotton, and the various raw materials; in fact, it was the principle of most modern business. And so Remington had, by degrees, got into the habit of taking *fliers* also. It was an easy way of making money, and his expenses were undoubtedly increasing. But Olney and Sagevilles are not to be found

every day; or, if one is fortunate enough to run across one, there is apt to be a corresponding drop in something else on the list which you hold. Remington's stocks hadn't gone up *for a cent*, to adopt a bit of financial slang. He had experienced hard luck, too, inasmuch as he had seen several ventures which he had tipped out, after holding them for a month without profit, jump up five points the day after. "You get scared too easily; you don't sit on things long enough," Stoughton would say, with the air of a connoisseur. "A man can't expect to make a fortune in a minute. Now, for instance, I bought yesterday a thousand shares in a Nevada silver mine—the Morning Star—that I shall very likely have to hold for a year. I got in at bottom prices, and I am going to sit on it. You haven't done badly as a whole. You're ahead on the entire *racket* for the year. What's the use in souring on your luck? If you only persevere and use judgment, you'll come out all right."

Thus, life down town was interesting enough. From one end of the week to the other there was very little chance for rest; and when Sunday came,—well, on Sunday most fellows slept pretty late. Remington did, however, usually manage to get to church about every other Sabbath. It was his intention to go always; but the arms of Morpheus are tenacious, when one has an opportunity of making up arrears. Still, Miss Crosby worshiped at the same sanctuary.

Sunday is not really much more of a day of rest in New York than any of the other six. Every one blessed with female acquaintances has occasionally to visit them; and frequenters of balls and dinner parties must call on their benefactors if they wish to be counted in next time. At least, Mrs. Fielding made it an invariable rule never to ask any one inside her house who had not acknowledged in person a previous invitation. She, to be sure, could afford to be select; and the same action on the part of a less admired hostess might have produced derision rather than consternation. But even the most lax and barefaced of youthful spirits are apt to bewail their negligence regarding visits. We would call if we only had *time*, they all cry; we never get up town in time. But then there is Sunday; and the truly conscientious young man reads the commandment: "Six days thou shalt labor and do all that thou hast to do, and the seventh day thou shalt *call*." Even Stoughton, who habitually cut church and spent his forenoon propped on the pillows, amid the penates of his own chamber, with the Sunday papers, always shaved himself in time to make one or two visits before dinner.

One Sunday afternoon, about three weeks after the Idlewilds' ball, Woodbury Stoughton dropped in upon Miss Crosby. He had intimated to her at a party a few nights before that he would try to do so.

Those who knew Dorothy well, and were familiar with the brilliant career and marriage of her sister, Mrs. Maclane, had, prior to her *début*, shaken their heads a little in private. She was bookish and quiet. She had ever evinced so much taste for more tranquil pleasures, that there might be a question as to whether she would become enthusiastic over society; and to be successful in the gay world, one must be enthusiastic. She was, of course, very pretty and lady-like and sweet to look at. But would she *say* anything,—would she talk? Were not her quiet ways likely to obscure her real cleverness, and deter prudent men from running the risk of stranding themselves for the evening by conversing with her? Balls are not or ought not to be charitable institutions; and girls who draw into their shells are apt to have a dull time. A few evenings of neglect are quite as sufficient to sour the feminine milk of human kindness as a thunder-storm the ordinary lactic fluid; and was not Dorothy just the sort of young person to set down society as hollow, because nobody asked her for the german?

Our nearest and dearest, however, prove sometimes quite mistaken in their predictions. What a miss of eighteen will develop into before the close of her first winter is beyond the calculation of parents. Mrs. Crosby, to be sure, had expended every penny that her income would allow to have her daughter well dressed; but exquisite clothes never yet made a girl a belle. Dorothy's air of good breeding and eloquent face had drawn to the small parlor in Washington Square, where she was wont to provide five o'clock tea, a goodly array of admirers ere many weeks of the winter had slipped away. Men liked to talk to her, for she was always so sympathetic, and ready to show interest in what concerned them. She was quick to catch the meaning of their various theories and pet ideas; and new lines of speculation were apt to call forth from her eyes that expression of intensity which was flattering to the speaker. She was a good deal of a belle; or rather, she would have been a tearing success had it not been currently known that she was comparatively portionless. As it was, she received much attention in a quiet sort of way; and the sight of occasional superb bouquets in her hand at parties, or cut flowers on the parlor table, filled with uneasiness the hearts of such of her admirers as could not afford these expensive tokens of devotion.

"No, thank you; tea always spoils my appetite for dinner," said Stoughton, in response to her proffered hospitality; and he watched Miss Crosby pour out a cup for herself with a graceful, undulatory movement of the arm, and her head on one side as if she were pondering the virtuous wisdom of his remark. She had, of course, no suspicion of the cocktail he would order some three-quarters of an hour later. She was fascinating,—no doubt about that. She would make a charming wife for a man. But what was the use of upsetting himself by thinking on impossible things? He couldn't afford to marry the girl. He had come here to have a quiet chat. It was a great pleasure to talk to her, for she always comprehended him so easily.

"I hope, Mr. Stoughton, you have brought with you the verses you spoke about the other evening at Mrs. Lawton's."

"Yes; I have them somewhere about me, I believe. They're only servile plagiarism, anyway," he said, fumbling in his tail pocket. "Ah, yes; here they are."

As he proceeded to unfold the manuscript, Dorothy leaned back in the big arm-chair and clasped her hands on her lap, prepared to listen. "What fun it must be to be able to write!"

Stoughton gave a little prefatory cough.

"I'd love thee, sweet, forever,
If I were not the child of fate;
No power our days should sever,
Could I but burst the gate
Which keeps our lips apart—
Keeps thy heart from my heart.

"But destiny, unbending
And ruthless as the sea,
Cries: Though love have no ending,
To love is not for thee!
And I——"

Just then the portière was drawn aside to admit a visitor. It proved to be Mr. Ramsay Whiting, whose attentions to Dorothy had become conspicuous of late.

"Hard lines," murmured Stoughton, under his breath; which expression, however, was intended to be typical of his luck, not of the verses.

"I hope I haven't interrupted anything," said Whiting, conscious of the pause which followed his reception by Miss Dorothy.

"Oh, no," she replied, naïvely; "Mr. Stoughton was just reading some poetry he had written. Perhaps he wont mind going on, now."

"Do. Don't mind me, really," exclaimed the new-comer urgently, but with a slight grin. Stoughton begged to be excused. The

verses were nothing, he said, but a condensation of a little philosophical discussion he and Miss Crosby had entered upon the other evening. The idea of reading them before Ramsay Whiting, who, good fellow as he was, had probably never opened a book of poetry of his own accord in his life, struck him as immensely humorous, and he returned the other's grin with interest. Whiting was going to devote himself to farming. He had some fine lands in the interior of the State, and his large fortune would allow him to sow without reaping for many years to come. He had set to work, however, most industriously, and the world were agreed that Dorothy would be just the wife for him.

"That black bull is dead," he observed confidentially, when Stoughton had taken his departure.

Dorothy sometimes got tired of agriculture as a topic of conversation; but Mr. Whiting was so kind and amiable that she managed in the end to excuse his lack of brilliancy.

"Yes," he replied, in response to her expressions of sympathy, "I would rather have lost any of the others. But, by the way, Miss Crosby, I told Hines to send down that bay mare I spoke to you about. She would just suit you, I'm sure, and I shall be delighted if you will ride her."

The eager manner of the young man made Dorothy blush a little. "You are very kind," she said, "but I'm afraid I shall not be able to ride this spring. What with society and my German and music lessons, I have all to do I can possibly find time for. Oh, how do you do, Mr. Remington?" She rose to greet her friend.

Despite the graciousness of his welcome, Remington was very formal in his behavior. Ramsay Whiting had been there lately whenever he called. There were roses on the piano, and she wore some in her corsage also. Whiting is rich, he thought, and she is going to marry him for his money. That's the way with girls nowadays—they are all so mercenary. He had supposed this one to be an exception.

He sat indenting the carpet with his cane, and saying but very little. For the sake of politeness he laughed in a sickly fashion when anything amusing was said by the others, who were now talking briskly. Dorothy seemed quite excited and interested. Apparently, she paid no attention to Remington's moroseness. When he arose to go, as he did soon under the influence of his mood, she bade him goodbye all smiles and quite indifferently.

Ramsay Whiting's attentions had given great satisfaction to Mrs. Crosby, who, as she often announced to her daughter, had heard

nothing but pleasant things regarding him. He had good manners, and was irreproachable in his habits; so every one said. "He isn't very bright, mamma," remarked Dorothy that evening. Mr. Whiting had staid nearly an hour, and had not been *especially edifying*, as Pauline Lawton would have said.

"I sometimes think, my dear," replied her parent, after a pause, "that you have too romantic ideas on some matters. I sympathize, of course, with your general views; but you must not forget, Dorothy, that, after all, life is practical. You cannot expect to find perfection in this world."

"No, mamma, I don't see many signs of it," said the daughter, a little wickedly. They were both busy with their work. Dorothy had in hand a large piece of canvas, on which she was embroidering flowers in floss. She glanced up for an instant stealthily at her mother, the click of whose large wooden needles was the only sound in the little parlor for some minutes.

"Why is not Mr. Ramsay Whiting, Dorothy, as attractive as Mr. Stoughton or Mr. Remington?"

"I did not say he wasn't, mamma."

"No, my dear; but I have noticed that you seem to have a partiality for young men who are without prospects. You must not misunderstand me, Dorothy. I do not wish to say anything against your friends, or to make mercenary suggestions. I believe them both to be most excellent young men; but they are neither of them likely to be in a position to be married for a long time to come."

"They are getting on very well in their practice."

"I dare say, dear; but it takes a large income nowadays to go to housekeeping with."

"I'm sure I don't want to go to housekeeping with any one. In the first place, nobody has asked me; and in the next, I wouldn't have them if they did," said Dorothy emphatically. "I don't see why you're in such a hurry to marry me off, mamma."

"When your father and I started life together," said Mrs. Crosby,—who, lost in a reflection on matrimonial wherewithals, scarcely heeded her daughter's remark,—“we had only fifteen hundred dollars a year. We kept only one servant, and put out the washing. I don't see how we lived exactly, but we managed to get along.” She shook her head mournfully in the fullness of her reminiscence, for those had been happy years she was recalling. "Girls to-day are not content unless they have everything their fathers and mothers left off with."

Dorothy made no reply. She was used to these discussions with her mother, one of

whose hobbies was the matrimonial question. "Mamma will never be quite happy until she has me off her mind," Dorothy was wont to remark. With all their affection for each other,—and they were extremely devoted, in a way,—Mrs. Crosby had not been able to establish that relation with her daughter which springs from a complete sympathy of tastes and ideas. They were much together, and Dorothy would have done anything in the world to please her parent; but somehow or other she had ceased to make of her a confidante,—to share with her the puzzling reflections that occur to every thoughtful girl. Why this was so, Dorothy scarcely knew herself. It had come about by degrees, as do all such partial estrangements, and was a frequent source of unhappiness to both. Mrs. Crosby complained in sour moments of being lonely, and at such times openly grudged the intimacy that Dorothy enjoyed with Pauline Lawton, a younger sister of the vivacious Florence. The daughter was apt to remain silent under such accusation. She recognized the truth of the statements. She *did* tell Pauline everything, and concealed her intimate self from her mother. Still, how was it to be remedied? That was the important point; and here it was that Dorothy realized, as it were, a certain hopelessness. "Mamma does not understand me," she would say to herself, as she lay recumbent on the outside of her bed, where she was apt to throw herself for reverie at night before undressing. "She does not care for the things that I do. My ideas do not interest her. We are different."

Mrs. Crosby was a plump, easy-going woman, between forty-five and fifty. She had retained much of the vivacity and quickness of wit which had marked her as a girl, as well as that peculiarly cordial manner which makes many Baltimoreans so charming. She wore habitually the air of a belle, as if wishing the world to believe that, though unlikely seriously to consider a second marriage, she was still able to control her destiny in this respect. She now rarely went into society on her own account; but her little parlor was a favorite resort for some of the cleverest men in town,—men who, like the hostess herself, were in the prime of middle life. She delighted to see people, and always had enough to say,—a circumstance which rather tended to put poor Dorothy, who had little of the maternal sprightliness before company, in the shade. Mrs. Crosby was every inch a lady, and bore the privations of a very moderate income with a perfect dignity. She had never wholly laid aside the mourning put on for her husband fifteen years ago. Black silk was becoming to her; but, apart from that, she es-

chewed gay colors out of sentiment. She spent much of her leisure in reading clever French novels.

Under the pressure of that propensity to analyze their parents which is a characteristic of American girls, Dorothy had often puzzled her mind as to what her mother had been like at her age. The romantic story of her parents' runaway match was of course familiar to her, and had shed, so to speak, a wake of poesy over her youth. There had been a time when mamma had seemed to her the very embodiment of genuine romance; but that was long ago. The change in the daughter's feelings had, as has been said, taken place gradually; but a sense of reluctant criticism had grown up in its stead within her heart. Her mother seemed to her, now, so indifferent to ideal considerations, so matter-of-fact, if not worldly, in her estimates! If she did not laugh at things which were sacred to Dorothy, she took no interest in them, or spoke of them as of secondary importance. It was perhaps, after all, not so much what Mrs. Crosby said as what she did not say that troubled the girl. It was the apparent diversity in their respective plans of life that oppressed poor Dorothy. Would she herself be like that some day? Was mamma once as much in earnest and as full of aspirations as she? How often would she ponder these questions, and the train of thought which they set in motion, in the solitude of her chamber!

She was, indeed, in earnest,—sweet, serious-faced Dorothy; and, hand in hand with her idealism, she had nourished a clear and penetrating intelligence,—an intelligence that, moreover, was analytic in its processes. With all her susceptibility to sentimental considerations, she was preëminently a seeker after truth. Her mind was a tribunal where she criticised her every action with rigid impartiality. She liked to sift things to the bottom and to flood them with light. Speculation and inquiry interested her, and she was ever alive to there being two sides to most questions. Her attitude was almost judicial, so deliberate did she strive to be in her judgments. She possessed a strong humorous perception (although, in common with all women, unable to appreciate a jest at her own expense) and a fund of irony, which she did not hesitate to employ against herself.

This habit of unflinching introspection was one of Dorothy's chief characteristics. Inherent in her disposition, which strongly resembled that of her father, it had been fostered by, or rather it had fostered itself upon, the excellent school training she had received. To be sure, it had had the effect of making her, during the last year or two prior to her

début, reserved and conscious, perhaps a little morbid. But she had acquired thereby a potent grasp over herself. Her shyness and self-absorption at that period had been a source of uneasiness to her mother, who had looked for a repetition of Mrs. Maclane's vivacity. Brimful as she was with feeling, Dorothy had been deficient in demonstrativeness; in fact, she was never superabundant in animal spirits. Mrs. Crosby, having, after diagnosis, made up her mind that her daughter was over-sentimental, had been prompted to present to Dorothy, with a greater force than she would have done otherwise, the desirability of being more like other people,—of being practical. Not even after the ugly duckling had lessened the maternal solicitude by force of a charming transformation, did Mrs. Crosby see any reason to alter her opinion. She thought she understood the girl completely, and flattered herself that her hints and *nagging*, as the victim called it, had done much to effect the evolution in question.

Dorothy had brought away from school beliefs that were simple and innocent. The scheme of ethics upon which her conscientiousness had expended itself was of a comparatively primitive order. The world, she had come to consider, was a place where men and women had been put to fit them for existence in a future state. To be unselfish, and eager to do all the good one could, seemed to her the most natural thing possible. Why men committed crimes, why they were sinful, or even idle, was quite incomprehensible to her. There was so much to do in life, and the time was so short in which to do it. Christ had died to save men from their sins; and were they not willing to live righteously for his sake? *She* would do so at least; *she* would prove herself worthy, so far as mortal was able, of the great atonement.

What she was going to do had not been precisely clear to her; but the doubt had never entered her mind but that the path would be evident enough. It might be beset with temptations; but were not faith and conscience proof against the subtlest snares? The way for men was simpler, perhaps; but woman's missions, if more humble, were none the less of service.

Side by side in her breast with these pure aspirations had nestled delightful hopes and imaginings regarding the social world where she was shortly to figure. She had grown to look forward to a brilliant career in society as a natural phase in a woman's destiny. The thought that she was only one of a small minority of the earth's inhabitants who spent their youth in such a manner did not occur to her; or if it did, she dwelt upon her good fortune,

and contrasted it pitiably with the general misery. The doubts and wonderings as to whether she should enjoy herself,—the vague but blissful dreams of conquests and adventures, of ideal admirers whose very suggestion caused her to blush in the dark,—had become her constant and absorbing companions. The thought of doing otherwise than those among whom she had been brought up never presented itself to her. To *come out* was a part of the ordinary sequence of a maiden's days.

So from guileless girlhood she had glided into real life; and the first experience of the same had been even sweeter than anticipation,—sweeter and yet different. The visions and fancies had scarcely fulfilled themselves in the ways she had imagined; but the entrancement of reality was an intoxicating substitute. The admiration of men of flesh and blood flattered her, even while she wondered at its diversity from what she had pictured in her maiden musings. She had been captivated by the delightful experience of becoming acquainted with her own powers, by the exquisite novelty of being sought and courted. With open, yet dazzled eyes, as in a delicious trance, she had let herself be swept along by the current of this strange, new existence.

But of late a sense of awakening had come over her,—not an abrupt and disagreeable experience, but, as it were, a slackening of the cord's tension, a gentle restoration to consciousness. The proportions of things were assuming more of a normal condition, and there seemed to be some chain of connection between the new life and the old. And yet, though painless, this coming back to reality was far from a return to the former status. In the past few months she appeared to have lived years, and, like the Sleeping Beauty in the fable, had awaked to find herself the same, and yet different. The mirror of fancy upon which she had breathed as a child, and traced with facile finger conceptions beautiful and fantastic as frost-work, had been wiped clean by the unfaltering hand of experience, and to-day she saw therein but the reflection of her own fair face. Puzzled and bewildered, uncertain and dismayed, she was confronting life's reality, and bending on its mystery the strength of her keen, honest intelligence and pure heart.

She lay on the outside of her bed that night, after the conversation with her mother, her head resting upon her clasped hands, thinking. Her mental glance sped, with the swiftness common to woman, wide over the field of human speculation, touching with thirsty inquiry on the dearest interests of mortality. What did it all mean? What was the purpose of it all? What relation was

there between the strange yearnings with which she thrilled at times and the bustling world that roared about her on every side? She, too, was one of the dwellers upon earth, and she must play her part in the struggle of life. Her part—what was her part? As she pondered, a vivid sense of the incongruity between the simple faiths of her childhood and the actual sphere of her activity came over her. Whisperings of such a kind had been heard by her often of late, and they would not be put aside, as she in the plenitude of her happiness perhaps would fain have put them aside. What was she living for? What was she trying to become—seeking to be?

She thought of her daily life—of the balls and thousand and one gayeties she enjoyed so keenly, of the constant round of pleasure and excitement. She delighted in them. Oh, yes; they gave her so much happiness. But what was it all leading to? What was the sense of it all? Was this the part she was put upon earth to play? What did she do in the course of the week that was useful—that helped to smooth the axle of the great world to which she belonged? She took a few lessons in music; she made an occasional flying visit to a sick friend; she tore from street to street to pay formal society calls; she went to lunch luxuriously with a bevy of girls; and at night she sallied forth to dinner and the german. There was the programme. On Sundays she went to church, and, kneeling, vowed at the altar of the true Lord to live “a godly, righteous, and sober life.” How grim a mockery, and how cruel a satire! Her thin lip curled with the biting consciousness of the irony.

Ah, yes! But what was she to do? Life was real. Life was practical. She had come to be what she was, and had been placed where she was, without her own agency or control. If she were to change her habits, and renounce all these pleasant things, what should she do? Society, after all, must exist, and calls must be made. Girls must be introduced to the world, and how except through the medium of entertainments? The ways were doubtless exaggerated, the methods mistaken; but what was she to do if she did not accept them? People always considered her romantic, and even peculiar. Her mother until lately had looked upon her as somehow deficient, and now that she was enjoying the triumph of success, was she to renounce it all? Ah, no! But still, was this the purpose of life? Was there no better aim or ambition than this?

With the fatality of her situation staring her in the face like a huge wall of granite,—or rather, like a dense mist, into which her aspirations plunged and lost themselves,—Dorothy, forced back to earth, turned

her reflections by degrees elsewhere. Together with these earnest, serious questionings, she was aware of a sense of dreamy pleasure that hovered about her and associated itself with this new life. What was it? What did it mean? Wherefore did all this admiration and attention excite her so greatly? It was marvelously agreeable. But what was the sense of it? Where would it end? It *did* excite her; ah, yes, it *did* excite her. And why? She closed her mental eyes and lulled herself for a moment in this sweet but unfamiliar consciousness. Then—slowly, and with the frightened side-way glance of the miser who goes to unearth his hoarded treasure, the existence of which he would, if questioned, indignantly deny—she opens her eyes to gaze upon a face that has glided half unbidden into her vision.

Turning her head first, as it were, to make sure that no one is looking, she darts a stealthy, frightened glance at her secret. Breathless and timid, she examines it with furtive scrutiny, as if she feared lest such inspection were not quite right, or some hidden peril attended her curiosity. Her heart beats mutinously, and, terrified at last by its very fascination, she shuts her eyes again, to banish the intruder. She has seen nothing,—oh, no! she has seen nothing. Even to herself she whispers, “I have seen nothing”; and she clasps her hands in the joy of her deliverance; or is it the unuttered, unacknowledged consciousness of her discovery? This is certain, at any rate, that Mr. Arthur Remington’s visiting-card—the one that accompanied the bouquet he sent Miss Dorothy Crosby for the Idlewilds’ ball—lies concealed in a secret corner of her writing-desk.

(To be continued.)

THE PRINCES OF THE HOUSE OF ORLÉANS.

IN the tomb of the Comte de Chambord lies the last of the direct line of Louis XIV. possessing any claim to the throne of France; he descended from the eldest son of the Grand Dauphin, who was son of Louis XIV. The second son of the Grand Dauphin became King of Spain as Philip V., and from him descended the families known respectively as the Spanish Bourbons, the Bourbons of Parma, and the Bourbons of the Two Sicilies; but, by the Treaty of Utrecht, Philip formally renounced for himself and his descendants all claims upon the throne of France.

Upon the extinction of the elder branch of the French Bourbons—direct descendants of Louis XIV.—the younger branch, descended from the only brother of the Great King, has taken its place, and fallen heir to whatever rights or claims it may have possessed. That younger branch is known as the house of Orléans; it springs from Philip, Duc d’Orléans, second son of Louis XIII., and only brother of Louis XIV., and its head is Louis-Philippe-Albert, Comte de Paris. This title was borne by Robert the Strong, the stock whence the family of Capet sprang, and also by his son Eudes, the first king of that Capetian race to which belongs the house of Bourbon, now represented in France by the house of Orléans.

From the time of the divergence of the two branches of the royal house, their respective members have shown marked differences of character and natural endowments. After

Louis XIV., no head of the elder branch manifested any marked strength of intellect, or active force of character for good ends; wedded to the theory of Divine Right, hedged in by and holding fast to the traditions, etiquette, and formality of the past, excluded from all contact with the people, they were incapable of understanding the immense changes occurring around them in the present, and bequeathed to their successors a future made infinitely more difficult and dangerous by their own lack of energy, wisdom, and foresight.

With the house of Orléans it has been very different. Its princes have always shown positive traits of character, and the last three generations, at least, have in no case perverted to bad uses the qualities with which they were endowed. All have been men of intellect, and have shown great fondness for learning, a high degree of cultivation, and a desire to encourage and protect men of science and letters. Whenever occasion offered they proved themselves good and brave soldiers, capable of exercising high commands; and whenever authority passed into their hands they displayed the qualities of wise and patriotic rulers.

Take as one example the famous Regent, known to many only as a man abandoned to luxury and debauchery. In his early youth he showed such military talents as to excite the jealousy of his uncle, Louis XIV. Withheld from the army for many years, he

devoted himself to the study of the natural sciences. Created Regent upon the death of Louis XIV., he displayed many high qualities as a ruler, and during the eight years of his wise control the country rapidly recovered from the terrible exhaustion caused by the long wars of the Great King.

The Orléans Princes have always been on the liberal side, have mingled freely with men, have not been blind to the signs of the times, and are honest advocates of the system of constitutional monarchy. In replacing the extinct elder branch, it is impossible that they should adopt its peculiar principles and doctrines; they can never become advocates of the divine right of kings to govern as they please, but must remain true to the traditions of their family. That is to say, they recognize the right of the French people to determine their own form of government, and will honestly do their full duty as citizens under the government so organized, be it republic or monarchy. But they regard a constitutional monarchy as best suited to their country; and, should the people ever decide to replace the Republic by such a form of government, they stand ready to accept the responsibility and perform their share of the work as honest men and true patriots. Should this change ever be made, it will be found that France is still in essence a republic, with a permanent executive, guided by more conservative counsels, and pursuing a more stable policy in regard to internal and external affairs.

It is not my purpose to dwell upon the reign and character of Louis Philippe beyond the extent necessary to indicate his influence upon the surviving members of his family. He used the full power of his position and abilities to increase the prosperity of France, to reëstablish order, and, as far as possible, preserve peace at home and abroad; he reorganized and vastly increased the efficiency of both army and navy. Finding on his hands the war of Algeria, he prosecuted it with vigor to a successful termination; he gave every encouragement to the arts, literature, and industrial pursuits; under him, public works received a great impulse, and liberal legislation was widely extended. Faithful to the constitution until age began to impair his faculties, he yet, toward the close of his reign, seriously injured his position by a strong tendency to substitute his own will for that of his ministers, and committed grave mistakes in foreign and domestic policy which brought about the Revolution of 1848. At first determined to employ strong measures to preserve his throne, he suddenly gave way and abdicated rather than sully the soil of France

with blood shed in civil war; for it would be illogical and uncharitable to attribute to less worthy motives the conduct of the man who distinguished himself most highly at Quévrain and Valmy, and—a lieutenant-general at nineteen—rallied the broken column of Dumouriez by his personal exertions, and at its head carried the intrenchments of Jemappes, thus converting disaster into the victory which secured the triumph of his country. Departing from the old traditions of the divinity which “doth hedge a king,” he gained for himself the title of the “Bourgeois King” by his accessibility and the simplicity of his family life. A devoted husband and father, he brought to bear upon the education of his children all the efforts of his good sense and the results of the experience gained in his checkered career as a prince whose early life was passed amid the excitement of war and the most violent of revolutions, then in exile, wandering not only through Europe but among the wilds of our own country as well, and at last upon a throne.

Louis Philippe inspired his children with the highest sentiments of patriotism, gave them an eminently practical education, afforded them early in life the opportunity of gaining experience of affairs and of sharing the toils and dangers of war with their fellow-countrymen. The result was that such a man as Sir Robert Peel could truly speak of Louis Philippe as a Frenchman all of whose sons were brave and all his daughters virtuous. The sons of Louis Philippe were, in the order of age, the Duc d'Orléans, the Duc de Nemours, the Prince de Joinville, the Duc d'Aumale, and the Duc de Montpensier; his daughters were the Princesse Louise, married to King Leopold of Belgium, the Princesse Marie, married to Prince Alexander of Würtemberg, and the Princesse Clémentine, married to Prince August of Saxe-Coburg-Gotha.

Ferdinand, Duc d'Orléans, was born at Palermo in 1810. When the revolution of 1830 broke out, he was colonel of a regiment of hussars. He took a prominent part in the Antwerp siege of 1832, commanding the advanced guard. In 1835 he was ordered to Algeria, and bore an active personal part in the campaign of that year. In 1836 he organized the Chasseurs de Vincennes, now known as the Chasseurs-à-pied,—picked battalions of light and active riflemen, who have often since more than justified their organization. He afterward served much in Africa, and always with distinction. He was killed in 1842, by being thrown from his carriage. He was immensely popular, and his death was regarded as a national loss; for he possessed all the qualities of mind and person which were calculated to endear him to the people,

and all felt that the nation had lost in him one who would have made an excellent ruler.

In 1837 he married the Princess Hélène of Mecklenburg-Schwerin, a Lutheran. She was in every respect a superior woman, uniting practical common sense with a brilliant intellect and a poetic temperament. Although she was very young when she left her native place, her memory is still cherished there with the tenderest affection. During the long years after her husband's death, she gave herself to the care of her children with a devotion and good sense which produced the happiest results. She had two sons, the Comte de Paris and the Duc de Chartres. The Count is now forty-five years of age, and was nearly ten when the revolution occurred which deprived his family of the throne and drove them into exile.

Many who read these pages will remember the impression made upon them at the time by the story of the young and widowed mother who, on the 24th of February, 1848, with her two children, in vain sought refuge in the Chamber of Deputies; driven thence by the mob, she with her elder child escaped with no little difficulty to Bligny, where, on the second day, they were joined by the younger boy, who had been rescued by a friend. Within a few days they crossed the frontier to Belgium, whence they repaired to Eisenach, remaining there until the summer of 1849, when they rejoined the rest of the family at Claremont, not far from London. Here the King died, and around this place the family clustered until the death of Queen Amélie, in 1866.

One of the most pleasant pictures of home life imaginable was that at Claremont during the last years of Queen Amélie. Her children gathered around her, and, wanderers as they were, always returned to her side. Having lost the country they loved so well, they seemed to find their compensation in the tender care and affection they lavished on this gentle lady, who, while preserving her royal dignity, never allowed those around her to forget that she was at the same time a loving and most lovable woman. Under the supervision of their mother and uncles, and with the ablest instructors, the two children of the Duchesse d'Orléans here passed their boyhood, and received an education which never lost sight of the former position of their family and the possibility of their return to France, clothed with the responsibilities of power. Both body and mind were highly cultivated.

Early in life the differences in their dispositions manifested themselves: the elder calm, reflective, and self-poised, the younger impetuous and full of fire; the one gradually

developing the qualities of a statesman and ruler, the other those of a soldier; both of excellent ability, each in his own direction. So far back as the time when they first crossed the channel from Germany to Claremont, their mother wrote in regard to their bearing under the horrors of sea-sickness: "One suffered in patience, thinking only of those who took care of him; the other exhibited an ill-suppressed fury against an illness whose inexorable power he was unwilling to accept."

Later in life, those who saw them in battle observed the same characteristics. One of their comrades during our war speaks of the Count as "a gentleman, in our sense of the word, imbued with the true sense of duty, with whom the motto, '*Noblesse oblige*,' meant something more than words. At the battle of Gaines's Mill, where I saw him under fire, he carried himself with perfect self-possession, and displayed courage of such an unassuming character that I remember being much impressed by his bearing. It was that of an earnest, gallant, God-fearing man, in a moment of trial." The young Duke was in those days a dashing sabreur, seeking danger for danger's sake, and never quite so happy as when under fire.

Until their mother's death, in 1858, the young Princes remained at Claremont, occasionally traveling in Germany, where the elder, especially, spent much time.

In the fall of 1858 the Count traveled in Spain, while his brother served in Italy; and in the following year the brothers traveled in the East, visiting Egypt, Mt. Sinai, the Holy Land, Syria, Constantinople, and Greece. They happened to be in Syria at the time of the Mt. Lebanon massacres, and in 1865 the Count published a work on that subject, under the title of "Damascus and the Lebanon."

In August, 1861, the two brothers, accompanied by the Prince de Joinville, sailed for New York. Toward the close of September they arrived in Washington, and the young Princes at once received authority from the President to enter the army as aides-de-camp, being permitted to serve without taking the oath of allegiance, and without pay; it was also understood that they should be permitted to leave the service should family or political exigencies require it. They were borne on the army register as Louis Philippe d'Orléans and Robert d'Orléans, additional aides-de-camp in the regular army, with the rank of captain, and were assigned to the staff of the Major-General commanding the Army of the Potomac. The Prince de Joinville accepted no rank, and simply accompanied headquarters, on the invitation of the general command-

ing, as an amateur and friend. The position held by these "young gentlemen" — as the Prince de Joinville always designated them — was not free from difficulties. Princes who might at any time be called upon to assume their places in the government of a great nation, yet serving in the army of a republic whose cause was not regarded with very friendly eyes by the existing government of their own country, they had many contradictions to reconcile, many embarrassments to overcome. Connected by family ties with so many of the royal families of Europe, always received by them as of royal rank, the elder regarded by so many in France as the rightful heir to the throne, they could never lose sight of the dignity of their position, while it was at the same time necessary for them to perform their duties in a subordinate grade, and to win the confidence and friendship of their new comrades, who were sure to weigh men by their personal qualities and abilities, not by their social position across the Atlantic. Their task was accomplished with complete success, for they gained the full confidence, respect, and regard of their commander and their comrades. From the moment they entered the service, they were called upon to perform precisely the same duties and in precisely the same manner as their companions on the personal staff of their commander.

In the dull routine of office work, in the intelligent analysis of reports in regard to the number and position of the enemy, in the labor of organizing the Army of the Potomac, in long and fatiguing rides with their general, whether through the widely extended camps around Washington, or from column to column in the field, in accompanying advanced guards and cavalry detachments, in carrying orders by day and night in storm and rain, in the performance of their duties on great battle-fields, they were excelled by none in the alacrity, tact, courage, and intelligence with which their work was done. Far from evincing any desire to avoid irksome, fatiguing, or dangerous duty, they always sought it, and were never so happy as when some such work devolved upon them, and never failed to display the high qualities of a race of soldiers.

Their conduct was characterized by an innate love for a soldier's life, by an intense desire to perfect themselves in the profession of arms by actual experience of war on a large scale, and by unswerving devotion to duty. Not only this, their heads and hearts were with us in our hour of trial, and I believe that, next to their own France, they most love this country, for which they so freely and so often exposed their lives on the field of battle.

Soon after the beginning of the peninsular campaign, the Princes were strongly urged by their friends at home to return at once to England, partly to receive the large numbers of their adherents expected to attend the Exhibition of 1862, and partly because the French expedition to Mexico had greatly strained the relations between this country and France. They persisted in remaining with the army until the close of the Seven Days, and left only when assured that the immediate resumption of the attack on Richmond was improbable. Had the prompt receipt of reinforcements rendered a new advance practicable, it is certain that no considerations would have withdrawn them from the field until the completion of the operations against Richmond. Although warmly attached to them and very unwilling to lose their services, their commander fully recognized the imperative nature of the reasons for their departure, and entirely acquiesced in the propriety of their prompt return to Europe.

In a letter accompanying his formal resignation, the Count wrote :

"I have the honor to inclose my resignation in the form you indicated. You know the imperious circumstances which recall my brother and myself to Europe. It is with deep emotion that we separate ourselves from an army whose destinies we have so long shared, and in whose ranks we have met with so cordial a reception. We are happy that we could at least delay our departure long enough to be present with you at the great events of the last few days. . . ."

The Duc de Chartres wrote :

"It is with the greatest sentiment of regret and sorrow that I feel myself obliged to tender you my resignation. . . . You know, General, all the numerous and important reasons which call us back to Europe, and I hope you do not doubt that, if it had been possible, I should have remained with you longer. . . . It is a sad feeling for a soldier to quit his general and his fellow officers when they are still face to face with the enemy, but I feel perfectly confident that every day new successes will enlarge the glory of the Army of the Potomac and the reputation of its commander. I am glad that, although I was sick, I remained some days more with you, and was able to witness all the important events of last week. I must also say that, leaving the army when the difficult movement of changing its basis of operation is finished, makes me feel much more safe as to the result of the campaign, and I feel perfectly confident that, if proper means are furnished to you, General, I will soon hear of your entering Richmond. . . ."

I have already referred to the presence of the Prince de Joinville with his nephews ; he remained with them until their departure. The Prince also brought with him to this country his son, the Duc de Penthievre, whom he placed at the Naval Academy, then located at Newport. The young Duke passed through the school with much credit, and, entering our navy, acquired the rank of lieutenant before he left it.

From their return to Europe until the Franco-German War of 1870, the young Princes occupied themselves with travel and literary pursuits. Soon after the termination of our war, the Comte de Paris undertook the difficult task of writing an elaborate history of that remarkable contest. He brought to the work an amount of literary skill, impartiality, good judgment, and patient labor which have, in the opinion of many competent judges, placed it at the head of the histories of the Civil War. In the collection of data he has spared neither labor nor expense. The arrangement of material, the opinions expressed, the literary composition are all his own, and it is, in the strictest sense of the words, his own work, and not that of another over his name. The first volume appeared in 1874; the sixth, which has appeared during the current year, includes Gettysburg and Mine Run. While preparing for this important work, he engaged in other literary labors of an entirely different nature.

On his return from this country he found the "cotton famine" at its height, and soon went to Manchester, where he carefully studied the vast system organized in aid of the suffering population of Lancashire. For the purpose of giving the information necessary to organize a similar system in France, he wrote an article entitled "Christmas Week in Lancashire." As the Imperial Government would not permit the publication in France of any article over the name of an Orléans Prince, the article was published in the "*Revue des Deux Mondes*," February 1, 1863, over the name of "Eugène Forcade."

His interest being aroused by this preliminary study of the condition of the working classes, he pursued the subject with great ardor, and in 1869 published an extended work on "The Trades-Unions in England." This book met with great success, and is remarkable for the abundance and accuracy of the information which it contains, the wisdom of its conclusions, and the candor, liberality, and elevation of its sentiments. The concluding chapter on "The Future of Trades-Unions and Political Liberty" is really a summary of the writer's views on one of the most important functions of government. He advocates the broadest political liberty, an entirely free press, and the unlimited right to form associations, to meet and to discuss all political, social, and economical questions, in the clear light of open day, as the best and only means of preventing those outbursts of popular passion which, fostered by repression and the natural tendency to seek refuge in secret societies, have so often proved fatal in Europe. He thinks that it is only by free

discussion that extreme views can be corrected and sound conclusions reached. This chapter—and in fact the entire work—will amply repay perusal on the part of any one interested in that great question of the present and future, the relations of capital and labor. In this book he also takes the ground that it would be right to apply, wherever possible, the system of participation in profits.

In 1867 he published in the "*Revue des Deux Mondes*" an article on "The New Germany," and in 1870 one on "The Spirit of Conquest in 1870." In these he clearly explained the then condition of Germany—a state of transition from a disunited group of large and small states, with differing laws, interests, and systems of government, into one vast concentrated empire. He argues that, having become a great military power, Germany must necessarily become also a great naval and colonial power, and that, to satisfy this new ambition and give scope to the mercantile aptitude of its people, it must eventually seek to gain control of Holland.

In 1868 he published an article on "The State Church and the Free Church in Ireland."

In 1864 the Count married his cousin, the Princesse Isabelle, daughter of the Duc de Montpensier and of the Princesse Marie, sister of Queen Isabella II. of Spain. This marriage has been in every respect a most happy one, for the Countess possesses a very high order of intelligence, and all the qualities necessary to insure the happiness of her husband and children, whether in private life or on the throne. They have four children, the Princesse Amélie, born in 1865, the Duc d'Orléans, born in 1869, the Princesse Hélène, in 1871, and the Princesse Isabelle, in 1878.

When the disasters of the war of 1870 began, the Count, like the other members of his family, sought permission to enter the French army; being flatly refused, he had no alternative but to wait, as patiently as he could, the termination of the war. At last, in 1871, the National Assembly revoked the decree of exile, and the Orléans family were permitted to return to their country. In a letter from Twickenham, dated March, 1871, the Count writes: "The curse of civil war has been added to our other misfortunes, . . . but all honest men are decided to uphold the authority of the government established by universal suffrage. . . . But we all ardently hope that the law of exile will soon be abolished, and we shall then return quietly to our native country, there to serve her according to our means, as the country herself may think best. I really do not know what our best friends could wish for us beyond that. What the future government of France will be is still a very obscure question.

We have to fear two dangers: Anarchy and Cæsarism. Whatever government will preserve us from them will be the one we should take and keep, be it Republic or Monarchy." Not long after their return from exile, the confiscation of the Orléans property was revoked and they reëntered upon its possession. The original confiscation was an act of spoliation, and a violation of the rights of private property.

Since 1871, the Comte de Paris has resided in France, often traveling on the Continent. For some years his residence has been the Château d'Eu, on the coast of Normandy, a few miles east of Dieppe. The present château was erected in 1578, by Henry of Guise—le Balafré—on the site of an older castle in which Harold of England visited William the Conqueror. It was enlarged and improved by Louis Philippe, who received Queen Victoria here in 1843. When the Comte de Paris recovered possession, the château and its grounds were in a state of dilapidation, for they had been completely neglected under the Empire. With the exception of three or four rooms, it was necessary to restore the whole interior. All the pictures and furniture have been brought back from England, and the long suites of galleries and apartments are once more hung with pictures and the portraits of the Guises and other historical characters, and decorated with fine old furniture, beautiful porcelain, and innumerable objects of art. The superb suite of rooms called the royal apartments is now hung with hundreds of Hispano-Moorish plaques, producing a very brilliant effect. The kitchens have been rebuilt, and are models of modern convenience; an artesian well has been completed, an ice factory established. The grounds have been largely extended and laid out with all the resources of landscape gardening,—presenting every variety of effect, from the somber grove of ancient beeches, historical from their association with le Balafré, and the heavy masses of trees shading the long line of the more elevated terraces, to the shrubbery, the brilliant masses of flowers, the little lakes and canals irrigating the rich greensward of the low ground bordering the Bresle. The stables at the château, the adjacent farms,—all in perfect condition,—with their kennels, model stables for hunters, farming animals and cows, barns and sheds, accommodation for farm hands, are worth study as examples of the most advanced improvement. All that money, taste, and skill can accomplish has been done, under the Count's direction, to make this one of the most pleasant and comfortable homes in Europe.

Adjoining the estate, and belonging to it,

there is a forest, many miles in extent, abounding in wild boar, which are hunted every autumn. The grounds of the château extend to the sea, close to the little watering-place of Tréport. Nothing could be more attractive than the home life in this château, where, surrounded by every comfort and by everything that can gratify the most cultivated taste, the utmost simplicity prevails in a family united by affection and mutual respect. The Countess, full of activity and kindness, not content with the cares inseparable from such an establishment, finds ample time to devote herself to the well-being of her poorer neighbors. The family have the love and respect of all around them, and as they pass along the roads all the people of the country—even the stanch republicans—halt as they meet, and, with a cordial smile of pleasure, salute "Monseigneur" or "Madame."

It is worthy of remark, that whenever the Orléans family are thrown in personal contact with Frenchmen, of whatever political bias, they seem to gain their respect and kind feeling, and are always received with the social deference due the former position of their family in the state. Their bearing is certainly admirable; for, while never encouraging or permitting familiarity, there is in their manner to the world in general a simple dignity and self-respect, with no touch of superciliousness, which permits them to exercise their natural cordiality without danger of being misunderstood.

The Comte de Paris holds the commission of a lieutenant-colonel of infantry in the territorial army, and conscientiously performs the duties of his rank.

THE Duc de Chartres is essentially a soldier; his bearing, his tastes, the character of his mind, all indicate that he was intended by nature for the profession of arms. In 1858 he entered the special military school at Turin, and when the Austrian war of the following year broke out, he was appointed sub-lieutenant in the cavalry regiment of Nice. On this occasion King Victor Emmanuel desired him to select a saddle-horse from the royal stables, and it is characteristic of the Duke that he chose an animal of pure white, which rendered his rider a most conspicuous mark for the enemy. His regiment bore its full share in the combats and battles of the campaign, and he won his way, step by step, to the grade of captain. After fighting by the side of the French troops, he gained the regard of his own countrymen as well as that of his Italian comrades, and such men as Cialdini and Fanti spoke of him as an officer who, instead of seeking a sinecure position under the pretense of witnessing great operations,

studied war in his place in the ranks, and gallantly did his duty under fire.

Leaving the Italian service at the close of the war, he came to this country and entered our army, as has already been related. Like his brother, he traveled much and engaged in literary pursuits. In 1869, under the title of "A Visit to some Battle-fields in the Valley of the Rhine," he published an excellent résumé of several noted campaigns in that region.

Toward the close of the same year appeared "The Campaigns of the Army of Africa, from 1835 to 1839, by the Duke of Orléans, published by his sons." For this the Comte de Paris prepared the preface, and the Duc de Chartres an introduction which in concise terms gave an admirable history of the events prior to 1835, when his father's narrative took up the thread of the story.

Immediately after the battle of Sedan, the Duke accompanied his uncles de Joinville and d'Aumale to Paris, where they in vain renewed their application to be permitted to serve in one of the French armies; failing in the effort, they were obliged to return to England. On the 25th of September de Joinville and de Chartres quietly disappeared from their homes, and a few days afterward a young man offered himself for enlistment as a private soldier in a battalion of Mables at Rouen; but being required to establish his identity, he departed. On the same day one Robert le Fort, recently arrived from America, was accepted as a captain of National Guards on the staff of the officer commanding the National Guards of the department. This le Fort was the Duc de Chartres, and his identity was confided to his commanding officer—a devoted friend of the family—only after the failure to enlist as a private soldier. He was at first assigned to the command of a small detachment of volunteer cavalry—"les *Éclaireurs de la Seine-Inférieure*." With them he performed such active and gallant service that his commanding general—Briant—obtained for him the commission of *chef d'escadron* in the General Staff corps of the regular army. While at Cherbourg his general was greatly inconvenienced by the total lack of maps of the country, whereupon de Chartres offered to obtain them if given thirty-six hours' leave of absence. This being granted by the general, who had no suspicion as to the real name of his staff officer, he crossed the Channel, went to his home near London, and returned within the specified time with a full collection of the General Staff maps. The secret of his identity was so well guarded that, in a spirit of well-meant kindness, the Prussian royal family caused inquiries to be made of the Duc d'Aumale as to the name under

which he served, so that, if he were taken prisoner, awkward mistakes might be avoided. To this the Duc d'Aumale replied: "Chartres is where he ought to be. If you take him prisoner, shoot him, hang him, burn him, if you choose. He is doing his duty, and we will not reveal the name under which he conceals himself to perform it."

Upon the signature of the preliminaries of peace, the supplementary corps were disbanded, and de Chartres returned to England. When the insurrection of the Commune broke out he went to France and offered his services to the Government, but was not received, because the great numbers of officers just returned from captivity in Germany were regarded as possessing a prior claim to employment. But, impelled by his adventurous spirit, he entered Paris, and was present at the bloody disturbance in the Rue de la Paix on the 22d of March, narrowly escaping the danger of falling into the hands of the Commune. About this time he was recommended by General Chanzy as a Chevalier of the Legion of Honor, under the name of le Fort; which honor was, however, willingly awarded him under his true name.

Shortly afterward, subject to the ratification of the Assembly, he was assigned to the Third regiment of the Chasseurs d'Afrique, and commanded the three squadrons acting with the column of General Saussier, marching on Batna and against Bou-Mezrog. Here, as usual, he distinguished himself.

After two campaigns in the Sahara, in 1872 and 1873, he was finally confirmed in his rank as *chef d'escadron* by the "Commission des Grades." In 1875 he was promoted to a lieutenant-colonelcy in the Eighth Dragoons, and in 1878 to the colonelcy of the Twelfth Chasseurs. He was recommended by his superiors for the rank of general of brigade, and was regarded as one of the very best colonels of cavalry in the army, having brought his regiment to the finest condition. On the 23d of February, 1883, during the excitement caused by the ill-advised proclamation of Prince Napoleon, he was dismissed from his command in the most brutal manner.

Immediately after his removal, which he bore with great dignity and propriety, he undertook a journey through the Crimea, Persia, Astrakhan, and the Russian cities, from which he has just returned.

In 1863 he married his cousin, the daughter of the Prince de Joinville; they have two sons and two daughters.

THE Duc de Nemours is of a retiring disposition, but is regarded by those who know

him well as a man of excellent judgment and a sound adviser. In his youth he bore an active part in the siege of Antwerp and in the Algerian war, where he acquitted himself with much credit. It is no doubt due to his quiet temperament that he has been less conspicuous than his brothers. He bears a striking resemblance to the portraits of Henri IV. He married a Princess of Saxe-Coburg, who died in 1857, leaving four children. The eldest son, the Comte d'Eu, married the Crown Princess of Brazil, heiress to the throne, and commanded the allied armies in the final operations against Lopez in Paraguay.

The second son, the Duc d'Alençon, is a captain of artillery in the French army, and married a Bavarian princess.

THE Prince de Joinville was educated as a sailor. He first went to sea at the early age of thirteen, and, passing the greater part of his time on active service, worked his way up through the various grades, until in 1838 he commanded the corvette *Créole* in the attack on Vera Cruz. Here he not only distinguished himself in handling his ship during the bombardment of San Juan d'Ulloa, but when the columns of attack were landed he forced the gates of Vera Cruz at the head of his sailors, and, after a sharp contest in the houses, took General Arista prisoner with his own hands. For his service he was made a post captain and Chevalier of the Legion of Honor. In 1840 he was assigned to the command of the frigate *La Belle Poule*, and charged with the removal of the remains of Napoleon from St. Helena to France. After this he cruised on our coast, visiting Philadelphia and Boston, and thence to the coasts of Africa and Brazil, where, in 1843, he married the Princess Françoise of Brazil, sister of the present Emperor. In the same year he was made a rear-admiral, and thereafter took an active part in the labors of the Board of Admiralty. In 1845, in command of the squadron of evolutions, he cruised on the Morocco coast, bombarded Tangier, and carried Mogador by assault. In this attack he landed with his sailors and, with a riding-whip in his hand, led the men in the assault.

For his conduct here he was made a vice-admiral.

When the revolution of 1848 took place, he was in Algeria with the Duc d'Aumale, and, although he had foreseen and deplored the errors which induced this crisis, quietly gave up his command. From that period until his visit to this country in 1861, he spent much of his time in travel.

When he accompanied his nephews through the peninsular campaign of the Army of the

Potomac, he manifested the greatest interest in all that occurred; his observations were accurate, and his opinions always of weight. His amiability and accomplishments endeared him to those who enjoyed his friendship and his intellectual ability, extensive information, and sound judgment gained their respect. Always in citizen's dress, he wore a large felt hat which attracted the admiration of the men, who knew and liked him, but who would inquire occasionally for the name of his hatter, and not infrequently designated him as "the man with the big hat." His excessive deafness sometimes exposed him unconsciously to fire, and when his horse comprehended the state of affairs the Prince would quietly jog along out of the fire with a quiet, pleasant smile, which showed that he moved more out of regard for the horse than himself. But whenever there was any occasion for remaining exposed, the horse was obliged to sacrifice his own preferences for those of his rider.

He possesses remarkable power with the pencil and brush,—is a true artist,—and constantly employed this power during the campaign, so that his sketch-book made a complete and interesting history of the serious and ludicrous events of the war.

He is a forcible writer as well, and, among other things, has published remarkable articles on the Mediterranean Squadron, the Chinese Question, the Steam Marine in Continental Wars, the Army of the Potomac, the Navy in France, and the United States in 1865, "Another Word about Sadowa," etc.

When the war of 1870 broke out, he made every possible endeavor to obtain permission to serve his country under his own or an assumed name. Foiled in every effort, he wandered about the Army of the Loire, as the American Colonel Lutherod, and whenever occasion offered took part as an artilleryman, as a rifleman, as an attendant on the wounded,—giving good advice to inferior officers, and becoming at last well known to the men, and always welcomed as "the man with the big hat." At length he was arrested and sent out of the country by order of Gambetta. It was a most affecting story, this of an exiled prince, wandering heart-broken among the wrecks of his country's armies, seeking in vain permission to serve her, and gaining such comfort as he could in risking his life in aid of those who, more fortunate than himself, were permitted to discharge openly the debt of patriotism. After the termination of the war he was elected to the Assembly, and restored to his grade of vice-admiral. He has not received any command since his restoration, and has very recently been placed on

the retired list, on the completion of his sixty-fifth year. It is a misfortune for France that she has so long been deprived of the services of so thorough a sailor and so able a man.

Most highly favored in the gifts of nature and of fortune, the Duc d'Aumale has been perhaps the most conspicuous of the Orléans Princes. An accomplished and successful soldier in early youth, a finished scholar and spirited writer, with a fine person and fascinating manner, he, as heir of his relative, the last Duc de Bourbon and Prince de Condé, is possessed of great wealth and vast estates. It would be difficult to find a finer type of the best specimens of the old French noblemen, accomplished gentlemen, and gallant soldiers. After his long years of exile he is still a true Frenchman of the best type; he is still, with the added dignity of years, the same man who, when a youth, ordered his regiment to "present arms" when passing by the Clos Vougeot, where is produced the royal wine, so well known throughout the world, and who, upon meeting the ambassador of Napoleon III. at Naples, in response to the inquiry as to whether his health remained good in exile, quickly said, "Excellent, I thank you. Fortunately that cannot be confiscated."

Educated like his brothers, the Duke entered the army at seventeen, and became a captain in the Fourth regiment of the line in 1839. In 1840 he accompanied his brother, the Duc d'Orléans, in Africa as an aide-de-camp; was first under fire at Afrouar, was present at the combat of the Mouzaia defile, and returned to France in 1841, ill. In 1842 he returned to Africa as a major-general, and until 1843 commanded the subdivision of Médéah. During this period he conducted the brilliant expedition in which he captured the "smalah" of Abd-el-Kader, containing his family, standards, flocks, and herds, his treasure and all his correspondence, besides thirty-six hundred prisoners, thus virtually terminating the contest with the Emir. Now, promoted to be a lieutenant-general, he received command of the province of Constantine, and commanded in other expeditions, in which he uniformly displayed marked ability and daring. In 1847 he became Governor-General of Algeria, and, although only twenty-six years old, acquitted himself of the difficult duties of the position with the highest credit. Upon the abdication of his father he still held the position of Governor-General, and, resisting the temptation to avail himself of his popularity with the army, quietly acquiesced in the revolution, turned over his command to General Changarnier, and went into exile. In England his

large fortune enabled him to live in princely style, and to surround himself with the objects of art and the superb library so congenial to his tastes.

Like his brothers, he traveled much, and when at his home at Orléans House occupied himself with literature and with hunting. In 1870 he also used every effort to reënter the service, but like the others failed. After the war he was elected to the Assembly, and was soon restored to his grade as general of division. He presided over the court martial which tried Marshal Bazaine, and acquitted himself of that delicate task with the utmost dignity and ability. After that time he was assigned to the command of the Seventh army corps, at Besançon, and proved that the long years of exile had not impaired his military instincts and aptitudes, for he promptly brought his corps to a very high condition of discipline and efficiency. In 1874 he was removed from the command and placed on the list of those "waiting orders"; in 1883 he was placed on half pay. Some years ago he was elected one of the forty members of the French Academy. Among his writings are articles on the Zouaves and the Chasseurs-à-pied, the Captivity of King John, the Siege of Alesia, the History of the Princes of the House of Condé, and the famous "Letter on the History of France," which created such an excitement under the Empire.

In 1845 he married the daughter of the Prince of Salerno, by whom he had two sons, the Prince de Condé and the Duc de Guise. The mother died before the revocation of the law of exile, and the sons have followed her, so that the Duke is a widower and childless. His usual residence is the château of Chantilly, about twenty-five miles from Paris. This favorite seat of the great Condé was somewhat enlarged and rebuilt by his grandson, and partly destroyed by a mob during the great Revolution. The Duc d'Aumale has rebuilt it upon the old foundation, and has collected there the gems from his various châteaux. The gallery of *chefs-d'œuvre*, with its old stained glass, the relics of the great Condé, the pictures of his battles painted under his own directions, the superb specimens of old furniture and porcelain, the room decorated by the hand of Boucher, the magnificent dining-hall, and the unsurpassed library, form a whole of the highest interest.

THE Duc de Montpensier, youngest of the sons of Louis Philippe, entered the army in 1842, at eighteen, as a lieutenant of artillery. In 1844 and 1845 he served under the orders of General Bugeaud and the Duc d'Aumale, taking an active and distinguished part in the

severe fighting of these campaigns. In 1846 he was assigned to the command of the artillery school of practice at Vincennes, and continued in the exercise of those functions until the downfall of the monarchy. He married the sister of Queen Isabella of Spain, and took up his residence in that country. Through the various changes and revolutions that have taken place in Spain, his position has been one of great delicacy; but by his great tact, intelligence, and firmness, he has retained the respect and good will of all parties. His marriage has been a most happy one, save in the loss of his daughter Mercedes, the young queen of Alfonso, whose sad and premature death, in the flower of youth and happiness, excited the sympathy of the world. His eldest daughter is the Countess de Paris.

WHERE so many elements enter into the solution of a problem, and especially in a country where the unexpected is so likely to happen, it is impossible to foretell the exact form of the future government of France. The student of French history who understands the character of the French people in the past and present can, however, safely venture to predict this much at least: that, whatever may be the temporary result of any great crisis in the domestic or foreign affairs of France, the enduring establishment of either despotism or anarchy is impossible, and that its permanent government in future must be, in its fundamental nature, republican,—that is to say, established and constantly controlled by the people, conducted in their interests, and in accord with their will. It is less easy to foresee whether this government of the future will remain in name a republic, whose chief executive officer is elected for a term of years; or whether that chief executive will eventually be

chosen for life; or whether France will return to a constitutional monarchy, hedged in and guarded as a real republic by the force of that public opinion which, in modern times, has become omnipotent in all Christian nations which have attained a certain degree of civilization, intelligence, and personal freedom. Whatever the future may bring forth in this respect, it is fortunate for France that her most conspicuous family is made up of men who love their country above all things, who are animated by the purest motives of patriotism, who, whether in exile or at home, have proved that they are not drones, but energetic men of active lives, liberal in their political views, in full sympathy with the people and their needs, and in entire accord with the progressive spirit of the age; men who “are decided to uphold the authority of the government established by universal suffrage”; who, when in exile, only desired “to return quietly to our country, to serve her according to our means, as the country herself may think best”; who, during the twelve years that have elapsed since then, have fully proved their sincerity by serving the Republic honestly, ably, and faithfully, in whatever positions they were placed, as private citizens or holding civil or military offices; and who have abstained from all intrigue against the Republic, and, when most cavalierly and harshly deprived of their offices, submitted quietly and with dignity to an insult not justified by any act or word of their own.

Every true friend of the French Republic may hope that it will feel so secure and strong as at least to trust men who have given no just cause for suspicion, and whose talents, experience, and devotion to their country enable them to render great services, whether in the conduct of affairs in ordinary times, or in some hour of great tribulation.

George B. McClellan.

SUMMER HOURS.

Hours aimless-drifting, as the milk-weed's down
 In seeming, still a seed of joy ye bear
 That steals into the soul, when unaware,
 And springs up Memory in the stony town.

Helen Gray Cone.

TOPICS OF THE TIME.

The Uses and Abuses of Trades-Unions.

"TRADES-UNIONS are regarded, not unjustly, by most workmen as the most effectual agency they can use to resist unjust exactions. If there never had been unjust employers, there would be no domineering trades-unions. The political economy which teaches that cheap production is always a great good, that no man is bound to consider his workmen's needs, that every man must look after himself, is largely responsible for the growing indifference on the part of employees to the interests of their employers."

So writes an intelligent and successful manufacturer in this city. The tone of his testimony is somewhat less severe than that which we sometimes hear from those who take the side of capital in its controversy with labor. He is able to see the workman's side of the question as well as the master's. He is not alone. The number of those who stand with him is not so large as it ought to be; but there is an increasing class of employers who decline to adopt the maxims of political economy quoted by him, and who are learning to put themselves in the places of their workmen. Such employers have ceased to use the sweeping terms of condemnation which were formerly applied, almost universally, to trades-unions, and have learned to speak of them with some discrimination.

It is not necessary to argue concerning the methods frequently employed by trades-unions. Whenever they resort to violence or intimidation they put themselves beyond the pale of good neighborhood. If the police cannot cope with such banditti, let the military be summoned, with grape-shot and bayonets; if they will not yield to milder arguments, let them be relentlessly put down. No man is under compulsion to join a trades-union, and no man in this free country, who obeys the laws and provides for himself and his own, must be forced by his neighbors to work when he does not like to work, or to desist from working when it pleases him to work. If labor is not free, to this extent, in this country, it is high time that we have another revolution to set it free. Whatever points the trades-unions can carry by fair argument, or by moral forces, they are entitled to; whenever they attempt to carry their points by the use of force or fear, they are outlaws, and should be suppressed in the sternest fashion.

It is also true that these societies often behave themselves as if they had been organized for the discouragement of industry. Their apparent object is to secure the largest amount of wages for the smallest amount of work; and a society of which this is the main purpose is a doubtful factor in the commonwealth.

When the trades-unions forbid men to work beyond a certain rate of speed, as they have sometimes done, and forbid the employing of apprentices, and ordain that the least efficient labor shall be paid as much as the most efficient, they are simply setting the interests of the members of their own particular group against the interests of society in general,—and the

interests of the least worthy among themselves above the interests of the most worthy; they are attempting to grasp for themselves advantages which they have no right to monopolize, and to distribute these advantages among themselves in such a way as to discourage industry and skill; they are acting, in short, in a manner extremely unsocial and injurious, and they cannot expect the countenance of intelligent and patriotic persons. The best that can be said about these practices of the trades-unions is that the wages system, as based on unmitigated competition, is a system of warfare, and that everything is fair in war. On no other assumption can such practices be justified.

These violent and selfish methods form no necessary part, however, of the life of a trades-union; and although they are still in use, there is a decided tendency to abandon them, and to rely on peaceful measures. Attempts to coerce non-union men are made much less frequently than formerly. The trades-unions are beginning to see a little more clearly what purposes are legitimate and what methods are expedient, and in working out this problem they are entitled to the sympathy and the aid of all intelligent employers. Unqualified denunciation of such combinations of workmen indicates not only unfairness but ignorance. There are no respectable writers on political economy of the present day who do not distinctly say that such associations of workmen are, under the present system, not only permissible, but indispensable. So long as the wage-system of industry continues without modification, and the rate of wages is determined by sheer competition, it will be necessary for workmen to combine in order to protect themselves. Capitalists combine in great companies and corporations, and the companies and corporations combine in associations that represent millions of money; such combinations are authorized and protected by law. The laborers have the same right to combine for the protection of their interests, and they ought to be encouraged by public opinion and authorized by law to do so.

Professor Sumner of Yale is, perhaps, the most thorough-going Ricardian economist in this country, and his theories of the workingman's rights and claims are certainly not over-sympathetic. Yet he insists, in his latest volume, that "trades-unions are right and useful, and perhaps necessary," and he goes on to give strong reasons for this assertion. "They may do much," he says, "by way of true economic means to raise wages. They are useful to spread information, to maintain *esprit de corps*, to elevate the public opinion of the class. . . . Especially trades-unions ought to be perfected so as to undertake a great range of important duties, for which we now rely on Government inspection, which never gives us what we need. The safety of workmen from machinery, the ventilation and sanitary arrangements required by factories, the special precautions of certain processes, the hours of labor of women and children, the schooling of chil-

dren, the limits of age for employed children, Sunday-work, hours of labor,—these, and other like matters, ought to be controlled by the men themselves through their organizations. The laborers about whom we are talking are free men in a free state. If they want to be protected, they must protect themselves. They ought to protect their own women and children. Their own class opinion ought to secure the education of the children of their class. If an individual workman is not bold enough to protest against a wrong to laborers, the agent of a trades-union might with propriety do it on behalf of the body of workmen." Here is surely a clear recognition of the right of workmen to form such associations, and a broad basis for their operation. Whatever they can do, by consultation, by discussion, by united action, without resorting to force or fear, to increase the rate or prevent the reduction of wages, or to promote their own welfare in any such ways as Professor Sumner has indicated, they not only may do, but are bound to do. The same enlightened public sentiment which denounces the abuses of the trades-unions should emphasize their uses.

The late Congress of the Unions at Paris seems to have been temperate in its action. An international convention for shortening the hours of women's and children's work was proposed and agreed to, and the following minute was adopted :

"The identity of the interests of the working classes in different countries renders international legislation in labor questions necessary. This legislation will be the outcome of class organization, and, above all things, tend to abrogate laws against trade combinations. It should, in the first instance, apply to the weakest and oppressed, to those least capable of protecting themselves, as women and children. Further progress should result from the development of the working classes."

The debates at the Congress are largely the utterances of moderate and fair-minded men, who have no revolutionary propositions to make, and who are cherishing no unreasonable expectations. Undoubtedly the affairs of the local unions are often managed by men of a different temper ; but the presence of a wiser element in their councils should be recognized and encouraged.

What has been said involves the rightfulness of strikes, when these are not accompanied by violence or intimidation. It is doubtful whether the rate of wages is ever materially improved by striking—whether the advance gained would not, in most cases, have come in due season without the strike, and without the serious loss which the strike occasions to workmen as well as masters. Nevertheless, this power of united action belongs to workmen, and should be frankly conceded to them ; it is only to be desired that they should learn to use it intelligently and effectively, in such a manner as not to inflict undue injury upon themselves and their employers.

It should be added that this discussion all proceeds upon the basis of the wage-system. So long as this system is maintained in its strictness, the considerations here urged will be valid. But there is another system to which this reasoning would not apply—a system of federation between workmen and employers ; a system in which private property would be fully recognized, and in which the captains

of industry would reap the full reward of their organizing power, but in which the workmen should have, in addition to their wages, a stipulated share in the profits of production, and thus be consciously and actually, as well as theoretically, identified with their employers in their interests. It is not likely that the labor question will ever be settled until some such method as this is in vogue. Its adoption would not render trades-unions superfluous ; they would still have a legitimate work to do ; but it would change their character, and correct their worst abuses.

Modern Catholicism.

THE recent celebrations of Luther's four-hundredth birthday have borne good fruit. They have given a distinct impulse to historical study ; and the results of this study, as spread before the people in elaborate addresses and in the public prints, have contributed not a little to popular education. The people who read are largely slaves to the record of petty passing events and the novel ; whatever delivers them, though it be but for a brief space, from this bondage, and leads them out into the wide realm of history, is a salutary influence. Moreover, the tendency of the present time to seek out the causes of the things that appear has led to a more careful exploration of the ages preceding the Reformation. It was the popular notion that the Reformation had its birth in the brain of Luther : the more profound and philosophical of the recent discussions have made it plain to multitudes that many political and intellectual causes had been long conspiring to bring on the crisis of which he was the hero. This fact is familiar enough, of course, to students ; but the great majority of the people, even of those who have been educated in the common schools, have but dim notions of the operation of those secular causes whose results are harvested in the great epochs of history : in their hero-worship they are apt to ascribe the uprisings and overturnings of nations to the men whose names are connected with them. Thus they get the impression that great reformations can be produced at any time to order ; and they are impatient of the delays which always attend the working out of important problems in church and state. Wherever the work of Luther has been adequately treated, much light must have been thrown upon this whole subject ; and we may hope that a few of the more rational of the modern reformers will learn from it an important practical lesson.

But the most significant feature of these celebrations is the reasonably good temper with which, in the main, they have been conducted,—the comparative mildness of the *odium theologicum* which they must needs arouse. The old battle between Papist and Protestant has been fought over again by some of the more strenuous partisans on either side ; and there have been those who have sought to make this anniversary an occasion for widening the breach between the two wings of the Western Church. But these have not been the only voices ; many of the discussions have been characterized on each side by justice and moderation. It is known by most of the eulogists of Luther that the Roman Catholic Church of this day and of this country is a very different Church

from that out of which Luther went ; that Leo XIII. is a far more exemplary and devout person than Leo X. and the popes who immediately preceded him ; that, in short, a constant reformation in discipline, if not in doctrine, has been going on within the Church against whose errors and abuses Luther recorded his protest. Doubtless, there is still much that needs to be reformed ; to this every intelligent Roman Catholic will consent ; but the moral condition of both the clergy and the laity of the Roman obedience is far better now than it was four hundred years ago. To what extent this improvement has been due to the counter-irritant of Protestant criticism and example, to what extent it has resulted from the increase of general intelligence, and how much of it must be traced to the vital and remedial forces that are inherent in the organism itself, it would not be possible to determine. It is enough to recognize, with gratitude, the truth that the religious reformation of the last four centuries has not been confined to the churches of the Reformers.

Some of the orators, while fully justifying the Reformation, and giving to Luther and those who wrought with him the honor due to them, have been sanguine enough to express the hope of a reunion in the future between the Roman Catholic and the Protestant bodies. Such a hope might have seemed altogether visionary twenty-five years ago ; but it cannot now be deemed irrational to entertain it. As the conflict with Materialism and Agnosticism has been waxing hotter and hotter, it must have become evident to intelligent Protestants that they have in the Roman Catholic theologians a strong body of allies with whom they ought to maintain friendly relations. It is not Protestantism, nor the Papacy, nor Calvinism, nor Trinitarianism, nor any other secondary Christian dogma that is now on trial ; it is the main question whether there is any such thing as religion — whether there is a conscious God, and a life beyond the grave, and a free will, and a moral law. Upon these issues Protestants and Roman Catholics stand together ; and their agreement, so far as it goes, ought to be recognized and emphasized.

In certain matters of discipline, vitally affecting the life of the family and of society, Protestant teachers gratefully acknowledge that the Roman Catholic Church takes high ground. The Roman Catholic doctrine and practice respecting divorce are much closer to the law of the New Testament than those of the Protestant churches have been ; and there is an earnest effort at the present time to bring the practice of the Protestant churches a little nearer to the Roman Catholic standard. In contending against the foes that destroy the family, Protestants and Catholics can stand together.

It is thus evident that there is much common ground for the two great divisions of the Western Church ; and it is to be hoped that the anniversary which has just been celebrated will have the effect of bringing the more moderate men of both sides into closer sympathy. Signs of this ironical temper are not wanting in recent literature. Two of the most successful books of the past season, "But Yet a Woman" and "The Story of Ida," exhibit a hearty recognition on the part of Protestants of the strength and loveliness of the Christian character as developed under the teachings of the Roman Catholic Church. Mr. Hardy has

not been accused of exaggeration in his pictures of the old priest and the two noble women of his story : he has painted what he has seen ; but his work gives evidence that a born Puritan is able to treat sympathetically the religious life of those in whom, not many generations since, no Puritan could have found a trace of good without incurring the suspicion of apostasy. As for "The Story of Ida," its transparent realism is irresistible. The grimmest Protestant will gladly acknowledge this young girl's saintliness, and will be grateful to Heaven for the faith that inspired and glorified her life.

In spite of all these practical and sentimental agreements, there are still vast differences between the Roman Church and the Reformers, — differences that reasoning cannot extenuate, and that good nature cannot set aside. There never can be unity between these separated churches until great changes take place in the beliefs of those who compose them. Is there any prospect of such changes ? So far as the Protestant bodies are concerned, there is nothing in their principles to hinder them from making any changes which increasing light may require ; and it is certain that the tendency among most of them is to minimize mere philosophical and ritual distinctions, and to put the emphasis upon those elements of character about which there can be no controversy. But what can be said of the Roman Catholic Church ? Is not that, by its very constitution and all its traditions, irreformable on the intellectual side ? Such may be the opinion of bigoted Papists and of bigoted Protestants ; but it is safe to predict that the Roman Catholic Church will not successfully resist the light of science and the genial influences of this new day. It has felt these influences already ; it is sure to feel them more and more. To realize how sensitive is Catholicity to its surroundings, one has only to compare the atmosphere of the churches in the United States with that of the churches on the Continent of Europe, or even with those of the French part of Canada. Many of the Roman Catholics in this country have the Bible in their hands ; it is not denied them, and there is light by which to read it. That mighty angel, the *Zeitgeist*, is abroad, and the rustle of his pinions is heard, now and then, under the arches of cathedrals and in the palaces of bishops. The growing intelligence of the people will make loud demands for reforms within the church. When the time is fully ripe for such reforms, the dogma of infallibility, as Dr. Dörner has suggested, may prove the engine with which to set them in motion. It was monarchy in the middle ages that brought in liberty on the Continent of Europe. The power of the king was strengthened, and he made common cause with the people against their feudal lords. The same thing may happen in the Roman Catholic Church. Some future pontiff, of a liberal spirit and a courageous temper, hearing the cry of the people for some lightening of their load of dogmas and ceremonies, and knowing that the time is at hand, may rise up and wield that supreme and unquestionable power which the Vatican Council has conferred upon him, in the reformation of many abuses, and in the great enlargement of the liberties of the Roman Catholic people. Such a movement, when it is once begun, is not likely to be arrested ; it may be long delayed, but its hour will come.

The Proposed Library Building in Washington.

ALTHOUGH the question of securing better accommodation for the Library of Congress has long been a burning one in Washington, it has not received as much attention from the outside press or from the people at large as is warranted by its great national importance. Few who have not personally inspected the present library can imagine the deplorable condition of the collection; few who have not read the reports of the librarian can conceive how rapid has been its recent growth or how inevitably this will increase in the near future; and still fewer, probably, know what steps have thus far been taken toward the erection of a new structure.

At the end of the year 1874 the library contained 274,157 volumes and some 50,000 pamphlets; while at the close of 1882 the aggregate was no less than 480,076 volumes and 160,000 pamphlets. All this immense and so rapidly growing mass of literature is now housed in a way which prevents its proper use and endangers its very existence. Long years ago the shelves were filled; supplementary ones—necessarily of wood—have been introduced wherever possible; and books are piled in great heaps all over the floor, allowing scarce space for the library attendants to move from point to point. The Toner collection of 27,000 volumes, a donation of the past year, is lodged in the crypts under the Rotunda. Every other unoccupied chamber in the Capitol has been pressed into service, and the very valuable files of domestic and foreign newspapers are stored in a garret partly of wooden construction. It is needless to say that the accommodation left for readers is ridiculously meager, and that there is not a place where a Member of Congress can work in even comparative quiet and privacy. A few more years and the librarians will be buried alive, and it will be physically impossible to introduce another volume. To this prospect must be added the unavoidable and ever-growing risk from a fire, which would be surely fatal if once started in these crowded rooms.

It has actually been asked more than once why, under these circumstances, are additions made to the collection? Such a question hardly merits a serious answer; but a sufficient one is furnished by the mere fact that here—alone in all the world—the functions of a copyright bureau are combined with those of the library proper. From this one source came, in 1882, 22,000 additional numbers into the collection. Of course there can be no pretense of affording proper accommodation for the copyright clerks, or proper storage for the specimen volumes furnished under the law. The fire which may occur in spite of the great watchfulness of the attendants would not only be a public calamity, but a great private injury to multitudes of authors and publishers. Every man who pays for the copyrighting of a book or print has therefore a special right to demand that Congress shall provide a place in which the records of the transaction may be preserved in a suitable manner.

Of course none of these facts are new to our legislators. It is many years since the necessity of further accommodation for the library was demonstrated, and no fewer than nine years since active agitation has been under way for its attainment. The first proposal was to enlarge the Capitol itself by means of a projecting

wing. This was seen, however, by every architect who was consulted and by every person who realized the rate of growth of the collection, to be a plan that would not only ruin the appearance of the Capitol, but afford only a temporary, makeshift shelter for the books. "But," many a Member of Congress has been selfish enough to say, "it is the Library of Congress, and as such must not be removed from under our roof. Better have it improperly housed here than properly in any other place." Such a theory is to the last degree mistaken. To say that Congress needs for constant reference all these half-million volumes of miscellaneous literature is palpably absurd. If the bulk of them were removed to another spot, the present rooms would give ample fire-proof accommodation to a library of some 50,000 or 60,000 volumes, which would be more than sufficient for the needs of our legislators, and more than are to-day included in the library of the English Parliament—which, nevertheless, does not seem to pine to have the British Museum collection brought in under its roof. It is time, indeed, that this sort of opposition at least should give way to the absolute and crying needs of a library which is national in fact, if Congressional in name.

Nearly ten years ago a public competition was opened to obtain designs for a new library. Many architects responded, though few whose names would now be cited as among those of our better artists. The prize—there was no immediate prospect of actual work—was awarded to a local practitioner. The "Joint Committee on Additional Accommodation for the Library of Congress" long afterward authorized three architects—among them the former prize-winner—to prepare competitive designs once more, and this gentleman again won the suffrages of the judges,—not in an unqualified way, however; for he has since been requested or allowed to alter and correct his essays and to draw new ones in several different styles, until no fewer than nine or ten now hang on the walls of the committee room. Two years ago a bill to secure an appropriation to buy ground east of the Capitol, and to begin work according to the premiated design, passed the Senate, but was postponed in the House. Last session—February, 1883—a similar bill was defeated in the House by a majority of eleven votes. Shortly after, an amended bill providing for the construction of a library building, in sections and limited to cost two million dollars, upon some "government reservation" to be selected by a commission composed of the Secretary of the Interior, the Architect of the Capitol, and the Librarian of Congress, received a majority of fifty-eight votes in the House, but failed to pass because of the necessity for a two-thirds vote.

The failure of the first bill was undoubtedly owing to the site named therein. This site, which lies east of the Capitol, just beyond its own grounds, is not a government reservation, but would need to be acquired by purchase. Immediately there arose the dreaded cry of jobbery, and Congress shrank before it. Yet it seems as though this were the best possible site, since it is near the Capitol, and yet far enough away—remembering that there are rapidly growing groups of large trees between—to obviate the necessity of adopting a style of architecture absolutely identical with that of the Capitol itself. The only other available site is on Government ground south of the Treasury

building and between it and the Washington Monument. This, however, offers a less fortunate opportunity for architectural treatment, since it is partly surrounded by buildings which are mean and yet are likely to be permanent, and since it lies lower than the level of the approaching streets. A site formerly recommended for the purpose — on Judiciary Square — has now been appropriated for the new Pension offices, and few indorse the suggestion that more of the too-contracted public ground lying between the Capitol and the Potomac should be built over for any purpose. Surely the people would not grudge the necessary expenditure to secure the best possible site for their national library, and any Member of Congress who will say this in the present session should receive the thanks of the public and the support of his colleagues.

Thus the matter rested at the close of the last session. The committee in charge lapsed with the dissolution of Congress, and a new committee has now been appointed, which may either indorse the old plans and measures, or advocate new ones, and must then in either case appeal again to House and Senate.

Much as one regrets on general principles the failure of former efforts, it is yet impossible not to hope that the new committee will not feel itself bound in any way by the action of its predecessor, but will start quite afresh from the beginning. It is true that some little time will be lost by this method of procedure, and that time is of vital importance, since the present condition of the library is a national disgrace, and may result in a national misfortune. But it would be a misfortune and a disgrace were we to be given a building inferior to the best that might be obtained, — were one more to be added to the long list of architectural monstrosities, put up under governmental control, which deform our cities and corrupt the public taste. Ten years ago it would have been possible to secure a respectable, dignified, and scholarly building. To-day it would easily be possible to secure much more than this. We have now not one architect, but several, able to erect a structure upon which we could look with contentment and with pride. But it is well within the bounds of truth and charity to state that none of the designs of the architect who has thus far been most successful in competition come within this category. Pressing as is our need of a new library, we might better wait for a long time yet than afflict posterity by the execution of either of his essays. It is not a mere matter of "taste" which is involved in this decision. It is many matters of *fact* which are not readily perceptible, apparently, to untrained eyes (since they were not perceived by the various committees), but which could be thoroughly demonstrated to any mind whatever, were the drawings at hand for illustration. The first proposed elevation shows a so-called Gothic structure, impossible to describe according to any recognized type or formula. Not that one would deny freedom to the modern builder, whatever the style he chooses, or the liberty to recombine his elements and innovate upon the grammar of his predecessors. Architecture is, if anything, a living art, and may grow as does a living language, often welding together elements from various tongues. But it is not growth, it is not liberty or originality, to plan an immense front without any expression of the building's purpose or internal structure, without proper distri-

bution of masses or consideration of proportions, and then to cover it from top to bottom with a wilderness of applied details drawn from many times and quarters, without relation to the building they cover, the places they hold, or the functions they might reasonably be expected to fulfill, and utterly inharmonious with one another. Many of the details of this drawing could hardly be executed in their given places unless made of wood; none of them serve to strengthen or adorn the building, but all of them to deform, if not to drag it down.

Another design shows the same general outline with "Renaissance detail." One instance may serve to show the author's capabilities in this direction. The upper range of windows is of a type commonly found in early Italian Renaissance dwellings, round-arched, and divided into two round lights, with a circle in the space above these — the design being, of course, a reminiscence of Gothic tracery. Such a window is quite complete in itself; but here the designer, in his mad desire for "ornament," has placed above each a straight cornice with a triangular pediment, having no connection with the forms below; and to show that it has no use, even as a protection from the weather, it may be added that immediately over it projects the heavy cornice of the building.

The design which received the latest indorsement of the committee is a simpler Renaissance essay, less objectionable by reason of being less ambitious, but not really more excellent. Any visitor to Washington may examine these designs for himself, or may look at the new part of the Georgetown college for an example of what their author can produce. It would be, we repeat, nothing less than a public misfortune should the erection of the great new library be a sister work.

But since better architecture is surely to be had, how should the committee go about the task of securing it? The first and most essential thing is that they should abandon the idea of sitting as expert judges in an artistic matter. In no other province does the average layman hold himself capable of testing and directing professional work; but in the art of building it is the unfortunate custom for such capability to be claimed. If it is desirable that the library building should be a good work of art, then no lay committee appointed on purely political grounds should attempt to guide its erection. If it is *not* desirable and necessary, then let all pretense in this direction be frankly given up. Let us have a plain brick warehouse, in which our books can be safely stored until such time as we realize more clearly our needs, and the way in which they should be satisfied.

The first thing to be secured, of course, is a good plan. For this, the advice of competent librarians is absolutely necessary. A committee of such might be chosen, and some design agreed upon as to general features and requirements only; for if the architect is in the least competent, he will be able so to modify it — in consultation, if desired, with them — that their ends will be better served than by their own inventions. For the selection of this competent architect, there is more than one way open. The plan most usually adopted at the present day, in England as well as here, is to invite certain artists to join in a competition, each, whether successful or not, to be remunerated by a sum which will pay him for his time and

trouble. A simpler, more economical, and at the same time more sensible and dignified plan would be to choose an architect out and out. Surely a man's ability may be as easily judged from structures he has already erected as from architectural drawings, especially as these may be among the most hieroglyphic, untrustworthy, and misleading of earthly things. Whichever course is decided upon — whether that of competitive or of immediate choice — the Congressional committee should not trust in its own wisdom. Its proper work would be to designate a disinterested and well qualified judge or judges whose decision should be final and untrammelled. It would not be difficult to find men amply competent for this task, — men (like Professor Ware of Columbia College, for example) who are educated architects and accomplished critics, able to understand both the artistic and the material requirements of the problem, but who, not being concerned with the actual practice of their profession, would be above all suspicion of prejudice or self-seeking. Indeed, Congress has such a man close beside it in the person of the Capitol architect. He has his hands so full of his own work, is so averse to personally directing this project, and is, moreover, so thoroughly acquainted with the necessities of the case and the course of former agitation, that no better acting representative of the Congressional committee could be chosen. By thus putting the artistic part of the matter out of its own hands, the committee would not accuse itself of ignorance. It would clearly show, on the contrary, that it had a wise appreciation of the dignity and difficulty of the problem, a wise judgment as to how it should be met, and a wise wish to shift from its own shoulders upon those better fitted to bear them the burdens of public criticism and possible professional jealousy.

It may be added that, with regard to the selection of a site, no commission could be better qualified than the one we have above named as already once selected for this purpose.

On the Reading of Dante.

WE doubt if there is any name in literature at the same time so familiar and so unknown to those who speak English as that of Dante. It is an evidence, indeed, of Dante's unique power, that his character, in its sterner aspects at least, has impressed itself so strongly upon the imaginations of men that his name, even where his writings remain unread, stands as a type of deep and awful insight. Even those who have not read a sonnet of the "*Vita Nuova*" or a single canto of the so-called *Divine Comedy*, know that this is the mortal who, in a certain real sense, has seen Hell. As a mere word, even as a typical and expressive word, Dante is constantly before our eyes; and yet there are comparatively few who have read, even in translation, anything but extracts from the world-famed trilogy. As a rule the "general reader," if curiosity leads him that far, seldom gets beyond the "*Inferno*." This is true in America at least, notwithstanding that American scholarship has long been especially occupied in translating, or otherwise elucidating, the life and works of the great Florentine, — as is attested especially by the writings of Parsons, Norton, Lowell, and Longfellow. And now, another de-

voted student of Dante, Miss Sarah Freeman Clarke, is about to make public (in the pages of *THE CENTURY*) the results of many pilgrimages undertaken with a view to identifying the places and objects visited by the poet in his wanderings. By way of preface to these chapters, a study of Dante by Miss Rossetti and a paper by Miss Clarke on the portraits of the poet are printed in this number.

It is greatly to be regretted that an exaggerated idea of the obscurity of the poem should lead so many who are well fitted for its enjoyment to neglect the leading work with which Dante's name is associated. It is true, however, that as culture extends a knowledge of Dante grows among us in a rapidly increasing ratio, owing partly to the interest reawakened by the Rossettis, and also to the labors of American scholars already alluded to. A good work is being done, moreover, by the Dante Society. Readers are learning not to stop with the first book of the *Comedy*, but to continue through the "*Purgatorio*" and the "*Paradiso*" to the proper ending. In no other way, of course, can the full beauty and compass of this extraordinary conception be comprehended. Certain of the former writers on Dante are partly to be blamed for the slight thrown upon the second and third books of the trilogy — a slight strangely undeserved. For the "*Inferno*" (though not without a certain completeness in itself) is, of course, but a prelusive part of the spiritual journey described in the trilogy. The climax of the wonderful story is not reached in this portion of the poem — or rather, neither of the two climaxes, for there are two. In the "*Inferno*" and in the "*Purgatorio*" Beatrice hovers unseen over the aspiring soul of her still earthly lover. As we read the "*Purgatorio*," we ask ourselves, can even Dante fulfill the expectations he himself has raised, when it comes to the actual meeting with Beatrice? But this he does in this second division of the poem, while to the third is reserved the still more difficult task of preserving the dramatic interest and bringing it to a second and higher culmination in the concluding vision. In describing Beatrice and glorifying her, how he marshals all history, all philosophy, and all theology! But the story rises ever upward, as it should, from Hell, through *Purgatory*, to Heaven, growing more and more ethereal, exalted, mysterious, till the final apocalyptic page is reached, and the poet comes at last to the central "abyss of radiance":

"O Light Eterne, sole in thyself that dwellest,
Sole knowest thyself, and, known unto thyself
And knowing, lovest and smilest on thyself!"

We cannot conclude this "advertisement for readers" of Dante better than by quoting the following from Dean Church: "The '*Divina Commedia*' is one of the landmarks of history. More than a magnificent poem, more than the beginning of a language and the opening of a national literature, more than the inspirer of art and the glory of a great people, it is one of those rare and solemn monuments of the mind's power which measure and test what it can reach to, which rise up ineffaceably and forever as time goes on. * * * It is the first Christian poem; and it opens European literature, as the '*Iliad*' did that of Greece and Rome. And, like the '*Iliad*,' it has never become out of date; it accompanies with undiminished freshness the literature which it began."

OPEN LETTERS.

The Silver Dollar: Is it Honest? and, if Honest, is it Expedient?

By the Constitution of the United States, we, the people, have wisely surrendered to Congress the power to coin money and regulate its value. We hold the fallacy lurking in the meaning of this word "value" responsible in a great measure for the criticisms issuing from many trustworthy and honorable sources against the honesty of our national legislation in remonetizing the old silver dollar. In 1873 our nation was enormously burdened with debts, which were solemnly pledged to be paid in coin, and it became a question of vital importance to select the metal of which the coin should be made.

The silver as well as the gold dollar was then, as now, a full, unlimited debt-paying coin of the country. As for more than twenty years preceding this time it required on an average over one hundred and three cents of gold to buy enough silver to make a dollar, it was thought to be a happy, economical stroke of policy to cease coining silver as full legal-tender money, and use gold alone, as it was the cheaper metal. In 1878 this rash financial mistake was rectified, and the silver dollar was again ordered to be coined. In the meantime the legislation of our country and of Germany against silver was one of the most potent causes in decreasing the demand for this metal, and consequently decreasing its intrinsic value, so that we find ourselves coining silver dollars out of a quantity of silver that we buy for about eighty-six cents in gold. Hence this dollar has received the libelous nickname of the "dishonest" or "clipped dollar," when it is well known that the quantity of pure silver contained in it has never varied since the first organization of our mints. It is equally well known that our Government in 1834 removed over six and a quarter per cent. of pure gold from the gold dollar. Whoever contends for the perfect honesty of this silver dollar strives for the honor of his nation just as effectually as if fighting her battles in a just cause at sea or on land.

When this word "value" is used in relation to money, no discussion can be precise unless qualified, either mentally or in words, by something to show its real meaning, and thus avoid being misled by one of the most seductive of word-fallacies. Money has at least three distinct kinds of value—debt-paying, intrinsic, and purchasing. The legal debt-paying value of money is a question of statute law, and is regulated only by this law. Its intrinsic value is a question of supply and demand, and is regulated only by this rigid economic law. Its purchasing or exchangeable value is a question of prices, and is regulated by the will of the people without regard to statute law. Thus, the silver dollar now worth intrinsically so much less than gold has a home debt-paying value equal to gold, and will purchase the same quantity of commodities or services from our people.

One of the most strongly marked characteristics of

our marvelous age is the growth and magnitude of our private and public debts. Hence, this debt-paying quality of money is a question of commanding importance, and must not be seriously interfered with, unless in a great emergency. Congress has full power to fix permanently this debt-paying quality of money by maintaining the material, weight, and fineness of the coin. Whenever it changes these elements, existing contracts are violated. A legal debt is simply a contract or promise to pay at some future day a certain, definite quantity of the commodities, gold and silver, coined into full legal-tender money; or, if the promise is fairly settled by paper, it becomes a title to real money or its equivalent. We admit, however, that Congress has enacted that greenbacks are full legal-tender money, and that our Supreme Court has confirmed the law, and our people have indorsed these actions; yet this triple confirmation does not logically bridge over the immense chasm between real money and this fictitious paper representative. The civilization of the world would be paralyzed without the use of paper money in some of its various forms, and hence it is of inestimable utility; but we should never for a moment forget that it is not real money.

Gold and silver money is our measure of the exchangeable values of all other commodities. While this is true, let us examine if by any possibility the intrinsic value of either gold or silver in comparison with each other, or with the various exchangeable commodities in use in common life, can be maintained at a fixed point. All political economists without hesitation answer, No. The intrinsic value of coins, it matters not of what they are made, cannot remain fixed, but is continually varying from day to day, and from century to century. The supply and demand of the metals out of which they are coined, which are always variable, regulate this kind of value.

The assertion that the intrinsic value of gold remains comparatively fixed is almost as absurd in the science of finance as the Rev. John Jasper's astronomical assertion, that the earth remains fixed in position and that "the sun do move." Yet on this false theory how many of the arguments against the use of silver depend. As it is utterly impossible to have any standard of intrinsic value that will remain unvarying, shall we abandon the attempt to have one as steady in this quality as possible? The united wisdom of the commercial world for ages has given us this double standard of gold and silver as the most fit materials for money. We admit that this measure is a constantly varying one, but it is far more steady in this quality than either metal alone could be. Statisticians of the greatest reliability give us these two important facts, bearing on this case: Scarcely one-tenth of the people of the world now use gold as their sole legal standard, and about forty-six per cent. of the real money in use in the world is silver. Is it not then an immense stretch of the imagination to say that gold is "the money of the world"?

Should the world abandon the use of silver as a full

legal-tender money metal, does it require the mental caliber of a Newton to see that the demand for gold would be so great as enormously to increase its intrinsic value? It would approximately double all of our debts and decrease by nearly one-half the prices of all exchangeable commodities. It would cause a complete financial crash and revolution throughout the entire commercial world.

The demand for either metal for coinage increases its utility, and hence its intrinsic value; and if the civilized world would wisely make their principal demand for the cheaper metal (whichever that might happen to be) for coining full legal-tender money, the constant tendency would be to equalize the two metals at their old ratio in intrinsic value. The effect would be very marked should Germany alone change her unwise legislation of 1871 against silver, and should England again fully remonetize silver, as so earnestly advised by many of her most able financiers. This alternate use of these two precious metals is one of the most active forces in giving us money of comparatively great stability in this most essential quality of "intrinsic value."

It is a common but very captivating delusion to speak of a gold yard-stick, or of a silver yard-stick, when referring to coins as "measures of values." Nature has given us unvarying laws to test our "standards of weights and measures." Statute law may enact that the yard shall be reduced to one-third of its length, but this will not make the real height of a man who was two yards tall a single hair's breadth greater. We have no such unvarying natural laws to test the intrinsic value of our money standards. We can maintain the weight of the coins by accurate balances, their fineness by chemical analysis, their appearance by careful coinage, and their debt-paying value by statute law, but here we must stop.

The use of the phrase "standard of value," referring to the intrinsic value, is a mischievous delusion unless we conceive of a standard as being *elastic*. The phrase "agent of valuation," rather than "standard of value," will give a correct idea of this function of money.

By the adoption of the simple common-sense expedient, of leaving the coinage of silver entirely under government control, restricting it within reasonable limits, and of buying all of the metal needed at its market price, we have avoided the calamity of being overrun with the silver of the world. Notwithstanding our immense silver coinage, we have not met with the bankruptcy and ruin which it was foretold would result from this one cause alone; but, on the contrary, our national credit was never better than at present.

Coin is specially fitted for vault service, not for the pocket; and bankruptcy will not likely disturb us simply because our vaults are filled with real money and our pockets with its well-secured paper representatives.

John A. Grier.

COMMENT.

THERE is a difficulty in the way of answering or commenting upon Mr. Grier's article — the difficulty of knowing what he is driving at. There is nothing so discouraging as attempting to answer a writer

who has no clear idea of what he wants to prove, and who skips with bird-like freedom and unconcern from one branch of his subject to another, disdaining any continuous line of thought. For want of any other fulcrum to begin work upon, let us take the caption of his article.

"The Silver Dollar — is it honest?" This query is of a piece with the general slipperiness and uncertainty of Mr. Grier's argument, because it may be answered in two or three different ways. If it is meant to ask whether the silver dollar really weighs four hundred and twelve and a half grains, nine-tenths fine, as the law requires, it is undoubtedly honest. If the question is whether the silver dollar is worth as much as any other American dollar, standing on its own merits, everybody knows that it is not, and that, so far, it is a fraud. Bear in mind that the silver dollar purports to stand on its own merits and calls itself a dollar, differing in this respect from the greenback dollar, which makes no such pretensions, but calls itself a promise to pay a dollar. "But," says one, "even if the silver dollar, standing by itself, is not worth as much as some other American dollars, it nevertheless passes for as much." So does a counterfeit dollar until people find it out. The silver dollar and the counterfeit dollar are dishonest and misleading in this, that both pretend to be the equivalents, as metal, of the property they exchange for. The silver dollar is at par with gold up to the present time because the Government redeems it at the custom house, the tax office, and the land office. The Government has never said that it would give a gold dollar for a silver one at the Treasury, but its action, for the time being, has the same effect, since otherwise its collections of taxes and duties would be made in gold — exclusively. Silver has thus received a factitious outside support over and above its metallic value, and it is this support which, for the time being, veils its dishonesty. The dishonesty consists in the very fact of passing for more than it is worth — as metal. Whether we consider twenty-five and eight-tenths grains of standard gold, or four hundred and twelve and a half grains of standard silver, the more fit and proper unit of value, all must agree that if the latter passes for as much as the former it passes for more than it is worth, and that its extra value must be borrowed from some extrinsic and foreign source, which may or may not always continue to lend it the necessary support. This proposition has all the force and certainty of mathematics.

If, however, Mr. Grier intends to ask whether the reintroduction of the silver dollar into our coinage after its value had fallen below the legal ratio of sixteen to one was an honest act, — if this is the purport of the query which stands in the caption, its pertinence at this time is not perceived. The question was debated in the forums of law and morals, at great length and with great heat, more than five years ago. The vote taken in Congress upon it never convinced anybody, and it is hardly worth while to go over the heads of the discourse now. What the Government did at that time was simply to assert its right to pay its own debts in silver dollars of four hundred and twelve and a half grains, nine-tenths fine, which it could produce at ten per cent. less than gold dollars. It did not authorize private persons to pay their debts in the same way, because it held in its own hands the

right to manufacture silver dollars, and refused to sell them to the public for anything less than the price of gold dollars. Having asserted its own right in the premises, it has never yet exercised it. It continues to pay its debts in gold or gold value. Whenever it shall exercise the right to pay its bonds, interest, pensions, and current obligations at anything less than gold value, the question of honesty will come up afresh. At the present time it is not important. The only other right which the Government assumed in the silver act was to take two million dollars per month from the tax-payers to pay for silver bullion to be stamped with the figure of a spread eagle, and laid back in the earth from whence it came. Although the question of honesty is not of immediate importance, the \$24,000,000 per annum of public money spent upon silversmithing is of real consequence to those who foot the bills.

Is the silver dollar expedient? This again depends upon another question—viz., how many silver dollars are meant? One silver dollar would be expedient as a matter of curiosity. A few millions would be expedient for small payments, although the superiority of whole ones over halves for this purpose is not apparent. Fifty or sixty millions would be expedient if all notes smaller than five dollars were withdrawn, and the gold quarter eagle stricken from the coinage. Finally, it appears that under our very cramped and rigid national banking law and the operation of rapid debt paying and bond cancellation, room has been discovered for the circulation and use of ninety-nine millions of silver certificates—these being the only form of paper currency which could be obtained in haste in any desired quantity, of denominations as low as ten dollars. No virtue need be attributed to silver for all this, since it is gold, or gold value, which is invariably deposited at the Treasury in exchange for silver certificates. An equal number of new greenbacks would have circulated as readily, there being a real demand for them arising from the country's growth. An equal number of new national bank notes would have been provided, if bonds had been plentiful and the price not too high. It happened shortly after the silver certificates were authorized that a great development of agricultural and mining industry took place in the West and Southwest, and a heavy stream of immigration set in from foreign countries. This Western development called for a new supply of paper currency, and the silver certificates were the only available source. They were taken out for want of anything better. They are not legal tender except at the custom house and the tax office, but being received there they answer the purposes of currency. Copper or iron certificates under like conditions would answer as well.

Taking things as they are, however, and pursuing the inquiry *how many* silver dollars are expedient, we may admit that of the whole amount coined up to this time, viz. \$158,000,000, all except \$39,000,000 are in use somehow either as coin or as certificates: \$39,000,000 remain in the Treasury, an altogether dead investment, representing at 3 per cent. \$1,170,000 of annual interest lost to the tax-payers; and this stock is invested at the rate of \$2,000,000 per month. It is shown that the services rendered by the silver certificates might be much more easily secured in other ways, but for

the sake of argument we will assume that about 119,000,000 of such dollars are expedient. The only question open to intelligent discussion is, whether it is expedient to go on manufacturing a particular coin after the limit of its circulation, either in its original or its representative character, has been reached and passed. Upon this question Mr. Grier throws no light. He does not seem even to apprehend it.

Never before in the world's history has any government charged itself with the duty of making metallic money, either gold or silver, beyond the needs of itself or its people. The United States alone furnish this example of wasteful and ridiculous excess. The solecism, it is well known, came about in the way of a compromise between two sections or factions of the "friends of silver" in Congress, one of which desired unlimited coinage, while the other desired limited coinage. It would be nearer the truth to say that one side desired to give everybody the privilege of scaling his debts ten per cent., while the other side desired to confine it to the Government. The result of the compromise was a limitation of the monthly coinage, but no limitation of the total. The arrangement was based upon no principles of finance. It was a mere "back fire" started against the Bland bill. It had the effect of stopping Mr. Bland's fire, but is itself still burning. What it may destroy hereafter is a matter of conjecture, but it is certainly consuming two million dollars per month of the public taxes, and serving no purpose except to steady the price of silver for mine owners in all parts of the world, and still more for the treasury and trade of British India, for which service we have as yet received no thanks.

The question, "Is the silver dollar expedient?" has no significance except as an inquiry whether the continued coinage of two millions per month, after all demands for silver dollars have been more than satisfied, is expedient. It must, of course, be answered in the negative.

Horace White.

Artistic Help in Divine Service.

It was thought to be of sufficient interest to the public to be stated in the reports of the meeting of the American Board at Detroit, last autumn, that at the beginning of the first service the hymn, "Joy to the world, the Lord is come," was sung "as usual." Of course, most of us understand that the tune always employed is "Antioch." It is worth the inquiry, as a curious little speculation, whether the third verse was produced with the reduplication of those expressive syllables "Far as," according to the music requirement, "Far as the curse is found, Far as the curse is found, Far *a-as*—Far *a-a-as* the curse is found"; and also whether the fourth verse is still loaded with the singular division which makes the people say: "And wonders of His love, And wonders of His love, And *wo-on*—And *wo-o-on*-ders of His love." That is the way it used to be in Monthly Concert.

It is difficult to conduct a sober discussion on the special point to which I have long been wanting to draw attention, as one of the singing multitude, without seeming to be in fun instead of in dead earnest. The simple statement of our embarrassment makes people laugh. Now above is the example: I want to insist

modestly that even the authority of Lowell Mason is not enough to fasten on the churches such an awkwardness as this, which is plain the moment it is mentioned; though it looks like a joke to show it up. Lately the attempt has been made to slur over the whole strain, and that is certainly an improvement. But one must be pardoned if in candor he asks whether a hymn shall be travestied forever in order to carry out what a composer calls his "musical thought."

Such a question is far-reaching in principle. Which is it that singing is to follow, the words or the tune? What is the real purpose of the American Board, or of any one of our churches, in the act of singing in divine services? Is it to render a "musical thought" adequately, or to give a poetic sentiment fitting expression? Take another case: Once when I was preaching in a church beside the Hudson River, in May, the busiest month of the fishing season, I gave out the hymn, "Jesus, lover of my soul." The leader set it to a tune which, for the sake of some man's "musical thought," repeated half of the final line. When I heard the first verse, I shrank with consternation in frightful prospect of the second; for the movement ran thus: "Oh, receive—Oh, receive—Oh, receive my soul at last." That did no harm, it was simply unnecessary. But the next was awful. When I repeat it, it will be supposed a joke, although I am writing in sad earnest of a fact which almost destroyed my service: "Cover my defenseless head—With the *shad*—with the *shad*—with the *shad*-ow of thy wing." The whole congregation stirred with irrepressible laughter. Must we all be forced to stand this?

Somebody will have to give in, and it is dangerous for a modern clergyman to criticise his choir. A good man in New Jersey last year came very near losing his charge for saying that he did not agree with his quartette in their adoration of the Virgin Mary, which they had been singing just for the sake of a piece of music. Frequently the worship is fashioned in order to admit of what are deemed artistic effects. Once in the city of Boston I had taken my place to begin; there had been presented to me a printed programme as I reached the vestry, the whole of which was filled in except the place for the closing hymn: it was issued by the choir as they had arranged it. While the organ was playing, up the pulpit stairs came a stranger; taking his seat by me on the sofa, he announced that he was the leader of the music, "basso." He purposed to sing for the anthem that morning a solo from "The Creation," and he desired me to read as the lesson the first chapter of Genesis, as "the most appropriate introduction." I meekly replied that if this was customary in that congregation, I had nothing to say. So I agreed to read the chapter, but I added that I trusted it would not be considered an innovation if I should put in afterward a few verses from the New Testament which I had selected. He bowed assent gravely as he left the desk. But when the moment arrived for the genesis of my perturbation to begin, once more I was favored with a visit, this time from the sexton, who only came to hand me a piece of a fly-leaf from a music-book, on which was written the gracious information that the leader of the choir, "basso," had concluded not to sing the solo, and I might feel at liberty to read what I pleased. How

much of that sort of artistic help is an educated minister, of a religious turn of mind, expected to endure?

It is of no interest to me to make issue with such willful vanity and outrageous conceit as this manifests; the man apparently assuming that the order of worship was to be constructed or modified to bring his voice into a proper orchestral setting. My troubles have come oftener from such sources as that intimated in the outset, than from the mere carelessness which grows out of a misconception. One of the older philosophers has said, "Incongruity is the soul of wit." This suggests a reason why we are not heard in stating our grievances; the cases have so much of incongruity in them, that our complaint is laughed out of court. We are supposed to be telling witty stories, when we are trying desperately to put an end to the dreadful incongruities in the divine service which destroy the worship we seek to conduct.

I wish to make this distinct point, and I never was more anxiously sober in argument in my life: I think that our choirs choose their "opening pieces" and their anthems with a view to the musical necessity of the voices or the day or the position, as they see it, and with no proper regard to the needs or wishes of those who have come to worship God. I do not assert that all do it, nor that any do it always; but I insist that this is the rule, and anything else is the exception.

Years ago, when I sought to hold our first Thanksgiving service in the Paris Chapel, it may readily be conceived by every New England heart how I was thrilled with eagerness of anticipation. My enthusiasm swept the people swiftly on with me. The leader wished me a hundred congratulations; he was full of joy; oh, he would give me such a grand anthem; but would I only let him put it in the place of the second hymn just before the sermon, after the congregation should all have come in and become still? I suffered it; and that was not all I suffered either. When the time came, the piece rolled out, "Bow down thine ear, O Lord." Ah me! you should have heard that splendid bass voice saying, "Thy will, O God, be done—*thy-ee* will, O God, be done!" Thus, there in the strange land, we hung our harps on the willows that Thanksgiving day; we had to send our cheerful gratitude aloft in the subdued strains of the most plaintive submission imaginable, for the entire choir were vying with each other in a chase to say best and most: "Thy-ee will, O God, be done!"

These things are among the commonest of all mistakes which try our patience. We started once last year upon an anniversary celebration; we planned to awake ourselves with a song. The pulpit shone with flowers; the Sunday-schools were trained in; the air quivered with sweet bright sunshine, hearts were alive, and memories full of exhilaration. The choir opened with a set piece, slow and hushed in tone, to which were adapted the words which they whirled over and over as they pushed on before them the involutions of an intricate fugue: "I will both lay me down in peace, and *sleep*; for thou, Lord, only makest me dwell in safety." I am not willing to call that artistic; I consider it nothing more than provoking; it was inartistic inappropriateness. The piece was chosen, I presume, because the music pleased somebody; no possible reference to the use to which it was to be put could have been had. I cannot argue

about an awkward destruction of the service like that; there was no sense in such a song then. If singers cannot see the point when the picture is before them, logic is useless—as useless as Simon Peter found it on the day of Pentecost, after he had told the multitude that men did not usually get drunken before the third hour of the day. We do not want our congregations to lay themselves down in peace and *sleep* in the morning of an anniversary day.

Then there is a most unphilosophical way of dividing up the verses in hymns which are personal and experimental. It is as much as congregations can do to sing such things at all with four parts in the music; but traditional use helps us a little. The moment, however, that the attempt is made to present them in the so-called "artistic" form of distribution among the performers, a challenge is forced, and we have to accept the office of critical estimate thrust upon us unawares. When a choir in effect says, "See how we will do it," we try to see. For example, it is not dramatic, nor artistic, nor philosophical, to divide the hymn, "Lead, kindly light," so that a bass voice of a man should say, "The night is dark, and I am far from home, Lead thou *me* on"; and then an alto voice should say with a woman's register of pathos, "I was not ever thus, nor prayed that thou shouldst lead *me* on." For that inevitably suggests two of them in trouble, and the illusion is destroyed; we have no distinct conception of a soul struggling with an individual experience; if we have any conception at all, it is of a quartette of souls comparing experiences in different octaves.

Let me show what I mean exactly: some things are not perfectly clear unless they become melodramatic and exaggerated. Once in Brooklyn our tenor began thus, "Jesus, lover of *my* soul"; then the alto said, "Let *me* to thy bosom fly"; then the soprano said, "While the billows near *me* roll"; and the next line slid off on the bass, who added, "And the tempest still is high." So the organ proceeded to conduct the tempest to a successful issue with tremendous stops, which shook the glass overhead in the windows. Now, what a common man would like to know is, how many vocalists at a time were engaged in that prayer. This sending an individual experience all around the choir to supply singers with words for "musical thoughts" is of no sort of edification to churches—of no sort of comfort to preachers.

It is not quite fair to assert that outsiders do not know the difficulties which composers and leaders and managers of music-people have to contend with. But let me say, modestly, that for one I have been told with great pathos, and that more than once, during the past twenty years. The conductor of our choir, the one we had long ago, said frankly, on the sad occasion when I had what New England people call a "to-do" with him for cause, that, after a most extensive experience in leading, he had found it impossible to keep the peace in his gallery unless he would apportion the solos carefully among the performers from Sabbath to Sabbath, so that each should have a chance; hence, he often chose for the sake of a voice, or two voices, a composition the rendering of which would bring down praise from "the house."

Now, just for a moment, I should like to quote from "Aurora Leigh":

"The artist's part is both to be and do,
Transfixing with a special, central power
The flat experience of the common man,
And turning outward, with a sudden wrench,
Half agony, half ecstasy, the thing
He feels the inmost."

After this fine burst of enthusiasm, Mrs. Browning explains and guards her meaning:

"Art's a service, mark!
A silver key is given to thy clasp:
And thou shalt stand unweared, night and day,
And fix it in the hard, slow-turning wards,
And open, so, that intermediate door
Betwixt the different planes of sensuous form
And form insensuous, that inferior men
May learn to feel on still through these to those,
And bless thy ministration."

Is art a "service"? Does the exercise of it in divine worship partake of the spirit of the inspired counsel, "Whosoever will be chief among you, let him be your servant"? This thrusting forward of a personality of display does not look like it. Once our alto asked me, as I was entering the pulpit, whether I had any objections to changing the closing hymn, for she was expecting some friends that evening, and they could not come till late, and she wanted to sing a solo. And once, at a week-day funeral, our tenor crowded me even to my embarrassment with a request that he might be permitted to precede the arrival of the train of mourners with a vocal piece in the gallery, for he had just heard that two members of the music-committee of another congregation would be present, and he wished them to hear him, as he desired to secure the place of conductor there.

"Art's a service, mark!" But does it take the place of the rest of the service also? This entire discussion turns at once upon the answer to the question whether the choir, the organ, the tune-book, and the blower are for the sake of helping God's people worship Him, or whether the public assemblies of Christians are for the sake of an artistic regalement of listeners, the personal exhibition of musicians, or the advertisement of professional soloists who are competing for a salary.

In our travels, some of us have seen the old organ in a remote village of Germany on the case of which are carved in the ruggedness of Teutonic characters three mottoes: if they could be rendered from their terse poetry into English they would do valiant service in our times for all the singers and players together. Across the top of the key-board is this: "Thou playest here not for thyself, thou playest for the congregation; so the playing should elevate the heart, should be simple, earnest, and pure." Across above the right-hand row of stops is this: "The organ-tone must ever be adapted to the subject of the song; it is for thee, therefore, to read the hymn entirely through so as to catch its true spirit." Across above the left-hand stops is this: "In order that thy playing shall not bring the singing into confusion, it is becoming that thou listen sometimes, and as thou hearest thou wilt be likelier to play as God's people sing."

Charles S. Robinson.

Fielding.

WITHIN the past few months, a bust of Fielding has been placed in the vestibule of the shire hall at Taunton, Somersetshire. Both Old and New England may

be said to have united in paying this tribute to the great novelist; for the speech at the unveiling of the bust was made by the American Minister. No one needs to be assured that the address on the occasion was fitting and felicitous. Some surprise, however, has been excited by the view then and there expressed of the character of Fielding; for, whether correct or incorrect, it does not seem altogether to accord with either the contemporary or the traditional reputation of the man. Yet any false impression conveyed by it, if such there were, was probably not owing to the fact that what was said was untrue, but to the entirely different fact that all that may be true was not said. Let us not, however, scan too critically anything that comes from a quarter in which silence has never been a virtue. American literature has made to American diplomacy a gift it can little afford, when the published work of Lowell for six years would hardly fill six pages.

It is sufficiently appropriate that a recognition in this way of the Somersetshire novelist should be made in his native county. But the real monument which Fielding's memory most needs is one that does not ask for the chisel of any sculptor or the voice of any orator. It is, moreover, a memorial which it would neither be difficult to raise nor pecuniarily unprofitable. That memorial is a complete edition of his writings. Though one hundred and thirty years have gone by since his death, this act of justice to his reputation has never yet been performed. Apparently, it has never once been contemplated. A portion of his work — and, in a certain way, of work especially characteristic — is practically inaccessible to the immense majority of English-speaking men. We are the losers by this neglect more than he. The mystery that envelops much of Fielding's career can never be cleared away, the estimate of his character and conduct can never be satisfactorily fixed, until everything he wrote has been put into the hands of independent investigators pursuing separate lines of study. Equally essential is such a collection to our knowledge of the literary, the social, and even the political history of his time.

Fielding's collected works were first published in 1762. To them was prefixed an essay on his life and genius by Arthur Murphy — an essay more remarkable for what it did not contain than for what it did, and distinguished in particular for the lofty scorn it expressed of what it called the "cruelty of narrative" practiced by certain biographers who had no higher object than to pander to a depraved taste, seeking merely for information. Murphy's collection, or rather selection, remained for nearly a century the one generally adopted. Roscoe, however, added some pieces never before reprinted, and a still larger number of pieces of this class were included in the ten-volume edition of Fielding's works which was published in 1871, and especially in the supplementary volume which appeared in 1872. To this collection the ponderous *édition de luxe* of 1882 added a little. But it seems as yet never to have occurred either to publishers or editors that it was worth while to have all of Fielding's works reprinted. In one or two cases, this has been due more to ignorance than to design. It is pretty certain, indeed, that some of the novelist's miscellaneous writings have escaped the attention of most, if not of all, bibliographers and biographers. Reference, for instance, is often made to, and quotations

have sometimes been taken from, the unsigned preface which he prefixed to his sister's "Familiar Letters between the Principal Characters in David Simple," published in April, 1747. But it is certainly not generally known — I am not sure even that it has ever been observed — that five of these letters, extending from page 294 to page 352 of the second volume, were the work of Fielding himself, and not of his sister. Their style would betray their authorship, even were this not directly asserted. The first of these five, it may be remarked, has a certain special interest on account of its criticism of the stage during the season of 1746-1747, and its allusion to a certain actor, meaning Garrick, as one "who never had, nor, I believe, ever will have, an equal."

Without mentioning other pieces of Fielding's which have never been reprinted, there is one class of his writings that has been treated, not so much with neglect as with unaccountable caprice. These are his contributions to the periodicals with which he was connected. Fielding, during his career, was the editor of four papers, "The Champion," "The True Patriot," "The Jacobite Journal," and "The Covent Garden Journal." He was a warm partisan, he gave little quarter to his opponents, and he certainly received none from them. His attacks, however, were mainly directed against their intellectual flabbiness and political misconduct; theirs were directed against his morals and personal character. It is possible that they aimed at his vulnerable part, as he assuredly did at theirs. But these papers are not merely political; they are also full of references to the social and literary history of the times. Still, they have never been reprinted save in part. The meager selection made by Murphy, with little taste and less judgment, has until very recently been slavishly followed. The latest edition, though it has added something, is still far from complete; and this, too, when pieces much inferior in interest and importance have been carefully reprinted. It is perfectly safe to say that a complete set of the four journals above mentioned cannot be found in all the public and private libraries of the United States put together. It is even doubtful if there exists in this country a complete set of a single one of them. The essays from "The Champion" were, it is true, reprinted in two volumes in June, 1741, and subsequently republished in 1766. But these did not embrace anything written after June, 1740, and Fielding himself assures us that it was in June, 1741, that he ceased writing for that paper. In this respect, students of the period are doubtless far better off in Great Britain than in the United States. Yet it is a significant fact that, even there, Lawrence, in his "Life of Fielding," — a laborious though not altogether successful work, — confessed that he had never been lucky enough to meet with an original copy of "The Jacobite Journal." No genuine investigator would ever be satisfied with a selection from these essays: he wants them, for he needs them all. Moreover, little respect can be paid to the judgment which made the selection originally. Of the thirty-three numbers of "The True Patriot," Murphy published only ten. One of those that he did not publish was the twenty-eighth number, which appeared May 13, 1746, and was entitled "An Address from a Footman in a Great Family to his Brethren of the

Cloth on the Execution of Matthew Henderson,"—Henderson being a footman executed the preceding month for the murder of his mistress under peculiarly aggravating circumstances. In all of Fielding's writings, hardly a finer specimen can be found of the irony in which he excelled than in this essay, which will be sought for in vain in editions of his so-called complete works. This meagerness of selection is even worse in the case of "The Jacobite Journal," which was published weekly from December 5, 1747, to November 5, 1748. Of the fifty numbers belonging to it, two only can be found in any of the editions of Fielding's works.

It is certainly full time that everything produced by the first great English novelist should be gathered together and put where every man who wishes it can find it. A critical edition of Fielding's writings, in which every change of text made by the author during his life-time should be noted, would be nothing more than a just recognition of his claims as a classic. This may be too much to expect. But there is surely no reason, either literary or pecuniary, why we should be deprived of the possession of his complete works.

T. R. Lounsbury.

Trades-Unions.

I HAVE read with much interest the several chapters of "The Bread-Winners," as also the correspondence in "Open Letters" of the October magazine.

While I make no pretensions to an intimate knowledge of the methods advocated and pursued by trades-unions, yet I cannot help feeling that the trades-unionists have been misrepresented by the author of "The Bread-Winners."

The late unsuccessful strike of the telegraph operators was an ineffectual protest of underpaid labor against a gigantic and heartless corporation. So far from its being started by a "few conspirators whose vanity and arrogance blinded them to the plainest considerations of common sense," it was a national movement, advocated by nine-tenths of the operators, and had the sympathy of the vast majority of the American people, and which was deplorable only in its fruitlessness.

The members of trades-unions do not surrender their individuality, nor do they follow blindly the dictates of their leaders. They are principally intelligent and honorable citizens. Of course, it will be admitted by all that there is more or less destruction of property, etc., in most strikes. But the respectable should not be held accountable for the ill deeds of the rascals; the many should not be judged by the few. Labor, of course, has a perfect right to demand the highest price it can get, and so long as it leaves unmolested the property of others, it is entitled to the respect of the people.

Railroads, telegraph companies, and the like, as a general thing, pay immense dividends, the funds for which come out of the pockets of the people. The corporations force labor down to the barest minimum on which it can subsist, and when the laborers, like Oliver Twist, ask for more, the cry is raised that the security of society is threatened; and as in the novel, the request for more is denied, and the workmen are put upon a bread-and-water diet for their impudence. There is, I am happy to say, a growing sentiment in favor of the Government's taking control of

the railroads and telegraph wires. This done, transportation and telegraphing will be immeasurably cheapened, and labor in these departments will receive its full and natural reward.

The author of "The Bread-Winners" should bear in mind that "In union is strength" is as good a motto for laborers as for legislators. Men linked together for a common object, advising and counseling among themselves and accepting the views of a majority of their number, can always be more certain of success than if every one followed a policy of his own. Collectively, the workmen can accomplish wonders; individually, they can do nothing.

J. H. Loomis.

Petrography and the Microscope.

I TAKE pleasure in responding to your request for a brief description of one of the youngest of the sciences—petrography, or lithology, a science the delicacy and elegance of which, as well as its great economic importance, entitle it to rank with its sister science, spectroscopy, as one of the marvels of the age. The study is still in its infancy, being little more than twenty years old, and but few popular accounts of it have yet been written. The tool of the petrographer is the polarizing microscope, and his field of work the investigation of the intimate interior structure of rocks. The folk-lore tales have become true: we have magicians now who can look through the solid rock and tell you what lies hidden in its heart. Extremes meet in the new science; the rich pencilings of the spectroscope tell the atomic story of a star millions of miles away, and the translucence of the rock-shaving, as seen under the microscope, invites the eye to witness the solidifications and crystallizations that befell a million years ago.

To see what a vast new field of investigation is opened up, consider the old methods of identifying the mineral components of fine-grained and minutely crystalline rocks. These methods were two, the hand lens and chemical analysis, both rude and imperfect in the case of most rocks. To offer a chemical analysis of certain aggregations of minute minerals, and call it a complete account of the specimen, would be very much like trying to get an idea of St. Mark's in Venice from its ruins—reconstructing in the mind the infinite complexity of its patterns of colored marbles out of the heaps of dust and *débris* into which they had been shattered. For many rocks, differing widely in minute structure and mineral composition, yield identical results under mere chemical analysis, and there are numerous little interchanges in the composition and molecular arrangement of rock-aggregates which chemistry could never discover. There are building-stones which undergo disintegration when they should not, and there are rocks which ought to contain metalliferous lodes, but do not. Micro-lithology ought in time to solve these puzzles, and undoubtedly will do so. An instance of its practical application has come under my notice, *i. e.*, a microscopical study, by Dr. M. E. Wadsworth of Harvard College, of the iron ore, or peridotite, of Iron Mine Hill, Cumberland, Rhode Island, in which the metallurgical problems presented to the iron-master by that ore are for the first time practically solved.

It is difficult to give an untechnical explanation of

the methods of the science; but a general idea may be given of the working of the instrument and of the preparation of the rock-slices.

A polarizing microscope consists of an ordinary compound microscope, in which two Nicol's prisms of Iceland spar are placed at a certain distance apart. One of these prisms polarizes the light, and the other shows you that it is polarized. Theoretically, common light is looked upon as vibrations of the particles of attenuated matter, called ether, with which all space is supposed to be filled. While the motion is propagated directly forward in straight lines, the particles of the ether are supposed to vibrate in every direction at right angles to the propagated motion. Now, if in any way these vibrations can be forced to confine themselves to one direction only, the light thus modified is said to be polarized. To make the meaning clearer, let the reader imagine a cord tightly drawn between two points, one of which shall represent the source of light and the other the eye. Let that cord be struck at the first end, the motion will be carried forward to the other, but the particles of the cord will of themselves only vibrate from side to side. Now imagine that the cord has been so struck that it shall oscillate outward in every direction about its former place of rest, as water does about the point where a stone falls on it, and it will yield us an imperfect idea of the vibrations of common light. Now imagine this cord struck so that it will vibrate from side to side only, and we have the vibrations as in polarized light.

When a ray of common light enters, in certain directions, a crystal of carbonate of lime (Iceland spar), it is separated into two parts, and in both of these parts the light is polarized; but when they leave the crystal they unite again, forming common light. If, then, by any means, we can get rid of one of the portions into which the light-ray has been divided during the passage through the crystal, the other portion on its exit will remain polarized.

Nicol found that by cleaving a crystal of Iceland spar into proper shape, then sawing it diagonally through its longest direction and cementing the parts together again by Canada (fir) balsam, the balsam prevented one of the two portions of the light from passing through the crystal, but did not interfere with the other portion. These calcite prisms, known from their inventor as Nicols, usually have at the end a rhombic outline; and when the shorter diagonals of the two prisms are parallel, the field of the microscope is illumined; but when the diagonals are *crossed* at right angles, the field is dark. When minerals or glassy substances are placed between the crossed Nicols, they act differently upon it, according to the system in which they crystallize. Glasses and minerals belonging to the cubic (isometric) systems, like common salt, do not affect the light at all; but those belonging to the other crystallographic systems present more or less beautiful and brilliant colors, showing oftentimes the most surprising contrasts and effects, such as no art can imitate.

Interpose a strip of porphyritic pitchstone between the Nicols: the matrix, or mass, of the pitchstone itself is glassy, and therefore remains dark, but the feldspar or mica crystals imbedded in it instantly gleam out in the most brilliant colors in the polarized light.

In practical work, the lithologist uses his microscope, sometimes without any Nicol, sometimes with one only, and then again with both, according to the problem he has before him.

Besides the Nicols, there are other appliances used, like quartz, calcite, gypsum, and mica plates, specially constructed thermometers for measuring the expansion by heat of the liquids and gases inclosed in the crystals, etc., which the limits of this article prevent our describing. Petrography, as at present studied, enables one to ascertain the origin of a rock, the various vicissitudes its component parts have undergone, their relations to one another,—in short, it gives a more or less complete history of the rock, while it throws a flood of light upon points previously obscure. It gives information regarding the decay of building-stones, and points out the injurious materials therein. It determines the minerals in the rocks, and, however minute they may be, yields them up to chemical analysis. It enables one to read the history of those celestial visitants, the meteorites, as plainly as the spectroscope does the stars.

The rock-sections are prepared by first striking off a thin flake of the rock as big as the thumb-nail, and then grinding this flake down on a wheel with crushed corundum and emery till it is so thin as to be transparent, or at least translucent,—so thin, in fact, that a couple of turns more would entirely remove it from the little glass slide to which it is attached. When necessary, the slices are cut on the treadle machine by means of a soft iron disk charged with diamond dust. After being attached by its smooth side to the glass slide (Canada balsam being used to cement it), the section is then made still thinner by grinding down the other side; next, another glass is cemented to that other side, and a number is scratched on the glass with a diamond, a paper label being usually added for convenience of reference. All the processes are extremely delicate and elaborate.

The most eminent students of petrography are found in Germany. Rosenbusch, Zirkel, Cohen, and Von Lasaulx are among the great names there. The first-named seems just now to stand forth most prominent. Zirkel came over to this country in 1876 by invitation of the United States Geological Survey, and accomplished the first extensive micro-lithological work done in America. He examined twenty-five hundred thin sections, and the results of his labors are embodied in his report on "Microscopic Petrography," containing twelve beautiful colored plates. The late Dr. George W. Hawes of the National Museum, and Dr. M. E. Wadsworth, now professor of petrography in the Agassiz Museum at Harvard, were among the first American workers in the new science—the latter having taught the first advanced course in modern petrography ever given in this country. Harvard is the only American college employing a professor of petrography exclusively, and the present chair is maintained by the generosity of Professor J. D. Whitney, the geologist. There are already over two thousand mounted rock-sections in the lithological collection at Harvard. The only text-book of lithology in English written in the modern system is the inaccurate one of Frank Rutley.

Wm. Sloane Kennedy.

BRIC-À-BRAC.

Valentine to an Anonymous Miss.

BALLADE.

GOLDEN locks in cunning curl;
Eyes like jewels set in rings;
Teeth, a row of polished pearl;
Lips, two rosy blossomings:
Spryly to my side he springs.
Pray, who is this fairy fine?
At my feet he coyly flings—
"Will you be my Valentine?"

Ah, my brain is in a whirl,
Thinking on such dainty things!
'Tis young Cupid; see him furl
At his back two tiny wings!
Just between, a quiver swings;
Dipt in love's delicious wine,
To each dart the flavor clings—
"Will you be my Valentine?"

Watching, I will see him hurl
Recklessly these sugared stings;
Shaped like lips of some sweet girl
Is the bow his shoulder slings—
Silken hair twined for the strings.
Snap!—What ails this heart of mine,
Clamoring with questionings?—
"Will you be my Valentine?"

ENVOY.

Muse, unto the maid who sings
For my ears this teasing line,
This reply the echo brings:
"Will you be my Valentine?"

Frank Dempster Sherman.

Valentine to a Man of Worth.

FAIR Sir! to you my maiden intuitions—
Shy but sincere—ingenuously incline,
And if I find you answer the conditions,
I'll take your bid and be your Valentine.

I know your worth—that is, your general merit;
But, when your mourned and wealthy father died,
Pray tell a simple girl, did you inherit
His virtues only—or—a bit beside?

Yes, I admire your lofty reputation,
Dear to my artless spirit as my own;
But tell me this—to still my trepidation—
Are you an owner in Bell Telephone?

Your learning, too, has bound my heart in fetters—
For you are wise, if street report be true;
I, too, a childish fancy have for letters—
I hope you're solid on "C., B., & Q."

Your noble presence—"dignified and stately"—
With inexperienced ardor I adore;
But those Villard stocks! Have you tried 'em lately?
And were you long or short on that Lake Shore?

So, gentle Sir, if you aright but read me,
And will with all your Bonds and Stocks be mine,
Then into Mutual Union you shall lead me,
And I will be—

Your booming VALENTINE.

The Indicator

OF THE GOLD AND STOCK TELEGRAPH COMPANY.

A SONG, a psalm, an upward note,
A rapid, joyous *click! click! click!*
And *click! click! click!*
As animated, full, and quick,
As any trill from thrush's throat,
And up the bubbles rise and float.

What song is this the siren sings,
That charms the fishes in the sea?
That from the fragrant meadow brings
The lambs that gambol friskily?
A tuneless song, but oh, how strong
To gather hearers short and long,
And fill the sails of yonder boat,
And make the bubbles rise and float!

The tide is rising, get on board!
The wind is blowing fair;
The crew are all of one accord,
To sail a glittering land toward.
Come, faithful souls, and get on board!
The dapper crew, so debonair,
Are very sure, extremely sure,
The pleasant weather will endure.

Oh, what a ship! Her silken sails
Are swept along by perfumed gales;
Her merry crew, the long day through,
Make much ado, and dance and sing;
For on a little way before
There lies a golden, glittering shore.
Clap hands, and make the welkin ring,
Ye merry crew, carouse and sing!
But saw ye not, oh blind, blind, blind,
The wolfish faces left behind?

A change of tone! a *click!—click!—click!*
Slow-dropping like a death-watch tick;
A dismal, gloomy *click!—click!—click!*
Whereat the radiant atmosphere
Assumes a livid, sickly hue,
And droops in ragged fringes blue;
A tone that scares the lambs at play,
And sends them scurrying far away
To safety on the upland lea,
And frights the fishes in the sea;
Then sullen waves their fronts uprear,
And bubbles break and disappear.

Ah, where the ship that sailed away
For golden shores, with streamers gay,
And merry crew that surely knew
That summer skies were always blue?
Ah, waves that roll, and winds that moan!
And broken spars that creak and groan!
And drowning men, on billows high,
Who turn white faces to the sky!

David L. Proudfit.

Dat Fretful Tilda Strong.

GOOD mornin', Missis Strong; I hope you'se well.
T'ank you; I will drap in an' set awhile.
Sebenty year is putty ole, my chile,
An' dough de heart is young, de years will tell.

Your life is hard? I guess no harder'n mine.
You'se berry poor? But, chile, you has your healf.
Don' scold de Lord becose you aint got wealf,
W'en out ob ten good tings he gibbs you nine.

Now, Missis Strong, I wants to ax you dis;
Jess len' an ear, an' let a ole man talk;
I'se lived so long dat I know cheese from chalk,
An' hev advice to gib you mussent miss.

Yes! put de dishes down, an' take a cheer;
Settin's better'n standin' w'en you kin;
Hang up de towel on de wooden pin,
For I've got sumfin dat you orter hear.

Dere! don' be offish; I'se a frien', you know;
Don' look so cross: I doesn't mean to scold;
I wants to ax, if I may be so bold,
W'at earlly use dere is in frettin' so.

It's nuff sight easier for to slip along
Widout dis peevish an' dis snarlin' way;
An' life don' go no smooover day by day
For findin' fault, now does it, Tilda Strong?

You can't untangle snarls by gittin' riled;
De more you yanks de freed, de wuss it is;
But coax de tangle, fust dat freed, den dis,
An' soon de t'ing is done, an' nothin's spiled.

I call your 'tention to de porkipine
Dat little Peter killed de odder day;
He's hangin' outen yander, an' I say
Dat he can preach a sermon better'n mine.

You stroke dat feller from de head to tail;
You don' git pricked, an' yet de quills is dere;
He seem so soft as dough dose quills was hair,
An' bleedin' fingers don' set up no wail.

But now, jess fetch your han' de odder way,
An' stroke de little beast from tail to nose;
Dere! don' git riled, becose it only shows
You tinks I mean a good deal more'n I say.

Now, Missis Strong, dat porkipine is life,
An' life is 'bout as full of quills as he;
Stroke up, an' t'ings is wrong as wrong can be;
Stroke down, an' you'se a cheerful, happy wife.

You kin broil bacon like a city cook;
You wash an' iron as no Chinese can;
An' w'en you has a possum in de pan,
Ole Pete look proud as any king could look.

But, Tilda Strong, you frets more'n you'se aware;
You specs dat eberyting go wrong, end fust;
Dat odders git de best, an' you de wust,
As dough de Lord had 'prived you ob your share.

Don' worry cos you hasn't all you wish;
A hearty laugh is better dan a groan;
An' if you hab enough to eat, don' moan
Becose you eats it from a broken dish.

Well, bless you, chile! No, no, I mussent stay;
I'll jess drap home agin wid dis remark:
W'en tings aint right, an' eberyting look dark,
W'y! stroke dat porkipine de odder way.

The Sequel.

(Respectfully dedicated to the author of "Nancy—An Idyl of the Kitchen.")

OH lovers, who fancy that if you are rich in
The love of a damsel who knows how to sew,
Who passes her mornings at work in the kitchen,
Your cake's in no danger of turning out dough,
Come listen awhile, as in mournfulest verses
A sufferer tells what you all ought to know,
And here for your benefit bravely rehearses
How his cake, alas! proved the heaviest dough.

My Prudence, although not possessed of a nickel,
Was raised by a notable mother; and so
There was nothing she could not preserve or else
pickle.

And her heart seemed as light as was always her
dough.

How often by chance, or by warm invitation,
I dropped in to tea, only lovers will know;
And though of my coming she'd no intimation,
She'd always fresh biscuits of well-kneaded dough.

"Ah, here," I exclaimed, "is the girl for my money:
It's not a great deal, but how far it will go
With a wife who makes bread that is sweeter than
honey,

And who isn't too grand, the dear thing, to knead
dough."

With a prospect like this, I'd no reason to tarry;
She owned that she'd loved me "a long time ago,"
And when I suggested that straightaway we marry,
She rose to the plan like her own lovely dough.

And what is the sequel? My home is perfection,
No doubt you will think. Oh, how much you all
know!

My wife is fatigued with a daily inspection,
And firmly declines the least contact with dough!
My little appeals to her conscience are slighted;
She's deep in a novel when not on the go,
And asks, with a smile, if I'm quite so benighted
As to think her fit only for kneading my dough!

To a slight explanation she once condescended:
Her life was a burden, she hated work so;
And she thought, when she married, her troubles
were ended,

And vowed never more to lay finger to dough.
With satins and laces I'm forced to adorn her;
She yawns over Ruskin, says Irving is "slow";
We deal with the baker who lives round the corner,
Although he puts alum, I'm sure, in his dough!

I offer, in meekness, a single suggestion.

A marriage may last fifty years, as we know;
Things beside heavy bread sometimes cause indi-
gestion:

Don't marry a girl just because she kneads dough.

Margaret Vandegrift.

Aphorisms from the Quarters.

DE blackin'-bresh don't half-sole de busted shoe.
Little flakes make de deepes' snow.
De lame horse can't tell when de road good.
De fros' dat kills your crap sometimes thins out
your frien's.

Red is de wrong culler for a patch.
Knot in de plank will show froo de whitewash.
A short yard-stick is a po' thing to fight de deb-
bul wid.

Dirt show de quikes' on de cleanes' cotton.

James A. Macon.

The Wooing O't.

A LAWYER once, unlike most of his class
 A modest man, fell dead in love. A lass
 He worshiped quite, but still his secret kept
 Till up the scale his cautious courage crept,
 And, well assured no one his purpose knew,
 He started out with this sole aim in view—
 To wit, to woo.

His way led through a wood, the shadows fell,
 His waning courage shadowy grew as well,
 Until he asked himself, disheartened quite,
 "Why am I here at this time of the night?"
 An answer from a tree-top loud and clear,
 In legal language couched, fell on his ear—
 "To wit! to woo!"

He fled in fear, although he no one saw;
 For fear, like many a lawyer, knows no law.
 The bird of wisdom perching overhead
 Slow flapped his wings, winked warily, and said:
 "Why should this be? Such haste I never knew.
 He sure an unwise purpose had in view—
 To wit! to woo!"

ENVOY.

Take well to heart this text drawn from the wood:
 Your modest wooer never comes to good.
 Though all the world your secret clearly knows,
 And through unheard-of shades your pathway goes,
 Let not your courage fail whate'er you do;
 Your wit keep always clearest when you woo.

William Howard Carpenter.

Leisure Lines

FROM A POET TO HIS FRIENDS.

[MR. AUSTIN DOBSON has the pleasant habit of writing kindly verses in the books he gives his friends. We have been permitted to collect five of these little poems. Four of them were written in copies of "Old World Idylls" (substantially identical with the American edition of "Vignettes in Rhyme"), and the fifth was prefixed to a copy of Mr. Dobson's monograph on Fielding.]

FOR H. C. B.

WITNESS my hand (and seal thereto),
 All ye who wrong, by word or sign,
 This unprotected Muse of mine:
 I wish you—something else to do.
 May all your bills at once be due!
 May she, whose grace you seek, decline!
 Witness my hand!

But you, acute, accomplished, true,
 And *candid*, who in every line
 Perceive a spark (or sparks) divine,
 Be blessed! There's luck in 'store for you.
 Witness my hand!

FOR —.

OLD friends are best! And so to you
 Again I send, in closer throng,
 No unfamiliar shapes of song,
 But those that once you liked and knew.
 You surely will not do them wrong,
 For are you not an old friend too?
 Old friends are best.

Old books, old wine, and Nankin blue,
 All things, in short, to which belong
 The charm, the grace that Time makes strong,
 All these I prize, but (*entre-nous*)
 Old friends are best!

TO L. H.

THERE is no "mighty purpose" in this Book.
 Of that I warn you at the opening page,
 Lest, haply, 'twixt the leaves you careless look,
 And, finding nothing to reform the age,
 Fall with the rhyme and rhymers in a rage.
 Let others prate of problems and of powers;
 I bring but problems born of idle hours,
 That, striving only after Art and Ease,
 Have scarcely more of moral than the flowers,
 And little else of mission than to please.

FOR J. B. M.

IN vain to-day I scrape and blot:
 The nimble words, the phrases neat,
 Decline to mingle and to meet;
 My skill is all foregone, forgot.

He will not canter, walk, or trot,
 My Pegasus. I spur, I beat
 In vain to-day!

And yet 'twere sure the saddest lot
 That I should fail to have complete
 One poor (the rhyme suggests) "conceit"!
 Alas! 'tis all too clear I'm not
 In vein to-day.

TO E. C. S.

PLEASANT to get one's book from press
 After a month (or more or less)
 In something like a decent dress;
 And pleasant, too, to sit and guess
 Whether the world will ban or bless
 Out of its Great High Mightiness;
 But pleasantest—I must confess—
 To post it off to E. C. S.

Austin Dobson.

A Sonnet by Browning.

MR. RAWDON BROWN, an Englishman of culture well known to visitors in Venice, died in that city in the summer of 1883. He went to Venice for a short visit, with a definite object in view, and ended by staying forty years. An incident of his death is recorded in the following sonnet, which is here printed by Mr. Browning's permission, and that of the lady at whose request it was written.

"Tutti ga i so gusti e mi go i mii."*
 (*Venetian saying.*)

SIGHED Rawdon Brown: "Yes, I'm departing, Toni!
 I needs must, just this once before I die,
 Revisit England: *Anglus* Brown am I,
 Although my heart's Venetian. Yes, old crony—
 Venice and London—London's Death the Bony
 Compared with Life—that's Venice! what a sky.
 A sea, this morning! One last look! Good-bye.
 Cà Pesaro! no lion—I'm a coney
 To weep! I'm dazzled; 'tis that sun I view
 Rippling the...the...Cospetto, Toni! Down
 With carpet-bag and off with valise-straps!
 "*Bella Venezia, non ti lascio più!*"
 Nor did Brown ever leave her; well, perhaps
 Browning, next week, may find himself quite
 Brown!

Robert Browning.

MARCH, 1884.

No. 5.

THE NEW WASHINGTON.

WITHIN the past ten years Washington has ceased to be a village. Whether it has yet become a city depends on "the point of view." It has no elevated railroads, no palace hotels, no mammoth elevators, no great commercial establishments; it has no opera and but indifferent theaters, and for a park it borrows the grounds of the old soldiers of the army. In short, it has none of those evidences of commercial prosperity which are proudly shown to the traveler in every thriving town, all the way from New York to San Francisco. On the other hand, it has large public buildings and monuments and numerous statues; it has a mild climate, clean, well-paved streets, and no "local politics"; its chief inhabitants are those persons who guide the action and control the interests of fifty millions of people—so far as they are guided or controlled at all in a nation which so largely governs itself. Washington is thus a place quite out of the ordinary run; whether city or no, it is certainly unlike other cities. Its origin and inception were novel and unusual in character. Other cities have originated in the necessities of trade, and have grown in proportion as that trade increased. Washington, on the contrary, was made to order on a map; and so far from extending its limits as its population increased, its population has not yet grown up to the limits which were originally laid out. It found its origin in the rivalry existing among the various States after the Revolution, all being jealous of the increased importance which would result to any one of them from having the federal city established within its limits. This feeling was increased by the mortifying spectacle which occurred at Philadelphia, in 1783, when Congress was insulted in its own halls and driven across the river by

a handful of mutineers from the army,—the State and local authorities being either powerless or unwilling to protect them from injury. Many of the members of that Congress were delegates to the Constitutional Convention four years later, and the recollection of this indignity was so fresh in their minds that they determined that Congress should itself make the laws for the place where it met. The result was the well-known clause in Section 8 of Article I. of the Constitution, which conferred on Congress the power "to exercise exclusive legislation in all cases whatsoever" over such district as might be ceded by the States and accepted by Congress as the seat of government. The selection of such a district was one of the very first questions which arose in Congress. As soon as laws had been passed organizing the various departments of the government and putting the new machinery in motion, the question of the location of the government came up, and it gave rise to long and acrimonious debate. Not only was it claimed by the large cities, like New York and Philadelphia, but each of the middle States, from New York to Virginia, inclusive, was ready with a piece of territory on which to found an entirely new city. It was finally settled by a curious compromise—the first recorded instance of "log-rolling"—in this manner. Hamilton was then (1790) engaged in his projects for funding the debt, all of which had passed except the final one assuming the debts of the States. This was a popular measure in the North, but somewhat unpopular among the Virginians. He needed some votes from the South in order to carry the measure through. Jefferson had then but lately returned from France, and, as he claimed, was not very familiar with the funding projects, which he subsequently opposed

so violently. He was, however, greatly interested in locating the new capital in the vicinity of Virginia. Hamilton was a foreigner by birth, accidentally settled in New York by reason of his marriage, but quite devoid of any feeling of local or State pride. He cared nothing for the location of the capital, but was anxious concerning his financial projects, which he considered of vital importance. It was therefore arranged—at a dinner-party—between himself and Jefferson, that the latter should persuade the Virginia delegation to vote for assumption, while Hamilton was to induce the New York delegation to yield their preferences concerning the capital. The two measures were thus carried, one on the 16th of July and the other on the 4th of Au-

lots were to be sold and the money applied to opening and improving the streets and erecting the public buildings. With these commissioners there was associated, for the purpose of making plans and surveys, a certain French engineer named L'Enfant, who had served under Washington's notice during the Revolution. His plans were as comprehensive and far-reaching in their way as was the Constitution itself. He planned for centuries, and for a population of half a million of people.

The plan was simple in its general outline, though its details were very elaborate. Three principal points were selected for the legislative, executive, and judicial buildings respectively; from two of these points ave-

THE STATE, WAR, AND NAVY DEPARTMENTS.

gust, 1790. The former prescribed that the permanent seat of government should be in the district ceded by Maryland and Virginia on the banks of the Potomac, and that the Government should be moved there in the year 1800. President Washington had remained neutral during the discussion, but he was much pleased at the selection made; and he gave his personal attention to the matter with unflagging interest throughout his administration, and, indeed, to the day of his death. Commissioners were at once appointed to acquire the land, which was obtained on the most liberal terms, the owners giving to the United States the fee of all ground necessary for streets and public buildings, and one-half of all the building lots in addition; with the understanding that these

nues radiated like the spokes of a wheel, affording short lines of communication to all parts of the city and forming numberless little parks at their intersections; a rectilinear system of streets was added, running north and south and east and west, the first being designated by numerals and the second by the letters of the alphabet. The avenues were named after the States of the Union, with much care and discrimination in guarding their respective susceptibilities by giving to those which were intended to be most important the names of the principal States. Everything was on a scale of large proportions, the avenues being grand boulevards of one hundred and fifty to one hundred and sixty feet in width, and even unimportant streets being ninety or one hundred feet wide.

The proportion
of streets and

open squares, which in most cities is about one-fourth, was thus laid out in this capital city at more than one-half of the whole surface. It was to be the capital of a mighty nation, and no one was to be pinched for space in it.

The plan was thus drawn on paper, and nothing remained but to fill up the uninhabited fields through which the imaginary streets ran. This was not so easy. The Government came there in 1800, and great expectations were formed, but they were not realized. For more than half a century the place remained a straggling Southern village, giving rise to much ridicule as a "city of magnificent distances." The diaries and chronicles of the first third of the century give curious accounts of the uncomfortable and dreary life in such an uninviting place; it was particularly amusing to the members of the diplomatic corps, and the contrast to London and Paris and Vienna must certainly have been very great. It was originally intended that the city should grow to the eastward on the broad, high plateau beyond the Capitol, and that the President's house and other executive buildings should form a sort of suburb like Versailles. But the lots on Capitol Hill were all bought up by speculators, and held at such high prices that people were forced to turn in the other direction, and the city thus took a course which it has never been possible to reverse. Its growth, however, was

extremely slow. The commercial advantages which were expected to result from the navigation on the Potomac and the transportation routes to the westward proved to be delusive. Commerce went to other cities. It was a city of office-holders simply, and at first these were not numerous. Gaunt rows of "six buildings" and "seven buildings" were erected here and there, principally as boarding-houses to accommodate the members of Congress and those who had business with them during the winter. But no one came there who did not have urgent business, nor did any one stay longer than was necessary. Its character changed but little down to the period of the war, and at that time—sixty years after it had been founded, and when the country had grown to contain thirty-two millions of people—it had attained a population of only sixty thousand inhabitants, who were scattered over a territory of several miles; its streets were so filthy and ill-kept that they were a by-word of contempt; none of its citizens were rich, and there were no handsome dwellings or other indications of private wealth; it had the usual government of a mayor and council, which had neither the means nor the disposition to beautify the

THE TREASURY DEPARTMENT—FIFTEENTH STREET FRONT.

THE U. S. POST-OFFICE DEPARTMENT.

city; the General Government had neglected its godchild, and while it spent lavishly for its own public buildings, it paid little or nothing to improve the general appearance of the city.

With the resumption of prosperity in the period following the war, the place first began to change; the business of the Government had greatly multiplied, and the number of its public servants had correspondingly increased; the population of the city had nearly doubled between 1860 and 1870, and among the new-comers were many energetic Northern men. It began to be realized that it was a

disgrace to have such a city for a capital, and that the General Government and the citizens must all unite in efforts to improve it. The result was the formation, in 1871, of a territorial government, with a Governor and Legislature and a Board of Public Works. The master-spirit of this government was Alexander Shepherd, a native of the city, who, though still young, had raised himself by his energy and talents from the apprenticeship of a manual trade to a position of means and importance in the community. The results of his government are too recent and too well known to call for fresh comment. Vast plans

were again matured, founded, as in the past century, not on the actual necessities of the moment, but on the requirements of a generation hence. Costly improvements were undertaken and prosecuted far beyond the limits of habitation. Miles upon miles of expensive pavements and other works were laid across swamps and streams, and through waste places where nothing but frame shanties and government stables of the war period had as yet penetrated. In less than three years Shepherd plunged the city into a debt which, for the numbers and wealth of the population, has no rival in all the world. No

personal dishonesty has ever been proved against him, but the recklessness and extravagance in the expenditures were extraordinary. The streets were torn up in every direction on a "comprehensive plan" of improvements, which was estimated at six millions of dollars and cost twenty; the rights of property-owners were disregarded, and they were assessed for "improvements" when their property was ruined. The result was a crash in 1874,

maintained wholly with Congress, which also assumed one-half of all the annual expenses, including interest on the debt. The taxes were to be covered into the United States Treasury and form one-half the revenue, the other half being provided by the General Government; and the entire revenue was to be disbursed on specific appropriations by Congress, the accounts being passed upon by the accounting officers of the Treasury. This system

"ABOVE THE GRADE."

when Congress abolished at one stroke the territorial government and everything connected with it, and appointed three Commissioners, in the nature of receivers, to take charge of the municipal affairs and straighten them out. These Commissioners remained in office for four years. The work of reconstructing the city had been so thoroughly begun that there was no option but to complete it. This was cautiously and carefully done, and the net result was stated to be a debt of twenty-three millions, resting on a community whose entire property was valued at less than eighty millions. Congress then determined to exercise directly, instead of delegating, its constitutional power of legislative control over the Federal district; and in 1878 it framed an act to provide "a permanent form of government for the District of Columbia." This act provided for three Commissioners, appointed by the President and Senate, who were to exercise all the executive functions necessary for the city, and who were to appoint and remove, and be responsible for, their own subordinates. The legislative power re-

is still in force, and after nearly six years' trial it is, in the main, quite satisfactory to all concerned. It would appear at first to be fundamentally opposed to the spirit of American institutions, for the people have no direct voice in the choice of their public officers. But while this is true as far as the citizens of Washington are concerned, it is to be remembered that the Federal city is the creature and protégé of the Federal Government, and that the interests of that Government are overwhelmingly great in comparison with the interests of the citizens. It is the seat of government, and the fact that persons reside there who are not connected with the Government is a mere incident. As a fact, a large portion of the population retain a residence elsewhere, and there is only an inconsiderable minority which is not directly or indirectly dependent on the Government. Were its official character to be lost, Washington would sink into utter insignificance. The city thus exists for the people of the whole country, and the people govern it through their elected representatives in Congress.

MASSACHUSETTS AVENUE, NEAR DUPONT CIRCLE.

The change wrought in the appearance of the city by the Shepherd government and its successors was fundamental and revolutionary. It might have been done more cheaply, but it was better to have it done extravagantly than not at all. Possibly, it never could have been done at all but by some man of Shepherd's intolerant energy, which sacrificed individual rights for the future benefit of the whole community. Had it been attempted prudently and cautiously, these individual rights would have defeated the whole scheme, for the community was not wealthy enough to compensate the injury done to them.

Fortunately, during all the years that the place had remained a wretched village, its grandiose plan had never been intrenched upon in any way; and when the work of development was taken in hand in earnest, it was at once manifest what immense possibilities the plan contained. The great boulevards, or avenues, were three times as wide as was necessary for purposes of communication; it was determined to use a portion of them only for a roadway, another portion for foot-walks, and to devote fully half of the street to lawns in front of the houses. The idea was not novel, for it had been carried out to a limited extent in many cities of Europe and America, where, on a few streets, the houses are built well back from the front line of the lot; but, as a general rule, city real estate is too valuable to allow such a luxury. In Washington, however, the streets were wide enough to permit this without sacrificing any private property, and the

system of "parking" thus became the rule, and not the exception. At the same time, the city was torn up from one end to the other, and regraded, filling up here and cutting down there, without regard to the existing positions of houses. Many were banked up to their windows, others were left high in the air; but the general result was a system of streets with such gradual slopes that there is hardly a place where an ordinary carriage cannot proceed at a trot.

The roadways being narrowed and the streets graded, the next step was the planting of trees, forming miles on miles of shade. This was systematically done, the trees being carefully selected by experts, certain varieties for certain streets, planted with great care, and protected by boxing. They have been wonderfully successful, fully ninety-five per cent. having thriven. The quick-growing maples and poplars were principally used, but there are large numbers of elms, lindens, box elders, and buttonwoods, besides other varieties, amounting to more than twenty. One feature of the tree-planting project was a continuous drive of several miles under lindens; a part of this extends for over three miles on Massachusetts Avenue, where there are four rows of the lindens, two on each side of the road-way, already of sufficient size to unite with their summer foliage in an arch over the sidewalk. In this matter of trees, Washington is unrivaled among all the cities of the world. Other cities have trees in their parks and here and there on

THOMAS CIRCLE.

a few streets, but nowhere else has it been attempted to plant trees systematically and thoroughly on every street, except those devoted exclusively to business purposes. Nowhere else are there one hundred and twenty miles of shaded streets. The effect of this planting is not yet fully developed, the elms and other slow-growing varieties being still quite small; but the quick-growing maples and poplars are now seven and eight inches in diameter and forty feet high. The view in the spring and early summer of the streets thus shaded, and flanked by lines of lawn or terrace or flower-garden, is novel and beautiful. Its beauty is increased by the flowers and vegetation of great numbers of little triangular spaces, which have been formed by the intersection of the avenues with the streets, and which have all been tastefully laid out, according to their size, either as simple lawns or flower-beds, or as parks, with walks, fountains, etc.

As the trees were the most successful and the most inexpensive of all the works of the Shepherd government, so were the pavements the most costly and the most unsuccessful. They were principally of wood, and they went to pieces very quickly, leaving the streets for some time almost impassable. Year by year the wood has been replaced with asphalt, which now covers a length of fifty miles, and is a great luxury for all who

use the streets, whether with cushioned carriage or heavy express wagon. By far the greater part of the streets used for residences are covered with these asphalt pavements, which are somewhat similar to those in Paris, but cover an extent three times as great.

It was but a short time after the city had been thus remodeled, when the natural result came in a new class of houses. And here again the French engineer's plan was found to be full of possibilities which hitherto had not been thought of. In a city laid out like New York and most other cities, in monotonous parallelograms, all the lots are of the same pattern. What can an architect do with the unvarying 25×100 feet? He may double it, and make it 50×100 , and he may expend vast sums upon it, but it is still the same. The streets of Washington, however, with its various intersecting avenues, afforded building lots of every conceivable variety of shape; and the architects were not slow to cover them with every conceivable variety of houses,—square houses and round houses, houses with no two walls parallel, with fantastic roofs and towers and buttresses and bay windows and nameless projections. Some of them were good and some bad, but hardly any two were alike. Even after making all deductions for the mistakes and failures, the result of this variety is certainly pleasing. The two miles of Fifth Avenue in New York between Washington

Square and the Central Park present an imposing manifestation of wealth; one may visit many cities without finding its equal. But in the whole length—excepting a few recent structures—there is not a house which has any individuality. So similar are they that they might all have been made on a machine, and one cannot but be oppressed by the interminable monotony of the long vista of brown-stone walls on either side, with gray-stone flags underfoot, and very little sky overhead, and no trace of vegetation of any kind. In Washington there is no such wealth—and no such monotony. As the eye wanders along

handsome avenues. Everywhere there are superb residences looking out upon fields of red clay and weeds, and flanked on either side by such shanties as perch on the rocks in the upper part of New York. This incongruity reaches its height on the principal street of the town, Pennsylvania Avenue, which is of unrivaled width, beautifully paved both for vehicles and pedestrians, flanked at either end by the magnificent Capitol and Treasury buildings, and possessed of every requisite for a famous boulevard—except buildings. There are, perhaps, a dozen large structures in its length of more

PENNSYLVANIA AVENUE.

the street, it constantly finds some new shape, some odd design, some strange combination in color. Many of these alleged "Queen Anne" houses, with their rooms cut up into all sorts of angles, are reputed to be most uncomfortable places to live in; but they serve an admirable purpose in street decoration. With streets, however, laid out for more than double the actual population, one has a wide range in which to choose a lot. This option has been freely availed of, and there are, consequently, three vacant lots to one which is built upon. The new buildings have clustered about the Scott Square and Dupont Circle, and the other little squares and circles, forming small settlements, separated from each other by long distances of vacant fields, unbroken except by the asphalt roads and the lines of trees. This scattering of the new building forces has given a very incongruous and ludicrous appearance to some of the most

than a mile, which tower high in the air, and are suited to the character of the thoroughfare. All the rest are dilapidated and wretched little houses of ancient date, which look singularly out of sympathy with their surroundings.

This is naturally to be expected in a place which was first planned, and subsequently improved, out of all proportion to the requirements of the moment. It grows in spots, which, like the settlements in the Far West, form each a little center of development, radiating and extending toward its neighbor, until finally they will all join and form a civilized whole. When this process is completed in Washington, it will be, among cities, the wonder of the world.

Such is the outward appearance of the Federal city. What sort of people live in it? It has no commerce, no great merchants, no powerful corporations, none of the classes

LONG BRIDGE.

which form the controlling elements in other cities. Its one hundred and eighty thousand inhabitants are, roughly speaking, the families of office-holders, or of persons who supply office-holders with food, clothing, shelter, and the other necessities of life. It is hard to realize to what extent the Federal business has grown. The official register contains the names of nearly fifteen thousand persons, beginning with President and ending with "cuspadorians," who serve the United States in the city of Washington. Perhaps one-half of these are clerks and writers, busy in settling accounts and claims; nearly one-fourth are employed in mammoth establishments like the Printing Office and Bureau of Engraving and Printing. Others are engaged in the various scientific departments under Government control. Finally, a number, small in amount but large in importance, comprise the prominent men in public life—the Senators and Representatives in Congress, the great lawyers on the Supreme Bench, the members of the Cabinet and chief bureau officers, the most prominent officers of the army and navy, the representatives of foreign governments. These form the ruling element in what is called "society" in its restricted sense. But they do not form the whole of it. Every year Washington becomes more and more a winter residence for

persons of leisure and moderate means. Its mild climate, its quiet streets, free from the hurried bustle and noise of a commercial center, and the character of its society, prove more and more attractive to certain classes. The merchant who has acquired a fortune in the fierce struggles of trade goes there to build himself a house and quietly enjoy with his family the results of his labors in a place where there is no business talk. The retired army or navy officer finds nowhere

else so many friends or so much consideration, —in fact nowhere else can he live on his pay with any comfort. The man of science goes there because he can find nowhere else so many men engaged in his own specialty, no matter whether it be in the domain of physical or biological investigation, and nowhere else can he prosecute his studies to such advantage. The man of letters finds there more than one distinguished author, and a library which has no equal on this continent. Other cities have probably more scientific and literary men, but they are relatively insignificant among the vast numbers engaged in commercial pursuits. They form their little societies apart, and are almost unnoticed in the great current of affairs; but in Washington they form an important part of the whole. Finally, during the winter all the world and his wife goes there for a visit—some for sight-seeing, to see what Congress and public men are like; some because it is the fashion to go to Washington in winter as to Newport in summer; some because they have cases to argue in the Supreme Court; some because they have their little measures to look after in Congress. The society is thus ever changing and kaleidoscopic; it is perforce completely revolutionized every four years, and partly so every second year, while every winter brings its fresh supply of mere temporary

residents. The "old-resident" element which, in the days of Southern supremacy before the war, ruled Washington society, is becoming every year more and more in a minority, buried out of sight in the avalanche of Northern wealth and numbers. It is this thoroughly cosmopolitan character which gives to Washington society its characteristic feature. It is the common meeting-ground of people of different tastes and different habits, representing communities and ideas as wide apart as

and, although they figure in the police court more numerous than the whites in proportion to their numbers, yet the offenses are nearly all trivial, most of them being petty larceny and sneak-thieving. Crimes of any magnitude are extremely rare among them, and they are not inferior to the whites in morality or in freedom from the lower vices. They know their legal rights, and are quick to enforce them if imposed upon, but if treated fairly they seldom give trouble. They

OUTSIDE THE MARKET.

the poles, but truly representing them, and all men of mark in their own localities, even though their importance dwindles when exposed to a national glare.

Not the least interesting among the features of Washington is the opportunity which it affords to study the results of emancipation. These results can there be seen at their best, as in South Carolina and Mississippi they appear at their worst. The war brought into Washington a large influx of negroes, principally refugees, who came tramping over the Long Bridge after each successive battle, hoping to find the promised land after they had crossed the Potomac. Their numbers are given in the last census at sixty thousand, or one-third of the whole population. They are as a rule industrious, sober, and orderly;

find employment as laborers in the various public and private works, as household servants (for which they are admirably adapted), as hucksters and purveyors for the markets. Others have improved their condition, and have learned trades as masons, carpenters, blacksmiths, etc. Many are sufficiently educated to carry on a small business or become messengers and clerks in the departments, and a few have held offices of importance, and have discharged the duties of them in such a manner as to gain the respect and esteem of all with whom they are brought in contact. Unlike the plantation negroes of the South, they are provident and economical, accumulate their savings, purchase comfortable homes for themselves, build expensive churches, and conduct a great number of

coöperative and benevolent societies with marked success. Even the poorer laborers are not without food and lodging, for which they are ready to work hard and long, and professional beggary is almost unknown among them. Good schools are provided for their children and filled with thousands of pupils. Those who have the means attach great importance to their dress, and although fond of gaudy colors, they are usually neat in their appearance.

Altogether, the negroes, as seen in Washington, form a very useful and unobjectionable portion of the community, incomparably superior in every respect to the low foreign element which forms the dregs of Atlantic cities. When one sees the intelligence and prosperity of those who have been educated, and the industry and good order which characterize the uneducated laboring class, it instills new hope for the future of their race. The dark past of the ante-bellum period, when slaves were herded in pens on the grounds now used as a botanical garden at the foot of the Capitol, and when the voice of the auctioneer, as he sold them, could almost be heard in the halls of Congress—these days seem to be separated from the bright present by centuries rather than years.

The society of Washington has of late years been the subject of much discussion and not a few novels. It was cleverly satirized three years since by the author of "Democracy." His book was hardly noticed in his own country, save by a few who imagined that they identified the originals of the types so baldly presented, and were amused to see the faults of their acquaintances thus made sport of. But in due time the book traveled to England, and was there gravely considered as an analytical thesis upon the results of a century of self-government. The "Quarterly Review" moralized at great length upon the remarkable spectacle thus presented of a mighty people rushing to self-destruction for lack of a ruling class. People at home then began to inquire for a book which excited such profound interest abroad, and the demand was met by a cheap edition, which all the world has now read.

The society represented in this book centers around a widow of an "assured position in society," who, having traveled everywhere and exhausted everything, comes to Washington in search of a new sensation; to whom court is paid by two men intended to form an antithesis—one a Senator from the West, distinguished as a leader in his party and a Presidential candidate, and the other a Southern gentleman ruined in fortune by

the war and now practicing his profession as a lawyer. Incidentally, there is a President who is a mere puppet in the hands of the Senator, a cynical diplomat, a historian who clamors for a foreign mission, a young miss of startling freedom of manner, and a host of constituents who throng the gaunt lodgings of the Senator, spitting tobacco juice on his floor and pressing their "claims" for office. The slender thread of the story hangs upon the rivalry of the two suitors for the heroine's affections, and the climax is reached after the Southern gentleman is disposed of by sending him off to Mexico as counsel for some sort of claims commission, and the Senator is about to win his suit—when the heroine discovers that he had formerly sold his vote in Congress on a bill for a steamboat subsidy. He tries to explain this, while admitting the fact, by saying that he used the money solely for political purposes in the crisis of an election on the result of which he believed the safety of the country to depend. But she scorns his sophistries and flies a place where no one is free from corruption.

The story is full of hits which, though local in their character, are cleverly made, and it is altogether an amusing little satire; yet no one but a ponderous reviewer would ever find in it any adequate justification for its comprehensive title of "Democracy."

It cannot be denied that certain measures in Congress have been tainted with corruption; the *Crédit Mobilier* and other investigations have distinctly proved it. But neither can any one deny that cupidity is the ruling vice in the nature of most men the world over; nor that in a place where the public business of fifty millions of people is planned, enacted, and conducted, there should be manifold opportunities for dishonesty of every shade, from open bribery to the most remote indirect benefit. But in spite of cupidity, human nature is not wholly bad; and in spite of its temptations, Washington society is not wholly, nor even principally or mainly, corrupt. There are professional lobbyists who go there in numbers every winter; their doings and their methods, with their restaurant dinners, their hotel life, their intrigues, and their secret conferences, can be traced by the aid of a detective reporter; and the spectacle is by turns exciting and repulsive, instructive and indecent. But the lobbyist and his companions are no more to be found in good society than the social outcast among decent people. The most that is known about the lobby and corrupt bills is derived from the principal newspapers, and one may live in Washington for years and never meet a live lobbyist. It

is highly probable that the amount of legislative dishonesty is at least not greater in Washington than in London or Paris. The difference lies in the amount of publicity given to it in America, and to the public craving for that sort of news which stimulates the supply of it, to an extent far exceeding what is warranted by mere truth.

Nevertheless, the lobby and corruption are legitimate subjects for satire. But the satire

ton are the prominent men of the country at large, and their morals and their character, their honesty and dishonesty, are a faithful reflection of the tone of public sentiment in regard to morality throughout the country. Those who believe that the people in general are corrupt will believe the same of their representatives; and those who believe that the prevailing sentiment in America and elsewhere throughout the world is in favor of

ENTRANCE TO NAVY YARD.

must not be accepted as a well-proportioned picture. If one should write a book and call it "Commerce," in which the principal character should be a notorious stock-jobber who amassed a great fortune by assiduously circulating lies which affected the value of the property he bought and sold, and in which the other characters should be a chief municipal officer and a judge who were mere hirelings of the stock operator, a minister of the Gospel who was a gross libertine, a merchant who made false returns of his income and false invoices of his goods, and a host of idle young men who scorned the trades in which their fathers gained the fortunes they were spending, and whose principal occupation was to assemble every night in a club to talk scandal and play cards—who would accept it as a faithful picture of New York society? and what would be thought of the foreign philosopher who should gravely discourse upon it as showing the inevitable results of engaging in commercial enterprises?

The prominent men of society in Washing-

ton will find the same sentiment in public men.

Leaving aside the question of political morality, few people who have passed a winter in Washington will deny the charm of its society. Acknowledging all its faults, its crudeness—narrowness, perhaps—and its lack of form, it must yet be acknowledged that it differs from all other American society in the fact that it is not founded on wealth. It is the only society which is really republican, though it has little resemblance to the "republican court" of the first administration,—the only one in America which has a well-defined basis. And that basis is public station, temporarily conferred, whether directly or indirectly, by the expressed wishes of fellow-men. The holding of such public station necessarily implies intelligence, and thus it is intelligence, as distinguished from lineage or wealth, which is the fundamental basis in Washington society. Such a society does not feel obliged to adopt certain customs because it is reported at second hand that they are

good form in London. Its opinions are robustly independent, its information is extensive, and its subjects of conversation are many and varied.

It is not to be imagined that such a society is well defined, or that its rules are clearly es-

President, where the doors are thrown open that every person in the street may enter them in a crush, and stand in a slowly moving procession for two hours, in order that during half a minute of that time the President may be seen and his arm may be wrenched.

STREET SCENE NEAR NAVY YARD.

tablished—though it is true that the “Etiquette of Social Life in Washington” has been most elaborately formulated in a little pamphlet, of which a fresh edition is perennially produced, and which is said to sell in great numbers. It is, undoubtedly, open to the criticism of being raw, to the same extent—but no more—that society in London is subservient and snobbish, and in New York illiterate and commercial. Nothing can be more ridiculous than the public levees of the

But this is not peculiar to Washington alone. Such “public receptions” are inflicted upon presidents in all cities which they visit. Hardly less incongruous are the Wednesday afternoon receptions of the wives of Cabinet officers, when their doors are also thrown open and hundreds of strangers tramp through their parlors “to pay their respects.” The wives of Judges and Senators and Representatives have to endure the same thing on other afternoons of the week. It has come

ST. JOHN'S CHURCH.

to be considered as part of the price of public station. But, no matter what office a man may hold, no one may come to his dinner table without an invitation. And it is in dinners that Washington society excels. Diplomats and travelers from every part of the world; men distinguished in political life, on the bench, and in war; men of science and men of letters; women of intelligence and culture, with the native grace and beauty for which American women are justly celebrated—there is no such wealth of choice in any other American city, and there are no other dinner-parties so entertaining as those of Washington.

Of great balls there are not many. Few people have the means, and still fewer have the disposition, to incur the expense and domestic nuisance of a ball at home. But those who think that society exists only for dancing have ample opportunities for their amusement in the constant number of balls given by the different german clubs in public halls.

Of evening parties, where there is occasionally dancing, but which can hardly be dignified as balls, there is an incessant round night by night, from Christmas to Ash Wednesday. There are perhaps two score of houses where people are at home one or two evenings in every month. As the society is still so small that there is but one set in it, one meets everybody, *i. e.*, some four or five hundred

persons, at these different houses. It would be absurd to say that these affairs are the equals in brilliancy of the salons of the famous French women of the last century, but they are of that type, and will gradually approach that ideal. A considerable minority—often a majority—of the company is composed of distinguished men and brilliant women; and it is the constant reunion of such people at dinners and small evening parties which makes up the most agreeable part of Washington society.

What, then, to sum up, are the attractions of Washington? It has a climate which is mild in winter and unrivaled in spring and autumn. It is a cleanly and convenient place to live in. It has many things to interest the curious. At the Capitol one may see in the Senate the most orderly and dignified legislative body in the world; in the House one may watch a debate of such turmoil and confusion that it seems an unintelligible Babel; in the Supreme Court one may hear the most profound legal argument, and study the proceedings of a court which has no equal in the extent of its jurisdiction and powers. Going up the avenue, there will be seen at the White House a building rich with memories of everything that is prominent in American history for the past seventy years, and in it the curious spectacle of a man performing the chief executive business of the nation in a small office where there is less ceremony than is usual with the president of a bank. On either side of this building is a vast aggregation of granite containing each many hundreds of rooms filled with busy

THE TREASURY DEPARTMENT.

clerks. In the one which is devoted to the State, War, and Navy Departments, there can be seen the original draft of the Declaration of Independence, much correspondence of Washington and others dur-

a quarter of a mile to a new brick building on the banks of the Potomac, under the shadow of the now nearly completed Washington monument, one may see this paper money and bonds and stamps in every stage

GENERAL LEE'S HOUSE, ARLINGTON.

ing the Revolution, and the original draft of every law which has been passed and every treaty which has been made since the foundation of the Government. On the walls of one of the rooms are the photographs of the successive Secretaries of State, and their faces are worthy of study. Beginning with Jefferson, Randolph, Pickering, and Marshall, the collection goes on with Madison, Monroe, Adams, Clay, Webster, Calhoun, Everett, Marcy, and Cass, and ends with Seward, Fish, Evarts, and Blaine. Few offices can show such a famous list of occupants.

Crossing over to the other great pile of granite, one comes into an atmosphere of money and the evidences of wealth which probably no other building contains. Here are between two and three thousand people, men and women, busy with figuring and settling accounts. In the vaults there are a hundred and fifty millions of hard cash; this is not shown to visitors, but must be accepted on the faith of the monthly Treasury statement. But in the safes of the National Bank division there are over three hundred millions of dollars in bonds, deposited there to cover the circulation of the banks. They are piled up in brown paper parcels, and visitors who are properly accredited sometimes amuse themselves by holding five millions or more in one hand. Going down

of its manufacture—the making of the paper, the mixing of the inks, the engraving of the plates, the printing, numbering, cutting, and counting. It is like any other four-story factory, yet even to the most philosophical mind there is a certain interest in the wholesale manufacture of money—or its representative.

Just across the street from this building, in the midst of a park most elaborately laid out, is the Department of Agriculture, where the theoretical farmer can learn all the processes of the latest experiments in agriculture, from the culture of expensive tea to the improvement of the common potato. In the continuation of the same park are seen two large buildings, side by side: one a graceful Gothic structure of dark sandstone, and the other a modern heap of red, blue, and yellow bricks. One is the Smithsonian Institution and the other the National Museum. The latter building covers five acres under one roof, and is the best stocked museum in this country, though it is yet far behind its foreign rivals.

And so the sightseer can go on, inspecting Washington's old clothes and camp chest, surrounded by countless models of machines at the Patent Office; penetrating the mysteries of weather predictions at the Signal Office; looking at pictures in the Corcoran Gallery; examining skeletons at the Army Medical

SOLDIERS' GRAVES, ARLINGTON.

Museum; driving out northward to the Soldiers' Home to get a bird's-eye view of the city from the hills which form its northern boundary; and finally, riding across the Potomac to Arlington to see the beautiful home which Lee left after so long and painful a struggle between his duty to his country and to his State, where now his majestic oaks look down on long lines of white headstones, covering those who laid down their lives in the great war with no reward save that

"On Fame's eternal camping-ground
Their snowy tents are spread,
And Glory guards with solemn round
The bivouac of the dead."

To such sightseeing there is no limit, so long as curiosity and physical strength remain unabated. But after all it is the people which form the chief attraction of any place. And Washington is the place of all others to study America and the Americans. It has no local types of its own; it is simply cosmopolitan and representative of every type, from Michigan to Texas, and from Maine to California.

Here these types meet every year in closer fellowship, every year broadened by mutual intercourse and a better knowledge of each other's characteristics, and ever more and more mindful of the great destiny which binds them all together into one mighty whole. Here one may gain faith to believe — what is usually disputed — that America has an individuality of its own, not Anglo-Saxon, but distinctly American, as different from that of England as France from Italy; to perceive the slow but incessant process by which this individuality is losing its angularities and its dissimilarities and becoming shapely and homogeneous; to realize that the New World, having risen to might and power, is ceasing to consider

"This Western giant coarse,
Scorning refinements which he lacks himself,"

as its highest type, and is gradually evolving a society of its own, not founded on caste or wealth, yet not lacking in grace or refinement. It is different from other society, and is well worth study.

HENRY IRVING.

HENRY IRVING AS "HAMLET." (ENGRAVED BY J. H. E. WHITNEY, FROM THE STATUE BY E. ONSLOW FORD.)

THE object of this article is twofold: to discover the position to which Mr. Henry Irving is entitled among his contemporaries on the English-speaking stage, and to examine the qualifications, natural or acquired, which have enabled him to attain that position. The task is more difficult than it would be in the case of almost any other living actor of eminence, on account of the

peculiar circumstances attending Mr. Irving's career: his sudden elevation to the topmost heights of popularity by his own countrymen, the extraordinary diversity of critical opinion concerning him, and the prejudices naturally arising therefrom; his disregard of physical limitations in his selection of characters, the wide range of his work, and the strange confusion of the old and new styles of acting

which, in conjunction with innumerable mannerisms of his own, constitutes his present method. The only way to reach an honest verdict is to dismiss from consideration all that has been written about him in the way of praise or detraction, and to treat him as an artist unknown here before that memorable evening when he made his first bow before an American audience in the character of *Mathias*.

In this first performance, it was most interesting to observe how the personal fascination of the man—that subtle attribute commonly called magnetism—gradually asserted its power over his hearers, compelling their attention and controlling their sympathies, in spite of their disposition to be critical. There were few persons in that great assemblage, which was largely representative of the taste and culture of the metropolis, who had not heard of those extravagances of speech and gesture which have been the occasion of so much bitter denunciation, and who were not eager to detect them. Little knowledge or discrimination was needed. The actor had not been upon the stage five minutes before he had justified many of the accusations of his most vehement assailants. When *Mathias*, after divesting himself of hat and cloak, strode across the stage, with lounging gait and heaving shoulders, and hailed the village gossips at the supper-table with a series of dislocated syllables, each shot from the throat like balls from a vocal catapult, the spectators sat in blank amazement, as if uncertain whether some monstrous joke had not been played upon them, and Mr. Irving was not an actor of burlesque, mimicking the heroes of the Old Bowery. Had a census of opinion been taken in the middle of this act, the verdict would have been that the foremost player of the English stage was an insolent pretender, offering as the most precious outgrowths of modern art the mouthings, stridings, and grimacings of a century ago. But this impression was as fleeting as it was false. In every player who has won public distinction there is some marked, if often indefinable, quality which exercises its influence upon the audience, independent of the histrionic methods employed. It soon became apparent that there was in Mr. Irving's work something far more potent than audacious extravagance and eccentricity. As the action of the play proceeded, evidences of resolute purpose and elaborate design began to reveal themselves. As the eye became accustomed to the excessive gesture and the ear to the curious mode of delivery, it was possible to discern beside the coarser outlines the delicate coloring of the true artist, and to appreciate

the laborious skill with which the progress of the struggle between conscience and will was portrayed. Here plainly was a man of subtle thought and keen perception, who had carefully traced the whole process by which a man of strong will and brain might be harried by the hidden torture of remorse and dread to despair and death, and who had carefully studied the physical symptoms by which the gradual advance of the mental malady ought to be portrayed. From the moment when, at the end of the first act, he was confronted with the apparition of the murdered Jew, and fell prostrate, with a half-suppressed shriek of agony, infinitely more expressive than any louder cry, he riveted the attention of his hearers, and his success was thereafter only a question of degree. The results of constant and intelligent study, aided by a keen comprehension of the full scope of the character, were manifested in a hundred different ways in the second act. The growing physical exhaustion, the haggard, weary face, the quick suspicion of the restless eye, the nervous petulance in the scene with the wife and daughter, the whole treatment of the episode of the counting of the dowry, the miserly weighing of the suspected piece, and the horrified recognition of the coin which came from the fatal belt; the rigid watchfulness with which he listened to *Christian's* theory regarding the disposition of the Jew's dead body, and the hysterical burst of laughter with which he declared that he too kept a limekiln in those old days; his feverish anxiety during the ceremony of signing the marriage contract, and the frantic outbursts of hilarity with which he sought to drown the fancied sound of sleigh-bells in his ears during the betrothal dance,—demonstrated beyond all doubt his possession of a rich imagination, true dramatic instinct, and thorough mastery of stage resource. The most notable feature of the impersonation up to this point was the extreme skill by which the rapid approach of *Mathias* to a condition akin to absolute mania was indicated. There was apparently, whether intended or not, a suggestion of positive insanity in the momentary and desperate assumption of recklessness in the murderer's solitary dance in his barred bedroom as he listened to the music of the revelers without. This assumption of what may be called a species of horrible nervous exaltation, conveying as it did an impression of almost insupportable strain, was a fitting prelude to the vivid terrors of the dream scene which followed, and which brought the impersonation to a most striking, pitiful, and imaginative climax. There has been small divergence of opinion touching the actor's

interpretation of this episode. It was a veritable picture of despairing guilt at bay. His breathless protestations and contradictions; his incessant cry for *Christian*; his demand for proofs, and his petrification of fear when confronted with the bloody robe; his terror of the mesmerist, and his desperate resistance to the mysterious fluid which was to rob him of his one defense; his mechanical recital of the preliminaries to the murder; his startling pantomime of the manner of the deed itself; the bold and picturesque attitude depicting the horror of the murderer at the glare of the dead man's eye, and the realism of the actual death, with the suggestion of the strangling noose,—were all triumphs of execution, and dispelled all doubt as to the genuine power of the performer.

The limits of this review will not permit detailed consideration of the various points of excellence in each of Mr. Irving's performances; but the play of "The Bells" is so intimately connected with his fame, and, as is now proved, furnishes so satisfactory a test of his artistic resources, that it is worth while to examine this representation with some minuteness. The chief emotions involved in the character of *Mathias* are remorse, suspicion, dread, greed, and cunning, all curiously blended with a capacity for warm family affection. The nature of it is complicated, but the portrayal of the different elements composing it, as will be seen upon reflection, does not call for the manifestation of genuine passion. In other words, the character has in it no attribute that is either great or noble, and is not, therefore, capable of great or noble treatment. Its phases, either individually or collectively, can be interpreted by means distinctly mechanical, without the aid of inspiration. If, indeed, the part was raised by the glow of genius above the level of ordinary humanity, it would cease to be *Mathias*. It is the humanity of Mr. Irving's impersonation—apart, of course, from his inhuman mannerisms—which gives it its true significance and value. There are few, if any, really broad strokes in the portrait. There are rigid angularities which only mar the beauty of the outline, but none of those bold masses of color which the painter of the highest type dashes in, as if by instinct. The effect is created by innumerable devices wrought with the utmost premeditation, although the execution is so neat, firm, and free that it has much of the effect of spontaneity. These devices represent the sum of artistic attainment. They signify a vast amount of physiognomical research, a control of the facial muscles which could only be acquired by patient practice, an artistic per-

ception of the picturesque in pose, and a knowledge of the principles of gesture as dogmatically taught by Delsarte; but they do not necessarily indicate the existence in the player of any faculty greater than a comprehensive intelligence. When a dramatic crisis is ennobled and illumined by the fire of genius, the observer is too greatly moved by the effect to be able to analyze the means by which it is created. Can any one ponder on the mechanism employed by Salvini in that piteous death-scene in "La Morte Civile"? There the sense of acting is entirely lost, and the spectators sit in motionless awe, even after the curtain has fallen, as if in the presence of actual dissolution. In the *Mathias* of Mr. Irving there is no such supreme moment. The illusion is never quite complete, and the attention of the spectators is sustained, not by engrossing interest in the fate of the mimic personage, but by admiration of the executive skill displayed by the performer.

The selection of *Charles I.* as the second character in the series of his performances was clever policy, the contrast to *Mathias* being so extreme as to raise the presumption of the rarest versatility. And Mr. Irving is undoubtedly a most versatile actor, in spite of the mannerisms common to all his assumptions, although in this particular instance the test was by no means so severe as at first sight it seemed to be. It may be granted at once that there is no similarity between the two characters, but it is nevertheless true that the actor possessing the qualifications necessary to a successful embodiment of the first would find little difficulty in playing the second. To put the case in a different way, the emotions of *Charles* are far less varied and far less acute than those of *Mathias*, and are far less exacting in the demands upon the actor's powers of intellectual conception. Neither part rises to the altitude of true passion, to say nothing of tragic intensity. The chief characteristics of *Charles* are gracious dignity, a courtly mien, aristocratic repose, an air of gentle melancholy, and the tenderness of a loving, indolent, but frank and noble nature. It is the king of the play, not of history, who is to be considered. There were beautiful little touches of paternal tenderness in *Mathias*, and Mr. Irving's treatment of the family scenes at Hampton Court was charming in its careless grace and unaffected tenderness, although he effectually shattered the illusion at one time by his vicious eccentricities of elocution in reciting the story of *Lear*. The whole episode was managed with the finest sense of pictorial effect. Every detail of pose, of gesture, of

color and grouping, had been most zealously studied, and the eye was constantly delighted by some striking change in the living picture. The work of the actor, in short, was subordinate to that of the artist. As the play proceeded, however, some of the most delicate expedients of the accomplished actor were used with admirable skill. In the scene with *Ireton* and *Cromwell*, for example, the variety and significance of Mr. Irving's facial expression were uncommonly fine, the more so because the actual movement of the features was the slightest possible. Given a mobile face like that of Herr Schultze, and an actor of average ability may create vivid effects by means of grimace, but it is only the genuine artist who can express the workings of the brain by methods almost as delicate as the processes of thought itself. The slightest exaggeration, either of gesture or expression, would have robbed the impersonation of its most artistic quality—a serene and lofty composure at a dangerous crisis, which was essentially royal. The disdain expressed in the question “Who is this rude gentleman?” was superb, and there was genuine majesty in his delivery of the line, “Uncover in the presence of your king”; but the effect in both instances was clearly due to art rather than inspiration, and could be wrought without any natural dramatic power. Where dramatic power was really needed, where *Charles* returns defeated from the field of battle to the queen's tent, he failed completely for the first and only time in the play, his manner being theatrical and artificial to a degree. The situation is almost tragic, or might be made so by an actor of real emotional fervor; but Mr. Irving struck no sympathetic chord. There was no ring of honest feeling in his voice, no suggestion of heartfelt impulse in his gesture, which was conventional, stilted, and unimpressive. Here was an opportunity for bold and imaginative treatment of a noble theme,—the portrayal of a regal nature in the first shock of crushing calamity,—and his acting was devoid alike of force and of imagination. At such a crisis, the mere cleverness of the player could not atone for the absence of genius. It recalled to memory the candle of *Colonel Sellers* which collapsed when it was asked to do duty for a fire. Fortunately, this was the one point in the play which required an exhibition of passion. Thereafter the story is purely pathetic, and the pathos, moreover, is of a kind which depends upon resources easily within Mr. Irving's control. Thus far he had shown himself much stronger in the suggestion than the manifestation of emotion, in intellectual appreciation than in physical delineation; and after the surrender

of the king, the tone of the play is one of repressed and dignified suffering. The natural refinement of Mr. Irving stands him in good stead in these closing scenes. The rebuke to the traitor *Moray*, a really fine bit of blank verse, was delivered with a dignity and pathos worthy of the highest praise, and the “repose” of the actor was a triumph of training. This was the loftiest achievement of the performance, because the effect was wrought by himself alone. In the last act, in the final farewell to his wife and children, the circumstances and the assistance lent by other players contributed greatly to the establishment of an illusion, and the absorbing interest of the situation devised by the author could scarcely have failed to stir the profoundest sympathies of the audience, even if the interpretation had been far less picturesque and touching than it was.

In “*Louis XI.*,” which was the play selected to follow “*Charles I.*,” Mr. Irving won the greatest personal success of his engagement, and justly, for a more brilliant example of elaborate and harmonious mechanism has rarely if ever been witnessed upon the stage. The personal appearance of the actor as the decrepit old monarch was a triumph of the dresser's art as well as of artistic imagination. The deathly pallor of the face, with its sinister lines; the savage mouth, with its one or two wolfish fangs; the hollow cheeks, surmounted by the gleaming eyes, whose natural size and brilliancy had been increased by every known trick of shading; the fragile body on the bent and trembling legs,—presented a picture of horrible fascination. It was as if a corpse, already touched by the corruption of the tomb, had been for one brief hour galvanized into life. The conception was exaggerated to the verge of grotesqueness, but the thrilling effect of it was indisputable; and, after all, a little exaggeration in the depiction of a character bearing few traces of ordinary humanity is not a grievous fault. As has been already pointed out, Mr. Irving's sense of the picturesque is very keen, and it is plain that he intended this impersonation for the eye and the fancy more than for the judgment. If tested by the rules of probability or consistency, it would be seen to be radically false and incoherent. Innocence herself could never be cozened by so palpable a hypocrite as this, and it is preposterous to suppose that so groveling a coward could by any chance become a ruler of men. In the veritable *Louis* there were, in spite of his hideous vices and despicable weaknesses, certain elements of greatness which in this portrayal are never even dimly suggested. The actor has simply out-Heroded

Herod by bringing into the strongest relief the theatrical side of the character so vividly sketched by Sir Walter Scott. For the historical personage he cares nothing, for the theatrical everything. It is worthy of remark that this impersonation has been pronounced a masterpiece by most of the actors of note who witnessed it. Now actors, as a rule, are not good critics, inasmuch as their professional habit leads them to study the mechanical rather than the imaginative or creative powers of the performer. They are apt to estimate a work, not by the soul which animates it, but by the executive detail which gives it a good surface finish. When the "business" is minute and neat, the grouping varied and effective, the exits and entrances picturesque, and the meaning of every line illustrated by a great wealth of intricate gesture, their ideal of dramatic expression is satisfied. Inspiration is a quality with which few of them have any intimate dealings; and when they happen to encounter it, they are likely to regard it with a feeling akin to contempt, if it does not happen to be in accord with that bane of the modern stage—tradition. Of mechanism, however, pure and simple, they are necessarily excellent judges, and their verdict in this respect on Mr. Irving's *Louis* is of positive value. It is, moreover, in accord with that of critical amateur observers. The cleverness of the whole performance is extraordinary, and the effect of it is all the greater, because the very exaggeration of the outlines in the picture drawn conceals effectually the mannerisms which mar all the rest of Mr. Irving's impersonations. It would be difficult, however, for the most ardent admirer of the actor to mention a point where absolute greatness is displayed. There is no opportunity, of course, for pathos, and there is assuredly no manifestation of passion. The exhibition of craven fear, in the interview with *Nemours*, is perhaps the nearest approach to it, but there is no effect in this which could not be wrought by theatrical device. The great merits of the performance lie in the wonderful manner in which the fanciful and grotesque ideal is sustained, and the skill with which the weaknesses of the actor are converted into excellences. There is not an instant which does not afford its evidence of deliberate calculation and assiduous rehearsal, and there are little bits of masterful treatment here and there which will long live in the memory. Among them may be noted the picture of the king warming his wizened and wicked old carcass by the fire in his bed-chamber, mumbling excuses to his leaden saints for the one little sin more which he hoped to commit on the morrow; the

scene with the peasants, with its ghastly suggestions, and the final death episode, the horrifying effect of which was due not only to the rare skill of the acting, but to the startling contrast between the wasted, bloodless body and the splendor, in texture and color, of its habiliments. The portraiture throughout was a marvel of detail, most cunningly devised and most beautifully executed. It failed only, as the preceding impersonations had failed, at the crises where the glow of true passion was essential to vitality. Emotion was indicated with unerring certainty and with infinite variety of resource, but it was never fully expressed. The obvious deductions to be drawn from the performance were that Mr. Irving excels in eccentric acting, that he is deficient in physical strength, and that he can depict the workings of the brain with much more certainty than the emotions of the heart.

The correctness of this judgment was strongly confirmed by his performance of *Shylock*, which, for an actor of his reputation, was absolutely bad, although it had, it is almost unnecessary to say, many admirable points. It is needless to consider it at length. In appearance it was a most attractive figure, dignified, intellectual, and thoroughly Oriental. But the promise to the eye was not fulfilled to the other senses. The most fatal objection to the impersonation is its inconsistency, a fault which Mr. Irving is generally most careful to avoid. In the earlier scenes, in fact all through the play up to the trial scene, *Shylock* is presented in his most forbidding colors. Those elements in his character which involve the pride of race and religion and the love of family are mainly disregarded, and the grosser attributes of sordid greed, supple servility, and malignant hate are brought into the boldest relief. Without entering into any discussion as to whether or not this view is the right one, it is clear that when it is once adopted it ought to be persisted in to the end, whereas Mr. Irving's *Shylock* at the crisis of the play undergoes a complete transformation. It may be willingly conceded that his interpretation of the last half of the trial scene is most picturesque, dignified, and pathetic, but it is wholly irreconcilable with what has gone before, and therefore false. The technical execution from the moment of the Jew's overthrow is very fine. Here, as always, the finest qualities of the actor are displayed in repose. The forlornness of a misery so deep as to be proof against all further trial could scarcely be more touchingly rendered, while the manner of the final exit would have been masterly if it had not been so incongruous. Previous to this there had been little to praise.

Apart from the question of conception, Mr. Irving's performance lacked force. There was not one single note of true passion, or one touch of genuine pathos, while the lines were often made almost unintelligible by the vilest of elocutionary tricks. His gesture, too, was excessive and not always significant, and in other ways his performance was distinctly below the standard which his previous achievements had established.

Mr. Irving's next appearance was in the double characters of *Lesurques* and *Dubosc*, in Charles Reade's melodrama, "The Lyons Mail." The descent from Shakspeare was somewhat abrupt and long, but the piece afforded him abundant opportunity for the display of some of his most noteworthy characteristics, especially his power of supplying natural deficiencies by the resources of artifice. The distinction between the two men, so much alike and so much unlike, was boldly drawn and ably maintained; but the true significance of his acting, as in several previous cases, was in its suggestiveness more than in its accomplishment. *Lesurques* was a comparatively easy task. It called for no serious outburst of emotion, and the actor had already proved his capacity of representing patient and tender fortitude under unjust suffering in the part of *Charles I.* He used the same methods with complete success in *Lesurques*, the less complicated character. It was in the second act, where *Lesurques* is charged with the murder, that he did his best work. His gradual change from a mood of amused incredulity to puzzled apprehension, and finally to indignant protestation, was uncommonly clever, and afforded one of many proofs that he can act with the utmost simplicity when he pleases. In *Dubosc* he was less happy, although this assumption bore far more convincing testimony to the scope of his resources as an actor. The ideal which he had pictured in his mind was admirable, but his equipment was too limited to reproduce it in fact. To melodrama of this kind certain physical qualifications are indispensable. Mr. Irving has not the thews or the bulk of a typical bravo. His very voice is a symptom of physical weakness, and his features are cast in too delicate a mold to signify a nature of bloody, brutal violence. He knows this, and, with the instinct of the true artist, seeks to hide these irreparable defects by stirring the imagination of his audience. His *Dubosc* is a pygmy in avoirdupois, but he has the swagger of a Hercules. To conceal the weakness of the voice, he speaks in the husky, liquorish monotone of the sot, and for animal ferocity he substitutes dogged, sodden callousness. All this is very clever, even brilliant; but the

extreme ingenuity of the expedients which he employs more or less defeats its object, and inevitably, because the device somehow becomes an attribute of the assumed character, and imparts to it a certain intellectual elevation which is foreign to it. All these expedients, moreover, fail at the supreme moment when *Dubosc*, in a brandy-born delirium, watches from his garret the preliminaries of the execution of his victim. No mere attitudinizing, or staggering about the stage, or demolition of a "property" chair, or originality of attitude, in lying prone on his belly on the floor and kicking his heels in the air, could compensate for the absence of that ferocious passion and muscular strength which give plausibility to the conception. This is the one scene in the play which provides a test of melodramatic power, and it would be ridiculous to pretend that Mr. Irving passed the ordeal successfully. He proffered the shadow for the substance; and it is probable that the majority in an audience of average mental capacity might be beguiled by the extraordinary adroitness of his simulation into believing that they had witnessed the real thing. They would not cherish the delusion long if they could see this scene interpreted by an actor of real melodramatic energy. Who, for instance, would dare assert that Mr. Irving, in such a character, could endure comparison with E. L. Davenport, J. W. Wallack, or Charles Fechter?

The two other parts in which Mr. Irving appeared in New York were *Doricourt*, in "The Belle's Stratagem," and *Richard III.* They may be dismissed with very few words, not because they were uninteresting, but because they added nothing to the previous knowledge of the actor's abilities. The *Richard* was a fragment, exhibited in one act only, and that the first. It would therefore be presumptuous and unjust to speak confidently of it; but from the specimen given, it would appear that the conception lies about midway between the old-fashioned *Gloster*, embalmed on this stage by John McCullough, and the cynical tyrant of Mr. Booth. It seems to combine a large part of the staginess of the one with the intellectual elaboration of the other. That it possesses tragic force is not likely. The *Doricourt* is chiefly valuable on account of its furnishing one more proof of Mr. Irving's mastery of all stage accomplishments. He has acquired all the traditional methods of the old English comedy, and reproduces them with that air of courtly and measured elegance which the younger actors of to-day strive in vain to imitate, and which was the stamp of the fine gentleman a century or two ago. In other respects, the

impersonation lacked sparkle and volatility, savoring too much of the tragedian in disguise; but it is only fair to add that there is probably no other living tragic actor who could play it half as well.

From *Mathias* to *Doricourt* is a wide range; but none of the characters thus far considered are of the highest dramatic rank, with the exception of *Richard*, which was not played in its entirety. Nor in Mr. Irving's performance of them was there anything to encourage the hope that he could give adequate expression to the great characters of tragedy. It is generally understood that he wished to make his first appearance here as *Hamlet*; but it is fortunate that this experiment was not tried, as his engagement would in that case have begun with a severe shock to his reputation. As it was, he had established his claim to admiration when he essayed the part of the melancholy Dane in Philadelphia, and had partly disarmed criticism by demonstrating the extent and limitations of his abilities. It is not easy to understand why this impersonation should have excited so fierce a storm of controversy in England, for there is not room for much difference of opinion about it. It exhibits all the virtues and weaknesses which would naturally be expected by all observers of Mr. Irving's acting, and would only create astonishment in persons unacquainted with the eccentricities and affectations of his style. These vices, grievous blots as they are at all times, become almost unbearable in Shaksperian tragedy, and could nowhere be more offensive or anomalous than in *Hamlet*. There is not, moreover, sufficient originality in the conception, except in the matter of minute details, to atone for the frequent violation of elementary principles. In this, as in every other part undertaken by him, he labors to increase the pictorial effect to the utmost, and the over-elaboration of artifice in the illustration of particular scenes often results in mental confusion. It would puzzle an expert in insanity to determine positively whether Mr. Irving's *Hamlet* is actually mad or not. Generally he is a natural personage enough; at times, his madness is clearly feigned; at others, as at one point in the interview with *Ophelia* and during parts of the play scene, it is, to all appearance, real. The question is not of particular importance, for the entire absence of tragic passion effectually relegates the performance to the second class. In the great scenes of the play—in the meeting with the *Ghost*, in the closet scene with the *Queen*, in the challenge to *Laertes*, and in the death scene—there was not a gleam of tragic fire; and it is scarcely

too much to say that the tragic side of *Hamlet's* character received no representation at all. The action was spirited, picturesque, dramatic, and incessant, and would have been most eloquent and impressive to an audience of the deaf and dumb; but in the delivery of the lines there was no thrill of passionate emotion. In other words, the actor was incapable of executing the design which his intellect had elaborated. In the quieter conversational passages of the play he was entirely successful. Here his fertility in all expedients of gesture and expression stood him in good stead. His scenes with *Horatio* and *Marcellus*, with *Rosencrantz* and *Guildenstern*, with *Polonius*, and with the *Players*, were almost wholly admirable, and were acted with a naturalness and simplicity which made his extravagances at other times all the more noticeable. His treatment of the scene with the *Grave-diggers* was perfect, the spirit being one of gentle and philosophic melancholy, lightened by a tinge of amusement. The impression gained from the impersonation as a whole was one of elaborate study, rather than subtlety. Most careful thought had been expended, evidently, upon the possible significance of lines and words, and upon the invention of illustrative business. An instance of this minute care was furnished in the case of the *First Player*, who had been instructed apparently to wave his arm in a particular manner, to enable *Hamlet* to make a clever point later on, when instructing him not to "saw the air too much with your hand, thus." Again, in the beginning of the play scene, *Hamlet* possesses himself of *Ophelia's* fan and retains it to the end, for the sake of giving pertinency to the words, "A very, very peacock." Other similar examples might be quoted, but these suffice to show the extraordinary care which the English actor bestows upon what less conscientious men would call insignificant details. It is by this patient forethought that he maintains the interest in his performances. Even so hackneyed a play as "Hamlet" is, under his management, transformed into something like a novelty.

It is this thought which is the key to the secret of his success. The stepping-stones to his triumph have been experience, study, taste, and resolution; to which qualities must be added a strange degree of personal fascination. In analyzing his different performances in this country, the intention has been to judge him in the most kind and liberal manner, but the result cannot be held to justify the claim of greatness which his friends make for his acting. It is plain now, not only that he cannot be included in the first

rank of living tragedians, but that he has scarcely any right to the name of tragedian at all, beyond the fact that he appears in tragic parts. Nature has opposed an insuperable bar to his progress in this direction by withholding almost every attribute necessary to tragic expression. His frame is slight, his voice is weak in volume and restricted in compass, and his features, although they are most refined, intelligent, and mobile, are cast in too delicate a mold to give full expression to the higher passions. Garrick and Edmund Kean were small men, to be sure, but their voices were of great flexibility and power, and both were filled with the might of genius. Of this most precious gift Mr. Irving has shown no trace here. His most fervent admirers declare that he has it; but if so, it is difficult to account for his failure to manifest it during the twenty years of constant acting which preceded his first successful engagement. Genius is not likely to remain hidden under a bushel or anywhere else, when it has every chance to declare itself. It may be a paradox, but it is nevertheless probable that Mr. Irving would never have attained his present undisputed pre-eminence in England had he possessed the genius which his worshipers are so ready to accord him; for, in that case, it is extremely unlikely that he would ever have acquired the fullness of culture which distinguishes him and has enabled him to win fame in a two-fold capacity. His career would not be half so interesting, instructive, and honorable as it is, were it not for the courage and resolution with which he has faced and overcome all obstacles. Throughout all the best years of early manhood, he acted in the provincial theaters in every variety of play known to the stage. It is a curious reflection that, not very many years ago, the present accepted representative of *Hamlet*, *Lear*, and *Macbeth* was only known in London as a player of eccentric light comedy and farce, who delighted by his grotesque portrayal of such characters as *Jeremy Diddler* and *Alfred Jingle*. All through these humble, laborious, and unremunerative days he was gradually acquiring that mastery of stage technique in which he probably has no superior. There is nothing unnatural in the supposition that he may have contracted some of his most curious mannerisms in those old days when he moved his audiences to uproarious laughter by the agility of his contortions and his representation of comic starvation. This sort of work could never have been congenial to so ambitious and intelligent a man, but he performed it with all the earnestness and care which he now expends upon his masterpieces of stage production.

Almost everything that he undertook was marked by originality and purpose. His execution was always bold, prompt, and precise, as if each mechanical detail had been carefully arranged beforehand, and nothing was left to chance or the inspiration of the moment. This mechanical precision is one of the most noteworthy features of his acting now, and is carried to such a pitch of perfection that it is almost impossible to detect any difference between two or more of his performances of the same part. Premeditation of this kind is an infallible safeguard against slovenly performances, but also tends to act as a clog to inspiration, and may possibly have had a bad effect in Mr. Irving's own case. Whether or not his persistence in certain ungainly gestures during this early period of his career, when he dealt largely in burlesque exaggeration, is the cause of the curious mannerisms which are such terrible disfigurements now, is a question which it would be interesting to settle. It is scarcely credible that any intelligent actor, especially with that keen artistic sense which Mr. Irving possesses, would ever deliberately adopt them as appropriate to every stage character. Charity, therefore, demands that his sins, in the way of walk and gesture, should be ascribed to unconscious habit. For his unaccountable system of elocution some other explanation must be invented. That it is not physical misfortune is happily demonstrated by the crisp and simple method of delivery which he employs when he chooses. Whatever his theory may be, it is a bad one. Nothing could be much more distressing to the ear than the gasping ejection of syllable by syllable in a dolorous monotone, which he tries to pass current for honest elocution, but which is fatal to rhythm, melody, and often to sense itself. But, after all, this is only one of the contradictions in which Mr. Irving's work abounds. His scholarly taste does not prevent him from violating the laws of proportion; he is a master of gesture, and yet descends to mere contortion; he is capable of creating the finest effects by the strength of artistic repose, and yet sometimes ruins a noble scene by inexcusable restlessness.

What is the charm which enabled this man, without genius and with all these faults, to outstrip all competitors? The puzzle is not insoluble. He first attracted public attention as *Digby Grant*, in "The Two Roses," by the originality and audacity of the conception and the brilliancy of his execution. This triumph made him the talk of the town and emboldened him and his manager to venture a step further and try *Mathias*. The success of this was immediate and splendid, and Mr. Irving, after twenty years of neglect, rose to

a pinnacle of fame. Presently he essayed another character, and the critics began to talk of mannerisms. The critics were right, but the battle was won. The mannerisms counted for little in "The Two Roses" or in "The Bells," and Mr. Irving, having reaped fame and fortune almost at a stroke, turned manager and began to reveal the extent of his abilities. The persons who abused him most went the oftenest to see him. His audacity excited sympathy, his sincerity and self-confidence compelled respectful attention, and the greatness of his technical skill challenged admiration. His enemies meanwhile increased his popularity by vehement abuse and insistence upon his faults; whereupon his friends, unwilling to admit and unable to defend them, decreed that his artistic vices were virtues and his whole system the product of genius. While the battle raged, Mr. Irving steadily pursued his course and began to show the fruits of his long and arduous apprenticeship. His stage soon became noted for the beauty and completeness of its appointments. Years before, he had been an admirer of that sterling actor and accomplished artist, Samuel Phelps, who for more than a quarter of a century made the lowly Sadler's Wells famous as the home of the legitimate drama. What Phelps, without influence, had accomplished in the East, Mr. Irving, already a favorite of fortune, resolved to do in the West. He had learned that the whole is greater than the part, and that if one good actor can bring prosperity to a theater, twenty good actors are likely to bring still more. He collected the best company in London, and became his own stage-manager. His varied experience was applied to every detail. Where his knowledge failed, he applied to the best available authority. Famous archæologists, antiquaries, royal academicians were sought out, that every detail of scenery and properties might be correct. Where there was a good precedent, he copied it; where there was none, he set the example. The critics still assailed his mannerisms and weaknesses, and most justly, but his reputation as an actor was no longer his one bulwark. As actor and manager, he had achieved a position never occupied before by any theatrical personage; and in raising himself from obscurity to fame, he had elevated the art and the profession to which he had faithfully devoted the energies of his life.

When it is said, therefore, that Mr. Irving is not a tragedian, as he assuredly is not, that he failed in the only pure melodrama which he produced in this city, and that his proper sphere is eccentric comedy and character-acting generally, so long as no display of genuine passion is involved, there is no intimation

that he is occupying a position on false pretenses. He is, on the contrary, most justly entitled to the honors conferred upon him and to the gratitude of all lovers of the stage. It is said that he has profited by the labors of others; that he reproduces effects created long ago; that he has stolen lightning from Macready, thunder from Phelps, and other munitions elsewhere. It may be so, probably is; and the only comment necessary on the subject is, that the sooner American managers indulge in larceny of the same description, the better. They will be comforted, perhaps, by the assurance that Mr. Irving's system is a cheap one in the end. Judicious expenditure will generally insure profitable returns. But liberal management means a good deal more than the mere spending of money. Taste and knowledge are more potent even than the check-book. Within the last ten or fifteen years there have been a dozen productions or revivals in this city which cost more money than any of Mr. Irving's representations, but when or where have there been such vital and fascinating stage pictures as he has given us? Where, within the last ten years at least, has any Shaksperian play been produced with a cast in which it would be hypercritical to pick a flaw, except in the case of the chief actor? When has a legitimate actor in New York been surrounded by supernumeraries who behaved like sentient and intelligent human beings? When was it that a legitimate play was presented in which every detail of scenery, external or interior, every bit of property, every costume was absolutely correct? The scenery which Mr. Irving used here was old; after months of service in London, it had been shipped across the Atlantic, and was erected on a stage which it did not fit; and yet, in tone of color, in fidelity to fact, in quality of drawing, etc., it excelled anything of the kind seen here in recent days. The pictures in "The Merchant of Venice," with their wealth of color, wonderful movement, and general verisimilitude, were revelations in the arts of stage decoration and management. The scene at Hampton Court, in "Charles I.," was photographic in its accuracy, as were the interiors at Whitehall. The interiors of "Louis XI." were marvels of taste and correctness; and the night scene in the first act, with its massive towers standing out in relief against one broad band of light in a dark and stormy sky, was extraordinarily effective. The solidity of the masonry in the first act of "Hamlet," the weird landscape with its expanse of rock and sea, which forms a background for the *Ghost*, and many other instances of exquisite artistic taste, might be cited.

A reference to these matters is indispensable in any review which professes to estimate the true position and influence of Henry Irving. He is a reformer of the stage and an educator; and were his faults as an actor ten times more flagrant than they are, his advent here would be a fact of the highest importance. It will undoubtedly affect the whole tone of reputable and capable criticism, for it has set a standard which cannot be ignored. The more bitter the assaults upon Mr. Ir-

ing's abilities as an actor, the greater the rebuke to American managers. He has proved beyond dispute that fine plays will be popular if they are properly represented. If they cannot be made popular in New York, it is either because New York has no actors equal to Mr. Irving and his company, or no men capable of scholarly, tasteful, and liberal management. There is the dilemma; the choice of horns is free.

J. Ranken Towse.

THE IDEAL.

"Das Dort ist niemals hier."
(The There is never here.)

Schiller.

O DREAM of Beauty ever hovering round me—
Now almost mine, now far and far away;
My longing when the slumber-chain has bound me,
My day's intenser day!

So near—so far! now close beside me glistens
The white robe, and the breath has warmed my brow;
And now—it sweeps the immeasurable distance,
The deserts part us now.

The organ song, that through the aisle rejoices,
The star-isled midnight, shoreless sea serene,
Are forms that clothe the Formless—are the voices,
The whispers of the Unseen.

The mid-noon sunbeam, flooding earth with splendor,
Is but a veil that shrouds light more intense;
And wordless feeling, thrills of rapture tender,
They spring to being—whence?

O beauty infinite! the sparks are shaken
From off thy vesture of celestial fire;
They fall, they kindle in the soul, they waken
The unquenchable desire—

The yearning, and the restlessness that lonely
Seeks through Creation for thy face alone,
And in material loveliness sees only
Thy shadow downward thrown.

The finite to the infinite aspireth,
The unbounded ever stretcheth on before;
The spirit's white wing pauseth not nor tireth,
Nor draweth near the shore.

Constantina E. Brooks.

THE NEXT PRESIDENCY.

It is a remarkable fact, and probably this is the first time it has occurred in our history, that, within a few months of the meeting of the nominating conventions of the two great political parties which divide the suffrages of the country between them, the only interesting feature of the political situation is the general indifference which prevails in all sections and among all classes, both as to the platforms and the candidates which will be presented in the struggle for the next Presidency of the United States.

All thoughtful observers of our politics have noticed for some years past a gradual but steady increase in political apathy, and many explanations of it have been offered. Some have lamented the decay of statesmanship and the absence from the scenes of political strife of great political leaders who gathered to themselves the confidence and the admiration of the parties which followed them; while others have given undue importance to the fact that we are living in an era of peace, after the exhaustion of a great war, and when the statesmen who dealt with the problems presented by the war have so recently passed away that, possibly, others competent to deal with existing problems have not yet taken their place.

Upon reflection, the truth, however, will be found to be that the average American citizen cares very little about politics at present, because the government under which he lives touches his life very rarely, and only at points of very little importance to him. From his rising up until his lying down, the vast aggregate of his interests and his activities are entirely beyond its scope, and there is hardly any serious interest of his life which is affected by it. He selects and pursues the occupation of his own choice. He worships in the church of his own choice. He educates his children in schools and according to standards chosen by himself. No compulsory service is demanded of him in his youth, and no burdensome taxes oppress him in his old age. The newspapers, as free as air, bring to him such news, and such comments thereon, as the proprietors suppose he desires to read; and, so long as he behaves himself fairly well, he is assured that his freedom to say what he likes and to do what he likes will not be abridged. Even the great inequalities of fortune, which often seem to him to be both unjust and unsafe, and

which are likely to appeal to the evil passions of the less fortunate, he knows are due either to the possession of less scrupulousness or more energy and capacity by their possessors, or to some of these qualities favored by causes beyond the domain of law. Indeed, the average American citizen is at present without a serious political grievance or a serious political sentiment of any kind, and he believes that his rights will be equally respected, and the interests of the country perhaps equally protected, whether one political party or the other controls the Government. He therefore concerns himself, if a man of business, about business; if a man of religion, about religion; if a man of letters, about letters; if a man of art, about art; if a man of leisure, about his leisure; and he does not feel called upon to concern himself about politics at all, except possibly to the extent of voting the ticket of his party.

Of course, such a state of feeling can exist only in a time of peace, and when no great and exciting question is agitating the public mind; but that is the present, and is likely to be for a considerable period the future condition of this country, and it must be expected, therefore, that the great mass of our citizens will not take any very active interest in the conduct of politics or in the strifes of parties. This condition of things is no doubt very undesirable, for it certainly tends to leave the management of our politics in the hands of persons who make it a profession, and expect therefore, directly or indirectly, to make a livelihood and perhaps a fortune by it. Indeed, very much of what is known as "machine politics" is due to this political apathy, which is in turn reproduced and strengthened by such politics.

A great city presents the best illustration of this truth. One finds there large numbers of active and competent men of business who, if they possessed adequate public spirit, could and, if they believed there was an adequate business necessity, doubtless would administer the affairs of their municipality with the same directness, economy, and fidelity with which they conduct their own business affairs. Unfortunately, many of them do not possess any public spirit worth considering, and, as a matter of business, they know that their share of the amount taken from the municipal treasury, in the various forms of abstraction in which the professional

politicians of our large cities have become such adepts, is insignificant when compared with their annual income, and that they can make more money by attending to their business and disregarding politics than they can save by giving a portion of their time to the government of the city in which they live. As a natural consequence, the professional politicians soon come to understand the power thus given to them, and they begin their career by assaults upon the municipal treasury.

When, however, they have succeeded in perfecting their system of municipal politics, it soon becomes an almost resistless tyranny to which many aspirants for places, honorable and humble, surrender their convictions and their honor; for the same organization which controls the city wards extends itself over the Legislative and Congressional districts, and the successful candidates for Legislative or Congressional honors, as well as for municipal offices, are the servants of the same men, for they are the men who are found to have control of all the nominating conventions.

The same power, "as if increase of appetite had grown by what it fed on," soon aspires to name also many of the delegates to the State and national conventions of the party. Perhaps the scene of the most effective activity of machine politics is in these conventions, for there the compact and disciplined delegations from the cities, under their astute leaders, are often able to exert a controlling influence. The delegates from the rural districts compare with them as militia compare with regular troops. It must be remembered also that the ambitious politicians throughout the State, looking forward to the office of Governor or Senator, or a place in the cabinet, or to some State office of less distinction but greater emolument, naturally desire to stand well with persons having it in their power, perhaps, to make or mar their future. Seekers after office throughout the State are generally found to be staunch supporters of the city politicians, and do not hesitate when occasion offers to flatter them as steadfast and noble-hearted defenders of "the grand old party." All this tends inevitably to consolidate their power and to widen the circle of their baleful influence; and it happens, therefore, that there are active and influential members of such conventions whom their fellow-delegates, who know them at all, know perfectly well ought to be "in durance vile." It is true that a good many of them get there sooner or later, but they are generally the smaller offenders. While State conventions were permitted to select delegates to national conventions, and to instruct them how to vote, it was apparent that a vast and far-reaching

power was vested in a few city politicians. Even when such authority is denied to State conventions, their right to select and instruct the delegates at large, when added to the natural desire of each State delegation to act with as much harmony as possible, so as to secure to itself the greatest possible weight in the deliberations and result of the convention, gives to a few men controlling the politics of large cities a very great power in shaping the nominations for the Presidency itself.

It would be amusing if it were not sad to reflect that by a kind of irony of fate these evil results, upon the stage of State and national politics, are largely due to the blindness which prevents our seeing that the administration of the affairs of a municipality is wholly a question of business, and has no proper relation whatever to partisan politics. The city of Philadelphia, for instance, possesses scarcely a single function which can properly be called political. There is scarcely a penny of her vast revenues which can be expended for any object, or in the discharge of any duty, which can properly be called political. To gather water into reservoirs and distribute it, to manufacture gas and sell it, to pave and repair highways, to extinguish fires, to provide watchmen to prevent as far as possible the commission of crime, to furnish schools for the education of children, to provide homes and food for the helpless poor: these are fair examples of the functions of a municipality. Is there one of them as to which there is the slightest propriety in dividing ourselves into Republicans and Democrats? Nobody seriously pretends there is, and the only consequence of continuing partisan strife in municipal affairs is to maintain in their power the machine politicians who divide the plunder of the city among themselves and their dependents, and thus gradually secure for themselves great weight in State and national politics also. One of our most urgent political needs to-day is the absolute divorce of questions of municipal administration from questions of partisan politics. And when the citizens of our cities, without regard to party, take the management of their municipal affairs into their own hands and treat them as matters of business, a brighter day will begin to dawn for our public life and our public men, and possibly not until then, so interwoven and interdependent are the grosser evils of our public life and our habit of treating the municipal offices of great cities as the spoils of partisan politics.

It would be no doubt a very instructive lesson, if some person having the requisite patience would show how, just in proportion as the general interest in political questions and struggles diminished when the civil war

was over and the safety of the Government was assured, the growth of the machine in politics steadily progressed from day to day. As good citizens, having no interest in public affairs but the welfare of the country, gradually relinquished active participation in them, a class of professional politicians slowly in each city emerged from their obscurity, and, securing the drinking saloons of their respective wards as their base of operations, grew day by day in audacity and in power. Their growth was mainly due to the fact that the great mass of their fellow-citizens were blind partisans, satisfied to repeat party cries long after they had ceased to have any real meaning, proud to follow party standards long after they had ceased to represent the same principles, and not ashamed to boast of their partisan fealty when they knew it was being used by unworthy men to enrich themselves at the public expense. The partisan fealty of the Democrats of New York survived the unparalleled crimes of the Tweed ring in the city and the infamy of the Canal ring in the State. It is true that many Democrats rose in insurrection against both these bands of organized plunderers; and whatever else may be said of Mr. Tilden, it is to his lasting credit that he was courageous enough and capable enough to do better work in the overthrow and punishment of such men than has been permitted possibly to any other American citizen; but it is also true that the partisan fealty of the Democrats of New York in general survived these severe trials of their faith, and they still permit Mr. Kelly to decide not only how the revenues of their metropolis shall be administered, but also to select the persons who shall administer them. It is even alleged that he is able to barter the vote of the State of New York to his political opponents, whenever it is necessary to do so in order to retain his hold upon the city.

The partisan fealty of the Republicans of Pennsylvania has withstood tests as severe. They have allowed their State and municipal treasuries to be the plaything of machine politicians, and to be prostituted time out of mind to their personal advantage. They have allowed their metropolis to be the prey of men who in themselves or in their chosen subordinates have exhausted almost the entire calendar of crime, while they masqueraded in the name of the Republican party and protested that their crimes were necessary to its preservation. They have stuffed ballot-boxes. They have forged election returns. They have stolen the taxes. They have stolen the water rates. They have stolen the receipts for gas. They have stolen the moneys appropriated to the repair of the highways. They have even descended to steal the moneys appro-

priated to the relief of the insane poor. And they have done all this in the name of the party whose first great historical achievement was the election of Abraham Lincoln, a name which has become a synonym, wherever the English language is spoken, for plain, downright honesty. These accusations are not rhetorical expressions. They are in substance extracts from the indictments and recorded judgments of courts of criminal jurisdiction, where the accused parties were tried by juries of their countrymen and were entitled to every presumption in their favor, and where they could only be convicted when no reasonable doubt could exist of their guilt.

Politicians, whether in city or country, are therefore abundantly justified in their belief, and they are safe in acting upon it, that the vast majority of the voters of each party will continue to vote the ticket labeled with the old name without very much regard to any other consideration; and when to this general party fealty of the great mass of voters is added a general apathy on political subjects, the political situation is undoubtedly grave; for the nomination of candidates to all places of profit or of honor, including the Presidency of the United States, is relegated to a considerable extent to men who follow the business of politics for plunder or for office. What kind of candidates such men are likely to consider it will be to their interest to present this year becomes, therefore, a very important question.

As to the platforms, it is likely both parties will substantially agree in their enunciation of what they are pleased to call their principles, with only such changes of phraseology as may give an appearance of difference to them. They would seem to be invited to this course by the lack of any important principle of governmental action upon which they radically and honestly differ. The war is over, and nobody but now and then an editor in need of a flaming leader thinks of abusing the South as a section, or of insisting that the civil government of great industrial States, such as the Southern States are rapidly becoming, could be wisely intrusted to the least intelligent of their people. It is not likely, therefore, that the Republican convention will declare strongly against the South. They will, of course, throw a tub to the whale in that respect in some general phrases; but they will have no vitality in them, and the chairman of the committee, when he reads them, will do so with his tongue in his cheek.

Even the repudiation of the debt of Virginia will not be commended, because Mahoneism, failing in everything else, has at last succeeded in compelling its opponents to accept its policy in that respect, and to approve

repudiation now would be to approve the position of both the Democrats and the Readjusters. It is to be hoped that the Republicans who assisted to secure this result are satisfied with it; certainly, those of us who protested against this dishonesty from the beginning are glad they made their protest.

On the other hand, the Democratic convention is in no danger now of denying that we are a nation, or of refusing to the National Government any of the powers or attributes inherent in a great sovereignty. If they differ from the Republican convention in any degree upon that question this year, it will only be whether the word Nation should bespelled with a capital letter or not; and that is a difference upon which angry passions cannot be aroused.

As to the tariff, in view of the surprising support Mr. Carlisle received from the Northwest and of the doubts which are now known to exist as to the policy of a high protective tariff in some of the Stalwart Republican States of that section, it is not improbable that the difference in the platforms of the two parties upon that subject may, in the end, be reduced to a declaration by the Republican convention in favor of a protective tariff with incidental revenue, and to a declaration by the Democratic convention in favor of a revenue tariff with incidental protection. If these identical phrases should not be used, other phrases equally ambiguous and elastic doubtless will; and care will be taken that it shall not be difficult for the Democrats of Pennsylvania to continue to be good Democrats, or for the Republicans of Iowa to continue to be good Republicans. Persons who suppose that the two parties will take positions of absolute antagonism on this subject are likely to suffer a severe disappointment. When the smoke clears away, it is not probable anybody will be found clamoring for less protection to our industries than will represent the actual difference in wages here and abroad, and nobody will be vigorously demanding any duty on raw materials if the duty has to be deducted from the wages of American labor. It would not be at all surprising if both platforms and the letters of acceptance of both candidates were found substantially in accord with the views presented in the letter of Mr. Hewitt, recently published. Indeed, that eminent and able statesman offers in himself the example of a happy compromise: as a leading manufacturer, he needs the fact of protection to American labor, and as a leading Democrat, he needs the cry of revenue reform; and he takes excellent care to retain both.

The currency question is now practically out of politics. We shall not be humiliated again

by the melancholy announcement to which we were treated for so many years by shining lights of both parties, at first as to our duty to pay the national debt in paper promises, to pay it only when it suited our convenience, and then only in other paper promises, and afterward as to our duty to pay it in silver coin of considerable less value than our promise. No trace of such dishonor will be discoverable in the platform of either party this year. By common consent we have recurred to the simple, plain rule of regarding a dollar as meaning neither more nor less, but precisely what our laws declared it to be when we used it in our bonds and in our notes—a certain number of grains of gold of a certain fineness. It is mortifying but instructive to remember how much Congressional and platform eloquence would have been saved if our politicians had done the people the justice to believe that, sooner or later, their sturdy good sense and honesty would bring them to that very obvious standard of duty in measuring the obligations they had assumed.

It is very likely that both parties will pronounce very vigorously in favor of civil service reform. Some of those who witnessed it still remember with shame the applause with which the last Republican national convention greeted a delegate who denounced it as a humbug, and declared that the object nearest the heart of the convention was the continued division of the public offices as spoils of war, according to the will of the bosses in their several grades. This year the convention will be more circumspect. It will "point with pride" to the law recently enacted by Congress and approved by the President, but it will forget to state that it was only so enacted and affirmed after the party and the President had suffered such a disastrous and humiliating rebuke by the people that the advent of the Democratic party to power seemed assured.

The Democratic convention will probably add a touch of humor to its treatment of the subject. It will give us a ringing declaration in favor of a radical and thorough reform, but it will insist that the first step in such a reform is "to turn the rascals out." It will forget to add that its definition of a rascal would be found to be any Republican holding an office. And if brought to book for trifling with a grave subject, the Democrats will assert that we set them the excellent example, that we delayed the reform for fifteen years and until we believed we were about to be turned out, and that then we had recourse to it only to retain our hold upon the offices. And then they may proceed to ask some awkward questions, as, for instance, why General Burt was dismissed from

the Naval Office at New York, in view of his long and invaluable services to the cause; what member of the present cabinet has ever spoken a word in its favor; why Commissioner Evans was allowed to dismiss competent officials from the Internal Revenue service to make way for men like Horton, "recommended by Governor Butler"; why the offices of Virginia were turned over to Senator Mahone; and why the organ of the Administration, owned by the friends of the President and edited by his Assistant Postmaster-General, has never ceased to indulge in sneers at the reform, and continues to publish advertisements offering to purchase influence in appointments to office. And Democratic orators will probably not forget to mention the recent action of the Republican Senate. The gentlemen elected are doubtless excellent and capable officers, but the changes were made on partisan grounds only; and the proscription extended even to the chaplain, as if the prayers of a Christian minister were likely to be better or worse by reason of the political party to which he happened to belong. The mischief of such an action is double. It encourages the belief that Republican protestations in favor of civil service reform are insincere, and it makes a precedent sure to be fruitful of evil.

It is not improbable, therefore, that the voter who does not acknowledge a blind partisan fealty which forbids his looking further than the name by which his ticket is labeled may have to decide his vote by a consideration of the past careers of the respective candidates. He will know, whether he finds it in any platform or not, that the Presidency of the United States is, in the hands of a strong, capable, and aggressively honest man, an office of very great opportunities, and therefore of very grave responsibilities; and if he has made himself conversant with the recent history of his country and the tendencies of its public life, he will also know that there is at this time great and noble work awaiting a President able and willing to do it. It goes without saying that he must be absolutely untrammelled when he takes his solemn oath to defend the constitution and to execute the laws. He must not have sought the nomination, nor must he have shown after his nomination what President Woolsey so aptly called "a most uncommon anxiety" for his election, for he must be without friends to reward, and without enemies to punish. In the present state of affairs at Washington, he must not only be an honest man, but he must be *a cause of honesty in others*. He must really hate every form of thievery, and must be able to dedicate himself to the solemn work of

reforming not only the administrative service of the National Government, but the very atmosphere itself of the national capital.

Four years of administration of the National Government by such a man would transform the public life of America. He would recognize the just limitations of true civil service reform, and know that all political officers in the Executive Department, all such officers representing in any degree the political action of the Government, ought to be in harmony with it, and that his Cabinet—his official household—ought to be composed of men possessed of his entire political and personal confidence, and in earnest sympathy with him in the work he proposed to accomplish.

His Secretary of State would take care not to vex foreign nations with requests which he knew ought not to be granted, and which, if made to us under precisely similar circumstances, would be indignantly repelled; but while avoiding such requests, he would keep vigilant watch over the rights of every American citizen in the world, and maintain not only the dignity and honor, but the interests of the country, in every quarter of the globe. Our foreign missions would be regarded as political offices, but they would be filled so as to reflect only credit upon the country; while our consuls would be regarded as commercial officers only, and be selected not because of their friendship with politicians, or with the President himself, but because of their knowledge of the people with whom they were to live, and of their ability to advance the interests of American commerce.

His Secretary of the Treasury would be able to devote all his time to the great fiscal problems which concern that department, and would not be obliged to waste it upon Senators and Congressmen, or deputations of local political magnates, in listening to their appeals for the appointment of a pensioner upon the Treasury. In giving to his subordinates the assurance of a permanent tenure while they discharged their duties effectively, he would inspire them with new zeal for the public service, and secure a larger measure of fidelity to the interests committed to their charge.

His Secretary of War would be able to secure punishment for the men who are now in such numbers tarnishing the fair name of their noble service, and thus bring the army back to its earlier and better state, when conduct becoming an officer and a gentleman was not supposed to include what, in the language of the capital, is by a delicate euphemism called "duplication of accounts," but elsewhere is called swindling.

His Secretary of the Navy would cleanse that department of its rottenness in contracts

and in navy yards as well as in ships, and the country would gladly accord him whatever moneys were necessary to place the American navy upon a footing creditable alike to the gallant and illustrious service it represents and the great country whose flag it carries in the waters of the world.

His Secretary of the Interior would so administer that vast department as to cleanse it of the agents of the Indian ring, the Pension ring, and the Land ring; and it would then be possible only for honest contractors to furnish the Indian supplies, honest agents to represent claimants for pension, and honest settlers to obtain titles to public lands. Congress would then possibly no longer hesitate to vote the money necessary for the proper treatment of the Indians, as the wards of a rich, civilized, and Christian nation.

His Postmaster-general would place the entire postal service upon a basis of absolute honesty and economy. Defaulting postmasters would not only be dismissed, but punished; and men convicted by the country of robbing the department would not be allowed to secure new contracts while they were being prosecuted for fraud in old ones.

His Attorney-general would be able to secure the selection of judges, marshals, and commissioners upon the ground of their fitness by character and ability to represent the administration of justice in their several communities; and the country would no longer be scandalized by the prosecution of unworthy officials who ought never to have been appointed to the places they have dishonored. Of course, it is not intended to suggest that many of the incumbents of these offices have not illustrated the qualities mentioned, but only that such a President, surrounded by such a Cabinet, would be able to do more to purify and elevate the public service in a term of four years than can possibly be done in any other way in the life-time of a generation. The corrupt and corrupting lobby which now infests Congress and the departments would recognize in such an administration an enemy which would only be satisfied with its immediate dissolution and dispersion. Its members would recognize that their calling and occupation were gone, and that any attempt to pursue them further would not only be accompanied by slight prospect of gain, but also by great probability of punishment. Then, too, the mere advent of such an administration would stop very much of the plundering possibly now going on. If any officer of the Signal Service, misled by Howgate's example, were tempted to obtain the public moneys by forgery, he would know that such an administration intended to reclaim Howgate

and restore him to the jail from which he was released without even the mockery of a trial. If anybody contemplated breaking into the Treasury and stealing bundles of notes, he would be deterred by the knowledge that such an administration would not enter into a compromise with him, whereby he should be allowed to depart in peace with a portion of his plunder. If a conspiracy were in process of formation to rob the Government by fraudulent proposals, fraudulent bonds, and false pretenses of services rendered, the conspirators would know that such an administration would be a unit in their prosecution, and not divided; so that, if one cabinet minister was exerting all his energy and ability in prosecuting them, everybody would feel sure that no other cabinet minister was exerting himself to shield any of them from prosecution. The detectives of the national capital would agree to resume the work of detecting crime in order that the criminals might be punished, instead of devoting themselves, as they have done for a considerable time past, to arranging with the criminals that their crimes should not be detected, upon condition that they divided their booty; for the detectives would understand that such an administration would pursue them even more relentlessly than the professional criminals. And still another inestimable benefit would be the relief of the clerks in Washington, of both sexes, from any danger of a recurrence of the abject dependency upon their patrons which they have felt so long, and which has gone so far to demoralize their lives. The historian of this country will find it difficult to induce his readers to believe that it was until a year ago, and may be again next year, a part of the recognized system of things that not only men, but women also, should be dependent for their appointment to clerical offices and their retention in them upon senators and representatives in Congress; that, no matter how honestly and faithfully they performed their service, the privilege of continuing to earn their bread by doing so depended upon the good pleasure of the man who had secured their appointment. In other words, each senator and member was offered the privilege of pensioning men or women upon the National Treasury; and in many cases the men to whom this privilege was offered, and the women upon whom appointments were conferred, were living away from the restraints and the protections of home. Such an administration as has been mentioned would find no difficulty, in a very brief time, in placing the subordinate civil service of the country upon a basis at once consistent with the

best interest of the service itself and with the highest self-respect of every man and woman engaged in it, no matter whether the recent law remains or is repealed, for it would need no laws but such as have long existed and its own resolute purpose to do its plain duty without fear or favor. The law recently passed was only needed to prevent a President from doing wrong; it was not needed to enable him to do right.

The city which is honored by bearing the name of the father of his country would then soon cease to be the paradise of lobbyists great or small, of conspirators in office or out, of adventurers of the one sex or the other, of prosecutors who do not prosecute, of jurymen who follow the profession of acquitting the guilty and thrive by it, of tradesmen who grow rich by corrupting the purchasing agents of the departments and are respected for it, of seekers after contracts and subsidies who seem to think even more meanly of the men they purchase than of themselves, and of all kindred spirits who have combined to call good evil and evil good, until honesty walks the streets ashamed and robbery is blatant and bold.

It is, of course, difficult to discover how many voters in the United States are now willing to try to secure a President of the character which has been indicated; but it is safe to say that there is a considerable number of them, and that they will not be imposed upon either by ambiguous expressions in platforms or by death-bed repentance in candidates. It may be assumed that no man will be nominated for the Presidency who has not been for a considerable time in the view of his fellow-citizens. They will accordingly judge him not by what he says or does in expectation of his candidacy, but by the general course and tenor of his public life. They will not expect him to agree with them in all things, but they will insist quite strenuously that the general drift and purpose of his career shall have been in accordance with the highest standards of public honesty and purity. As the time for the national conventions grows nearer, the influential politicians of each party will become more and more sensible of the wisdom of yielding to a considerable extent to this demand of the independent voter. They know that party ties sit now much more loosely than ever before, and that the next contest is likely to be very close, —so close that even a small handful of brave and independent men in a single State may be able to decide it. They will therefore make considerable sacrifices of their own preferences in order to give their party the best chance of success at the polls. It is not at all likely that any candidate will be nominated on

partisan grounds only, or because he is a reliable, steadfast party man; and it is much less likely that any man will be nominated by either party whose political career on its moral side has ever been the subject of serious criticism, or whose political methods and standards have been objectionable to any considerable section of his party. Then, too, the Democratic party will be sure to avoid nominating any man who can be shown to have been in active sympathy with the rebellion; and the Republican party will be equally sure to avoid nominating any man whose candidacy would re-open, on the one side or the other, the controversy which was waged so fiercely against President Garfield, which resulted so fatally to him, and which did not cease when he was in his grave. That controversy and the awful tragedy which followed it are still painfully remembered by very many Republican voters in other States besides Ohio, and any nomination made in contempt of the opinions entertained upon that subject would be equivalent to a surrender before the battle began.

The only real danger lies in the possibility of each party presenting a candidate who has never been bad enough to provoke active hostility, and never good enough to offend "the baser sort" of his own party, and who, if elected, would form an administration of discordant elements and "unrelated parts," going possibly to the bench for one cabinet minister and to the lobby for another, and selecting the rest at haphazard, or for reasons of locality, or because they were out of a place, or because they desired to show the country they were "not so black as they were painted," or for some such reason.

Until such a misfortune actually happens, however, we will hope that one party or the other, if not both, will offer a candidate whose politics are positive, not negative, and who is really fit to be the President of fifty millions of free men; a man and not a name only, a statesman and not a politician only, of greatness of mind, an ardent lover of his country and her free institutions, resolute to defend the right and assail the wrong, and without spot or stain in his connection with politics, or suspicion of any such thing. Each party possesses many men answering these requirements, and it is very likely that one party or the other will ask the suffrages of the people for such a man. Possibly the good fortune awaits us of witnessing a contest for the Presidency in which both candidates will be strong, pure, brave men, willing and able to do the good work which is waiting to be done, and which only such a President can do.

Wayne MacVeagh.

OLD PUBLIC BUILDINGS IN AMERICA.

ST. PAUL'S CHURCH, NEW YORK, FROM CHURCH STREET.

As "Old New York and its Houses" * proved to be a subject hardly less interesting to the readers of the article so entitled than it was to the writer, he is led, not unnaturally, to the consideration of a kindred theme, the

public buildings of colonial and immediately post-colonial times—led thereto, as before, by the sight of tempting sketches of such subjects. There may be some pleasure in this direction, and certainly there will be some profit, if we consider the style of the

* See THE CENTURY for October, 1883.

buildings in which the grandfathers and the great-grandfathers of those living Americans, whose Americanism did not begin within the last half century, worshiped and legislated. The existing representatives of these structures are unhappily very few; for in most cases they have been ruthlessly destroyed, with blindness to their beauty and indifference to their associations; yet often, it must be admitted, because there seemed no practicable way of preserving them. Enough, however, remain to tell us what manner of men they were who did our public building in this period—so little thought of and so little known.

The rows of unhomelike and even unhouselike dwelling-places which are generally spoken of as “brown-stone fronts”—phrase unlovely, and therefore most fitting—may properly be regarded as manifestations and embodiments of the spirit of our domestic architecture in the second and third quarters of the present century. In them the fatuous frivolity and obtrusive vulgarity of that period found complete expression. As geologists designate the various stages of the earth's formation as the Eozoic and the Paleozoic, and the Eocene and Pliocene periods, and the like, so we may well designate the stage of house-building through which we have lately passed—and from which we are slowly emerging, but with struggles and lingering throes of adhesion—as the brown-stone period of American architecture. How firmly imbedded we have been in this stratum of old red sandstone, thin laminæ of which seem to have cropped up out of our soil, through our very souls, as veneering to our “stylish” domiciles, may be inferred from a two-part story, as dual as a pair of trousers, which reached me through two architects.

A certain very costly mansion in one of the principal avenues of New York was designed by its architect to be built of a light-colored, grayish stone; but the client, although he accepted the design, rebelled against the proposed material, and insisted on having his house in brown stone, “like other people.” Then another projector of a “palatial mansion,” a dweller in California, but a native of New York, astonished his architect by declaring that his house must also be built of brown stone, although the country around him abounds in stone more beautiful and in every way better for building,—assigning as his reason that he “wanted to have a brown-stone house like Mr. —’s, on — Avenue, in New York,”—the elaborate structure before mentioned; wherefore, poor building material for a house in San Francisco was transported from New York. This disposition to copy New York has been deplorably in-

jurious to the architectural as well as to the moral aspect of the whole country. No sooner is the “Interocean City” of some farthest Western frontier of civilization out of the log-cabin period, than it has at once a Broadway, a Fifth Avenue, and an Academy of Music; and in the two former parallel passages through its desolation, where “saloons” and “dry” goods stores—the wet dispensaries outnumbering the dry in the proportion of three to one—alternate with stump-dotted clearings, its ambitious citizens begin to erect shapeless, roofless houses, with heavy sham cornices of the regulation New York model, which, brown stone being unattainable, they paint as nearly as possible brown-stone color; the object in view being not convenience, nor comfort, nor beauty, nor fitness, but “style,” in cheap imitation of the style of New York—rich New York, big New York, ever richer and ever bigger New York; and when at last a house is built with its front of veritable brown stone, it is looked upon with a feeling as nearly approaching veneration as the Interoceanites are capable of, and is hailed as a blessed harbinger of coming metropolitan splendor.

The place which the brown-stone-front house fills in the history of our domestic architecture, is filled in that of our public architecture by a sort of building of which the Post Office and the new City Hall of New York are perfected types and oppressive examples. The very presence of the Post Office on its present site is an insult to good taste and a defiance of common sense. It may safely be said that in no other country, hardly in any other city in the civilized world, would such a fine open place as the old City Hall Park, being the property of the city and almost coeval with it, have been destroyed. Some modification of its former condition was made necessary by the increase of population and of traffic. But the indications pointed very plainly to a change the very reverse of that which has been made. That triangular piece of ground which has become the center of the business part of the city was of no account as a “park.” It was much too small for such a name, or for any use indicated by the name. Many years ago it had fulfilled its function as a place of recreation, of lounging, or of intramural verdure. But as an open *plaza* it would have been respectable, and could have been made admirable. In size it would have equaled many such ornaments and breathing-places in the capitals of Europe. Its position at the junction of the two great thoroughfares of the city, and the fact that it contained the building which was at once the City Hall and the

handsomest not the only the city, unit-ions to plead of its original and unencum-railings, its trees also, The Register's

public structure, if handsome one, in ed with old associa-for the preservation expanse, un-reduced bered, although its grass, and perhaps should be removed. Office, and an un-stone structure be-

the old Park was filled with wooden barracks ; and when at last the time happily came for these to be pulled down, the spirits of greed and corruption had taken possession of New York, and of all the imitation New Yorks in the country ; and 'nothing, public or private, under our skies was looked upon but as a means of getting money by fair means or by foul. Therefore it was that, a new post office being required, the site of it, by selfish, roguish intrigues, the history of which remains unwritten, was cut ruthlessly out of this fair little expanse of earth and air, in which every citizen of New York had an interest, and which might have been made for the future, as it had been in the past, a sightly, healthful, honored ornament and landmark of the city. Bright open space and pleasing urban vistas gave place to gloomy restriction ; the old Park was destroyed forever ; and traffic was increased and concentrated upon a point which should have been relieved. And this was done simply and solely that some men might get money, and that others might save money. That like motives directed the planning and building of the New City Hall, it is needless to say. It stands a fitting monument of the political and social condition of which a Tweed is the natural, if not the inevitable, product ; a sign and a token to all peoples and all generations that, in the course of less than half a century, New York attained a pitch of combined vulgarity and corruption unequalled in the records of municipal history.

The old City Hall in New York, handsome as it is with a handsomeness of the kind that we call elegant, does not quite do justice to the design of its architect. That design sought to give the building a becoming dignity. This was attained in part by its elevation upon a paved plateau. I suspect that few people, except those who frequent this building, know that it does not stand upon the level of the surrounding land, and that to reach the plane from which its entrance stairs ascend there is a rise of two steps to a large semicircular plateau paved with square stones, which have not been disturbed for three quarters of a century. In justice to the architect, Mr. John McComb, it should be said that the city corporation obliged him to modify his original plan by reducing its ground-plan proportions in certain directions. The lines and proportions of the detail were preserved. The design is of a character which lends itself to such modification with a facility hardly possible in other styles ; yet the loss was material, although not destructive, for it probably made just the difference between respectable elegance and imposing dignity, in which

ST. JOHN'S, NEW YORK.

hind it, should have been taken away, and the accommodation needed for the city court-rooms and bureaus provided by the extension of the City Hall at right angles about an in-closed court. The result, if the style of the old building had been conformed to and harmoni-ously developed in a structure of larger prop-ortions, might have been a public building of admirable beauty and of ample size for all re-quirements, so situated as to be at once con-venient to business and an imposing object when viewed from any quarter. Such a building could hardly be better placed. And this was the modification of the old Park and the Hall which a few public-spirited citizens, of culti-vated tastes, projected some twenty years and more ago. But then came the Civil War, and

OLD STATE HOUSE, BOSTON.

elegance would not have been lacking. The reason of this change was, of course, economy of material and of work,—simply of cost. The same motive caused the north side, or rear, of the building to be built of sandstone, although the front and sides are of white marble. When the Hall was built, in 1803, so small and so comparatively unimportant was that part of the city on the north of "the Park" (as it was called) that sandstone was supposed to be good enough for what would be little seen. Briefly, then, when New York was so small that its business and its dwell-

ing parts together did not extend much above Chambers street, its citizens erected the handsomest public building that to this day is to be found within its new immensity, and one of the finest to be found in the country.*

The cheap sandstone of the north side provoked more animadversion thirty years

* The plans of the Hall, and a commonplace book or diary written by the architect during its erection, still exist; and we hope at an early day to present to our readers selections, with comments by a member of his family.—EDITOR.

ago than now, because then it was more observed than it is now by city people and by sight-seeing strangers. When New York had marched solidly up beyond Bleeker street, and was stretching on to Union Square, the pride of the prosperous up-town Gothamites found one of its vents in sneers at the blindness of the fathers of the city, who thought that sandstone was good enough for "up-town." This well-known feeling led to a

ordered social evolution, entered one Saturday afternoon two serious gentlemen, white of face and unexceptionable in appearance, who announced themselves as emissaries of the Common Council, which had resolved that New York should no longer be disgraced by a City Hall white on three sides and brown on the fourth, and that therefore the fourth side should be whitewashed. Would he undertake this important job, in earnest of

THE BOSTON STATE HOUSE.

laughable practical joke on the part of two wags. At that time whitewashing was as much practiced in houses as it has been since in politics; and the trade was almost exclusively in the hands of the colored inhabitants of the city, who were of much simpler minds, although hardly of less exuberant manners, than their brethren, or rather their children, of the present day. At that time the negrominstrel was not a black-faced singer of sentimental songs and propounder of satirical conundrums, but a man (Dan Rice) who sang and jumped Jim Crow, alternating this *chanson de geste* with "Clar de Kitchen" and other genuine plantation songs. To a boss negro whitewasher, in this stage of col-

which a deposit of five or ten dollars was tendered? Indeed he could and would, and he not only jumped at the prospective profit, but rose some hundred feet or more in his own estimation. Sunday was passed in preparation for the great undertaking; and early on Monday morning an array of sable laborers, armed with pails and brushes and ladders, appeared, and the great work (typical of an inward moral necessity soon to be developed) was begun. It did not continue long, although long enough to attract an admiring and jeering crowd; and it was with some difficulty that the eager and simple-minded sable artist was convinced that his services were not required by the city, and

that the money which he had already received (probably quite enough to secure him against loss) was all that he was likely to get by his contract.

Close by the City Hall stands another building of the same period, but somewhat older, and of equal architectural merit,—St. Paul's, one of the finest Wren churches now existing, if not the very finest. In all my walks about London and through other cities in England, I saw not one at all equal to it. The spire is remarkable for its lightness, its fine gradation, and its happy combination of elements which are in themselves so little suited to spire treatment that the eye protests against them, even while it admires the triumph of the constructor over his reluctant materials. The spire of St. John's Church, which stands on the eastern side of the square now covered and oppressed by "Commodore" Vanderbilt's big freight depot, is little inferior to it; but St. Paul's springs more lightly from its tower, and rises to its vanishing point with a gradual grace which St. John's does not attain. The Broadway end of St. Paul's is hardly less admirable. Its pediment and lofty Ionic columns are beautifully proportioned, and are worthy of far more attention than they receive, except from well educated architects, who show little reserve in their admiration of this building and of its neighbor, the old City Hall. It is true also that in construction these churches, and other buildings in this country of that period, are much superior to those in England of the same date. This I say upon the advice of competent professional men; for I pretend to approach architecture only as a dilettante and on its æsthetic side.

The interior of the churches, of which St. Paul's and St. John's are the best existing types, were not without a certain kind and degree of beauty. They were, indeed, not truly ecclesiastical in spirit. They lacked entirely the sublimity and the mystery which the architecture strangely called Gothic expresses with such natural facility. For them no soaring nave and dimly lighted clear-story. But they were better than most of the little sham Gothic tabernacles which succeeded them. They were genuine; good of their kind; well suited to their purpose. In them respectability and decorum were so happily expressed that they were raised with an embodied grace. If people must assemble in large bodies to worship in pews, and take part in a ceremonial of which the most important part is the listening to a sermon, it is difficult to see how it could be more conveniently, comfortably, and appropriately done than in one of these old Wren parish

churches. The chancel ends of these churches, in which both the pulpit and the reading-desk were usually placed, were in some cases dignified by rich drapery, the fitness of which to a Protestant house of worship is, I am inclined to think, greater than that of the chromatic mural decorations by which it has been succeeded in the imitation Gothic city churches of to-day. Some of them were lighted by rows of chandeliers entirely of cut glass, splendid with pendent prisms; and when these churches were lit up for service at night the combined effect of the interior and the mass of worshippers on the floor and in the galleries (for churches were then apt to be thronged) was imposing and thoroughly expressive of the Protestant and modern spirit of the service. It may be questioned whether in going back to the mediæval style we have not made a vain attempt to defy congruity. Good examples of such interiors are those of King's Chapel, Boston, to which I shall again refer, and Christ Church in the same city—the latter however being, I believe, much more modern.

The style of architecture, however, in which Wren attained his eminence, although it is not without a happy fitness to small Protestant town-churches (for in the country its mien of artificial urbanity seems strangely foreign and impertinently obtrusive), falls very short of the higher needs of ecclesiastical architecture upon a larger scale. What is admirable in the small is not admirable in the large: a magnifier discovers defects and emphasizes deformities; we tolerate in a statuette what would be intolerable in a statue; and that which is well suited to a parish church like St. Paul's in New York only attracts attention to its own deformity in a cathedral church like St. Paul's in London. The Wren style, not a natural growth, not a development like the Grecian, the Gothic, the Byzantine, or the Moorish styles, but a composite fabrication, an outcome of the school of Palladio, is wholly lacking in religious expression. It has not a single element of ecclesiasticism. Moreover, it is without any individuality of its own, and expresses nothing but the spirit of conventional respectability and a kind of solid, decent convenience. Such a style in a great cathedral church, in which utility and convenience are not the needs to be supplied, but the function of which is to unite the influences of awe and mystery and beauty, is wholly out of keeping. Wren's style has no elevation, no charm, and only an inferior middle-class sort of dignity.

The London "Builder," in commenting upon "England Without and Within" in terms which certainly should satisfy the crav-

ing vanity of any author, finds yet one grievous fault in that heartily written book—its expression of a very positive non-admiration of St. Paul's (London) and of the modern part of Hampton Court Palace. "Where,"

but would point its irreverent finger at a more celebrated building, which the eminent architect of St. Paul's, in designing it, had in mind, and upon which, in some respects, he improved. It would even venture to say of

CHURCH AT WILMINGTON, DELAWARE.

it asks, "is Mr. Grant White's reverence?" And subsequently a contributor to the same publication points out that this irreverent writer, in finding fault with Wren's work, is condemning some of the most important buildings in his own country. Well; and what of that? Criticism which asks not what a thing is, but where it is or whose it is, and which fails to emulate charity in beginning at home, is little to be trusted. And as to reverence for Christopher Wren; as reasonably ask for reverence for the wren without Sir and without Christopher! Nevertheless, Wren commands respect as a man of great knowledge, of great skill, of notable mastery, within certain limits, of the resources of his art, and, chiefly, as a great constructor. But he was an architect without a spark of creative genius, without a touch of poetic feeling, without a sense of the higher beauty. He was the greatest of architectural manufacturers. Moreover, this criticism does not stop at St. Paul's,

St. Peter's at Rome that, magnificent in many respects as it is, as a cathedral church it is a magnificent mistake. The impressiveness of St. Peter's is in its vastness and its splendor; but the gorgeous hemisphere of its mighty dome is wholly void of religious feeling. Buonarroti stole the dome of Bramante, and by the herculean force of his brawny genius he heaved the Parthenon into the air, and its vast Olympian curve dominates not only the city but the surrounding country, as if the soul of Cæsar had passed on through the centuries to find at once a monument and an expression in visible form and substance. But that expression is purely material, mundane, heathen. Within, too, this is even more manifest than without. He who gazes upward into that colossal concave feels no elevation of soul, no humility of heart, no hushed awe, no mystery, no aspiration; only the wonder which always accompanies the consciousness of a vast inclosed space, with

a vague admiration of the forms and the decoration which themselves lose by their remoteness. For in this respect Wren improved upon his model. His double dome, by which he gained inner beauty without

bodies and the details of both these great basilicas have little which commands intelligent admiration—any admiration except that cheap sort which is easily provoked by bigness, bombast, and blazonry.

ÉGLISE DE NOTRE DAME DE BONSECOURS, MONTREAL.

losing external grandeur, was a triumph of his great constructive talent. But both St. Peter's and St. Paul's are chiefly domes, and in St. Peter's, except the dome, not much of what we see is Michael Angelo's: the

There are no such domes as these in the United States. The nearest approach to them is that huge mechanical hollow which fitly crowns the Capitol at Washington. But the State House at Boston furnishes, on a much

OLD SOUTH CHURCH, BOSTON.

smaller scale, a far better example of the sphered dignity with which this pompous architectural form can rule a region of surrounding country. The dome of the Boston State House is the revered sign and token, seen from afar, of the only true capital city—that is, a seat and center of government, of society, of literature, of art, of commerce—in all “America.” It is indeed a mere protrusion

heavenward of the hub of the universe; the globed and gilded tip of that axis around which all that is best in our Western world revolves, ever has revolved, and it seems ever will revolve, *sæcula sæculorum*. Here this style of architecture has its fit and becoming place. The Boston State House is not a wonderful nor a very beautiful building; but it is worthy of admiration for its expression of dig-

CHRIST CHURCH, BOSTON.

nity, decorum, and eminent respectability. Far be the time when it shall be displaced; but I confess that I myself could spare it more willingly than I could its old predecessor. Compare the two, and see in the elder—smaller, less costly, more provincial, if you will—a character which is not to be found in its grander, gilt-domed, hill-crowning successor. You could imagine the new State House designed according to a formula at any time, by almost any clever, thoroughly educated architect; the old one seems to be the natural product of a period. We need not to be told that Holmes's "Last Leaf" must have fluttered gayly about it in the spring of his life, and probably drooped near it in the autumn, to be borne past it, withered and lifeless, to mingle with earth from which it had sprung. If I should live long in the neighborhood of that old State House, I should come to love it dearly. I cannot imagine the new one as

the object even of a Platonic attachment.

Of like lovableness, and of even greater charm, is the little old stone church at Wilmington, in Delaware, with its great welcoming side porch, its truncated gable, and its open belfry, in which a dainty decency and fitness attain to prettiness and almost to beauty. A railway deforms its neighborhood, and the engine roars and shrieks within the sound of the preacher's voice, just as another does in London (Southwark), past that beautiful relic of the old priory of St. Mary Overy, which is now St. Saviour's Church, where is the tomb of John Gower, Chaucer's contemporary, with his effigy lying, stone-canopied, in many-colored state, and where, too, Fletcher and Massinger and Shakspeare's brother Edmund were laid to final rest. Even this parish church, made out of a mere transept of the priory, was venerably old long before the Wilming-

ton church was built; but there is a spirit common to the two, so remote from each other in time and distance,—an expression of stability, of religious feeling, of sober, still decorum, which is wholly at variance with the presence and the action of the "rapid transit" machinery that now disturbs their solemn vicinage.

Somewhat like this Wilmington church, but quaint, daintier, primmer, is the little Église de Notre Dame de Bonsecours, which, with bare, sharp gable, surmounted, but not mitigated, by its double open belfry, cleaves the air at the end of Bonsecours street in Montreal—a genuine bit of unpretending work. Its modest door-way is really beautiful; and seen through its vista of sound, respectable home-looking houses, it has the air of a demure, sweet-natured old rustic spinster, fully conscious of a lack of grace and elegance.

Eminent among the very few of our old sacred edifices which have not been (like the whooping aborigines—the real “Americans”—who once roamed over their sites) improved off the face of the earth, are the King’s Chapel and the famous “Old South Church,” in Boston. The former—a stone structure rich in the soft and somber harmonies of hue which are found only upon the palette of Old Time, that prince of colorists—is elegant, and,

in peril? It would seem that its days are numbered. But there should be mourning in Boston when the “Old South” is taken away; and I verily believe that some genuine tears will be secretly shed on that sad occasion. It is the perfect model of a New England “meeting-house,” of the highest style in the olden time. Bare of the beauty of architectural detail, it delights the eye by its fine symmetrical proportion; and its oc-

KING'S CHAPEL, BOSTON.

although small even for a city parish church, has true dignity. Standing in its well populated church-yard, an historical link between the orthodoxy of the last century and the free thought which the close of that century first awoke in the general mind, it is perhaps the most interesting, as it is certainly one of the most pleasing, of our few ecclesiastical monuments. It should never be removed, and it probably never will be; for it is in Boston, where there is still some capacity of love, some remnant of reverence, for what may be lovable and reverend, except money and the signs of money.*

And yet is not the life of the “Old South”

* King's Chapel was built for Church of England (Protestant Episcopal) service; but its congregation gradually drifted into Socinianism, and modified their Common Prayer Book into what is known as the King's Chapel Liturgy. This pretty church is the cradle of Unitarianism in the United States.

tagonal spire, springing from an airy, eight-arched loggia, is one of the finest of its kind, not only in this country, but in the world. Nothing more light and elegant and graceful can be found, unless in the finest Gothic work. Not a “Wren” spire (indeed an architect would scout the notion), it yet suggests Wren to the unprofessional eye; but I have never seen a spire of Sir Christopher's which equaled it in grace and lightness. A peculiar interest attaches to it because it is of home growth. It is not a copy nor an imitation of anything else. It is the conception of a Yankee architect—the outgrowth and development of the steeple-belfry of the rural New England meeting-house. New England may well be proud of it. Needless to tell here of the connection of this church with Boston's part in the struggle, at first for freedom and at last for independence, more than a century ago. No one building in the country so

unites religious and patriotic associations. Its removal would not be a sin (for it may become a necessity), but it would be a grievous misfortune that would be felt by every son of the scattered New England stock between the world's two great oceans.

The interiors of these old meeting-houses, the very best of them, it must be admitted, are devoid of all semblance of beauty. In them the hard, utilitarian, unsentimental spirit of the old New England life and the old New England Puritanism was fully expressed; but intuitively, and without purpose. There no charm of color, there no grace of form, there no monuments of departed notability were allowed to divert the eye and mind from religious business. They were bare, galleried halls, in which mass meetings were held for worship. In our day many of them have been modified, softened, and enriched, and most of them, indeed, have given place to structures the comfort of which would have offended the ascetic souls of the "Fathers," not less than their pleasing forms and colors would, or the profane "box o' whistles" which has taken the place of the bleating pitch-pipe of the old chorister. Better, indeed, that they should be taken down with solemn and reverent hands, and become mere memories, like old St. George's in Beekman street, New York, than that they should have the fate of two famous churches in the same city, Orville Dewey's Unitarian chapel and the Murray street church, known to our grandfathers as "Dr.

Mason's," in which that celebrated divine, whose fame reached Europe, thundered the denunciations of Calvinistic theology when New York was a "Sabbath"-keeping town, in which chains were stretched across the streets on each side of every considerable church, in order that no passing vehicle might disturb either the devotions or the slumbers of the worshipers. Both these somewhat famous churches have become theaters of the "variety show" sort. The Dewey Theater stands (with a new brick façade hiding its massive stone masonry) on its old site in Broadway, opposite Waverley Place. Dr. Mason's church was taken down carefully and carried up-town, where it was rebuilt so carefully, stone by stone, in Eighth street, opposite Lafayette Place, that it seemed to have been transported upon Aladdin's carpet. Abandoned by its congregation, it passed into the hands of the Roman Catholics. Abandoned in turn by them, it became the property of Mr. A. T. Stewart, who used it as a factory of upholstery. Now it is a theater, in which all the young rascals of the upper Bowery region who can compass fifteen cents see male jugglers and female jigglers, and listen to dramatized penny dreadfuls and dime novels. Its history is characteristic of the city of which it was once one of the respected landmarks—a center whence radiated truth and purity, and of which it is now one of the pestilent nurseries of vulgarity.

Richard Grant White.

SONG.

THE sunset light is on the sail,
The water all aglow,
And on the billows up and down
The boat rocks to and fro.
The birds float upward to the sky,—
Oh, how I long for wings to fly!

The boat has wings,—the birds have wings,
But none remain for me;
But wings of kind and loving thought
And wings of memory.
On these I come, and still repeat,
I love, I love, I love you, sweet.

Mary L. Ritter.

COUNT VON MOLTKE.

THE ancient Hindoo idea of the world represents it as resting upon three mighty elephants. In like manner the German Empire appears to rest upon the shoulders of three mighty men; and seeing that they are old as well as mighty, it is impossible not to wonder what will become of the edifice they have artificially reared and upheld when Nature shall demand her dues and remove them. Of this trio,—the Emperor, Bismarck, and Moltke,—we feel tempted, when we name the last, to echo the words of David, when speaking of his generals: "Was he not the most honorable of the three?" "The Great Taciturn," as he is familiarly called in Germany, is an attractive figure; and though, owing to his excessive modesty and his dislike of all noisy notoriety, Bismarck seems to overshadow him, it is doubtful whether Germany would have existed for Bismarck to rule, if Moltke had not welded her together by force of arms. In any case, the one is as great as the other, while Moltke's is by far the more refined and attractive personality.

It is no mere coincidence that the words of David have sprung to my pen. In reading the history of Prussia, and that of Germany since she has become Prussianized, the mind almost inevitably recurs to ancient Biblical history—there is so great an analogy. Here, too, we encounter as firm a faith in a God of battles as among the Israelites. Emperor, generals, ministers, subordinates—all echo the language of Israel in asserting loudly that the Lord fights only for them, is only concerned about them, that they are his chosen people. Their motto is, "Gott mit uns." Only if read in the spirit of the Old Testament can a foreigner comprehend the spirit that animates modern Germany. But while Israel was a theocracy, Germany is rather a stratocracy, if I may coin such a word. Neither in America or England—countries that are rapidly outgrowing the love of war for war's own sake, in which respectively an Emerson and a Herbert Spencer have preached that this sentiment is one allied to barbarous times—is it possible fully to conceive that, at our very doors, in this later nineteenth century, there exists a people strangely like the ancient Israelites—educated, yet combative, advanced in many directions of thought, yet left far behind in one of the most essentially civilizing. In Germany the army is the darling of the nation. The people will suffer any privations,

make any sacrifices, for its sake, not knowing or not caring that this military spirit depresses their culture, prevents them from cultivating to their fullest extent the arts of peace, and keeps their manners rude and boorish. A military atmosphere has of late years pervaded all things in Germany. Military rigor is enforced already in the school-room, and the unquestioning spirit of military obedience bids fair to quench all individuality of character. All this must be borne in mind, if we would comprehend the deification by Germans of their military heroes. No wonder that above all others Count Moltke is worshiped, for to him in great part are due the efficient state of the army and its late splendid victories.

The career of this great military genius is probably unique in one respect. There is, perhaps, in all history no other man who rose so high and yet had attained his sixty-sixth year without attracting the notice of the world. It was not till after Sadowa that the name of this silent, retiring officer became familiar as a household word over the entire globe.

Count Moltke's life has not been an eventful one. It has been spent more in thought than in action. When asked to supply some details of his history, he said: "You are very much mistaken in coming to me, if you think my life will furnish any of those brilliant descriptions dear to poets and the general public. My life is so poor in episodes that it would be considered quite tedious, and I do not see how my biography should contain anything but dates." Moltke here underrates the natural curiosity felt by all the world in a man who has distinguished himself, but he is right when he speaks of his life as poor in episodes. Outwardly his career until he had nearly reached the appointed span of men's years is tranquil enough; and since to be silent is one of Moltke's marked peculiarities, he has not even furnished ana for the anecdote monger. "The man that holds his tongue in seven languages,"—so the people call him, referring to his taciturnity and his linguistic powers. Perhaps, like the Scotch, he holds that "it's canny to say nowt." But one thing is certain: when Moltke speaks, whether by word of mouth or of cannon, he speaks to some purpose; with force, clearness, and directness. His speeches in the German Reichstag are models of their kind.

This man, whose life forms a page of no small import in the history of Germany, was, like General Blücher, of Mecklenburg birth and origin. The Moltkes are an old aristocratic Mecklenburg family, who were closely allied with their neighbor, Denmark; indeed, they are more Danish than German. Moltke's father had married a wealthy Hamburg lady, and was living on his estates, having retired at her wish from the army; for from all time the Moltkes had been a military family, and there was never a question as to the sons' careers. On October 26, 1800, was born at Parchim, in the house of his uncle Helmuth, where his parents were then visiting, Carl Bernhardt Helmuth von Moltke. Born with the century, all the great historical dates of the century mark events in his own history. At his birth Napoleon's star was in the ascendant; in his childhood Bonaparte began to rule the whole Continent with his iron hand; and it was partly on this account that for some years the Moltke family led an unstable life, now residing in one spot, now in another. In 1803 they settled for awhile in the quaint old Hansa town of Lübeck. "My earliest recollections," says Moltke, "are connected with that old city and its gates and towers, and I recognized our house in the 'Schrangen' after many long years, in spite of its altered surroundings." It was here that he became early acquainted with Germany's hereditary foe. In 1806 the French stormed the town, into which Blücher had retreated. They sacked and plundered it, and treated the inhabitants with much barbarity. The Moltke house suffered much, and the incident made a lasting impression upon the boy. From this moment misfortunes thickened about the family. Their country house was burnt down just as the harvest had been gathered in. The Hamburg grandfather, from whom they had expectations, died, leaving nominally a large fortune, but one so heavily weighted with legacies that when the whole was realized, in those troublous times, owing to the heavy and unforeseen losses entailed by the war, it proved that the Moltkes were seriously out of pocket, and it became needful to retrench. In 1811 Helmuth and his elder brother, Fritz, were placed for two years under the care of an able and kindly tutor, Pastor Knickbein, who held a living at Hohenfelde, near Horst. These two quiet years in the country are counted by Moltke among the happiest of his life. He was a favorite with the pastor, who early recognized his rare genius and believed in him long before all others. "My dear master and friend, to whom I owe so much,"—so Moltke spoke of him

in after life. The favorite pastime of the two brothers was playing at war, and a characteristic anecdote has happily been preserved of this time. The two brothers loved to gather together the peasant boys and place themselves at their head as commanders of rival armies. On one occasion, when Helmuth was heading the weaker section, his troops were put to flight and some taken prisoners. His brother called on him to surrender. He would not. "All is not lost," he said; and, quickly rallying his men, he marched them straight to a pond in the pastor's garden, and bade them hurry on to a little island, accessible only by a draw-bridge made of a single plank. The embryo field-marshal then turned on the enemy with a few of his strongest men and kept him at bay, while the rest of his forces made their way into this island fortress. When all had entered, Moltke himself being the last, the draw-bridge was raised and the victory complete. This island in the pond had been made by Moltke with great labor out of materials collected from all directions; he had borne in view its possible utility in their mimic warfare. It so happened that his father and the pastor beheld this scene, which delighted the Freiherr and confirmed him in his belief that Helmuth would make an able soldier yet, the tutor having asserted that he was more of a bookworm, and having urged the father to permit his son to embrace a studious career. This island, christened after his favorite pupil, was planted and cared for by Pastor Knickbein; and though he is long gathered to his fathers, it exists to this day in the grounds of the village parson, still cherished, visited by strangers and pointed out with pride by the villagers.

The years that followed those at Hohenfelde were not happy ones for Moltke, and it is probable that he then first contracted that habit of excessive taciturnity that has earned for him his nickname. The family affairs had gone from bad to worse. Economy was imperative. Freiherr von Moltke moved his two sons to Copenhagen, that they might attend the school for cadets. As there was no vacancy for them at first in the school-house, they were boarded with a General Lorenz, an easy-going bachelor, who took little heed of them, but left them to the tender mercies of his virago of a housekeeper, from whose violent temper the two boys suffered much. Helmuth, in especial, had a sensitive nature, and the change from the love and care at Hohenfelde to the lovelessness and loneliness here told on him. Nor did matters mend greatly when ultimately they were removed to the academy, where they received board, lodging, and an allowance of fifty thalers

each. At General Lorenz's it had been an existence of perpetual bickering; here it was the soulless monotony of barrack life. To this day Moltke cannot speak without a shudder of those joyless years. "Our boyhood in a foreign city, without relations or friends, was truly miserable. The discipline was strict, even severe; and now, when my judgment of it is quite impartial, I must say that it was too strict, too severe. The only good this treatment did us was that we were early obliged to accustom ourselves to privations of every kind." It must be borne in mind, too, that Danish was an unfamiliar language, and that in this speech all their studies were conducted. This obstacle, however, weighed little with Helmuth; after six years, a much shorter time than the usual curriculum, he passed first class in his officer's examination. He had particularly distinguished himself in all the literary and scientific branches of military study. This was in 1818. He was now ripe for his lieutenantancy; but before getting this he had, according to a rule of the school, to fill for one year the post of court page, this being deemed a mode of acknowledgment for the free education accorded by the state. A school-fellow thus describes Moltke at this period: "He was a slender young fellow, with fair hair and good-humored blue eyes, with a quiet courtesy of manner, an open and genial countenance, clouded at times by an expression of deep melancholy. There was no difficulty, however great, which his indomitable industry and firm will did not overcome. His comrades had a great respect for him; but though he knew this, he never abused it in the smallest degree. In social intercourse he could be talkative and communicative; on duty or at work he was sternly reserved. An untiring devotion to his duty and an almost unexampled conscientiousness distinguished him."

In 1819 Helmuth von Moltke was appointed lieutenant in a Danish regiment stationed at Rendsburg. His father, who had reëntered the service, owing to his losses, had already attained in Denmark the rank of lieutenant-general. But he had a large family and small pay, and could not assist his son, who was forced to live upon the scanty pittance of a Danish officer. Nor were his prospects more brilliant than his pay. When by the peace of 1815 the powers obliged Denmark to cede Norway to Sweden, Denmark saw herself obliged to reduce her army; but as she retained her large staff of officers, chances of promotion were slender for the younger ones. Moltke, who felt in him the strivings of genius, longed for a wider sphere, a larger army. Very naturally his thoughts

turned to Prussia, which had so distinguished herself in the War of Liberation; and, undaunted by the knowledge that if he entered that army his four years of service in Denmark would count as nothing, that he would have to begin afresh and undergo the Prussian examinations, to the regret of his commanding officer he tendered his resignation and left the Danish army. From this time forward Moltke was to live almost entirely alone. At Berlin, whither he turned his steps, armed with high testimonials, he passed the needful entrance examination for the army, and passed it so brilliantly that he was at once gazetted as second lieutenant in the Eighth infantry regiment, then stationed at Frankfort-on-the-Oder. The regiment is one that boasts noble traditions, yet to-day its officers are prouder of nothing than that the great Moltke once served in its ranks. At that time, however, he was unknown. Still, his superiors soon noticed him, because of his serious application to his work and the rare ability he displayed in its execution. After a year with his regiment, Moltke returned to Berlin and remained there till 1826, studying closely at the great military academy. He studied not only the art of war, but its history, also mathematics, physics, geography, everything that bore, however indirectly, upon the one theme that was the passion of his life. Already, then, his peculiarly scientific method of regarding and conducting warfare evinced itself: a method so far removed from — so much more intellectual, if we may so call it, than — the mere butchery of earlier times. Hard work, privations of all kinds, marked those years at Berlin. Moltke did not lead the gay, careless lieutenant existence. He was poor, and he was eager for knowledge. His scanty pay hardly sufficed for his livelihood, much less to defray the cost of lessons. Still he contrived, by means of pinching and self-denial, to save enough to enable him to take private lessons in foreign languages—an essential in his eyes to a soldier's career, and one he has encouraged since he has had the control of the German army.

Speaking of this period, Moltke says:

"The first part of my career was destitute of the joys of life. I entered the *Kriegs-Schule* at Berlin at a time when my parents had lost almost the whole of their property, owing to war and a series of misfortunes. Not one penny could they allow me, and it is scarcely possible to imagine how I had to economize. And yet, in spite of this, I contrived to save enough to get instruction in foreign languages. But truly, the lot of a poor lieutenant is not an enviable one."

In 1827 Moltke rejoined his regiment at Frankfort-on-the-Oder, and how highly his

superiors thought of him may be gathered from the fact that he was appointed to the direction of the military school there, a school that had fallen into disorderly ways. He entered upon his post with such courage and energy that in a year the school was well conducted and well regulated. Moltke's conduct of this by no means easy task earned him high commendation. No longer needed there, he was attached to the topographical department of the General Staff, then engaged on a survey of Silesia. General von Müffling was at the head of this department, and to this kindly and able man Moltke loves to acknowledge his obligations. Under him, Moltke studied practical and theoretical tactics, a branch of knowledge in which it is demanded that all members of the German General Staff should be proficient.

"The examinations in tactical exercises," says Moltke, "used to excite us younger officers greatly. We knew that not only a correct, but a terse and precise solution was required from us. It was demanded that we should imitate the concise and logical style of our chief."

It was upon the language of this chief that Moltke modeled his own pithy, laconic style, which rightly commands admiration. Never a word too little, never a word too much: what could be more desirable for military dispatches and commands? That Moltke, while always being direct and simple, can still expand, be copious and discursive in private intercourse,—to that his letters to his friends bear testimony.

For three years Moltke served on the staff, his powers of combination and organization developing under the scientific and exact nature of his studies. In 1833, he was formally enrolled in it, a distinction that is only accorded to men that are decidedly above the average. He also received his captaincy. It was then that Moltke first paid attention to the yearnings that had long agitated him to enlarge his knowledge of the world. His youth and early manhood had been spent in hard struggles and severe application; holidays had been unknown. He now longed for one, but he wished that it should also combine profit with pleasure; and hence, while his desires turned toward classic Greece and romantic Italy, they also turned to Turkey, then as now the center of all European complications, the crux of all diplomatists. He wanted to see with his own eyes the country whence any day a war involving Europe might arise. In 1835 Moltke therefore applied for a so-called royal leave of absence which would permit him to be away some months. He little dreamed it would

be years before he again set foot upon his native soil.

It was to Turkey that Moltke first wended his way. The journey thither was at that time one of no inconsiderable difficulty, difficulties graphically described by Moltke in his letters home. Indeed, with no period of Moltke's life is the world so fully acquainted as with that of his Turkish sojourn. He addressed long letters about it to his sister, the only member of his family with whom he remained in constant intercourse. This sister, who had married an English widower, Mr. John Burt, was settled with her husband in Holstein. To her were written at every spare moment detailed accounts of his experiences, the only mode of expansion and expression the silent man found or needed in a strange land. These letters have since been published, and ought to be translated into English. They are delightful reading, for their graphic power, their vivid coloring, the wide and general knowledge and sympathy they display, as well as for the side-lights they throw upon their author. Moltke's visit to Turkey was in the reign of Mahmoud the Second, the Sultan who seriously desired to restore the Sick Man to health, and who broke his heart in the vain endeavor. When he learnt of Moltke's presence, he requested the Prussian Government to lend him this officer for awhile, that he might have his aid in reconstructing his army on the Prussian model. Moltke's proposed holiday resolved itself into very hard work, for he could not learn Oriental apathy and lethargy. He drew up a scheme of military reform; he planned bridges, fortifications, and water-works; he made topographical surveys of the country; on horseback, on foot, by cart, boat, raft, and carriage, he explored the whole empire, which he pronounced lovely, but neglected beyond all conception. The more he grew acquainted with Turkish affairs, the less hopeful he was of their reformation. "The kingdom is rotten," he exclaimed, and he regarded this rottenness as even more likely to cause Europe trouble than the conquest of the country by a foreign power. Turkey, he said, had fallen under a ban, and this ban is the Koran, which teaches so warped a doctrine that its laws and decrees must of necessity oppose all social progress. Moltke did all that a single man could do to carry out the high trust the Sultan had reposed in him; but what could one man do against Eastern indolence, indifference, and dishonesty? He was about to demand his leave, when there broke out the conflict between Turkey and Mehemet Ali, the Egyptian Viceroy. The Sultan desired Moltke to join the troops that were placed

on the frontier of Asia Minor under Hafiz Pasha, that this general might profit by his advice. The story of this campaign, as told by Moltke with some caustic humor and much descriptive force, is highly interesting. It is perhaps almost needless to say that the Turkish commander would not listen to Moltke's counsels, and consequently met with a disastrous defeat, that would have been yet more disgraceful and calamitous but for Moltke's coolness and judicious conduct of the retreat. And yet, though he could not bring himself to obey him, Hafiz Pasha really felt high esteem for Moltke's knowledge and energy. Once, when reviewing his artillery that had anything but distinguished itself, he said to them, "There was a time when our artillery was considered the finest in the world, and now we can scarcely execute the simplest manoeuvre. We have daily to thank the Padi-shah for having provided us with an officer who has our interests more at heart than even we ourselves, and who works whilst we are sleeping."

After this defeat Moltke returned to Constantinople to explain the disaster to the Sultan, and once more to request that he might return home. He crossed from Asia in an Austrian steamer. Writing to his sister, he said: "With our foot once on the Austrian steamer, we exchanged Asiatic barbarism for European civilization. The first thing we asked for at Samsoun, on the Black Sea, was potatoes, which we had not tasted for eighteen months, and then for some champagne, wherewith to drink our king's health, here on the waters of the Black Sea. In our tattered Turkish dress, and with haggard faces and long beards and our Turkish servants, they scarcely allowed us to go into the cabin until we had spoken to the captain in French. You can't think how comfortable everything seemed there, with chairs and tables and a looking-glass, books, knives and forks,—all luxuries of which we had almost forgotten the use."

Moltke was chafing at the Turkish inaction and restlessness; he was proficient in Turkish; he knew the country far better than the Turks themselves; there was nothing to retain him longer in the East. The Sultan, too, under whom he had served, was dead, for Mahmoud had expired six weeks before Moltke again entered the Golden Horn. He had died a victim to the failure of his life's aim. His young and incompetent successor readily granted the demission Moltke craved, and in September, 1839, he once more turned his face homeward.

Without much delay Moltke resumed his post on the General Staff, his energies quick-

ened, his intellect sharpened by his travel. The four years in the East had been of great value to his development: they had taught him independence of action, quickness of perception, promptness and precision in forming a correct estimate of the strategic advantages of a position. He has ever delighted to recall his Turkish experiences, and to say that he was the first European who penetrated to the Mesopotamian desert, and that his immediate predecessor in observing the Euphrates, where it forces its way through the Kurdish mountains, had been Xenophon. In this statement, however, Moltke is mistaken, for it would appear that General Chesney visited both the Kurdish gorges and the Mesopotamian desert some few years before him. It seems strange that Moltke should not have known this, or should not have seen General Chesney's work, which contains a map of the route of Xenophon for comparison with his own. After Moltke's return he published anonymously an account of the Turkish campaign, also maps of Constantinople, the Bosphorus, and Asia Minor.

In 1841 Moltke perceived that the exertions and privations he had undergone had given a shock to his nervous system. He once more applied for leave of absence, and visited Heligoland and his sister in Holstein. The German writer Adolf Stahr, who met Moltke at the watering-place there, describes him at the time: "In figure he was tall and spare, his face gaunt and weather-beaten, with clear-cut features, the taciturn earnestness of his thin-lipped, compressed mouth in nowise corresponding with the vivacity and occasional sly humor which we meet with in the clear and fluent pages of his book. At that time he was only forty years old, though, from his appearance, one would have taken him for close upon fifty. What was specially noticeable about him was the simplicity and naturalness of his whole person, his reserved demeanor appearing only to spring from a mind of innate reticence." Indeed, nothing is more remarkable about Moltke than that he has at all times been free from that supercilious, arrogant manner that has made the Prussian officer an object of dislike and a by-word to all Europe.

Stahr was not the only person whom Moltke charmed at this time. His letters to his sister had been eagerly read by the whole household, and none had read them with more eagerness than Frau von Burt's step-daughter, who had been a mere child when Moltke went away. She was prepared to like their writer; how well she liked him and he her may be gathered from the fact that they soon became engaged, and were married in

1842, shortly after Moltke had been gazetted major. As the Turkish voyage was the romantic episode in Moltke's life, so his marriage was the poetic. It was a union of rare happiness, concord, and sympathy, despite disparity of years and nationality, for Frau von Moltke, it must be remembered, was an Englishwoman. After his marriage Moltke continued to labor ardently, but unobtrusively, at his post until, in 1845, he was appointed adjutant to Prince Henry of Prussia, then living in Rome. The position being a mere sinecure, Moltke had much time on his hands; but, since to be idle was impossible to him, he employed his spare hours in making the peaceful conquest of a desert hitherto unexplored from a scientific point of view. Accompanied by his wife, an intrepid horsewoman, Moltke daily rode out at early dawn to the Roman Campagna, armed with theodolites and other instruments of exact measurement, and thus drew up the first map of the Roman environs that had been based on actual survey and made with instruments of mensuration. He had intended to accompany the map with an itinerary, of which five historical sketches remain in a fragmentary form. What there is of them is interesting, displaying Moltke's accurate classical knowledge, his acquaintance with geology and physics, his power of picturesque and graphic expression. His descriptions are as sharply defined, as definite, as the choicest etchings; with a few touches he delineates the landscape. Even when technical, he is never dry. Among other matters, he wrote urging the repopulation of the Campagna by agricultural laborers. That his work remained a fragment was owing to the circumstance that Prince Henry died in the summer of 1846. Moltke, however, remained in Rome just long enough to hear the exultant cries of "Evviva Pio Nono!" that greeted the newly elected Pope, in whose liberal promises the Romans had yet faith. Then he hastened to Berlin to acquaint the King with his uncle's death. He was appointed to return to Rome and superintend the removal of the body to Prussia. On his return, he notes: "I saw how rapidly the enthusiasm had subsided as soon as the new Pope had convinced himself that he would have to halt upon the liberal path which he had chosen." The corpse was taken by sea to Hamburg. Moltke landed at Gibraltar and pursued his journey by land, taking this opportunity of gaining a general idea of Spain. His letters thence testify to his power of turning every moment of his life to account, and of rapidly mastering the characteristics of a country and its inhabitants.

Once more in Prussia, Moltke was appointed to the staff of the Eighth army corps, then at Coblenz; and in 1848 he became chief of the staff of the Fourth army corps, then at Magdeburg, which post he held seven years. Advancing by degrees, he became lieutenant-colonel in 1850, and full colonel in 1851. In 1855 his staff duties were interrupted for a time by his appointment as equerry to the Crown Prince, whom he accompanied in this capacity in journeys to England, France, and Russia. He thus made acquaintance with the principal European capitals and their chief dignitaries. In a series of clever, picturesque letters written to his wife, he sketches his surroundings; and mingled with much caustic humor there is much shrewd wisdom, much accurate observation. In 1856 he went with the Prince to Russia to be present at the coronation of Czar Alexander. His letters from Russia, of which an English translation is extant, reveal his ideas of the national character of the Russians. They show, too, as usual, his talent of turning all opportunities to account. He made some valuable military notes, studied the Russian fortifications, the Russian army, and gauged their efficiency. The outcome of his remarks is that Russia has a great future before her, but that this future cannot be realized until her officials become more honest. "Honesty among Russian officials," he writes, "can only be brought about by many years of iron severity." A few weeks after his return, Moltke went with the Crown Prince to Scotland, and in 1858 he again accompanied him, to be present at his marriage with the Princess Royal of England; 1861 was to see him again in London, at the funeral of Prince Albert. His English letters have unfortunately not been made accessible; hence we do not know what Moltke thought of the native land of his wife, nor how he was impressed with the atmosphere and institutions of a free country. In the French letters written in 1856, when the Empire was at the pinnacle of its glory, Moltke once more evinces acute penetration; he was not wholly blinded by the glitter and glamour of the gay Tuileries Court. For the Emperor he conceived a genuine respect, which was not abated even after the Sedan disaster, which Moltke lays to the charge of the French people rather than to that of their monarch. While entertaining him, Napoleon little knew or guessed that in the person of this taciturn, unobtrusive officer he was welcoming the man who at no distant date should pull his gay throne down into the dust.

Returned to Berlin, Moltke once more resumed his staff duties, and continued to lead

his life of modest obscurity. It was in the following year that an important change in Prussian affairs called him to the front. The King's at-last-acknowledged dementia made it needful that his brother should become Regent. This change meant that less attention would be paid to art and letters, and more to the army, for Prince William was then and ever nothing more than a soldier. The military force was at once to be strengthened and enlarged, and at General von Manteuffel's suggestion Moltke was appointed chief of the general staff. Manteuffel had long observed the diligent, intelligent, quiet officer, and felt assured that Moltke was fitted for this high post.

He was not to find himself mistaken. Moltke entered into his new duties with heart and soul, and among other matters he drew up a plan of a general system of defense for the German coast. As the Germanic Diet was then still determining the affairs of the various states, the plan had to be submitted to its approval. After three years' hesitation and foolish objections the Diet rejected it, though Moltke and other efficient military men had shown how urgently it was required. This done, Moltke and his master, recognizing that nothing was to be looked for from Austrian and Hanoverian indifference and the mutual jealousies of all the little states, resolved to concentrate their efforts and their attention upon themselves, and to reorganize, strengthen, and improve that which was under their own control, the Prussian army. These efforts were supported by Von Roon, the Minister of War; and while he and Moltke were thus quietly, unobtrusively, but surely laying the foundation of Germany's military power that should one day unite her by force of arms, another man, who had also learned to despise the sluggish action of the Diet, was scheming how, diplomatically, to bring about the same results. This man was Bismarck, who, long Prussian representative at the Diet, was at this moment living quietly as Ambassador at St. Petersburg. No wonder these three men, when they became acquainted, became sworn friends and allies. Bismarck, recalled by King William on his accession to the throne and appointed Prime Minister, in his favorite autocratic manner soon made an end of the opposition the military reorganization scheme had met with in the Prussian Parliament. When Parliament refused to vote the supplies for this purpose, Bismarck dissolved the Parliament and governed without it; and as he was upheld by his sovereign, and as parliamentary institutions in Germany are feeble, he of course carried the day. Moltke was, there-

fore, able to work on unhindered. The minor points concerning the army he left largely to the King, who loved to occupy himself with the petty details of military millinery. Moltke concentrated his own energies upon the more intelligent section and upon the staff, which he gradually worked to that pitch of excellence that has made it the wonder and the admiration of Europe. As yet, however, no one, not even the King or Bismarck, knew that Moltke was not only a great organizer, but the greatest of strategists. They were soon to know it, however. Scarcely was the reorganization of the army completed, when storms loomed over Prussia, successively from the north, south, and west. The first to break out was that which came from Denmark in 1864. The feud between the Diet and Denmark concerning the Schleswig-Holstein Duchies, long continued, now broke into open rupture; and, to the amazement of Europe, Austria and Prussia for a time suspended their bickerings and joined issue against the common foe. Moltke went with the Prussian army as chief of the staff, and now for the first time displayed his marvelous coolness and foresight. He was convinced from the outset that the most rapid and effective method to coerce the Danish Government was to take possession of Fünen and Alsen, the two islands lying opposite North Schleswig. The Austrians were not inclined to second him; but Moltke felt convinced of the justice and efficacy of his plan, and he forthwith ordered the Prussians to put it into execution. Alsen was secured, and Fünen, too, would have been seized in a like way, had not the Danes, overwhelmed by this *coup de main*, sued for the armistice that proved the first step to the subsequent peace. The plan upon which this campaign had been formed was like in essentials to that on which Moltke had beaten his brother in the pastor's garden at Hohenfelde,—a curious coincidence enough, as also that Moltke's first strategical honors had been won in a campaign against the country in which he had learned his first military lessons. It was a plan as wonderfully conceived as it was calmly, effectually executed. To be slow, cautious, careful in planning, bold, daring, even seemingly reckless in execution, is Moltke's method of action, true to his self-chosen motto, "*Erst wägen, dann wagen*" (First weigh, then venture). From this time forward the army looked with confidence to the chief of the staff. The country, however, still did not know him; but the time of his universal recognition was approaching. Scarcely was the war ended when Austrian and Prussian bickerings were resumed, the

victors adding squabbles over the war spoils to their other points of contention. In 1866 there broke out that war between Prussia and Austria that proved of such vast import to both countries, giving to the former the ascendancy in German affairs, and forcing the latter to abandon the proud position she had held for centuries. The events of this seven weeks' war are too fresh in all memories to need recapitulation here. It was the crowning success of Sadowa (or Königgrätz, as the Germans prefer to call it) that brought to the light of day all Moltke's genius; to him it was due that the war was so short and so entirely successful for Prussia. The difficulties with which he had to cope were enormous: ignorance of the enemy's exact whereabouts and strength; ignorance as to the exact position of his own troops, that had been divided into three armies. Calculating for all possibilities, all emergencies, Moltke saw at a glance how his troops should be distributed, how concentrated. His clear intellect not only apprehended everything needful, but he had also the power of making others see with his eyes and believe in the probability of his conjectures, the justice of his conclusions. As chief of the staff, Moltke never led the troops to battle; he had to arrange how and where these troops should march; he is the brain of the machine of which the commanders are the arms. His plans are formed, his orders issued often, far from the scene of action. Thus Sadowa partook of the character of an impromptu. At the last moment there came to head-quarters dispatches that altered the whole state of the case. Moltke was not flurried; he did not hesitate; he had long been ready with schemes to meet all emergencies. Late on the night of July the second, in his tent, before a table strewn with maps, on which were placed colored pins indicating the different armies, Moltke played as on a chess-board the game of war before his King, explaining why he desired to issue certain orders. The King gave the requisite sanction, and Moltke then sent to the leaders of the armies his pregnant directions,—directions that display his peculiar qualities, and are half the secret of the Prussian successes. For Moltke issues no hard-and-fast orders, such as lead to disasters like that of the charge of the Light Brigade. He outlines his scheme; he holds it the secret of good strategy that the will of one man should direct the whole, that there should be no clashing views of action; but to the discretion of those in command he leaves the nature of the execution, rightly comprehending that something must be left to the man who is in action, to the changeful exigencies

of the moment. The Prussian generals are therefore no mere wire-drawn puppets, as many imagine. Each must think and act for himself, and is responsible for his actions. When all the orders were issued, long past midnight, Moltke retired quietly to rest. At five he was up again, superintending everything with an iron calmness. He knew that it was a hazardous game that was about to be played, but he felt so certain that he had calculated all chances and mischances that no doubts tormented him. The whole day was spent by him on horseback, watching at different points the movements of the army. At the most critical hour he was calmly smoking a cigar. When the news of victory reached him, he was neither elated nor astonished, but at once issued dispatches directing how it should best be followed up. To strike before he could be struck was Moltke's method, and that he always knew how and when to act is the secret of his genius. Concerning this war, he tells us in his own modest words: "Two points only were decisive in the attainment of our object, together with God's help and the bravery of our men. These were the primary distribution of our forces upon the different theaters of war, and their concentration upon the field of battle. Austria, fully prepared as she was, was manifestly our most formidable opponent. If she were crushed, the bond which held Prussia's other enemies together would be burst asunder; for, though banded together by their enmity to us, they were without any natural unity between themselves. The only course to success was a bold one—namely, to move our whole nine corps simultaneously toward the center of the Austrian monarchy." "I have but done my duty," was his reply to the praises and congratulations that came to him from all sides. It was a real annoyance to him, on his return to Berlin, to find that his name was in every mouth, his praises sung in all quarters. In the course of a speech relative to the campaign, he took the opportunity of saying publicly: "I have a hatred of all fulsome praise; it quite unsettles me for the whole day. Ay, the Bohemian campaign is a great and deathless page in the world's history,—an event, the importance of which it is impossible now to fathom. In this campaign I but did my duty; my comrades did theirs too. God's omnipotence led on our banner to victory. He alone lent strength to our army, vigilance to our generals, success to my plans. And thus, when I listen to all the exaggerated flattery which the public see fit to bestow upon me, I can only think how it would have been if this victory, this triumph, had *not* been ours. Would not

this self-same praise have changed to indiscriminate censure, to senseless blame?"

Pursuing the subject, he said of Benedek, the Austrian general: "Alas! a vanquished commander! Oh, if outsiders had but the faintest notion what that may mean! The Austrian head-quarters on the night of Königsgrätz—I cannot bear even to think of it! A general, too, so deserving, so brave, and so cautious."

Still Moltke, though he disclaimed all excessive laudation, was not indifferent to his successes. Soon after his return from the seat of war, he said: "How beautiful it is that God should have thus lit up the evening of a man's life as he has done that of our sovereign and many of his generals! I, too, am now sixty-six years old, and for my duties in this state of life I have had such splendid reward as can fall to the lot of few. We have conducted a war of immeasurable importance to Prussia, to Germany, to the world. God's mercy has crowned our honest endeavors with the glories of victory; and we elders in this campaign, in spite of the rough battles of our earlier years, may yet boast ourselves to be seemingly still the darlings of fortune." In public acknowledgment of his services, the Prussian Landtag voted him a gratuity of thirty thousand pounds, and with this he purchased an estate in Silesia that has become his Tusculum.

Some outwardly quiet years followed, though those that were behind the scenes knew full well that the relations between France and Prussia were strained and that an ultimate outbreak was inevitable. Moltke, therefore, worked quietly at a plan for a French campaign, making himself acquainted with all the needful minutiae and being careful to see that the army was kept in its high state of efficiency. He knew that king and country put supreme trust in his strategy, and that he should be looked to when the political horizon had once more darkened with the clouds of war. Before this storm broke, there fell upon Moltke the great sorrow of his life. His dearly loved wife, his constant companion, his friend, his helpmate, was taken from him on Christmas Eve, 1868, leaving him childless and alone. It was fortunate for him that the political cloud grew darker and darker, that he was forced to work and could not wholly abandon himself to his grief. In order that he might not be quite alone, the King of Prussia by a graceful and thoughtful action appointed as Moltke's adjutant his only and dearly loved nephew, the son of Frau von Burt, his sister. Thus Moltke secured a constant companion; and when, soon after, his sister was widowed and

came to keep house for him, he once more had a home circle—a matter of inestimable value to one of the most retiring and domestic of men.

The storm from the West finally broke quite suddenly upon Europe, not prepared for the foolhardiness of the French, in rushing into war before they were ready. Moltke, however, had long been ready. The news was brought to him at Kreisau late one night; he had already gone to bed. "Very well," he said to the messenger; "the third portfolio on the left," and went to sleep again till morning. From that hour till the end of the campaign he was incessantly active. Once asked at Versailles whether, at his advanced age, he did not feel the effects of all the privations and hardships, he quietly answered, "I should if I were old." War is his element. We have it on Bismarck's authority that the mere prospect of war makes Moltke look ten years younger, while the reality takes from him twenty years of life.

The Franco-German war proved the crowning evidence of Moltke's marvelous gifts of combination and foresight. An event like that of Sedan, when a whole army was made to surrender to the enemy, has no parallel in the history of the world. The nearest analogy is the brilliant successes of General Grant at Fort Donelson and Vicksburg; but, notwithstanding that there is considerable likeness, Sedan was the more remarkable operation. Moltke's powers were now revealed to all Europe, and all Europe united to laud them. But that his art cannot be taught—that a tactician, like a poet, "*nascitur non fit*"—is Moltke's firm persuasion. Strategy, as he conceives, is not so much a science that can be learned as an inborn genius which enables its possessor to form plans bearing upon a certain situation, which, though it may alter hourly, may not interfere with those plans, nor with the calmness and decision which must regulate their execution. In all Moltke's campaigns it would almost appear as if he must have foreseen the plans of the enemy, so surely did he counteract them.

On his return from France, all Germany vied in showering honors upon him. The Emperor created him Count and General Field-Marshal; the chief cities bestowed on him their honorary citizenship; his statues and busts were multiplied. But as little as he had cared before for praise, so little did he care for it now, and he shrank as far as possible from all public and private demonstrations.

The following little anecdote is highly characteristic of Moltke's simple tastes as well as of his decision. The regiment in which he had served on entering the Prus-

sian service had just erected new barracks at Frankfort-on-the-Oder, and were going to open the building with some ceremony. In honor of the event, they were anxious that their oldest surviving as well as most distinguished officer should grace the occasion with his presence. Moltke assented to their wishes, but stipulated that he should be in no wise distinguished above the other officers, and very specially begged that there might be no public reception at the railway station. The officers agreed; but when the moment came, they could not bear the thought that the general should not at least have some extra conveniences. Frankfort-on-the-Oder boasts few carriages. A rich burgher, however, is possessed of one, and on him a deputation of officers waited, begging the loan, which was readily accorded. At the appointed hour, therefore, an officer appeared at the railway station with this carriage, of which he asked Moltke to avail himself. To his dismay, and to the astonishment of the bystanders, Moltke simply thanked him, but declined, and, beckoning to a modest cab that stood close by, he entered it together with his nephew and drove off.

Moltke's life is passed in busy regularity; for, notwithstanding his advanced age, he does not abate his labors in the least. His time is divided between Berlin and his home at Kreisau. At Berlin he occupies a wing of the General Staff building, a fine roomy dwelling that looks out upon the monument commemorating the three wars whose extraordinary successes were mainly due to Moltke. His time is marked out with military exactitude, never broken except when he attends the sittings of the Reichstag, which is only on occasion of a military debate. Moltke is a staunch conservative, but not an ardent politician. That department of the German Empire he leaves with absolute confidence in the hands of his colleague, Bismarck.

Winter and summer, Moltke enters his study at the stroke of seven A. M. Here he drinks his morning coffee, smokes a cigar, and writes until the stroke of nine, when his business letters are brought to him, which he reads and dispatches. He then exchanges his dressing-gown for his uniform, and is ready at eleven to receive his adjutants, to hear their reports, and issue his orders. While at work he partakes of a simple lunch, and when his adjutants are gone resumes his writing until the stroke of two, when the work is pushed aside. He then receives the higher officers of the staff and listens to their reports. This ended, which may be longer or shorter according to circumstances, Moltke goes for a walk. It is no infrequent thing to encounter him in the

busy streets of Berlin, peeping into the shop windows which appear to have an attraction for him. At four he takes a frugal dinner in company with his family, and the hour of dinner is for them the happiest of the day. Then the taciturn man becomes loquacious, and delights his hearers with his charming, cheerful talk. From five to seven he again devotes himself to writing; from seven to eight the newspapers are perused. At eight he once more rejoins his family at the tea-table, after which follows a game of whist, in which the great strategist is naturally a proficient. The game over, the evening is generally ended with music, to which Moltke is devoted. At eleven he retires to rest.

At Kreisau he allows himself a little more leisure. He is attached to his little farm, and spends the early morning hours superintending his laborers. The garden, too, receives the benefit of his personal attention; and, above all, his nursery of young trees, which he musters as strictly, tends as carefully, as though they were a regiment of recruits. With his own hand he prunes weakly or dead branches. In matters great or small the Field-Marshal hates all that is incompetent, unfitted to its task and purpose. As long as his wife lived, she generally accompanied him on these expeditions, and it is her memory that attracts him to Kreisau. For it is on an eminence in his park that Moltke has erected, after his own designs, a modest chapel, in which reposes the body of her he loved above all things in the world. The exterior is red brick bound with sandstone; the interior is lined with black and white marble. In front of the altar stands the simple yellow coffin, at all times covered with wreaths; while in the apse is a fine sculptured figure of the Saviour, his hands spread out in benediction. Above Him are inscribed the words of Saint Paul: "Love is the fulfillment of the law." The key of this chapel Moltke always carries about him. When at Kreisau, his first and last walk in the day is up the gentle eminence to commune with his own heart and his dead wife. Often and often, when business retains him too long away from his country home, he will pay it a rapid visit, merely going to the chapel, and returning after a few hours' stay.

Outwardly stern though he seems, Moltke has a warm and tender heart. Of this, alone, his undying affection for his wife is a proof, while innumerable stories of unobtrusive, thoughtful acts of kindness to friends and perfect strangers still further testify to his amiable disposition. Strange that a man with so gentle a spirit, so loving a nature, should be utterly devoted to a profession so cruel and ferocious, regarding it not merely as a

sad temporary necessity until mankind shall have further advanced out of the barbarous state, but as a divine and divinely appointed institution. "War," he wrote to the Swiss jurist Bluntschli, who had pleaded in favor of gentler measures, "war is an element in the God-ordained order of the world;" and he added that, though he could sympathize with efforts to alleviate its horrors, he regarded it as an unthinkable proposition even to contemplate its possible suppression. Moltke thus gave his adhesion to the sentiment expressed by another gentle spirit, Wordsworth, "Carnage is God's daughter."

"Caute et candide" is the ancient motto of the Moltke family, and one to which their youngest descendant has remained faithful. It is a fine life to look back upon,—that of this veteran soldier who has never swerved from the service to which he has devoted his life and energies with a self-sacrifice and fidelity as rare as it is admirable. The outer aspect of the man is true to his character. His spare, tall, upright figure, which the burden of fourscore years has not bent, seems born to command. His features convey the impression of being cast in bronze; and since his face is beardless, every line and wrinkle is distinctly to be seen. The iron firmness of his will is written in deep lines

upon his face. Of his heart the evidence can only be found in his eyes, that look out upon the world with an expression of deepest melancholy. It is a singularly immovable face; even when he speaks, it does not alter, brighten, or darken. His mode of speaking, too, is slightly colorless and monotonous; but when he does break his habitual silence, all ears wait upon his words, for these Moltke never wastes.

Moltke is the ideal impersonation of a German officer, in his rectitude, his unquestioning devotion to his sovereign, his narrow-visioned patriotism, his want of imagination, his self-negation, his stern, unbending, unelastic devotion to his profession and the duties it entails; a man who, taken as a whole, is rather the representative of an elder day, when life was more circumscribed, the intercourse of humanity more inimical, before that advance had been made toward a fulfillment of the angelic greeting, "Peace on earth, good will to men," toward which we fondly hope mankind is tending. But, judged from the elder platform, he is a splendid figure. Of him, when Nature shall claim her dues, Germany may well say, in the words of Hamlet,

"He was a man, take him for all in all,
I shall not look upon his like again."

THE VOYAGER.

Down stormy seas our straining bark
By whistling gales is onward blown;
The tackle shrills, the timbers groan,
The rack is wild and dark.

No land we sight, no bark we see,
The ice makes in the forward shrouds.
The blast that curls the scudding clouds
Is cold as cold can be.

Sometimes the moon is red as blood;
Sometimes the air is white with snow;
Yet care we not, but on we go
Across the hissing flood.

The swift flaws darken on the lee,
The salt sea-spray is flung behind,
The canvas bellies in the wind,
The north wind whistles free.

And sometimes, on still southern seas,
We feel the freshening of the gale,
That leaves behind our path a trail
Like swarming, silver bees.

The bell sounds in the quiet night;
Through driving clouds the full moon plows;
The shadow of our plunging bows
Doth split the wan moonlight.

Yet still we sail and sail and sail
Through many circles of the sun;
Sometimes into the dawn we run,
Sometimes through twilights pale.

And though the wild wet waste is round,
We cannot sail for evermore;
There is no sea without a shore,
Some port will yet be found.

L. Frank Tooker.

THE SUPPRESSION OF PAUPERISM.

It has been for some time apparent that the people of this country were not to be exempted from the social evils that have so long plagued their European ancestors. The breadth of fertile acres that fell to us, a heritage unequaled in history, has not availed, in spite of all our boasting, to maintain plenty in the homes of our citizens. It has not availed that we entered upon it at an era when liberty of thought and liberty of action were, for the first time, coming to be recognized as the inalienable rights of mankind, or that we have developed it in the light of all the amazing discoveries of modern science. All our wealth of advantages and opportunities has not averted the fate that is common to nations as well as individuals. To the most richly endowed of mortals, that sobering moment some time comes when the first wrinkle or the first gray lock awakens the consciousness that youth is not perennial; and, though a community may not die, it cannot escape the infirmities of increasing years.

That happy equality of condition for which our people were once distinguished is gone. The independent, self-respecting citizen is fast giving place to the truculent yet slavish employee. The rich are separated from the poor by higher barriers than in many an ancient aristocracy, while the kindly bonds of mutual obligation and respect, the redeeming feature of that form of society, have here no existence. There are more rich than of old; but there are infinitely more poor. Not that the material condition of the common people is now much worse than formerly, for this is not true. But the immense additions to the wealth of the nation have been so ill-distributed that the poor man of to-day is probably no better fed, not so well clothed, and little better housed than the poor man of twenty-five years since, and the number of poor to be cared for by charity has frightfully increased. There are no statistics of pauperism for the country at large that are of value,—statistics when incomplete being greatly given to misleading those who put their trust in them. But we know that the expenditure for the relief of the poor is now far greater than formerly. From 1850 to 1880 the population of the city of New York increased 134 per cent., while the payments for charitable purposes increased 539 per cent. These payments do

not now fall much short of three million dollars per annum. We cannot tell definitely how much is expended by private charitable societies, but it is probably about four million dollars, rather more than less. This does not include the charities connected with the individual religious organizations, of which there are some five hundred in the city. It is a moderate estimate to put the churches and private individuals down as contributing at least one million dollars annually to the poor, making a total of eight million dollars. Roughly speaking, the expenditure in London is perhaps six times this amount for a population nearly four times as great. At the rate at which we are advancing, the New World promises to beat the Old in pauperism as well as in other things.

If we distrust the evidence of these figures, we shall not fare better with certain others. There are more than two hundred charitable societies, exclusive of branches, church societies, and public institutions, now in operation in the city of New York. In 1850 only forty-five of these were in existence, and their expenditure was less in an even greater proportion. It would seem as if there were hardly so many human needs as would afford scope for all these organizations. There are societies for the relief of the poor of the different nations that have contributed to our population. There are societies for the different sexes and ages and for all sorts and conditions of men. There are societies for the relief of sickness in general and of the different sicknesses in particular. There are societies for the comfortable ushering of the pauper into the world; for his aid during early youth; for his education in certain rudiments of learning, and for the prevention of his education in certain other rudiments of learning whereto he is prone; for his assistance in transferring his superfluous presence to other regions; for supplying him with medical advice, medicine, and food in his own abode or in special hospitals provided for his use; for his maintenance at the public expense when he cannot make shift for himself; for the supervision of this maintenance, and for the supervision of these supervisors; for keeping him out of prison; for looking after him while in prison and when he emerges; and, finally, for his assistance in decently leaving a world which seems never to have wanted him, to have done as little as it could for him at

the greatest possible expense, and to have gotten back from him in service and gratitude perhaps even less than it deserved.

This immense body of charitable institutions is certainly an impressive monument of the generosity of our people, but it is also, unfortunately, a proof of the vast growth of the evils with which these societies contend. It is even maintained, by some persons well qualified to judge, that the labors of these societies in relief of suffering have actually ended in increasing its amount. One of the wisest and noblest of the workers for the uplifting of the London poor grimly remarks: "Our object, *i. e.*, my rector and self and some others, is to put a stop as much as possible to all benevolence"; and those who have had the widest experience seem generally the most inclined to adopt this view. To understand the reason for this opinion, it is necessary to consider the manner in which charitable enterprises are carried on. The general aim being to better the condition of the poor, we may say that all benevolent labor is directed either to the relief of suffering or to the removal of the causes of suffering. The relief of suffering is simple, intelligible, and naturally delightful to every one. To feed the hungry and heal the sick are the first impulses of the heart; but to ascertain the reasons for the hunger and sickness, and to form and carry out plans for their prevention—these are difficult and tedious labors, the mention of which is generally enough to check the benevolent impulses at the very outset. The heart is here, as always, the motive power, but the demands upon the judgment and the patience are too severe for such charities to be popular. Hence the immediate relief of suffering, although merely palliative in its effects, has always constituted by far the largest part of all benevolent work, and has in fact monopolized the name of charity.

Among those charities that are devoted to relief rather than prevention there is still an important distinction to be observed. There are two great sources of suffering—accident and misconduct. That is to say, we can generally find some one who is to blame for the suffering, or we cannot. Either the individual sufferer, or some one connected with him by family ties, has brought about the suffering by improvidence, vice, or other misconduct; or the suffering could not have been prevented by ordinary human virtue or forethought.

Benevolent people, acting under the desire to give immediate relief to suffering, have not been much disposed to ponder upon this distinction. The result has been sufficiently deplorable. The distribution of charitable relief, without regard to the origin of suffering, has

had about as satisfactory results as would follow from administering the same antidote in all cases of poisoning. The Elizabethan poor-law was designed to relieve the poor, and came near pauperizing the English nation. Yet no profound reflection is needed to discover that the effects of relieving suffering caused by accident may be, and must be, greatly different from those of relieving suffering caused by choice. It is obvious enough that, besides the immediate relief, there are remote effects upon the individual relieved and upon the community that knows of his relief. When suffering is the result of accident, we may say with reasonable certainty that to relieve it will not tend to increase it. Men do not habitually expose themselves to accident or loss, more than they otherwise would, because they know that their sufferings may be lessened by charity. It is true that such charity may have some remote effect in encouraging improvidence; a man may not be at the same pains to save money for life insurance if he believes that his family will be cared for by charity in the case of his accidental death; but we cannot say that public opinion really considers a laborer improvident who does not invest in life insurance. On the other hand, it is plain that relief of this kind can have no effect in removing the causes of suffering. Accidents are not prevented by the existence of ambulances, and hospitals, and orphan asylums.

But, when we undertake to relieve suffering caused by misconduct, it is evident that a fundamental and, doubtless, beneficent provision of nature is interfered with. When we suffer in consequence of our own willful acts, the natural effect is to deter us from repeating those acts. When this suffering is relieved by others, the natural effect is to encourage us to repeat those acts. The mass of mankind will repent of their sins, whether of omission or commission, only under the influence of actual present pain—either felt by themselves or most clearly set before their eyes. Take away this pain, and they will go on sinning and to sin until the day of judgment. Moreover, all those who are tempted to sin, observing that if they yield they shall not surely die, feel their power of resistance thereby greatly weakened. The testimony is conclusive in repeated cases that, where relief has been most generously bestowed, there has been a permanent increase of vice and poverty. As a London missionary said, after a winter when the sufferings of the poor had been unusually severe and alms-giving correspondingly profuse, every gift of a shilling ticket had done four pennyworth of good and eight pennyworth of harm. The fourpence

represented the food that went into the stomachs of the wretched population; the eightpence, the premium given to their wasteful and improvident habits.

It is sometimes hastily said that it is the truest benevolence to leave people to suffer the consequences of their own misbehavior. Granting this, the real difficulty of the problem is untouched. Altogether, the most harrowing perplexities occur when we consider cases of suffering caused, not by the misconduct of the individual sufferer, but by that of those with whom he is connected by family ties. The most profound social questions are here involved and presented in the most distressing concrete forms. The appeals to compassion are sometimes so irresistibly touching, that it is not surprising if clear views on these subjects are not prevalent: The calm calculations of reason as to what may result in the remote future have little chance of being listened to when the ears are filled with the wails of sick women and starving children. Nevertheless, experience sternly teaches that even here the hasty yielding to sympathetic impulses only multiplies suffering. What is more repulsive to contemplate than an ill-assorted marriage? Life cannot seem worth living when the future offers only long years of quarrel, neglect, and disgust. But to enable those who are dissatisfied with the result of their contract to dissolve it at will, is to loosen the bonds of society. It means the destruction of the family,—the institution, above all others, upon which the happiness of mankind depends.

But what is to be done when we find a wife suffering from the idleness or improvidence of her husband? If her sufferings are relieved by charity, the result is, almost certainly, to encourage the husband to continue in his bad habits. Not only this, but other husbands in like circumstances are encouraged to believe that charity will relieve them from the difficulties in which they have involved themselves. Even more must be added, for those who are contemplating matrimony without any assured income will be encouraged to carry out their intentions. Difficult and painful as such cases are to deal with, they are far less so than those where children are involved. Marriage is not contracted until the parties have reached what are called years of discretion. They may be presumed to have contemplated the natural results of their deliberate action. But the doctrine of original sin, in its most extreme form, never went so far as to maintain that infants were consciously present in the deliberations of Adam and Eve, and common sense instinctively refuses to hold human beings responsible for what they never had

anything to do with. Nevertheless, it is undeniably true that, if charity undertakes to do the work for children that the vice and improvidence of their parents have left undone, parents will furnish charity with more work of that kind than it can attend to. Such relief is not only an encouragement to reckless marrying, but, what is still more deplorable, to illicit unions. The enormous mischief wrought by the great founding institutions of Paris and Vienna has long been notorious. The inhabitants of New York City are required by law to support similar institutions, and to extend their influence as widely as possible by paying a certain sum for every infant and every mother to which those institutions may afford shelter!

There is probably no charity more widely known or more generally beloved than that conducted among the poor children of New York. It has so recommended itself that it receives donations from all parts of the country. It has undoubtedly saved thousands of children from death and tens of thousands from degradation. It has removed vast numbers from conditions which would, in all probability, have converted them into criminals, and distributed them throughout the land so that they are subjected to wholesome and reformatory influences. It has given a modicum of education to those who would otherwise have had none, and has at least alleviated an enormous amount of misery that it could not wholly remove. It seems reasonable to give credit to the statements of its agents, that those children who have been removed from the city have almost without exception done well. It is therefore open to no strictures, so far as its influence upon these recipients of its bounty is concerned. Nor can it be doubted that its influence upon the children that have received its aid and have remained in the city has been highly beneficial.

Yet, what is the significance of a fact like this? In a single room in a cellar, in the city of New York, almost destitute of furniture, destitute even of bed-clothing, there lived last winter a family of seven—father, mother, and five little children. Poor as they were, they had shared their wretched shelter with a family still poorer than themselves, although they had no food to share with them. The children, being without shoes and almost without clothing, were, of course, unable to attend the public schools; and when an industrial school was suggested the mother approved, saying that she herself had attended one before her marriage. Obviously, the parents could not care for five children. They were not vicious nor lazy. They were honest, well-meaning, ignorant people, who were glad to

work when they had a chance, but who could find no work to do. The man was a common laborer, earning a dollar and thirty-five cents a day during that part of the year only when outdoor labor is not interfered with by frost. He had been without work for four months. The average income of the family, including what the mother could earn by occasional washing or scrubbing, was probably not a dollar a day. The rent of their cellar was seven dollars a month, so that the daily allowance to each member of the family for food, fuel, clothing, furniture, etc., was about ten cents. The father was advised to answer an advertisement calling for men to clean old brick. He was too late. The men previously employed in this work had struck for an advance upon the dollar and a half that they had been receiving. Their places had been immediately filled by Italians at a dollar a day.

There is nothing peculiar about this case. It differs happily from many others in that it is not complicated with sickness. But it suggests the query whether this society that cared for the mother twenty years ago and that is now to care for her five children, will not stagger under the burden when these children's children in their turn need relief. Thirty years ago the population of New York was about five-twelfths what it is now; that is, since that time it has somewhat more than doubled. The number of poor children sent out of the city in 1854 was about eight hundred. Last year it was four thousand. The expense of caring for poor children in 1854 was about \$10,000. Last year it was \$236,000. What will these figures be thirty years hence? Noble as the aim of the society is, honorable as its management has been, and fruitful as are its labors, the evils with which it deals have a capacity of increase greater than any palliative agencies. The supply of friendless children will keep pace with the demand. As parents find that others will care for their children if they do not, the sense of parental responsibility, already deplorably weakened, will still further diminish, and with it there will disappear all those qualities that lift man above the brutes. The godless, soulless, reckless, hopeless life of the Parisian *canaille* is fast becoming the life of the populace of New York.

As matters stand now, we are met with a horrible dilemma. Either we may harden our hearts to the cries of innocent children, homeless and starving—at which humanity revolts; or we may relieve their suffering, well knowing that present relief but increases the future evil—whereat reason rebels. But there is no need that matters should stand as they now stand. It is entirely practicable to administer so much relief as mercy demands, and at the

same time to let suffering have its wholesome effect. As to confirmed wrong-doers, their sufferings are their own choice, and it is vain for charity to interfere. As to wrong-doers who may be capable of reformation, a noble work may be done, but not by charitable corporations. The saving influence must come straight from a human heart. Soul must speak with soul, the watchful guidance of friendship must be ever at hand, or relief will surely bring more harm than good. As to those whose suffering is caused by the misconduct of others, they must indeed be relieved; but at the same time the misconduct that has caused them to suffer must be sternly punished. What maudlin charity is this that encourages parents to drop their helpless offspring into the cradle of a foundling asylum, to be cared for at the public expense! What imbecile legislation that compels the public to pay for the farming out of the care of these wretched infants! It is impossible to conceive a system more depraved than that which practically offers to parents who will desert their children a bounty of ten dollars a month, provided they again assume their care. Yet such is the system that now prevails in New York. A single institution, founded scarcely a dozen years ago, now draws from the public treasury about \$240,000 per annum, has under its care about 2500 infants, and annually receives about three per cent. of all the children born in the city of New York.

It seems the plainest dictate of common sense that parents who would desert their offspring should have their way made hard and not easy. If they are reduced to poverty by causes beyond their control, they should be encouraged and assisted to maintain their homes. If they are able to support their children, and will not, they should be compelled to set apart such portion of their wages as will suffice for such support in the various children's homes, under penalties severe enough to insure obedience. If they are so improvident, so vicious, so dead to parental affection, that they will not work for those whom nature has made dependent on them, if they will not display so much feeling of responsibility as the humblest of the brutes show to their young, they should be punished as criminals, that their example may be a warning to all that stand in need of such teaching.

Without such restraining measures, most of our existing charities have a future entirely without hope. Their labor is as vain as that of working the pumps of a leaky ship. The vessel may be kept for a time afloat, but the leak is widened by the very efforts to undo its effects; the water is pumped back to its

source, and the crew are worn out with their Danaïdean task. The alarming nature of our situation has happily aroused the intelligence of the charitably disposed to the need of action, and considerable attention has recently been directed to preventive work. The names of the more recently organized societies themselves indicate the change, their general aim being to keep people from falling into a condition where they will need relief. It is too soon as yet to expect any considerable unanimity as to the methods to be employed, or even any very distinct views as to the true purpose of these efforts. Nevertheless, it may not be unprofitable to state some of those conditions, upon compliance with which success depends.

The great need of our modern civilization—at least in those communities where a military organization is unnecessary—is to maintain the highest possible standard of living among those citizens who are supported by their daily toil. To bring about this end, influences of two distinct kinds must be employed. On the one hand, people are to be taught to do as well as possible with what they get; on the other, it is to be provided that they get as much as possible. Into this great field of future labor we can do little more than glance; but if, as we maintain, the State should punish parents for not bringing up their children to habits of industry, it should certainly do its best to deprive them of excuse for their negligence. Free education has not a pauperizing tendency. The knowledge that children will be educated at the public expense has an entirely different effect from the knowledge that they will be supported at the public expense—at least, when parents are compelled to support their children while they are receiving education. There is no encouragement to either idleness or vice in such a system. But the education given in our primary schools is merely rudimentary, while that of the higher schools is to a great extent of value to the pupils only as fitting them to teach what they have been taught. It may seem a startling proposition, but it is nevertheless true, that if, instead of spending a quarter of a million dollars annually in the indirect encouragement of illicit unions, the city of New York should spend the same sum in giving instruction in working in wood and metal, in cooking, in dress-making, in drawing, even in washing and sewing, much more suffering would be prevented than is now relieved. But so long as a majority of our citizens are of the opinion that a foundling asylum is a more beneficent establishment than the Cooper Institute, there will be no surplus revenue to devote to such purposes.

Under this head must be classed those enterprises, now rapidly growing in number, that are directed to the improvement of the homes of the poor, and to the removal of the causes of vice and improvidence. The resulting legislation has unquestionably had an immense effect in improving the condition of the tenement-houses of New York and in checking the spread of disease. There are not wanting those who regard with apprehension the effect of the paternal legislation by which these changes have been brought about, as tending to undermine the spirit of independence, which under our form of government it is so important to maintain among the poor. However it may be in the future, the immediate result has been to better the conditions of living.

As to the second of these great ends, the maintenance of a liberal reward for labor, there is one difficulty so formidable as to dwarf all others. We shall therefore not dwell upon the fact, which has been proved in London and is susceptible of proof elsewhere, that a liberal distribution of alms has, in addition to the effects already mentioned, two others that are seldom thought of. One is to lower the rate of wages, the other—which amounts to the same thing—to raise rents. Wheresoever the carcass is, there will the eagles be gathered together. Where the soup-kitchen is established, there the poor will swarm, underbidding one another for work and outbidding one another for shelter. The remedy is here so obvious that there is nothing discouraging in the situation.

But there is an evil, vast and far-reaching in its effects, that defies all charitable labors, and nullifies every effort for the elevation of the poor. If, with infinite pains, the lowest stratum of society be raised somewhat, a vacuum is created into which all Europe stands ready to pour her degraded population. If, by miracles of legislative wisdom and prodigies of charitable zeal, our present poor should have their self-respect so far developed as to scorn the vile living that may be had out of the refuse of the rich, and for a season the ash-barrels and garbage-pots of New York should stand in peace, straightway a new brood of harpies would scent their food and fly to these shores to renew the disgusting feast. The poor that we have with us may be uplifted, but we cannot uplift the poor of the world. Whosoever lifts upon that which exceeds his lifting power by but a pound weight moves it not at all, only converting his energy into useless and uncomfortable heat. In the end nothing has been gained; rather, ground has been lost, for the average condition of the poor is lowered. In any

society, the rate of wages depends finally upon the standard of living set for themselves by the common laborers. Bring in upon them a host of strangers used to lower wages and poorer fare, and an influence is at once set at work to reduce the prevailing rate of wages and therewith the standard of living.

It may be fortunate that a considerable feeling has been expressed—perhaps, too, really exists—upon this subject of the competition of foreign with American labor. Certain of the community have demanded protection to our laborers and got what passes for such. Whether laborers can be protected,—that is, whether their high wages can be maintained by duties upon imported goods,—is a question which it is needless here to ask or answer. But that their wages can be reduced by importing foreign laborers is not to be denied, while importations of this kind are made for this avowed purpose and with this actual result. It should seem that those who sincerely desire to secure to American labor a generous reward would heartily support measures to check both the immigration of paupers and the importation of debased and ignorant laborers, while those whose sincerity may be questioned could not consistently oppose such measures.

What is needed is a provision of the following character: Every person not a citizen entering the United States should be required to produce a certificate of deposit in his own name, or exhibit funds owned by him, to the amount of at least one hundred dollars, suitable arrangements being made for the representation of families by their head, and for the exception of first-class passengers and temporary visitors. It would be a harsh measure to impose a tax upon immigrants, as it would be necessarily collected at a time when its payment would be most onerous to them. But if a foreigner wishes to become a citizen of this country, it is not only a mercy to him, but an act of justice to ourselves, to require him to come provided, either by his own ex-

ertions or through the aid of friends, with such a capital as will enable him to make advantageous shift for himself, and render it improbable that he will become a charge upon the community. In this way we should draw to ourselves only such thrifty and provident material as good citizens can be made of, for the amount named would seldom be saved without the exercise of some virtue. The competition of such laborers need not be dreaded, for the standard of comfort implied by the possession of such a capital is not a low one. The degraded, the beggars, the incapables, would be excluded; and those foreign communities that have shrewdly reasoned that it costs them less to pay the passage of their paupers to our shores than to support them at home would find their calculations seriously disturbed.

This is not a matter in which the city or the State of New York is alone interested, although they are primarily liable for the support and assistance of five or six thousand wretched wanderers every year. New York is the great organ of distribution, not only of merchandise, but of men. Whatever improves the quality of either is a very direct benefit to the vast interior of our country. But, unless something can be done in the direction suggested, the burden upon the charitable people of that city will become greater than they can bear. The rates of ocean passage will never be higher and are likely to be lower. There is no end to the supply of foreign poor. It is not lessened by any draughts that can be made upon it. New sources are continually opening,—Italy, Bohemia, Poland, Russia, have recently been added,—and in these countries there is a wealth of poverty that is perennial. Population presses hard on its bounds, and any relief from emigration is quickly followed by a corresponding increase. It is not a hopeless task, considering the charity and intelligence of our people, to provide for our own poor. It is otherwise if we have to deal with the paupers of the world.

D. McG. Means.

BYRON AT THE CELL OF TASSO,

ST. ANNA'S HOSPITAL, FERRARA.

THOSE tears become thee, Byron! Wandering free
As wind and sunlight over Italy,
O'er every land of beauty and renown,
Yet stamping oft a satyr's hoof-mark down;
How could'st thou view the cell where, undefiled,
Impassioned, pined the sun-god's elder child,
And not weep for lone Tasso? Woe for thee,
In seeming freedom, heavier chained than he!

Mary Stacy Withington.

AN AVERAGE MAN.*

BY ROBERT GRANT,

Author of "The Little Tin Gods on Wheels," "Confessions of a Frivolous Girl," etc.

VII.

LENT had come, and the back of the winter and the winter's gayety were broken together. There was no visible alteration in the external aspect of the great city; but in certain hearts were to be found signs of a profound veneration for the season, evidenced by a careful discrimination between dining out and going to the german,—or, indeed, dining out where the number of the guests was six and where it was twelve. "I draw the line on talking-parties," said Miss Lawton. "I go to them, Mr. Remington, and don't see any harm. Do you?" Now, on the principle of the young lady who gave up butter during the holy period, because sacrifice did not count unless you renounced something you really liked, Miss Lawton was *way off*, as the saying is; for talking-parties were decidedly her element, and especially as Mrs. Fielding set a very high standard in this respect. The latter lady did not go out anywhere. She put her foot down so firmly as even to feel obliged to give up dining with her own sister. The only diversion she permitted herself was the five-o'clock tea she had spread for such of her friends as were inclined to drop in.

This lull in general gayety was, theoretically, much of a boon to Remington and Stoughton, who were both beginning to wince somewhat under the strain of such a busy existence. Now they would have plenty of time to read in the evenings; and visions of a comfortable easy-chair close to the blazing hearth arose before them. They were each a little inclined to moralize on the waste of time that parties really were, and to vow they should cut all that sort of thing another winter. Dinners were, after all, the most satisfactory form of entertainment. One could talk to the right person without interruption. Of course, the right person was here a decidedly necessary premise to enjoyment; but, then, a discerning hostess was apt to arrange her guests with a deference to social whispers. They were beginning to be rather frequently invited to quiet little affairs of this sort. A winter had tended to develop them amazingly in the line of conversational powers and ease of man-

ner. Stoughton's natural power of attraction was made more prominent through a greater fluency and a certain audacity of speech. People described him as a handsome creature. He had gained some flesh, too,—just enough to fill out without impairing his figure. Remington also had made much progress in the way of becoming a favorite. He no longer was obliged in society to have recourse to the acting of Neilson, or the *status quo* of winter sports, to fill up a hiatus in conversation.

The hoped-for repose of Lent was little short of a delusion, as Remington, at least, shortly found. His cherished schemes for improving himself, and doing some solid work in the evenings, proved terribly abortive. The time slipped away about as fast as ever, and he felt none the less driven. Unlike Stoughton, he did not seem to flourish on the *racket*, as he styled it, that he had been pursuing. He was conscious of a tired, strained sensation. It seemed to him as if he could never quite catch up with himself. He looked thin, and as though he drew on his vitality unsparingly.

He went to a doctor and consulted him regarding his condition. "You are a bundle of nerves," responded the physician, as a summary of the situation; and he proceeded to deliver Arthur a sensible homily on the advantages of moderation, illustrating his theme by examples taken from mechanics. A small engine, he said, could not do the work of one that was ninety horse-power. There was nothing the matter, if Arthur would only take care of himself. His cough was simply symptomatic. Did he smoke? Cigarettes? Well, he had better cut himself off for awhile. Medicine? No; there was no need of medicine. Still, perhaps influenced by the young man's glum look at this announcement, he gave him a tonic, to be imbibed before every meal, which comforted Arthur's mind somewhat.

"You think too much. You take life too seriously," said Stoughton, who noticed his friend's brow. And, indeed, Remington did spend a good deal of time in puzzling over all sorts of matters connected with the problem of living. First of all, Miss Crosby had

come to be the central figure of his thoughts. He was in love with her, and the prospect of his being in a position where he would be justified in asking her to marry him seemed very remote. As to what her feelings toward him might be, he was quite at sea. There was no doubt that Ramsay Whiting was extremely devoted to her. He frequently found Stoughton, too, beside the little tea-table when he went to call. Stoughton's way of saying things appeared to fascinate her. She frequently spoke of his cleverness to Remington. But then, Stoughton was said to be as good as engaged to Isabel Idlewild.

There had come a lull in the law business also. Sundry bills for flowers and other little extravagances began to pour in about this time, and Remington found hard work in meeting them. The income from his pittance of a property, even including a small profit from his speculations, was lamentably small. What made it more irksome to have to be so economical was the success of Stoughton, who even drove a Tilbury on the proceeds of his winter's dabbling in the stock market. The latter confided to Remington that he had cleared twenty thousand dollars, which he intended to *salt down*. "If you had only followed my advice," he said to his friend, "you might have done just as well. I gave you points enough."

This was perfectly true, but the difficulty was Remington could not make up his mind to take the necessary risks. Despite the specious argument that the money was his own, he could not help feeling it was wrong to speculate. To be sure, the force of that word "wrong" was a little hard to determine nowadays. Wrong toward whom? It certainly did seem as if only those who were unlucky lost caste by speculation. All about him were instances of men who had made large fortunes in a very short period.

There was Eugene Finchley, for example. It was said that he and his partners had realized an enormous profit by floating the bonds of a new Western railroad. That was not speculation exactly. It was presumably merely in the line of their regular business, for they were bankers. But the result of the thing was the same. It was the making of a vast sum in a comparatively short space of time that attracted him. It seemed so desirable to be well off. He heard it often said that it was impossible to be prominent in New York unless one had half a million.

But though all this made Remington despondent at times, he stuck pretty steadfastly to his principles and ideals, at least theoretically. He knew well enough that there were better things than mere money-getting, and

when he acted on a contrary basis he felt uncomfortable. He was put into the world to do useful work, and it was not very difficult to see that in many ways his life was far from what it ought to be. However uncertain he might be as to precise articles of faith, he was sure that he was responsible to some higher power for his actions. He wanted to contribute his share to the labor of the world.

And so, despite occasional spells of idleness and discouragement, he did some hard work on the Treatise on Railroad Law during the spring and summer. He spent most of the hot weather in the city, running down for an occasional Sunday with his family, who were at the sea-side. He took a vacation of three weeks in August, which he spent at Newport, for Miss Crosby was there. He found as much going on in the way of gayety as in winter, and rather against his will accepted invitations for dinners and dances. Woodbury Stoughton had been there all summer, and looked the picture of handsome health in his white flannel suit. His face was tanned a becoming brown. He was one of the leading spirits of the place and a crack tennis-player. He meant to go in for polo another year, so he told Remington, whom he looked up at the hotel soon after his arrival.

"You ought to have let me know you were coming, and I'd have engaged you a room at my house. I could have got you one three days ago, but they're all taken now. Ramsay Whiting and I have first-rate lodgings together. You ought to have come down before, my dear fellow, instead of stewing in town. You look as white as a ghost."

The three weeks slipped away fast enough, but Remington did not return to New York in an altogether equable frame of mind. He had not been able to see nearly so much of Miss Crosby as he hoped. She was overburdened with engagements, and, with the exception of a walk on the cliffs one Sunday afternoon, his interviews with her were very fragmentary. He met her at a dance or two, and played tennis in the same party, but he found himself put in the background by the other young men, with whom she seemed to have more in common, for he was necessarily ignorant of the current jokes and chitchat.

The Sunday walk, however, was very delightful. They strolled along the path that skirts the green lawns overlooking the sea, and, climbing down, sat upon the rocks. Miss Crosby inquired about the progress of his Treatise, the existence of which she was aware of. He philosophized a little, they discussed several books, and stayed gazing at the sunset until it was necessary to hurry to reach home before dark.

Miss Idlewild was much admired this summer. She drove a pair of agile, graceful ponies, and she took Remington out in her phaeton one afternoon, two days after his walk with Miss Crosby. She looked lovely in her dark-blue close-fitting suit, with a billy-cock hat, and with a bunch of pansies at her throat. Remington felt quite proud to be at the side of the young beauty. People still said Stoughton was going to marry her. Then, too, Finchley was at the hotel. He had been there three or four days. Town was hot, he said, and business dull. Remington had sat up with him smoking, the night before, talking about business. There would be a crash some of these days, Finchley said. Stocks were selling for all they were worth.

Remington found it rather difficult to converse with Isabel if he left the field of badinage. She evidently enjoyed compliments, while protesting against them. They got on famously when they talked sheer nonsense; but if he ventured to introduce more serious topics she became embarrassed and silent. She was an excellent whip and took a keen interest in her ponies, which were a birthday gift from her father.

She had turned Dandy's and Dewdrop's heads homeward. The sun had just set and the western horizon was streaked with deep violet hues, suggesting the near advent of autumn. Remington was ruminating under the influence of the evening light, and, a somewhat ungracious proceeding, it must be confessed, looking his gift horse in the face; for he said to himself that, in spite of all her money, Miss Idlewild would be no wife for him. He liked her very much; but his idea of marriage was that a woman should be a companion to her husband. It must be a fine thing, though, to have a million, he reflected, as a criticism on this conclusion.

"Aint it lovely!" exclaimed Isabel. "Just look at that cloud."

"It looks like a dragon with four heads. See, one of them is dropping off now. Do you remember the verses of——"

He stopped short for an instant and made a little swallow. Miss Idlewild laughed. She turned toward him:

"Are you stopping because you forgot yourself and thought you were talking to some one else? Please continue, and imagine I am literary. I really think I should like poetry if some one would educate me. Go on, Dewdrop," and she gave a little touch of the lash to the off pony.

Remington laughed nervously. "I forgot the lines. I thought I saw a ghost in the hedgerow, and it frightened me so they have slipped my memory."

There was more truth than fiction in this speech, for as the phaeton passed one of the side streets that intersect Bellevue Avenue, his eye had recognized Dorothy Crosby and Woodbury Stoughton sauntering together. The twilight had thrown them into perfect relief.

"A ghost? What fun!" cried Isabel, unaware of his meaning.

"Yes; a ghost that boded no good either to you or to me."

The girl laughed and looked again at her companion.

"How queer you are to-night! Your tone then was positively sepulchral. What did it look like?"

"Miss Idlewild, let us elope," he said, with a sudden burst of sprightliness, as of one who sweeps away the fumes before his eyes.

"Certainly. Let it be this very evening."

They both laughed gleefully, and an instant later the noise of the wheels upon the gravel path told them that their drive was at an end.

Remington returned to the hotel in a state of excitement, which he was conscious would soon settle into gloom. On the veranda he encountered Finchley, who carried an overcoat across his arm.

"What! Are you going back to-night? Hold on until to-morrow, and I'll go with you."

"I can't. There's been a bad break in the market. It has come even sooner than I expected. Scioto Valley has dropped ten points since yesterday."

"Pheugh!"

At the moment, Stoughton came up swinging his cane. He appeared very good-humored, and remarked that the pair looked grave as owls.

"What's the good word?" he said.

"Look here, Stoughton." Finchley put his hand through the other's arm and walked him aside.

"The devil!" Remington heard his friend ejaculate.

"You know, I told you not to buy at those prices," said the broker, and he waved his hand at the driver of the omnibus. "I'm off."

Stoughton stood whipping his cane against the leg of his trowsers.

"This is a nice thing to have happen at the height of the season."

"Are you stuck badly?" asked Remington.

"It isn't as deep as a well nor as wide as a church door, but it's enough," he growled. "I was a fool, as Finchley says. It's only two thousand," he added presently. "I bought a couple of hundred Scioto Valley for a turn last week, and it has gone the wrong way."

"Tough luck." Remington did not feel quite so sympathetic as if the afternoon's episode had not been in his mind. Besides, he had a little Scioto Valley himself. Everything seemed to be going wrong.

They both returned to New York on the following day. The break in the market was only temporary. Even Scioto Valley recovered a large portion of its decline. But Remington tipped his out at nearly the lowest point it touched. He was afraid to hold any longer, for it might go all to pieces, his broker said. He did not like to run the risk of falling into debt. This loss made a sad hole in his capital. Two thousand dollars was all he had left. He made the resolution, however, that he would never buy stocks on a margin again. He would trust to his profession for his income in future.

"I pulled through that racket pretty well," said Stoughton, a month later. "I sold my Scioto Valley to-day, and my whole loss is only four hundred, including interest. I'm going to the caucus to-night. Come ahead. There's likely to be some sport."

"I was intending to go," answered Remington. "Ramsay Whiting was in my office this morning. He said the Independents were going to make every effort to prevent the election of Collamore delegates."

"Hm! They'll find it no easy matter. Corny French is a pretty hard customer to deal with. The trouble with Ramsay Whiting is that he's so impractical. There's no use in going into politics with kid gloves on, I've made up my mind. You've got to fight the beggars with their own weapons."

Woodbury Stoughton had flattered himself that in going into politics his motives were disinterested; that is to say, he believed any ambition he might feel for personal distinction to be quite subsidiary to his desire to promote the cause of reform in public life. It seemed to him that the intervention of the better classes was necessary to repress the corruption and debasement of tone which threatened to honeycomb our system of government. He was going to devote his energies to advocating pure methods and blocking the wheels of machine rule. For the pursuance of this object he was desirous to hold office, but he would never make use of any but the most unexceptionable and straightforward measures to advance his own interests.

It was in this spirit he had at first attended the primaries in his ward. The germ of the evil was said to lie here. Let good citizens take pains to be present at these meetings, and the monster could be strangled in the cradle.

His hopes had been, however, a little

dashed and his vanity somewhat wounded by his first experiences. The sense of helplessness a novice realizes at an ordinary ward-room gathering is almost pathetic. The clock-work regularity with which everything is done suggests the neat, exquisite movement of a machine which receives at one end a commodity in the staple and reproduces it at the other in the textile. His presence seemed absolutely futile. He might just as well have staid at home. A small clique of men, whose names were completely unfamiliar to him, appeared to run everything to suit themselves; while the mass of the constituents, as they were styled from the platform, lounged and smoked in gaping indifference. Occasionally, some disappointed aspirant, whose name had been omitted from the printed ticket supplied by the committee, would denounce the cut-and-dried condition of affairs, only to be rolled and trampled in the dust by a wheel as inexorable as Tarquinia's. Every few years the so-called respectable element of the district—roused by a scandal of more than ordinary proportions, or whipped into line through the persistency of some would-be candidate for preferment—turned out in force and filled the ward-room to overflowing. Then there were speeches made and resolutions passed, and read by a chairman of blameless character, calling for the systematic coöperation of the voters against the wire-pulling of the politicians, while the gentry in question, already foreseeing the calm certain to follow this outburst of enthusiasm, suffered the movement to have its head, and even added their own testimony to the worthiness of the cause.

As is commonly the case, the ingredients that went to make up the constituency to which Stoughton belonged were various. In the first place, there were the well-to-do and educated, who were many of them vastly indifferent to their rights of suffrage. At their antipodes were the poor and ignorant folk, who possessed little else but their votes upon which to raise money. Between them lay that great middle class, to whom orators delight to appeal as the bone and sinew of the American people,—the class whose standards must, under republican institutions, determine largely the standards of the nation. This last element held the balance of political power, and, while deprecating anything that could be construed into out-and-out dishonesty, was disposed to pardon much to a *smart* man. In other words, they were not thin-skinned. When matters became notorious,—which is another way of saying "when they began to lose money,"—they arose in their might and made a clean sweep

of the slate; but for the most part they took things easily, and believed in supporting at the polls men who would never feel ashamed of them. Finally, there were the politicians pure and simple; which, if we take the words in the literal sense, was about the last term that could properly be applied to them.

"We shall never get pure government in this country," Ramsay Whiting observed to Stoughton at one of their Civil Service gatherings, "until the moral tone of the average voter is raised. When the masses begin to understand why it is not respectable for an office-holder to use his place to supply his friends with comfortable berths, we shall see an improvement. As it is, they no more look for squeamishness in such matters than they expect to get full weight at a country grocery. In regard to cracking a bank or embezzling trust-funds, the popular sentiment is generally sound; but short of these, it is not inclined to judge a ready speaker too harshly." The only thing to be done, he went on to say, was one's self to fight the evil, and trust to time to leaven the lump. Every little helped.

By degrees Stoughton had made the acquaintance of the leading politicians in his ward; and it had surprised him to find what a decent lot they were, compared to his expectations. To be sure, his preconceived ideas on the subject had pictured the genus in question as a kind of human vulture,—a groggy, seedy individual, who, when he was not plundering the public till, haunted pot-houses and kindred resorts. However apt this diagnosis may have been regarding the lower strata of the profession, it certainly did great injustice both to the Honorable Cornelius French and Mr. Alderman Dunn.

To-night was to be one of the most important primaries of the year. A Republican candidate for the Assembly was to be nominated, although nomination in this district was not always equivalent to an election. Delegates were to be selected also for the convention shortly to meet to choose a United States Representative. The Honorable Hugh Collamore, who had already served two terms in the State Senate, was anxious for the office, and his nomination would have been regarded as a certainty, had it not been for the opposition of the Civil Service wing of the party. This reform element had endeavored, though unsuccessfully, to defeat Collamore at the polls last year; but the attempt had rendered the contest so close that the managers were putting their heads together to try and patch up matters. If the Reformers were to go over to the Democrats, it would be a serious affair. They must be

humored in some way, or, better still, set at variance among themselves.

Ramsay Whiting was one of the leading members of the Civil Service Reform Club. His labors in this direction rivaled even his devotion to his farm. He was the ruling spirit of the organization in his own district. Remington and Stoughton had signed the constitution and enrolled themselves as aiders in the good cause almost immediately after coming to New York. Stoughton had been, the previous autumn, among the bitterest opponents of Collamore's nomination. But when it had come to election day, and it was evident that there was no chance for Mr. William Webster, the Reform candidate, Stoughton showed his common sense, as he said, and worked for Collamore against the regular Democrat, who was, likewise, an ardent politician.

"It's a choice of evils, but Collamore's the better man," was his remark to those who inquired as to the merits of the candidates. "There's no use in voting for Webster; he's got no chance, and it will be merely a waste of your ballot."

Whiting had endeavored to remonstrate with Stoughton. The independent candidate was an unexceptionable nomination, he said, and respectable people, by scratching Mr. Collamore's name, could teach the party a valuable lesson. Next year, they would not be in such a hurry to put up a second-rate man.

"But don't you see, my dear fellow, it won't do any good to vote for Webster?" protested Stoughton, with some irritation. "You can't possibly elect him, and the result will be merely that that beggar Holmes will get in. He's worse than six Collamores, and is a Democrat to boot. You're cutting the throat of your own party."

"Exactly, if you choose to put it that way. I don't consider myself bound by any party ties to vote for an inferior candidate;" and Whiting turned on his heel.

Collamore, meeting Stoughton in the street a few days later, had greeted him cordially. Without thanking the young man in express terms, he declared himself greatly indebted for the efforts of the friends to whom he owed his election. Stoughton felt considerably flattered, and went on to say how glad he was that the Democratic candidate had been beaten. "Well, sir," answered the politician, with an air of disgust that was not without pity, "it's not becoming perhaps in me to say it, but he's a poor lot. I would sooner cut off this right hand"—and here he shook his fat fingers within an inch of the other's nose in virtuous indignation—"than resort to the

tricks which that Holmes practiced to try to get an election. Why, sir, the fellow's hirelings violate the sanctity of the home in their attempts to buy votes. It was disgusting, simply disgusting!" and the speaker looked as if the purchase of a freeman's suffrage was something against which his very nature rebelled.

"And who is talked of for the Assembly next fall?" inquired Stoughton, presently.

Mr. Collamore was not sure that any names had been prominently mentioned in that connection. Young Finchley was a rising man, and was likely to be returned from one of the city districts. "Wouldn't you like to go yourself, Mr. Stoughton?"

Stoughton was not sure that he would not. "If the party would like to have me serve, I shall be very glad of the nomination," he continued.

"Well, we'll see,—we'll see if it can't be managed," said the politician, thoughtfully.

The latter had referred to the subject on several occasions since, and Stoughton had come to regard himself in the light of a possible candidate. He had already made sure of the support of the Reformers. At a meeting of the executive committee of the club held a week ago it had been agreed to run him for Assemblyman, and Talboys De Witt, an intelligent young banker, for Congress on one ticket, and to oppose the Collamore candidacy.

Two days before the present caucus, secret overtures had been made to Stoughton to the effect that a compromise was desirable. The political element would assure Stoughton the nomination for the Assembly, if his friends would vote for Collamore delegates. There was no chance for both the Civil Service men, and by a refusal to settle matters amicably the chances were much in favor of neither of them getting the nomination. This argument of the envoy sent on behalf of the other side was represented as worthy of consideration by Stoughton to Ramsay Whiting, to whom, without revealing that he had been approached, he suggested the possible advantage of some such move. But the young Reformer was steadfast in his determination to avoid bargaining with the enemy. If the consequence was defeat, at least they could say they had been faithful to their principles. Stoughton had shaken his head incredulously. His reply to the messenger of the other faction was that perhaps something might be done on the night itself.

Remington and Stoughton entered the ward-room together, which was crowded with men standing in little knots, smoking. There were a number at the door armed with printed tickets which bore various headings,

such as "Regular Republican Nominations," "Straight Republican ticket," and the like.

"Holloa!" said Remington, glancing over one of the ballots, "they've got your delegates on the Collamore ticket, Wood."

"Is that so?" replied Stoughton.

They walked forward to the middle of the room. "Ah! Mr. Stoughton, how d' y' do?" said one of the ward politicians, a tall individual, with a sonorous voice, the distinguishing points of whose dress were a long, black frock-coat and a black whisp tie. "Mr. French," he continued, turning to a portly man with a round, red, sphinx-like face, and glittering pig's eyes, "I want to introduce to you a young friend of mine, one of the new men of the party. Mr. Stoughton—Honorable Cornelius French."

"I am happy to meet you, sir," said the great man, taking the neophyte's hand in his, while he scrutinized his face with a keen glance. "I thought I was acquainted with all the rising political talent."

"I belong to the youngsters," said Stoughton, with a laugh.

"So do I, sir; so do I," protested Mr. French, with a mock gesture of deprecation. "I am not to be classed with the antiquities yet."

"Mr. Stoughton is the young man of whom I was speaking to you the other day," the henchman went on to observe. "As I was just saying to these gentlemen," and he turned toward the group, "we are determined to send clean men to the Assembly next time."

"Quite right, sir; quite right. The country demands that the public servants should be worthy of their trust." Mr. French gravely passed a blue silk handkerchief over his smooth chin.

Corny French, as he was styled in political circles, was a remarkable character. He was primarily a self-made man; which, in his case, was largely associated with the fact that he had always looked out for himself before everything and everybody else,—even including the grand old party to which he belonged, and of which he was one of the main-stays. He was one of the powers behind the political throne, one of those personages who, like the manipulator of a puppet-show, handle the wires invisible to the ordinary eye. Originally a journalist, he had obtained office under the New York City Government, as the reward of a spicy advocacy of a successful candidate. Thence he had eaten his way deep into the municipality. Few in public life had been brought so intimately into contact—or rather into contract—with the civil needs, in the line of lamps, sewers, and pavements, as himself. He was an alderman for a number of

years, and later figured as a legislator in both branches at Albany. He could have been sent to Congress at any time had he so desired; but it suited his ambition better to say who should not go than to go himself. Political manipulation was the dearest interest of his life. There was to-day no cleverer party manager in the country than the Honorable Cornelius French. He had literally grown gray in the service; and there was many a politician who was indebted for his subsequent notoriety to the favor shown him at the start by this modern Warwick. From the enormous circulation of his newspaper he had realized a handsome fortune, and he lived in luxury. His private tastes and accomplishments indicated a mind of no mean order. He was an omnivorous consumer of books, and could read with pleasure, it was said, six different languages. His library was among the choicest of the city. He was said to be an intimate student of the English poets. He had never been accused of personal pilfering of the public money.

Just then Ramsay Whiting came up and drew Remington aside.

"See here, what does Stoughton mean by letting his delegates appear on the opposition ticket? It was agreed that he and De Witt should run together."

"So I thought. You'd better ask him."

But Stoughton had slipped away, and presently there went a whisper round the room to vote the split ticket. Despite the efforts of Whiting, who button-holed Reform men, and urged the importance of avoiding compromise, the general sentiment seemed to be confused. Somebody had started the watch-word that, by meeting the politicians half-way, more would be gained for the cause than by suffering total defeat.

"I say, Stoughton, you ought to get up and decline to run, except on the same ticket with De Witt," said Remington, seeking out his friend. It was plain to him that Stoughton had made some bargain with the enemy.

"It isn't my fault that they've put my delegates on their ticket. If I should do that, neither De Witt nor I would have a ghost of a chance."

"Well, I shall have to vote against you, then."

"All right. Just as you please."

The politician in the frock-coat, who was the Honorable Hugh Collamore's chief fogleman, was standing near by with Finchley.

"It will be a walk-over. They've swallowed that bait pretty solid."

"Yes, and don't let on," Finchley whispered behind his hand; "but I've got the whole kit of their ballots, except about twenty,

wrapped up in my ulster. One of the *daisies* put them behind the bench for safe keeping, and I cabbaged them."

It was plain sailing after this. In the midst of the noise and chatter, one of the Ward Committee knocked the meeting to order, and called for nominations for a chairman. A big fellow, with a voice like a Bashan bull, got up, and, after looking around him as much as to say that he would wipe up the floor with any one who should gainsay him, proceeded to make a motion that Mr. Alderman Dunn act as the chairman of this meeting.

Remington, who was in a state of much excitement, started to his feet and nominated the Honorable William Webster. The meeting was desired to express its choice by a show of hands. The vote stood: Dunn, 97; Webster, 85. Stoughton, who had voted for Webster, arose and urged that Mr. Dunn's nomination be made unanimous.

Mr. Dunn, while in a sitting posture, had the effect of being without a neck. His square, heavy-jawed countenance, smooth-shaven and furrowed with seams, appeared to rest directly upon his broad shoulders after the manner of a snow image fashioned by boys. He had an expansive smile, and a confidential, caressing manner, which was intended to be very ingenuous,—as if to imply that whatever secrets one might intrust to him would go no further. His person was ordinarily redolent of jockey-club,—a peculiarity which was easily accounted for, however. Mr. Dunn was in every-day life a dealer in horses, and it having been intimated to him that the flavor of the stables was disagreeable to his associates, he had endeavored to obviate the difficulty by the use of scent. The choice of jockey-club was only an accident; so he explained to Stoughton, who came upon him one day in the municipal dressing-room, sprinkling himself from a small bottle. It might just as well have been patchouly or any other perfume; he had not intended to pun upon his occupation. And then he had laughed hoarsely, and rubbed the young man with his elbow, which was his way of suggesting that he had said a good thing. He was an alderman at present, and reputed to be one of the shrewdest workers in the party.

He now ascended the rostrum, and two secretaries, one from each faction, having been chosen, he declared the meeting organized for business. There was some little confusion among the Reformers, owing to the mislaying of their ballots. Some one called for a committee to nominate delegates, and an attempt was made to have distinct ballots for delegates to the congressional and assemblyman conventions; but both these motions

having been defeated, a vote was taken for both together. The result was announced by the chairman.

He declared elected the list of Collamore delegates, who had received 121 votes to 61 for their opponents, and likewise the delegates in favor of Woodbury Stoughton for Assemblyman, whose majority was even larger owing to his support from both factions. Upon the announcement of the result a loud shout went up, coupled with cries for a speech from the would-be Congressman, who at last suffered himself to be escorted to the platform. He was a ponderous-looking man, with coarse red hair and beard, and a hawk's eye and nose. He was arrayed in black broadcloth. From his showy watch-chain hung a Masonic emblem, and a large diamond pin spluttered in his shirt-bosom.

After a short preface of thanks "for the honor conferred," he proceeded to take the bull by the horns in saying that he had reason to believe that there were some who had come to the meeting for the purpose of sowing dissension in the ranks of the Republican party. He looked around the room, as he spoke, with an air of righteous indignation, amid cries of "That's so," "Give it to 'em, Hugh," "We'll teach 'em what reform means!" The air was blue with tobacco-smoke, and the worst element evidently felt the inspiration of success.

"Gentlemen," the speaker continued, stimulated by the last interjection, "I have heard the word *reform* fall from the lips of some one in this assembly. Reform! Thank God, gentlemen,"—and here he banged with his fist upon the desk,—“thank God, I can stand up proudly in this place and say that, if there is one thing I believe in, and have striven for during the whole course of my political career, it is reform. Reform, gentlemen, reform, the sacred beacon and watch-word of our party, the golden hope of the political future and of the present,—aye, gentlemen, of the present —”

"How about that Spuyten Duyvil Bridge job?" piped a voice at the back of the room.

The eyes of everybody were turned in the direction from which it had emanated, and seemed to center on Ramsay Whiting, who was standing near the door with folded arms and a disdainful smile on his face. His ulster was drawn up about his ears, and he had been apparently on the point of taking his departure. There were loud cries of "Who was it spoke?" "Put him out!" and the like. The remark had not come from Whiting, but the crowd chose to consider him responsible for it; or, at least, the Honorable Hugh did,—for, as he resumed his harangue, his fin-

ger was pointed unmistakably in his direction. "Some gentleman has made a remark," said he, and, as he paused dramatically, the whole company turned toward the young man. "Some gentleman has taken it upon himself to make a remark which reflects upon my conduct as a public servant, and which calls in question my fidelity to the trusts that this constituency has placed in my hands. I might, upon such an occasion as this, fitly decline to notice language so unparliamentary; but it has been my boast, gentlemen of the Republican party, since first I assumed the sacred garb of office, that I have been ever ready to submit my behavior to the light of scrutiny,—aye, gentlemen, to the scorching blaze of noon. The allusion that the honorable gentleman has seen fit to make is Cimbrian in its darkness, gentlemen, Cimbrian."

The orator paused to give due effect to what he considered, doubtless, an apt and correct classical allusion.

"Let him stand forth and proclaim himself!"

There were loud cries of "He dar'sn't!" "What's his name?" and the like.

"Let him no longer seek a cowardly shelter behind the rampart of the anonymous. I care not who he is, whether he be a lowly son of toil or one who haunts the gilded halls of aristocracy,"—and here he stopped and shook his fat finger menacingly at Whiting,—“I proclaim him from this platform a base and perjured liar."

Whiting made no reply; he simply looked amused. And the Honorable Hugh, having, so to speak, placed himself on record, was evidently satisfied, for, after looking around for a moment, as if in search of some one to take up his gage, he went on to say, in a pathetic tone: "Perhaps, gentlemen, I may have been in error to consume your valuable time with matters of private moment. But"—and here he struck his chest with his fist—"no one, my fellow-citizens, from the poor but free-born tiller of the fields to the honored magistrate upon the bench, can afford to allow the foul breath of slander to sully the snowy bosom of his reputation; his reputation, gentlemen, which, in the words of the immortal bard, outweighs the miser's gold."

He sat down, overcome by his feelings, amid vociferous applause, and the meeting was speedily adjourned. Stoughton went off with a number of jovial spirits to celebrate the occasion. He saw fit first, however, to invite Remington and Whiting, who were standing together, to join him.

"Arthur," said Stoughton, "let me introduce you to Mr. Alderman Dunn."

The Alderman said a few words to the young men. He addressed Whiting with a

show of deference. "We feel, Mr. Whiting, that the efforts of your association in the interests of good government should be recognized. Mr. Stoughton's name will add strength to the ticket. The people will see that the so-called politicians"—and here he smiled with the air of one who, though unjustly accused, is still patient—"are not wholly regardless of the public interests. I regret that you will not join us in a little something. Good-evening, gentlemen."

Whiting, on the way home, was severe in his criticisms upon Stoughton's conduct. If men of his stamp did not take a high stand in such matters, what could one expect of the uneducated? He declared that, after what had happened, he could not vote for Stoughton. "I consider even that Finchley a less dangerous man, for I believe he acts up to his lights, and Stoughton doesn't; I'm terribly disappointed in him. It was perfectly evident to-night that he slaughtered Talboys to save himself."

Remington was unable to say a word in his friend's defense. He felt that the latter had behaved badly. He had unquestionably sacrificed principle to his own private ambition. The young men shook hands cordially at parting. They had come, of late, to feel a mutual liking, notwithstanding their devotion to the same woman.

VIII.

IT was a beautiful summer day, late in August. The fog, that for a week past had enveloped Bar Harbor like a shroud, had rolled away, and the atmosphere, appropriate to a cloudless sky at this season, was tempered by a breeze fresh from the ocean.

One approaching this picturesque resort—more familiarly, though erroneously, described as Mount Desert—cannot fail to be deeply impressed by the bold rugged beauty of an immense pile of cliff known as Great Head, which lifts its broad flat surface to an unusual height above the level of the waters and juts seaward from amid the lesser crags that line the iron coast, a huge sentinel.

Many hundred miles to the north, where the waters of the St. Lawrence River mingle with the Atlantic, stands another mammoth of the geological world, the Percé Rock. The incessant action of the wind and waves has divided the latter from the main-land, and further eaten into its solid center an arched pathway, through which small skiffs can pass with safety when the sea is tranquil; but though its core is threatened, the superb crag towers proudly and, like its more familiar rival, raises to the cold heavens a broad expanse, where

myriads of sea-birds find a resting-place secure from the invasion of man. Naught disturbs these feathered creatures save when an occasional steamer—the sole link uniting the inhabitants of the isolated gulf-ports, Percé, Paspébiac, and the beautiful Gaspé, with the outer world—rests for a little by the rock-bound village, and fires a gun athwart the startled twilight. Then in an instant, as by a touch of magic, the vast rock—which but just now, erect amid the waters and outlined against the evening sky, inspired the gazer by its silent majestic beauty—wakes to life. Countless flocks of gulls and cormorants, disturbed by the unaccustomed din, start from their aeries with hoarse strident cries, and hover on wide-extended wing above the sea-girt pile. A small number, startled into more decided action, describe a short ponderous flight oceanward or sail solemnly along the shores, and for a few minutes the air teems with the feathered tribe; but as the sounds die away among the ancient hills, the birds settle once more on the familiar resting-place.

Although the geological formation is different, the boldness and wild, silent grandeur of Great Head awaken emotions kindred to those which the sight of the Percé Rock inspires. Little by little, as the steamer steals up the coast, the features of the giant crag define themselves, and the wondrous colors of the rugged stone are revealed to the admiring eye. Civilization seems far remote. Nature, pure and simple, untrammelled, unrestrained, holds free court amid her silent worshippers.

The steamer passes close to the headland, but the traveler, while still afar off, is puzzled as to the identity of sundry objects, at first mere specks, which become visible at frequent intervals along the level and down the face of the rocks. So motionless do these appear, that only on a near approach is it apparent that this citadel of nature is possessed by living creatures. By degrees it dawns upon the astonished senses that every sheltering ledge, every nook and comfortable recess,—from the broad top to the base-line far beneath, rough with barnacles and slippery with weed, where the salt wave licks the feet of the unwary,—harbors a pair of human beings engrossed in the delights of intimate communion. With apparently nothing to interrupt their unfettered confidences, with the sky and ocean and grand old rocks as sole witnesses of what each may say to the other, is it strange that the shrill notes of the whistle breaking on the ear convey the first warning that they are no longer unobserved, and that earth claims them once more? Then, as the

vessel steams abreast of the vast promontory, from every airy niche along the shore, from every ledge that slopes toward the sea, and from behind bowlders that guard the entrance to fascinating caves, handkerchiefs, hats, and gay sun-umbrellas wave back a joyous answering welcome, and eager eyes are strained upon the faces of the new-comers. But the swift course of the steamer leaves them but little time in which to satisfy their curiosity. For a few short minutes query and comment absorb those upon the shore and those upon the sea. Then, as the vessel lapses into distance, the young people sink back upon the rocks and resume the thread of interrupted discourse.

No man, it is believed, has ever quite gauged the cleverness of woman. Every now and then we flatter ourselves that we have come to the end of her resources, and hold her, figuratively speaking, in the hollow of our hand, when all of a sudden some new little device peeps out, as shyly as a violet from a hedge-row, to show us the folly of our pretension. It was always with a certain air of exultation, as of a consciousness of security from pursuit, that the hard-worked male of our great cities had fled to the trout streams and deer woods to spend his pitiful fortnight's vacation. His plea that the discomforts of the primeval forest are beyond the endurance of the gentler sex always seemed unanswerable. Yet, mark the sequel! Woman, with a docility that should have awakened suspicion, appeared to accept the situation; but in secret she diligently cast about for an argument, until she had installed herself in an isle where all those health-giving properties for which her mate was clamorous were to be found in abundance, and the annoyances of an outlandish existence merely such as added a zest and piquancy to the circumstances. Here, assuming the garb of Diana the Huntress, she showed herself prepared to woo the delights of nature and the unconventional. History repeats itself. We are all familiar with the fate of the too fond Samson, whose flowing locks grew less under the scissors of the artful Philistine. To-day, in many a sylvan grove and by the rock-bound sea, the hair of our strong men, closely clipped for the needs of summer, grows long again in the laps of maidens far cleverer than she.

Among those the current of whose thought was broken in upon by the approach of the steam-boat on this particular morning were Arthur Remington and Miss Dorothy Crosby, who, having walked thither from the village after breakfast,—a pleasant tramp,—had now for several hours been ensconced in a pleasant nook. Remington wore a little round

cap, a sack-coat over his tennis shirt, and knickerbockers. Her dress was of dark-blue flannel, the looseness of which was confined by a broadish leathern belt. About her neck she wore a white muslin scarf, nonchalantly tied, and the masses of her hair were surmounted by a wide-brimmed straw hat, perched on the back of the head, and bound with the same variety of muslin. Seated close to the water's edge, she was leaning back comfortably against the solid wall of rock, while Remington lay stretched out beside her on the sloping ledge. They were talking earnestly; and, as the interest deepened, he picked, with increasing nervous energy, with the point of Miss Crosby's red sun-umbrella, at the barnacles that grew upon the rocks around him.

Another winter had slipped away without witnessing any material change in the circumstances of Remington. He had dug away at the law, and been rewarded by some little business,—nothing very important or lucrative, but sufficient to keep discouragement, which is quite as gaunt a wolf as hunger, from the door. His book on Railroads had been favorably received by the legal community, even if the profit accruing to the author had not been considerable. He had been almost as frequent a patron of gayeties as the winter before, but nothing had come of this party-going beyond a deeper conviction than ever of his love for Dorothy Crosby, who was still unmarried, though a favorite. The attentions of Ramsay Whiting were unremitting, and people who had nothing better to do wondered whether she would take the unexceptionable young millionaire or that handsome Woodbury Stoughton, with whom she was seen sometimes tripping the cross streets. Woodbury Stoughton was in the Legislature, and doing very well, every one said.

Remington had run down to Bar Harbor to spend the three weeks of vacation that he had allowed himself, leaving his office in the charge of a small boy, with directions to say, if any one called in the meanwhile, that he would be back by the 15th of August. New York, even varied by an occasional afternoon at Coney Island or Sunday on a yacht, was extremely hot and dull, and really there was nothing on earth to detain him at home. Woodbury Stoughton had gone to Newport again. Rumor still found material in his intimacy with Miss Idlewild.

Miss Crosby was at Bar Harbor. She had gone down there the first week in July; and Remington had cause to believe that Ramsay Whiting's yacht had started recently in the same direction. He mechanically stretched out his hand for the newspaper. There would be a steamer from Boston to-

morrow evening. He could catch it if he chose. He looked at his watch reflectively. "John," he exclaimed, with decision.

"Yes, sir."

"I am going away to-night, and may not be back for three weeks. If Mr. Phillips—that bald man with the sandy whiskers—comes in while I'm gone, his papers are on my desk."

On the way to his destination he had made several acquaintances,—notably a Miss Plumber, from Philadelphia, who sat out with him in the moonlight and discoursed on the affectation of persons who spelt her family name with an *m*, instead of a *b*. Wasn't it absurd? *She* was not in the least ashamed herself because her ancestors might have been plumbers centuries ago. Remington had sat puffing his cigarette, and was very quiet. After Miss Plumber had gone to bed,—or had *retired*, as Miss Johnson, a spinster, who was chaperoning the young lady in question, called it,—he had walked the deck for some time in a pensive mood, now and again pausing to gaze out over the stern, beneath which the churning waters of the wake lay silver-white in the moonshine. His thoughts were reminiscent, and he sought to analyze the experiences of the past six months. As always, the influence of the beautiful in nature affected him strongly. He turned his face up to the quiet skies as though he would fain pierce the riddle that balks the scrutiny of all. Hopes and strong resolutions for the future filled his breast; and, free for an instant from the pressure of material considerations, he let his fancy have full reign. His episode with Isabel Idlewild came back to him as an indifferent memory. His spirit seemed to soar, and reached itself out in an unqualified ecstasy toward her whom he hoped to see upon the morrow.

Remington was already tolerably familiar with the place and its customs. A new-comer to Bar Harbor is apt at first blush to be rather flattered by the numerous attentions showered upon him. Urgent solicitations to join picnics and the various expeditions which form a frame-work for romance greet him upon every side. He finds himself speedily initiated into the mysteries of the closely packed buckboard and the sailing party, picturesque with wraps, and, haply, a guitar. He is greatly in demand, and his name is ever on the lips of would-be entertainers. All this is pleasing to the novice; but as in the natural course of events he comes to make, among the young ladies whose acquaintance he has formed, those distinctions which render the presence of a third party invidious, he ordinarily develops into an ardent disciple of the school who share the opinion that two in the woods are happier than three on a

buckboard; for, let the uninitiated learn, each seat of this recognized vehicle of the neighborhood is fashioned to hold a triple freight. Then, by degrees, it grows obvious even to himself that for the sake of sequestered walks and talks with the beloved *she*, he is ready unblushingly to *bluff*, with the plea of a previous engagement, the hardest and most persistent of picnic organizers.

At the time of this expedition to Great Head, Remington had been to Bar Harbor about a month. He had overstaid his prescribed time by nearly a week. During this period he had managed to see a good deal of Miss Crosby. His lot, however, or rather his state of mind, had not been completely blissful; for Ramsay Whiting's yacht and the poetizing tendencies of a Mr. Lattimer, who had also turned up here, were formidable distractions to his *innamorata*. Lattimer, in especial, had interfered with his plans. The young writer had lately produced a new volume of verses; and what woman is proof against the attraction of having a poet all to herself? Canoeing by moonlight with a bard looks a great deal better than making the same trip with a layman. These water trips and other cast-iron expeditions (the term *cast-iron* symbolizing their complete exemption from interruption) were a favorite method of procedure with Remington, and it was galling to find a rival who had such unusual resources at command plowing with his heifer. He was handicapped from the start, he mournfully reflected. Sometimes, in desperation, he would affect for a day or two the society of the aforesaid Miss Plumber, who sang "Over the Garden Wall" and other ditties to a banjo with charming chirpiness. She was an audacious little person, and informed him one evening, as they were floating under the harvest-moon at the respective ends of a canoe, that she preferred playing first banjo to second fiddle. Remington pretended not to understand the jest, but he took care for the rest of the evening not to let his eyes wander so much in the direction of another skiff that lay to leeward.

Nevertheless, he had managed to be pretty assiduous in his attentions to Miss Crosby. He had become vastly more intimate with her in the course of their wanderings over the island, and it seemed to him as if he had confided to her his uttermost self. What she did not know about him was, as he would have phrased it, not worth knowing. Together they had probed the most interesting problems of human experience and destiny, and wandered at will over the delightful field of speculation. But time, which latterly had seemed to the young man as naught, now

stood frowning in his rôle of task-master. It was necessary for Remington to leave upon the morrow. This was to be his last interview with Miss Dorothy Crosby; and, in truth, at the moment of their interruption, he had been bewailing the harshness of his fate in this particular.

"Yes," he exclaimed, moodily, as the steamer lapsed into distance, "such is life. Just as one is beginning to be thoroughly contented, 'comes the blind fury with the abhorred shears.' But there's no use in complaining. I must go."

"I wish you could stay," said the girl. "We really have had a very pleasant time these past few weeks in our rambles, or rather scrambles, together, haven't we? Whatever people say, there's no place like Mount Desert for getting to know one's fellow-creatures,—for seeing them in a pleasant way. In New York it always seems to me, somehow or other, as if I never get a moment's time to myself. We live in a perpetual whirl from morning to night; and as for seeing anything of one's friends, it's completely out of the question. Every one there keeps on the go until she is ready to drop."

"That's what we all do in America," replied Remington. "We live on our nerves through the winter, and when it thaws we pine and peak with the snow-piles." He was thinking of his own debilitated condition the preceding spring. In fact, he felt by no means rested now. He had kept up the pace pretty well since he had been down at Bar Harbor. "Do you know, comfortable as we both look stretched out here, I suppose that really it is all wrong. This luxury of limpness, this yearning for flannel-shirted Platonism, what are they but protests of overtaxed nature? We overdo, and so in our leisure moments we shrink from upright attitudes and conventional costumes."

Miss Crosby was leaning lazily back, so that her head rested against the base of the cliff. Her arms were folded, and she was looking out over the sea. "A good many of us certainly do have the air of convalescents. Why," she continued after a pause, "do you say Platonism?"

"Oh, I don't know exactly. Perhaps I was ambitious to be a little epigrammatic. I imagine," he continued, making a ferocious dab with the tip of the sun-umbrella at an obstinate barnacle, "what I meant was that, when one feels debilitated and in a state of collapse, there is a tendency to grope after sympathy, just as one takes a tonic."

"That is, three times a day, before or after meals, according to circumstances," said Dorothy, with a laugh.

"Precisely. This getting to know each other *all to pieces*, as we do down here, is, so to speak, a sanitary precaution. It props one up. It acts as a stimulant. Our systems have become so dependent upon excitement that if we renounced it altogether we should die, like the opium-eater suddenly deprived of his drug." He paused a moment. "And when the medicine has fulfilled its purpose you throw away the bottle," he said, with a tone that, though jocular, had a certain bitterness.

The girl, however, seemed not to notice the sudden introduction of the second person. "I am afraid that is what sometimes takes place. Don't you think, Mr. Remington," she asked, "the generation of to-day is dreadfully disposed to be contented, provided only it can amuse itself? It sometimes seems as if we, who have all the advantages of life,—at least the girls,—are brought up to go through the world reaching out our hands after happiness, just as a reckless person wanders through an orchard breaking off apple-blossoms simply because they smell sweet."

"Only, for apple-blossoms, read hearts."

"Hearts, and a great many other things, Mr. Remington," she replied, with a blush. "It isn't hearts alone. It's anything that caters to our yearning for excitement, that charms our love of the beautiful, or the luxurious, or the clever. Do you know, I believe that unrefined people are secretly more disturbing to my equanimity than bad people, and ugliness at times affects me to a degree that makes me ashamed. Somehow, I seem to myself to be gliding down the river of life in a golden barge,—with lilies in my hair, and my senses steeped with music and the aroma of flowers and all that is soft and delicious. I often think that all I live for is sensations. It is a dreadful thing to say one doesn't care for people, but it comes over me occasionally that I am heartless, or rather that I care for most human beings in the same way as I do for poems and symphonies and statuary; they appeal to my æsthetic sense,—in short, they cause me an emotion. While I am in their presence I am fond of them; if I cease to be with them they pass out of my mind."

As she spoke she gazed out to sea over the expanse of tranquil water, with the expression of intensity usual with her when absorbed. Remington looked up at her stealthily. He was endeavoring, as men are so apt to do in discussing the subjective with the other sex, to discover some allusion to himself in her words.

"I should say you have a great deal of feeling," he protested earnestly.

Her glance still strayed dreamily oceanward. Her bosom rose and fell as with the stimulus of interesting emotions. She clasped her hands together in her lap and sighed gently.

"Why do you sigh, Miss Crosby?"

"Did I sigh?" Her cheek flushed slightly, and she turned her eloquent eyes full upon him. "I don't know exactly why I did sigh, Mr. Remington." The color in her face deepened, as if either the ardor of the young man's glance had suddenly suggested to her the vicinity of peril, or she were mortified at the degree to which she had been led into uttering her secret thoughts. At any rate, she roused herself from her position and stood erect upon the ledge of rock. The breeze gently stirred some loosened bunches of her hair and the streamers of her jaunty hat. She shaded her eyes with her hand.

"How calm the sea is to-day! Oh, look, there is another yacht! It isn't unlike the *Culpriit*."

That was the name of Ramsay Whiting's sloop, and the reminder was scarcely pleasing to her lover, who still dallied in his recumbent attitude. His thoughts were coursing curiously. To one genuinely excited, the outline and proportions of things often present themselves to the mind with a distinctness analogous to that with which we behold material objects at sunset. There is a clearness in the brain at such times that resembles the crepuscular atmosphere. Impassioned as Remington was by his sudden determination to declare his love to Dorothy,—for he had, on leaving the hotel that morning, only a haunting suspicion of a design to take any such step,—he was still conscious of himself as an individual; that is to say, he could not help thinking of the language and attitude most befitting an avowal of this kind. With all his trepidation, he had leisure to recognize the absence of a spontaneity and suppleness he had supposed germane to proposals of marriage, and to deduce therefrom grim and caustic reflections regarding the methods of his ancestors. He was, in truth, the victim of their philosophy of repression. His power of feeling intensely had been so far abridged and adulterated that he was unable to escape self-scrutiny in his most ardent moments. Determined as he was in his mind to ask Miss Crosby to become his wife, why should the arguments in favor of and against his action appear as distinct to his consciousness as Banquo's ghost to the guilty Macbeth?

"And so you are going back to-morrow to the law and liberty," said Dorothy, and she smiled with the satisfaction of one who is pleased at finding a half truth in her alliter-

ative and somewhat random speech. She resumed her seat, as if glad, now that she was on her guard, to return in a measure to their former ground. "It must be rather nice to be a man," she continued, reflectively; "you all have such opportunities." She delayed a moment, and, picking up a pebble, tossed it from her hand and watched it bound from rock to rock into the sea beneath. "It's a strange world. I wonder if things puzzle men as much as they do girls. We seem, somehow, to skip through existence just like that stone, and our influence in life is about as wide as its paltry ripple." She leaned back, and, clasping her hands behind her head, bent her gaze on space from under her hat.

"Perhaps I have rather romantic ideas on the subject," he answered, with eyes cast down, and tapping gently on the ledge with the sun-umbrella. "Do you know, Miss Crosby," he continued, in a low tone, "I think the men in this country are brought up to have a peculiar reverence for women. We look up to them somehow as higher and purer beings than we are. I believe a truly noble woman is the divinest thing in creation, and that she can raise the man who loves her, and whom she loves, up to those shining stars whose ministrant she is. That is her power; that is her mission." Remington spoke earnestly. Conscious as he was of his words, he believed them with all his heart. "I've been rather an aimless fellow, I know; I don't suppose I amount to a great deal; but I've always clung to a faith in something ideal regarding love." He paused nervously. "Miss Crosby, I—I love you. Are you willing to become my wife?"

He wanted to call her Dorothy, but he felt instinctively that he had no right to do so. His moral and mental faculties were both under his control.

"Oh, Mr. Remington!"

There was a deathly silence. Miss Crosby sat with her eyes on her lap,—the type, as it were, of hushed, demure contrition.

"I know," he exclaimed, in jerky sentences, "it's very premature. Of course, I've no right to say anything of the kind on so short an acquaintance. But I couldn't help it, Miss Crosby; indeed, I couldn't. These past few weeks have been the happiest of my life. I meant to go away without letting you know anything, but somehow or other the words escaped in spite of me.

"I'm perfectly aware," he went on presently, as the girl still remained motionless, save for a few sighs and slow shakings of the head, "it's impossible you can care for me. I'm a friend,—as you said the other day, when we were at Duck Brook,—and the idea of any

other relation has very likely never entered your mind. But I do love you so much!"

And he leaned forward beseechingly, with a sudden impetuosity.

"I thought of you merely as a friend," she murmured. "Oh, I'm dreadfully sorry, Mr. Remington. We were such good friends."

"Is it impossible, Miss Crosby?"

"I'm afraid so. Oh, yes, quite,—it's quite impossible."

Remington covered his face with his hands, and for several moments no word was spoken. She was the first to break the silence.

"I think I must be starting for home, Mr. Remington. It is getting late."

"I should like to ask one question," said Remington, with a dry, relentless accent:

"Is there any one else that you care for? I mean, is there no chance for me because you like somebody else?"

"No," she answered, quietly. "There is nobody else that I care for, I think."

Their walk to the village was silent and embarrassed. They halted at the steps of her hotel.

"I suppose I had better say good-by now, Miss Crosby. We sail early to-morrow," he said, a little stiffly.

"Good-by, Mr. Remington. I thought we were going to be such friends. But you will come and see me in New York, wont you?" and she held out her hand.

"I will try to do so, Miss Crosby. Good-by."

(To be continued.)

THE CRUISE OF THE ALICE MAY.

SECOND PAPER.

AT the close of the preceding paper we were about entering upon an inspection of Paspebiac. As the name indicates, this was, first of all, an Indian settlement, probably of the Gaspesian tribe. The terminal *ac* is indicative of place, like the affixes *eck* or *ecque* and *adie* employed by the Micmacs. The French came next, followed by the Normans of the Channel Islands. It is to these that this straggling, thriving town of three thousand people owes its present existence and success. We had never heard of the place before, and yet here it has existed for centuries, a center of business and a wonder of beauty, on the supposed bleak shores of the Bay of Chaleurs. We found the key-note of the whole matter immediately on landing. One hundred and forty years ago some capitalists of St. Helier's came over from Jersey and established a depot for cod-fishing on the inner shore of the point of Paspebiac, where boats could land with safety in ordinary weather. Since then, empires have arisen and fallen, our own great republic has come into existence and has grown to its present dimensions, and still the firm of Robin & Co. carries on its business with the vitality of youth, and with steadiness of purpose and entire unconcern regarding the rest of the world and its affairs. Not only does the original family of Robin maintain itself at Paspebiac to this day, but it has thirteen other establishments as complete as this one at various points in the maritime provinces, all conducted with

the same system and discipline. We saw several of these depots at other ports during our cruise, and can therefore say that the one at Paspebiac is typical of the whole. A lofty fence with gates incloses the establishment. Within are immense buildings for storing the fish and store-houses for all the materials that go to the building and victualing of ships, besides smithies and carpenters' shops, a large kitchen and eating-hall, a telegraph office, and the houses of the overseer and chief employees. On the harbor side are extensive wharves, landings, cranes, and the like, built of solid masonry and iron. There is nothing flimsy about the materials and construction of any object about the place. The extraordinary neatness of everything is like that of a Dutch house. There is not even the odor of stale fish, or of any fish at all. The workmen wear a uniform,—consisting of white trowsers and blue blouse and cap,—and thereby strengthen the first thought that occurs on seeing the place, that it must be an arsenal. This impression is reinforced by the cannon ranged on the quay, and by the fierce figure of a Scotch Highlander brandishing his claymore from the gable of the central building, which was once the figure-head of one of the company's ships. The discipline of a man-of-war is also strictly preserved here. The employees enter in boyhood and work their way up. Here it is, in this yard, that the firm builds the fleet which it employs to carry the fish to the markets of Europe

and South America. No finer fish leave the shores of North America for the feeding of good Roman Catholics on fast days. Few people have reflected on the fact that one of the most important occupations followed by men is almost wholly dependent on the religious beliefs of one sect. The small amount of salt cod eaten by Protestants is not worth mentioning compared with the amount absorbed by Roman Catholics. Besides their ships for foreign transportation, the Robins also have a large number of schooners and boats directly engaged in catching the fish. Most of the fishermen in their employ are poor, and, as they are paid in kind, they are largely in the power of this great monopoly. As one result, it is very difficult to purchase land at Paspebiac, because a large part of the freeholds there are mortgaged to Robin & Co. on account of advances made to the fishermen.

Adjoining the establishment of Robin & Co. is a similar but less extensive fish depot, belonging to the firm of Le Boutillier, who are also a Jersey company, transacting their affairs in the Dominion by means of experienced factors. The original founder of the house was trained by Robin & Co., and, having a difference with them, started a rival house, which is conducted with similar system and owns three or four stations. The gradual dying out of the Le Boutillier family indicates, however, the approaching extinction of this firm. To an American familiar with the fishing business of Gloucester, Massachusetts, who imagines that the enterprise of that thriving port has contrived to absorb a monopoly of the cod-fisheries of the world, there is something rather mortifying in considering for the first time such an establishment as the one I have described; for it shows that we have yet a few things to learn in regard to making a business at once prosperous and permanent. I met a man once in England who was traveling for a tobacco house that was established in the time of Queen Elizabeth and was still engaged in making money. After all, there is a majesty and dignity in the grand fact of permanency that is worth striving for, in a world and an age that is ever shifting. We like to dream sometimes that not "virtue alone outlives the Pyramids."

After having been shown about the establishment of Robin & Co., we turned our attention to other matters of interest at Paspebiac, and found that it abounds in natural attractions. The sandy point is really an island at high water, and a substantial bridge connects it with the main-land. Near, to the bridge are the residences occupied by the members of the two fishing firms, when at Paspebiac, or by their agents. The Robin mansion is near

the foot of the slope, completely surrounded by a lovely grove agreeably intersected with winding paths. The Le Boutillier house, on the other hand, is on the brow of the rich brown cliff, superbly situated, and commanding an outlook over the Bay of Chaleurs. It is approached from the road through a double avenue of noble willows, which were imported, we were informed, from Jersey. There is not a private residence in the Dominion which occupies a finer site for a summer villa. From the bridge, the road rises abruptly until it reaches the crest of the slope. There it meets a post road, or street, running along that height for twenty miles toward Dalhousie. It is along this road that the town of Paspebiac, occupied by French habitants, is laid out in an extended street, which continues until it reaches the charming semi-aristocratic hamlet of New Carlisle, which is occupied by Scotch people, and is the seat of a courthouse, a jail, and the residence of the judge.

We decided that we could get over more ground that afternoon by means of a carriage than on foot. But the only vehicle to be found was a ramshackle open carry-all belonging to the postmaster,—a jolly, vivacious little Frenchman, whose excellent English speech was yet curiously characterized by an accent. The horse was a fit subject for the attention of Henry Bergh and the carriage was so ancient and dilapidated that the spring broke down and the floor split with the weight of five healthy men. But we had a delightful ride to New Carlisle, for all that. The afternoon was so fine that it seemed to have an invigorating effect on the piety of the local clergy. We met the Presbyterian minister, the Episcopal vicar, and the *curé*, all engaged in making pastoral visits. The first was in a buggy accompanied by his wife. The other gentlemen, in spotless garb, trudged along the highway, alone and on foot, after apostolic fashion. The physician was also making his rounds on a buckboard. On our return, the postmaster invited us into his humble cottage, which was typical of all the houses at Paspebiac. His best room was decorated with cheap images and prints of the Virgin. The office was in a small adjoining apartment. When a letter was to be mailed, it was taken at the door by some one of the family. We noticed here, as well as in almost every other house in the town, and, in fact, throughout that region, that the windows were always kept tightly closed, even at midday with the mercury at seventy-five to eighty-five degrees. Consequently, the air inside is stuffy and oppressive.

For those who may like to visit Paspebiac, it may be well to add that it can be reached

by the stage-coach from Dalhousie, which makes the distance of eighty-two miles thrice a week; time, twenty-two hours. Better still, there is a steamer from Dalhousie semi-weekly, which touches there in its trip around the Bay of Chaleurs. As we were passing along the road at four o'clock, the village school broke up and the children bounded forth full of glee, the boys separating into one group and the girls into another. But it was

the peasants of France. It is curious how the peasant classes change their step with age, the light tripping of the young maiden turning into a long, ungainly stride. The piquant brunettes, still in the morning of life, also collected thither in clusters, toiletied in their best, and giggling and blushing with zest when some handsome young fisherman went by, throwing a sentimental glance in their direction, or venturing some sally of rustic wit.

FISHERMEN AT PASPEBIAC.

beautiful to see them come to a sudden stop when they met us, the boys in a row on one side of the road and the girls on the other. Then, with the utmost respect, the former bowed, while the latter demurely courtesied. Having accomplished this feat, they all ran off again in a delightful manner. After all, we can learn a little from the Latins, without being untrue to our Anglo-Saxon convictions.

The following day being Saturday, we had a capital opportunity to see the habitants of Paspebiac in their best attire, for that is their market day. This really means, in that place, that on that day the two fishing firms make advances of goods to the families of the fishermen they employ. The women came in groups, the matrons garrulous with gossip as they straggled down the road with the heavy swinging gait which they have inherited from

Many came in rude carts, drawn by oxen or mares followed by their colts. Across the bridge or fording the inlet, these simple folk came in a steady stream until toward noon. It was, for all the world, like a bit of France, for these French habitants change far less from the original type than the English settlers. Later in the day there was a general movement to the other end of the point, where the fish-market was held on the beach. Dogs, swine, geese, fowls, men, women, children, carts and oxen were here gathered indiscriminately on the sand by the surf, in a promiscuous and chattering crowd around the stands, where fresh fish were being cleaned for sale. A merry sensation was produced when a boisterous youth dashed by at a tearing gallop on horseback, shouting Yankee Doodle at the top of his voice. This was

THE BEACH AT PASPEBIAC.

A VIEW OF THE BAY.

intended as a salvo for us, the first American tourists, possibly, who had ever been to Paspebiac. A gentleman connected with the custom-house, which is a wee bit of a hut, officiates as United States consular agent, and was very polite to us. But it is a question whether his annual fees amount to enough to pay for the matches for lighting his pipe.

Some of our party were enthusiastic anglers, and the afternoon was therefore devoted to a long and heated walk to a trout brook, where those sportive fish were reported to be actually pining to be caught. The rods and flies were of the best quality, and they were wielded by fishermen of skill and experience.

The net results of the trip amounted, however, to only half a dozen five-inch trout. We were told that, in a lake beyond, the trout were so numerous there was hardly room for them to swim without scraping the scales off their backs as they jostled each other. But the enthusiasm of our fishermen being now at its ebb, we returned to the schooner and ordered the captain to make sail.

If the wind had been favorable, we should have continued up to the head of the Bay of Chaleurs. But it was a long beat with the stiff north-west wind that was blowing at the time, and other and more distant scenes for-

A FISH ESTABLISHMENT AT PASPEBIAC.

bade us to linger here. Therefore we put the helm up and ran to the eastward. The wind was fresh, and the schooner was staggering under the pressure of her kites, and required delicate steering. Rapidly we flew

holder with awe. The sea in the distance appeared suddenly to roll up with a high, angry surge, advancing rapidly toward us as if it would overwhelm the vessel, and naturally suggesting that a very strong wind was coming.

CAPE GASPÉ.

past the beautiful northern shore of the bay, the jagged peaks assuming the loveliest of tints in the light of the sun, now nearing the west. But our race was suddenly checked. I was looking through the glass at a schooner two miles away, when I saw that she was sailing with a different wind. Hardly had I time to sing out to the captain, "The wind's coming out ahead!" than our vessel was taken sharp aback. Everything was at once in confusion. "Let go the guy tackle!" "Take in the stay-sail!" "Haul aft the main-sheet!" were orders quickly given, and in another minute the *Alice May* was heeling well over, and pitching in a head-sea. Now occurred a series of magnificent marine effects. Brief squalls of wind and rain followed in quick succession; the cliffs and the sea were alternately black with brooding gloom or gleaming with blinding bursts of sunlight; rainbows hung on the skirts of the clouds in the offing, and the driving masses of cumuli were warmed by glorious hues. Then succeeded a sight not uncommon in the Gulf of St. Lawrence, but which, wherever seen, inspires the be-

FISHING-HOUSES AT CAPE GASPÉ.

But it advanced no farther, always preserving the same appearance, as if held back by some mysterious agency; and we now perceived that it was a form of mirage, probably reflecting the surf breaking on a distant shore. The turbulence of the elements subsided almost as soon as it had arisen, and then we had barely enough wind to waft us to Port Daniel. The anchorage here being very exposed, we did not remain there, but only "looked in," as sailors say. This is a fishing village, situated around a deep cove, which lies at the foot of one of the highest and most abrupt peaks on the bay. The church occupies a hillock at the bottom of the cove, and the houses are beautifully situated on precipitous slopes and ledges.

Light and baffling airs now followed, and we spent the greater part of Sunday off Cape Despair. There was a most exasperating glassy swell, which tumbled the vessel about unmercifully. It is said that this swell very rarely goes down at this part of the Gulf. In the morning Captain Welsh sat at the wheel reading his prayer-book while steering. He was in one of his communicative moods, and spun yarn for some time. He expressed the emphatic opinion that "tobacco is good for some folks." He was sure it had been a benefit to him in the long night watches and the life struggle with storms. All day long, the grandly bold, abrupt precipices of Mt. St.

evidently a corruption of the former word. A number of large fishing stations are here, and the fleet of fishing boats was now seen shooting out from the coves after the cod which abound in this bay. These boats are large, and are manned by two men; they are rigged with three spritsails and a jib, which gives them the jauntiest look of all the fishing boats on the coast of America. This matter of the rig and build of fishing boats is very curious. It is easy to see that the character of a certain beach or of the prevailing weather may in a given locality affect the shape of the boat; but why there should be such differences in rig is incomprehensible. The fishing boats of every port we visited had their peculiar rig and sails. We can understand how whim may incline this or that man to prefer one rig to another; but why all the boats of one port should uniformly have one rig, while in the very port adjoining all the boats have entirely another rig, is a matter which is not easily explained.

As the wind died away, we anchored near the southern side of Gaspé Bay to avoid drifting. Water-fowl abounded. In endless

HEAD OF AN OLD PILOT.

UP GASPÉ BAY.

Anne at Percé towered before us like a mighty fortress, guarding the double entrance to the Bay of Chaleurs and the River St. Lawrence. At its foot is the lofty island of Bonaventure, around which we passed with a light air on the night of July 17. At sunrise we were close to the tremendous rock of Percé, and could see the long, low outline of Anticosti in the north like a gray wall. In the opinion of our captain, the heavy swell made it inexpedient to anchor at Percé, which is very exposed. We kept on across Mal Bay, past a low, flat islet which the French call Plateau, and the English fishermen Plato, which is

flocks the ducks fly at morning to the fenlands at the head of the bay, and return at night to roost amid the rocks of Percé. We went on shore and succeeded in bagging a few ducks and sea-pigeons under the cliffs; after which we climbed up the heights to a farm-house and procured some milk. The people could not speak English. The babies and the sucking pigs were tumbling over each other under the table in affectionate embrace. Outside was the oven, a characteristic feature of domestic civilization in Gaspé County. It is built thus: A flat slab of limestone is laid on four posts, and a dome

PERCÉ ROCK.

of clay is built over it. This in turn is protected from the rains by a thatched roof. These rustics were specimen bricks of the people who live around the bay. The population of this part of Canada is confined wholly to the coast. Civilization ceases a mile or two inland, and the bear, the caribou, and the panther still roam through the primeval woods which cover the mountain ranges of the interior. The aborigines of

this region were the Gaspesian Indians, who now appear to be entirely extinct.

A breeze springing up toward noon, we stood across the bay to Cape Gaspé, a noble gray headland three hundred feet high, which from one point looks like the front of a Gothic cathedral. By keeping past it a short distance, we entered the River St. Lawrence and saw Cape Rozier, a tremendous precipice soaring seven hundred feet vertically. Cape Gaspé takes the

CROSSING THE FERRY AT GASPÉ.

AN OLD OVEN.

full brunt of all the gales of the St. Lawrence, and has been the scene of many wild and appalling wrecks. Some years ago, on a stormy night, the tide being unusually high, a vessel was swept against the cliff, and, of course, entirely destroyed. The event never would have been known if the bowsprit had not been discovered in a cleft of the rock, far above the usual level of the sea, together with remains of the bodies of the crew. After this we stood up the bay, along the northern shore. For several miles the cliffs are seamed with deep fissures, as if the beach had been partitioned off by walls into retired marine alcoves with soft, sandy floors, where the mermaids could perform their toilets in seclusion. But, generally, these recesses are occupied by curious and often highly picturesque fish-drying houses, built over the water on extensive stagings. An extraordinary accident occurred here thirty years ago. A ship bound up to Quebec grounded off these cliffs in a fog. The wind was light, but there was a high swell, which made it dangerous to land. Fifteen gentlemen, however, concluded to go on shore, and with the boat's crew got into the boat before it was lowered. One of the poles broke, and they were all precipitated into the water. The tide drew them under the ship, and they were all drowned before the very eyes of their wives and children. Some weeks after, a fisherman caught a cod in whose maw was a man's finger, with

the diamond ring yet glittering on the severed joint.

Here we landed to sketch the fish-houses. The shores were very precipitous, and it required some circumspection to climb up where the houses of the country folk are perched. We had some difficulty on returning to the schooner, as the wind had risen, creating a high sea rolling in from the Gulf, and the schooner was handled in such a clumsy manner that the boat was in serious danger of being run down. Our crew were not accustomed to this sort of service. There was yet time to reach Gaspé before dark if the strong breeze held, which was sweeping us up the bay. Near Port Douglas, where General Wolfe anchored his fleet on his way to Quebec, the scenery began to develop extraordinary beauty. Nothing of the sort has so impressed me except the neighborhood of Lake George. The shores were gradually closing in, and on either hand and ahead of us were mountains descending to the sea, draped in the dark-green mantle of the densest woods. Here and there a little church might be seen perched on a height. At last we reached the light-ship, and in a few minutes we would have been clear of the bar and heading directly into Gaspé Basin. "Are you sure you are heading right, captain? Aren't you keeping too near inside?" we said to the captain. "Oh, no; there's plenty of water; I guess we are going all right," he replied. At that instant the schooner struck on the bar, and ran her bow up on the sand, with a dull grating sound that made us sufficiently disgusted. A ship is only good afloat. A ship on shore is like an eagle with a broken pinion. We were in for it this time, there was too much reason to believe, for it was about high water, and the breeze was making a chop on the bar. Two circumstances were in our favor: the night promised to be fine, and Captain Asca, the light-house keeper, who now came on board, was an ex-

perienced skipper, and was thoroughly acquainted with the bay. Every effort to haul the schooner off the shoal proving of no avail, we should have been obliged to heave out her ballast if the next tide had not promised to be unusually high, the change of the moon being at hand. Since nothing more could be done until the next tide, we therefore accepted Captain Asca's invitation to go to his house. The hour and the scene were so

filling the entrance of a ravine, where a mountain stream dashed down near a bar, over which we rowed across the rolling foam. The new moon hung in the west, and the deep glow of twilight yet throbbled over the mountains, as we climbed a winding, wooded path to Captain Asca's house. His pet parrot had come down to meet him, and was waiting on the stile for his master, on whose shoulder it alighted, while the dog, with a

CURING FISH AT PERCÉ.

enchancing that we were quite compensated for the inauspicious circumstances that detained us there.

Captain Asca was a fine specimen of a Scotchman; tall and large-limbed; his tawny, flowing beard was tinged with the snow of sixty winters, but his keen steel-gray eye had in it the fire of youth, and his voice rang across the ship with the firmness of one born to command. And yet his life had been passed in coasters and fishermen. Both of his grandfathers were in the army which stormed Quebec under Wolfe. His relation to the light-ship was an anomaly in the history of harbor lighting, for he both built the vessel and owned it, besides keeping it for a meager allowance granted by the Dominion. A curious way, this, for a government to light a harbor by private enterprise! His father's grist-mill was on the seaside, romantically

bark of welcome for his master and a suspicious sniff for us, bounded down the slope to meet us. We were cordially invited to enter the house, and were pleased to see an immense fire-place across one-third of the kitchen wall; but we preferred to sit on the door-step, where the light-keeper's daughter brought us a pitcher of fresh milk. Behind the house the dark woods arose, clothed with shadows; before us and at our feet lay Gaspé Bay and our little schooner; beyond—north, east, and south—were Gaspé, the Dartmouth River, and the mountains fading into night. A great quiet reigned over all the landscape. Its tranquillity and beauty were ideal. We felt like saying, "Why should we longer roam?"

But fate and the ship called us away. In the middle watch the tide happily floated the schooner, and under the pilotage of Captain Asca, who left the light-ship in charge of an

RETURNING FROM CHURCH.

assistant, we glided into the harbor of Gaspé, called the Basin, as it is so snug and sheltered. Gaspé is built on the sloping sides of the Basin. It has eight hundred inhabitants, a mayor, and a United States consul. The houses are embowered in shrubbery, and the little town is really very attractive. All business has left it, and it is now in a state of somnolence. But, like places which have had a period of prosperity, it retains a certain aristocratic air, and the society is agreeable and refined. The people are largely descended from loyalists of the Revolution. The place is three days' ride from the nearest railway station. A railway would doubtless greatly add to its prosperity by

bringing tourists there, for at present it has only a semi-weekly steamer and a daily stage-coach. The winters are long and the snows deep, and the people, of both sexes, go to church on snowshoes, which they leave stacked up in the porch during the services. But the summer is temperate, while the scenery, the fishing, and the moderate cost of living com-

bine to make Gaspé a place of unusual attraction. I am thoroughly assured that no one would be disappointed who should make it a summer resort. The fisheries of Gaspé are chiefly in the hands of the Le Boutilliers, who have the finest residence there. The fish are chiefly exported to Brazil. They are not packed in tierces, but in tubs, to suit the mode of transportation in South America. Two of these tubs make a mule load.

The good people of Gaspé are greatly moved to devise some scheme to restore their departed prosperity. They are agreed in the opinion that a railroad would do it, and the matter comes up before each political election. Theodolites, chains, spirit-levels, pick-axes, surveyors, and laborers appear, and the candidate is profuse in his enthusiasm for the railroad. After the election is over, the question is laid on the shelf, and the enthusiasm is bottled up and kept to help the candidate into office another year. Human nature is pretty much the same, the world over.

Our consul, Mr. Holt, was very courteous toward us, and exerted himself to entertain us. We decided to spend a day in trout-fishing, for which the neighborhood is noted, and all the consular influence was brought to bear to procure a suitable vehicle to carry us to the fishing stream six miles distant. But horses and carriages seemed to be the scarcest

PERCÉ ROCK. (DRAWN BY THOMAS MORAN.)

articles in Gaspé County. We had about given up expectation of finding a conveyance, but were still discussing the question in the shady street, when a wood-cart came by.

Our party presented a truly backwards aspect as we rode through the streets of Gaspé down to the ferry, coiled up on the floor of this rude vehicle. The St. John's, to which we were bound, lies on the side of Gaspé Basin opposite the town, and the cart had to be taken over in the ferry-boat. The grasping owner of the Gaspé ferry-boat line had not only contrived to obtain a monopoly of the business, but had also managed to get all the stock into his own hands. Judging from the leakiness of the boat, the stock seemed to have been pretty well "watered." The propelling power of this crazy flat-boat was represented by a lad of thirteen and a mere shaver of seven or eight summers. But they managed to get us over without accident, which was more than I anticipated. The monopolist aforementioned had grown so wealthy off the business that he had built himself a house, which commanded a fine view of the river. In order to save ground-rent or taxes in a country which is now so densely populated that there is probably one inhabitant to every ten square miles, he had built his mansion on a raft anchored by the shore. The house was twelve feet square, and was divided into two ample apartments. There, in quiet, unmolested, and luxurious seclusion, this aquatic Cræsus was seen smoking his clay pipe in his own door, while his faithful wife and daughter cooked his meals, and his boys raked in the dividends for him by rowing the ferry-boat.

We had a warm ride of two hours through the spruce forests on a mountainous road. The air was redolent of the fragrance of the gum exuding from the trees. I could not avoid noticing how much more rare singing-birds were in these forests than in New England. But the mountain glens abounded, we were told, with game. An English sportsman killed forty-eight caribou in these wilds during one season.

The St. John's is one of three rivers emptying into Gaspé Bay. The others are the York, which empties into Gaspé Basin, and the Dartmouth, which finds an outlet at the head of the bay. Each of these rivers has a romantic beauty of its own, and all are said to abound in trout and salmon. These reports are given for what they are worth. My own belief in the trout-yielding properties of a stream depends upon actual and personal observation. I have found that so enormous is the capacity for exaggeration of the so-called "trout-liar," that I

would sooner believe a horse jockey or the captain of a yacht. I therefore decline to assume responsibility for any of the rumors I may quote regarding fresh-water fishing in the Dominion.

At midday our expedition at last stood on the banks of the St. John's, and gazed with exultation upon its rushing current. The stream is a hundred yards wide at that point. There were woods on each bank, which echoed

MAP OF THE CRUISE (PASPEBIAC TO THE MAGDALEN ISLES).

back the musical carillon of the rapids. We found a boat-keeper's lodge there and a number of canoes. The canoes used now by the sportsmen in that region are shaped exactly like the typical Indian birch-bark canoe; they are not made of bark, however, but of thin cedar planking, on a light frame of oak or ash. Two of the party went down the stream in a canoe with the guides, whom we found living in the lodge, while Burns and I whipped the stream from the banks. After a protracted trial, neither attempt was attended with such success as to kindle the enthusiasm of which we were capable under favorable circumstances. The guides assured us, however, that farther up the stream there was no end of large trout. This assurance failed to make the impression it might have done if we had been at liberty to cast a fly in that part of the river. But it was leased to a number of Boston gentlemen, and not even the proprietor of the adjoining banks could fish there without being liable for trespass. It may be seriously doubted whether so much money goes into the Dominion, annually, by the leasing of the streams as if all tourists were allowed to fish anywhere during the season. Each tourist and sportsman brings money into the country, which is, indeed, sadly in need of it. Now, I maintain that the large number of sportsmen who would come there during a season if allowed to fish without restriction, would bring more money into the country than the revenue now derived from leasing the streams

to a few dozen gentlemen. Of course, this view of the question must be to a degree hypothetical. But there can be no question that it is a monstrous usurpation of the rights of property for a government to usurp the power to lease away the riparian rights of an owner to the half of a non-navigable stream that runs by or through his own lands.

We found compensation for our poor luck with the rod in the ravenous appetite with which we returned to the good supper awaiting us on the schooner. The weather being fine, we decided to move, and ordered the captain to make sail and drop down the bay toward Percé, when the land breeze arose with the turn of the tide. Being becalmed off Point Epitre, we anchored to avoid being drawn ashore by the swell. The time was well spent in visiting the extensive fishing establishments, one of which belongs to a clergyman. The following night a breeze sprang up, but it was accompanied by a dense fog. The fates seemed to be opposed to our visiting Percé. But we had taken Captain Asca with us as pilot, until we should leave Gaspé Bay, and felt confident that his familiarity with those shores would get us safely to Percé. He was certainly feeling his way by the aid of some sixth sense, for at sunrise it was impossible to imagine that we were near land except from the vast, unbroken procession of water-fowl trending north-west to their feeding grounds at the head of Gaspé Bay. But, firmly grasping the wheel, and gazing with eagle eye into the fog, Captain Asca kept the schooner going, until we could hear the dull boom of surf tumbling into the caves of the cliffs. There is sometimes about the effects of nature an apparent sensationalism which would be highly censured if attempted by any reputable artist; but she carries it off so well that we accept it and readily admit that she does it in a way that "defies competition." We had a striking example of this fact on this very morning. For just as the pilot said, "I guess we are getting in pretty handy to it; we'll take a cast of the lead," the fog parted as if by magic, rolling away on either hand like a curtain, and where, one instant, nothing was to be seen, the next a superb spectacle lay revealed before us. The village of Percé lay not half a mile distant, reposing at the foot of the grand overhanging precipices of Mount St. Anne, whose base terminated at the shore in mighty, precipitous, sea-beaten cliffs; while on the other side soared the tremendous bulk of the famous Percé Rock, dun and terrible against the morning sun, presenting altogether the most varied and effective view on the Atlantic coast of North America.

"Let go the anchor," cried the pilot at once, and down rattled the cable, in fifteen fathoms. At last we had arrived at Percé.

There is no harbor there. The mountain range of Gaspé County terminates with Mount St. Anne, which makes to a point, rounded off by a low cliff. Directly off this point, and detached from it at high water, is the rock. Ships can make a lee of it in good weather, dodging from one side to the other according to the changes of the wind; but it is not long enough to make a lee in severe weather, and the sea rolls around it. A ship lying there, which it would only do in summer, must therefore watch carefully every shift of the wind.

Percé is a shire town. The houses are cheap wooden structures, but the appearance of the place from the water is foreign. It is shut in by the mountains on the land side. The large Roman Catholic church occupies an eminence in the center of the town; and the court-house is also a prominent object. Mount St. Anne is peculiarly shaped. A steep, densely wooded slope rises from the town to a height of nearly one thousand feet, and terminates in a perpendicular cliff richly hued with iron tints, which crowns it like a Roman fortress and soars to a height of fourteen hundred feet. Percé Rock derives its name, as any one familiar with the French language would at once perceive, from the immense arch which pierces it near the eastern end. There was yet another arch thirty years ago; but it fell in during an earthquake, and left one side of it a separate rock. A columnar rock called the "Old Woman," off Cape Gaspé, was overthrown by the same convulsion. Before this event it was possible to reach the summit of Percé Rock, but at present it must be considered inaccessible. One or two daring fishermen have succeeded in performing the feat; but several have been killed in the attempt, and to try to scale it is now forbidden. There is a legend that the rock is haunted by a spirit, who may be seen on stormy nights hovering over the summit. Of this I do not feel at liberty to speak with certainty, not having seen this water-wraith myself. Perhaps it was to counteract the unceasing influence of this mysterious being that an immense iron cross was erected on the point immediately adjoining the rock. But whatever the facts regarding its supernatural denizens, this can be affirmed with certainty—the summit is peopled by an innumerable and loquacious colony of sea-birds. Their clanging never ceases until dark, and may be heard for miles and miles, blending with the roar of the tireless surf. Percé Rock is about a furlong in length and three hundred and

twenty feet high. The abruptness of its shape makes it seem much more lofty. The rock is sublime in shadow—a dark and tremendous bulk. But it is gloriously beautiful in the sunlight. The former conveys an effect of grandeur, the latter brings out the variety and brilliance of the coloring. It abounds in ferruginous tints. Golden-yellow, copper-reds, ochres, leaden and roseate grays are either distinct or deliciously blended in a grand mosaic on this marvelous wall, where Nature has shown what she dares in the way of color. On a clear afternoon, when the sky and sea are a deep, dreamy purple and azure, the beauty of Percé Rock baffles description. A foil or background to the picture is the isle of Bonaventure, a mile distant. The afternoon light bathes its bold outline with the most ethereal roseate grays, which affect the soul like the strains of tender song. The time is coming when Percé will be painted and sung and celebrated like the already famed resorts of the Old World.

While we were at Percé we climbed up to the summit of Mount St. Anne. It is a long afternoon walk; but there is nothing difficult about it until within three or four hundred feet of the top, when it becomes very steep. The prospect is one of great extent and of enchanting loveliness. On one side one gazes down on Percé and the Gulf of St. Lawrence, and on the other he looks down the gorges of the Canadian mountains, which fade away in unexplored solitude into the distant west.

The fisheries at Percé give to it the animation of human life. But, excepting for the picturesqueness of the fleet of boats going out and returning, I should greatly prefer the whole business at another place; for the smell of the decaying fish on the north beach is not an inspiring odor, although it is a curious and interesting sight when the boats come home to watch the women and children flocking to the beach and helping the sterner sex to clean the cod. The women sometimes protect their skirts when cleaning fish by getting into empty barrels! The occasion is also one of mirth and sly sparking; we detected our crew engaged in this profitless pursuit when they were sent ashore to fill the water-casks. A sailor is never quite so comical as when he is making love to a girl on shore. There is a massive bluntness to his speech, a self-confident diffidence in his manner which is exceedingly funny. Giving another turn to the quid in his cheek, and cocking his cap on the back of his head, to gain an appearance of nonchalance, Bill sidled up toward a tittering girl who, with knife in hand, was splitting fresh cod, and could

not get away from him at once, because she was buried up to her armpits in a fish-barrel. Before long they had struck up a brisk confabulation. Finally, Bill lifted the girl out of her cage, and helped to carry home her basket of fish. The south beach of Percé is more neat, and far less inodorous. Robin & Co. have one of their fine establishments there; and to say that, is equivalent to giving the synonym of neatness. Their drying-yard is spread with pebbles brought from the shores of Jersey, which are preferable to a bed of sand, as it allows the air to steal under the fish, and hastens the process of drying. When the fish are brought in they are thrown into pens, one for each boat. Thus the respective quantity belonging to each is easily ascertained. When the fish are salted, they are carefully laid in separate rows; and after they have been dried on the stages or lathe platforms, they are piled in neat stacks, protected by birch bark. One cannot fully realize what an extensive and laborious occupation the cod-fisheries are, and how large is the number of men and the amount of capital employed in them, until he has cruised over the Gulf of St. Lawrence. Robin & Co. also have an establishment at Bonaventure Island.

The sweetest hour at Percé is when the sun has just set, and the tips of the ruddy cliffs are yet warmed by its glow. The hyaline swell languidly kisses the shore; the new moon hangs in the west; the shadows creep like a mantle over St. Anne's velvet-like slopes, and cast a veil over the town; the toll of the angelus from the church tower floats musically over the sea, and the lights quiver on the ocean's tranquil bosom. Easily could we have lingered at this delightful spot for months, but the wind shifted so as to place us on the weather side of the Rock, bringing with it a dangerous swell. A dark cloud, brooding intensely over Mount St. Anne at midnight, also suggested a possible squall, a thing to be carefully avoided at Percé, where the flaws from the mountain are sudden and violent. The watch was called, and we made sail and put to sea.

Hitherto our cruising had been along the western coast of the Gulf of St. Lawrence. But now, with a fresh north-west breeze, we headed east by south for the Magdalen Islands, which lie nearly in the center of the Gulf, about two hundred miles from Percé. At daybreak we were out of sight of land, and the wind fell almost to a calm. We were now out of the track of vessels, and saw none. But there were plenty of whales sporting clumsily about us. Toward night we sighted a water-logged wreck at a great distance. We were at supper when it was

discovered. On learning of it when we went on deck, we at once ordered the helm to be put down, and turned back in hope of reaching the wreck before the long twilight should conceal it from view. But the wind was so light we made little progress. There were no evidences of life about the wreck, which was probably a schooner; only the stump of the foremast remained above the deck. The hulk lay very deep in the water, and wallowed in the languid swell as if liable to go down at any moment. There is something indescribably melancholy about an abandoned wreck at sea. We kept up the slow chase for several hours, in the bare hope that, if any one was yet lingering on board, we might rescue him. But we lost sight of the wreck before we could reach it; probably it sunk. Soon after, the moon went down, and a mysterious starry gloaming settled over the sea. The night was superb. Never were the stars more brilliant, or the silvery clouds of the Galaxy more sublime in the southern heavens. Above a dark bank of cloud in the north, the northern lights flashed like a greenish fire. The eerie chattering of Mother Cary's chickens in our wake was all the sound that blended with the ripple of the water as the schooner fanned along with a light air in her serge-like sails. At midnight a southing wind from the south piped up in the shrouds. Deeming it useless to grope longer for the wreck, and anxious to take advantage of a fair wind, we headed once more on our course. At dawn the *Alice May* was tumbling headlong over the heavy seas, staggering under a press of sail, and taking in torrents of water through her lee ports and scuppers. Every one was on the lookout for

land, alow and aloft. As the sun burst over the sea, a faint hazy line was discerned, looming above the horizon. It proved to be Deadman's Island, the most westerly of the group for which we were heading. It is indeed a singular rock, about a mile long. Not a herb, nor a bush, nor a blade of grass is to be seen on its rocky sides, which rise to a sharp, razor-like ridge in the center. Seen from its side, the island bears a vivid resemblance to a giant body laid on its back and covered by a sheet, and is a fit subject to inspire the wild fancies of superstitious mariners. Toward noon we slacked off the main-sheet, and ran for the narrow passage over the bar which makes between Amherst and Entry islands. We kept the lead going constantly, and, as Captain Welsh was not familiar with the channel, we did not feel at all easy when we saw the rollers taking a pale green tint, while the lead announced only two fathoms under our keel. It was a narrow squeak we had; the schooner was lifted over the shoalest part on the top of a sea, or she would have struck heavily and bilged! The truth was that we were a little out of our course. But once past that point, the water deepened rapidly, although it is never more than a few fathoms in the neighborhood of the Magdalen Islands. We would advise no ship, unaccompanied by a pilot, to try this passage without a leading wind and clear weather. It is better to go around Entry Island, even although that would involve two or three hours more of sailing. This advice is the more pertinent, because the sand from the dunes of Sandy Hook, the extreme end of Amherst Island, is gradually filling up the channel.

S. G. W. Benjamin.

(To be continued.)

IN PRIMEVAL WOOD.

THIS deep, primeval wood—how still!
Lo, silence here makes all his own;
Veiled shapes, with hands upon their lips,
Stand round about his darkened throne.

The patient pleading of the trees—
How deep it shames the soul's despair!
In supplication moveless, mute,
They keep their attitude of prayer.

John Vance Cheney.

HOW LOVE LOOKED FOR HELL.

To HEAL his heart of long-time pain
One day Prince Love for to travel was fain
With Ministers Mind and Sense.

"Now what to thee most strange may be?"
Quoth Mind and Sense. "All things above,
One curious thing I first would see—
Hell," quoth Love.

Then Mind rode in and Sense rode out:
They searched the ways of man about.

First frightfully groaneth Sense.
"Tis here, 'tis here," and spurreth in fear
To the top of the hill that hangeth above
And plucketh the Prince: "Come, come, 'tis
here"—

"Where?" quoth Love

"Not far, not far," said shivering Sense,
As they rode on; "A short way hence,—

But seventy paces hence:
Look, King, dost see where suddenly
This road doth dip from the height above?
Cold blew a moldy wind by me"
("Cold?" quoth Love)

"As I rode down, and the River was black,
And yon-side lo! an endless wrack
And rabble of souls" (sighed Sense)

"Their eyes upturned and begged and
burned
In brimstone lakes, and a Hand above
Beat back the hands that upward yearned"—
"Nay!" quoth Love—

"Yea, yea, sweet Prince; thyself shalt see,
Wilt thou but down this slope with me;

'Tis palpable," whispered Sense.
At the foot of the hill a living rill
Shone, and the lilies shone white above;
"But now 'twas black, 'twas a river, this
rill,"
("Black?" quoth Love)

"Ay, black, but lo! the lilies grow,
And yon-side where was woe, was woe,—
Where the rabble of souls," cried Sense,
"Did shrivel and turn and beg and burn,
Thrust back in the brimstone from above—
Is banked of violet, rose, and fern:"

"How?" quoth Love:

"For lakes of pain, yon pleasant plain
Of woods and grass and yellow grain
Doth ravish the soul and sense:

And never a sigh beneath the sky,
And folk that smile and gaze above"—
"But saw'st thou here, with thine own eye,
Hell?" quoth Love.

"I saw true hell with mine own eye,
True hell, or light hath told a lie,
True, verily," quoth stout Sense.

Then Love rode round and searched the
ground,
The caves below, the hills above;
"But I cannot find where thou hast found
Hell," quoth Love.

There, while they stood in a green wood
And marveled still on Ill and Good,
Came suddenly Minister Mind.

"In the heart of sin doth hell begin:
'Tis not below, 'tis not above,
It lieth within, it lieth within:"
("Where?" quoth Love)

"I saw a man sit by a corse;
Hell's in the murderer's breast: remorse!
Thus clamored his mind to his mind:
'Not fleshly dole is the sinner's goal,
Hell's not below, nor yet above,
'Tis fixed in the ever-damnèd soul'"—
"Fixed?" quoth Love—

"Fixed: follow me, would'st thou but see:
He weepeth under yon willow tree,
Fast chained to his corse," quoth Mind.
Full soon they passed, for they rode fast,
Where the piteous willow bent above.
"Now shall I see at last, at last,
Hell," quoth Love.

There, when they came, Mind suffered shame:
"These be the same and not the same,"
A-wondering whispered Mind.
Lo, face by face two spirits pace
Where the blissful willow waves above:
One saith: "Do me a friendly grace"—
("Grace!" quoth Love)

"Read me two Dreams that linger long,
 Dim as returns of old-time song
 That flicker about the mind.
 I dreamed (how deep in mortal sleep!)
 I struck thee dead, then stood above,
 With tears that none but dreamers weep";
 "Dreams," quoth Love:

"In dreams, again, I plucked a flower
 That clung with pain and stung with power—
 Yea, nettled me, body and mind."
 "'Twas the nettle of sin, 'twas medicine;
 No need nor seed of it here Above;
 In dreams of hate true loves begin."
 "True," quoth Love.

"Now strange," quoth Sense, and "Strange," quoth Mind,
 "We saw it, and yet 'tis hard to find,—
 But we saw it," quoth Sense and Mind.
 Stretched on the ground, beautiful-crowned
 Of the piteous willow that wreathed above,
 —"But I cannot find where ye have found
 Hell," quoth Love.

Sidney Lanier.

NOTES ON THE EXILE OF DANTE.*

FROM HIS SENTENCE OF BANISHMENT WHILE IN ROME, 1302, TO HIS DEATH IN RAVENNA, 1321.

TO THE lovers of Italy and Italian literature more about Dante can never be unwelcome. There has been a gradual accumulation of evidence concerning the course and chronology of his wanderings in exile, ever since Boccaccio gave to the world the first biography of this great poet, who died early in the fourteenth century. Villani and other historians add something to this knowledge. Tradition has preserved a record of his presence in many places not mentioned by the historians, and the verses of the poet show a wide acquaintance with his own and foreign countries. The name of Dante is known and his memory loved and honored throughout Italy, even by the ignorant. In this nineteenth century, Italy is so much like what it was in the fourteenth, that it is not difficult to find the course of Dante's wanderings and the places where he rested. The castles where he visited his political friends are still to be found, some in ruins, one, at least, inhabited. The cities of Italy maintain very much the relative importance that they held in the time of Dante. There are convents, castles, town-halls, and houses bearing marble tablets that record his visit to the place on some public errand as ambassador from Florence before his exile, or show that here he met his friends in council, or that there he found a friendly refuge and a temporary rest from his weary and lonely travels.

It is well known that sentence of exile was passed upon Dante at the very time when he was acting as ambassador, in the service of Florence, to Pope Boniface VIII., in Rome. That pope was himself in league with the enemies of Dante in Florence, and detained him in Rome on various pretexts till their treacherous purpose could be accomplished. Learning in Rome that something of this kind was preparing against him, he with some difficulty detached himself from the Papal court, and, proceeding to Siena, he there learned that sentence of exile had been passed against him in company with a crowd of inferior persons, and that he was promised a cruel death by fire should he return to his home without permission. This occurred in 1302, and Dante never again saw Florence during the remaining nineteen years of his sad life. Born in 1265, he was at the date of his exile thirty-seven years of age.

Dante had been dead about fifty years when Boccaccio recorded, in a short biography, such fragments of his personal history as could then be collected. Troya says that Boccaccio's father was in Paris when Dante was there, and suggests that probably some particulars of the poet's history came to the son through the father's acquaintance with him. Other information has been gathered from the writings of Villani, Dino Campagni, and other historians of those times. Later

* THESE notes with pen and pencil were made to commemorate a pilgrimage of the author to the cities, convents, and castles that gave Dante refuge in exile, and to some other places known to have been visited by the poet, or that are mentioned in his verses. The order of his wanderings has been kept as nearly as possible, but the notes are necessarily incomplete.—S. F. C.

The illustrations are nearly all from Miss Clarke's drawings, which have been redrawn for engraving by Mr. Harry Fenn.—Ed.

scholars have carefully collated these passages, and much critical writing has been expended in proving or disproving their truth; and it is not probable that much more will be known on this point than is known already. Don Carlo Troya, in his "*Veltro allegorico di Dante*," published in Florence in 1826, brings together much of this desired information; and Fraticelli, Dante's latest biographer, gives the mature result of the researches of Dantean scholars on the course and events of his exile.

Dante was a great traveler—not, indeed, like Christopher Columbus or Marco Polo; but, though he neither circumnavigated the globe, nor discovered a continent, he visited all parts of Italy; he penetrated the passes of the Tyrol; he passed along the border of the Mediterranean Sea from Spezia to Nice, and thence to Paris. Returning, he came, it is believed, by way of Milan. In Tuscany he visited the Casentino, where in his youth he had fought in the battle of Campaldino as a soldier of Florence. Again in the north of Italy, he visited Can Grande at Verona, and thence went to Ravenna, where he died. These journeys were probably made on foot. To-day a circular ticket takes one through the peninsula with little expense of time or money, and perhaps with even less advantage. Not such were the travels of Dante. In his day there were no carriages and no public conveyances; all journeys were performed either on foot or on horseback. Dante was equally poor and proud, and, though he speaks of himself as being during his exile a beggar, it is not likely that he accepted anything but the necessities of life, even from those friends who delighted to serve him. He might figuratively call himself a beggar, because he received those absolute necessities, food and shelter, as gifts; but it was not in pity, but in honor, that they were accorded to him. While still a chief citizen of Florence, rich in esteem and love there, as elsewhere, he was many times sent as ambassador to other cities and powers, and then, no doubt, he traveled on horseback and with attendants. But when he had, by his banishment, been deprived of all personal possessions, it is unlikely that his proud spirit would allow him to travel at the expense of his friends. There is also much evidence of these lonely walks in the "*Divina Commedia*," which is enriched with so many passages where the coolness and tranquillity of nature break in as relief upon the horrors and severities of the terrible under-world. The "*Paradiso*" is full of distance and atmosphere, as well as of light, tenderness, happiness, and beauty. Everywhere in the poem is seen familiarity with

Nature in all her moods and forms, with sunrises and storms, with starry nights and shining days, with her mountains, her skies, seas, shores, valleys, forests, and rocky solitudes. In the course of these pages I shall have occasion to quote many passages in illustration of what I am now saying.

According to Fraticelli, Dante must have passed the first three years of his exile in or near Tuscany. This is opposed to the belief, founded on some verses in the "*Paradiso*," that he first visited Verona as the guest of the Scaligeri. These verses are:

"Thine earliest refuge and thine earliest inn
Shall be the mighty Lombard's courtesy,
Who on the ladder bears the holy bird."
Longfellow Tr. "Par.," xvii. 71.

The great Lombard here spoken of is supposed to be Can Grande, but it was his brother Bartolommeo who was chief in 1303, and it was in 1317 that Dante was visiting Can Grande in Verona. To remove this difficulty, Fraticelli suggests that Dante must have meant that this refuge was first in its great kindness, and not in the order of time. He says that *primo* in this place signifies principal or greatest, as we say of Dante that he is the *primo poeta del mondo*, the first of poets,—not the earliest, but the first in the character of his poetry. Bruni says that Dante passed from Rome to Siena, from Siena to Gargonza, and thence to Arezzo, where, between hope and despair, he remained till 1304. If this be so, he cannot have made Verona his first refuge.

ROME.

DANTE was in Rome as ambassador from Florence to Pope Boniface VIII. in 1302, and at the same time the intrigues against him were perfected, and that sentence procured which made him a perpetual exile. What object in this most wonderful of cities shall we select as illustrative of the visit of the greatest Italian poet? Three things in Rome he speaks of: the church of St. John Lateran, the bridge of St. Peter, which is now the bridge of St. Angelo, and the Pine Cone of the Vatican. The first is slightly alluded to, "*Inferno*," xxviii., verse 86, where, in speaking of a war between the Pope and the Colonnas, it is called *the War of the Lateran*. Again, in the "*Paradiso*," the bridge of St. Peter is spoken of as bearing the multitudes which thronged it on the occasion of the jubilee at the completion of the thirteenth century. This bridge is much changed since that time, and as the Pigna or Pine Cone remains as it was when Dante saw and used it as an illustration, though it was then in another place, I

have chosen it for my first sketch. This great pine cone is of bronze, and at first adorned the crown of Hadrian's tomb. Later it was placed in front of the old church of St. Peter, where it stood in Dante's time, and is now seen in the vast niche of Bramante, in the Vatican Gardens, where it is flanked by two bronze peacocks. It is mentioned in the following lines describing the giant Nimrod in the "Inferno":

"His face appeared to me as long and large
As is at Rome the pine cone of St. Peter's,
And in proportion were the other bones."
Longfellow Tr. "Inf.," xxxi. 58.

Dante, having imagined this wonderful giant, now gives circumstantial evidence. As the pine cone measures eleven feet in length, the giant, whose face is as long and as large, must be about seventy feet high, or even more, were he a well-proportioned giant.

It is to be noticed that, in the great poem, none of the wonderful monuments of ancient Rome are mentioned. The Coliseum, the aqueducts, the baths, the temples, the palaces of imperial Rome, Dante never speaks of. It is as if he had never seen them, and yet, eyes were never used to better purpose than the eyes of Dante. It would seem that these grand desolations must have appealed with especial force to this somber and poetic spirit, and that the sight of them would have borne fruit in his verses. It is true that much of what is now seen of these grand remains was in the fourteenth century still buried in the earth, but the Coliseum and the aqueducts can never have been hidden.

It is believed that Dante twice visited Naples as ambassador, and yet he never mentions Vesuvius. Yet who, that has walked at night on that mountain during an eruption, and has passed over the black lava fields lighted with flashes from subterranean fires, has seen the moon and stars blotted with masses of black smoke, and noticed the thronging, shadowy forms circling in these weird places, but must have perceived that here was presented the whole scenery of the "Inferno."

The Basilica of St. John Lateran was begun by Constantine, who, it is said, labored at the foundations with his own hands. It was consecrated 324 A. D., in 896 was overthrown by an earthquake, and rebuilt 904, and at that time consecrated to John the Baptist. This second basilica, to which Dante alludes, was almost entirely destroyed by fire in 1308. It was rebuilt and again burned in 1360, and remained four years in ruins. It was restored the third time in 1364, and the oldest remaining part that we see now is the transept which opens on the piazza and looks north. It is more picturesque on that side

than on that of the façade, and more ecclesiastical with its two pointed towers. It has gravity, antiquity, and dignity in its aspect; and when in the long summer afternoons the sun shines in at the north-western arches on the transept's end, and breaks up the numerous openings into light and shade, the old structure is brought to life and much beautified.

SIENA.

RETURNING from Rome to Florence, as he believed, Dante paused at Siena, and there he first learned the full particulars of the calamity that had befallen him. Up to that period Dante was of the Guelph or Papal party; but the Guelphs themselves were divided into Bianchi and Neri, and it was to that division of the Guelph party called Bianchi that he belonged. These factions were full of bitterness against each other, and it was to his enemies the Neri that Dante owed his banishment. The Bianchi were nearer in their wishes and their policy to the Ghibellines, and about this period, from the pressure of circumstances, became nearly identified with them. Thus, it was not so much that Dante changed his party, as that he changed with his party. It must have been here that his mind was preparing itself for the change. At Siena we find the old Palazzo Tolomeo in extremely good condition. I have learned that it continues at this time to be inhabited by a member of the Pia family. The well-known story of Pia di Tolomeo is alluded to in the "Purgatory":

"After the second followed the third spirit,
Do thou remember me who am la Pia;
Siena made me, unmade me Maremma;
He knoweth it, who had encircled first,
Espousing me, my finger with his gem."
Longfellow Tr. "Purg.," v. 133.

The door of this old palace is drawn as it stands now in the Piazza Tolomeo, and near it the pillar on which is seen the wolf of the Capitol nursing Romulus and Remus. This group is more frequently seen at Siena than even at Rome. Dante speaks of the Campo, the grand square:

"'Where he in greatest splendor lived,' said he,
'Freely upon the Campo of Siena,
All shame being laid aside, he placed himself,'"
"Purg.," xi. 133—

alluding to Provenzano Salvani, who, when his friend was taken prisoner by Charles of Anjou, King of Sicily, and was condemned to lose his head unless redeemed by an enormous ransom, went into the Campo di Siena, and sat there begging in his friend's cause till the necessary sum was raised. This humility and generosity saved him in purgatory much of the suffering deserved for his sins.

Siena is again alluded to in the "Inferno":

"And to the Poet said I, 'Now was ever
So vain a people as the Siennese?
Not, for a certainty, the French by far.'"
Longfellow Tr. "Inf.," xxix. 121.

The story of Pia di Tolomeo is this: Her husband, thinking he had reason to suspect her fidelity, took her from this palace in Siena, which was their home, and conveyed her to his castle in the Maremma with the deliberate purpose of destroying her life by the malaria. And in this he was successful.

GARGONZA — 1302-3.

WE now come to Gargonza, which is about half way between Siena and Arezzo. Dante must have gone there on leaving Siena, as it is well known that he met a number of Ghibelline leaders in that place. Finding it more convenient to reach it from Arezzo, I there took a little carriage one fine day in September to drive the twenty-four miles. Distances are not carefully measured in Italy, and this drive was, I think, less than the number of miles named. The way led along the Val di Chiana, a plain that in the time of Dante was pestilential, being rendered swampy from the overflow of the Chiana. This he mentions thus:

"What pain would be, if from the hospitals
Of Val di Chiana, 'twixt July and September,
And of Maremma and Sardinia,
All the diseases in one moat were gathered.
Such was it here."

Longfellow Tr. "Inf.," xxix. 47.

OLD PART OF THE CHURCH OF ST. JOHN LATERAN, ROME.

VOL. XXVII.—71.

THE PINE CONE OF THE VATICAN.

The whole valley is now a healthy and fertile district, as may be seen in the multitudes of gay, happy-looking people, and the abundant harvest of maize spread upon the house-tops and hung in festooned bunches on the walls to dry in the sun, and the same grain hung in the olive trees, thus making a bizarre arrangement of color, the strong yellow of the corn shining among the silvery grays of the olive. The vines well loaded with healthy-looking fruit, vegetable gardens in good condition, and other signs of rural prosperity, all speak of the present happy condition of things in this valley.

After crossing these pleasant plains we begin to ascend the hills that lie between Siena and Arezzo, on the heights of which is situated the Castle of Gargonza. At Monte San Savino we take another horse in front, and after a few miles of ascent reach the top of the hill, where, on the right side of the road, a few straggling cypress trees indicate the place of an old gate-way. A wild road among the trees soon brings us to a turn, from which we see at a short distance below the old tower of Gargonza. This is no ruin, and to it is joined a piece of the old castle wall. Some small houses cluster about these remains of the mediæval castle, in one of which my driver tells me is living the proprietor of the tower, making his villeggiatura. As I find myself here well situated for making my sketch, I unpack my easel, and, selecting a convenient point, am soon at work.

The driver goes on to a neighboring farmhouse, where he can rest and feed his horse. He is directed to go to the tower and ask if

it can be seen; also, if there are any indications of Dante's visit to the place. Soon appears a liveried servant bearing a courteous note from the Marchese and Marchesa Corsi-Salviati, inviting me to join them at their *déjeuner*.

This is a kindly and unexpected hospitality, as they know nothing of me but that I am an artist, and think I may be in need of refreshment. I am obliged, unwillingly, to refuse

TOWER CHAMBER AT
GARGONZA.

this kind invitation, as the sun will not stand still, and I must finish the sketch be-

fore going to look at the tower. After having worked about two hours I find I can do no more, since the light has so much changed. Descending the hill, the path turns and leads up to the tower. The driver guides me, and at the door of a house the Marchese receives me with much courtesy, and he and the Marchesa make me kindly welcome. After learning what he can tell me of the history of the castle, some items of which he writes out for me, I am conducted into the old tower, and into the very chamber in which, according to family tradition, Dante lived some months. I looked with the deepest interest on this little stone chamber, as here he passed through the great crisis of his life, and from a Guelf

became a Ghibelline. As the tower is of stone, and in good preservation, it is really very much what it must have been at the time when its walls witnessed the struggles of this great soul with fate. Fraticelli says:

"While Dante, seeing how inefficacious was his embassy to Pope Bonifacio, remained in Rome, uncertain how he ought to act, he received news of the ruin of his country, and a little later of his own misfortunes. Freeing himself, then, from the Pontifical court, and cursing in his heart its duplicity and perfidy, he hastened into Tuscany and arrived at Siena, where he heard the particulars of these melancholy facts. He well saw, and all the other banished men saw, that there was no mode of reducing their adversaries to milder measures; wherefore they took counsel to unite themselves together, and their first reunion was at Gargonza, a castle of the Ubertini family, standing half way between Siena and Arezzo, and here they decided to act with the Ghibellines of Tuscany and of Romagna, and to establish their head-quarters at Arezzo. The change of Dante from the Bianchi of the Guelfs to the party of the Ghibellines dates only from this time—that is, from February or March of 1302; and whoever has said differently has not well studied these historical facts, their causes and their consequences. In Arezzo, then, they assembled, and here organized their forces, taking for their captain Count Alessandro da Romena, and naming twelve councilors to stand by him; one of these was Dante."

Thus it appears that the decision to join the Ghibellines must have been reached at Gargonza. The tradition of the place is that Dante passed some months in this stone chamber, and that he wrote some part of the "Inferno" here. The room occupies the whole body of the tower; it is entered by a ladder from below through a trap in the floor, and the same sort of passage leads to the room above, and another ladder to the roof. There are two small windows; one is tall and reaches nearly to the floor, the other small and high and is reached by a few steps worked in the thickness of the wall. This ladder stair-way, the Marchese assured me, was the same that had always been used; the same arrangement is seen in Galileo's tower, near Florence. Villani says: "The Castle of Gargonza is celebrated for the congress, in 1304, of the Ghibellines of Florence and of Arezzo, among whom was found the exiled poet, Dante Alighieri."

I climbed to the top of the tower, whose high battlements seemed still to wall me in; but the view across the Val di Chiana to the hills where Arezzo stands is full of airy sunshine, is Italian and intoxicating. In other countries one may look on a wide and beautiful view with a certain coolness; one criticises its features and finds it better or poorer than other views; but in Italy, though it be but a level plain, the transparent curtain of the air, traversed by threads of golden light, makes an enchanted veil in which the specta-

tor is caught and held as in a net. He cannot criticise or compare; he can only yield to the magic spell.

Returning to Arezzo, the road passes Pieve al Intoppo, the site of a battle between Guelfs and Ghibellines.

SAN GEMIGNANO—1299.

NEAR Siena is San Gemignano, an old town on a hill, and so full of towers that from a distance it seems composed of them, and to be a fortress. In the middle ages every city had many towers erected by the great chieftains, whose families took refuge in such high and safe places during the wars that were incessantly raging between these jealous neighbors. They also served for a point of attack. A walled city kept off enemies from other cities and powers, but within its shelter almost every man of importance was the enemy of his neighbor, and fighting without end was the consequence. If Romeo fancied Juliet, the lives of both families were put in danger; or if a drunken brawl occurred among the followers, and any violence was done, war was declared immediately, and the ensuing fights often involved whole neighborhoods, and a tumult of violence would fill the great city. Vendetta was declared and peace forever driven away. In the town-hall of this place is a tablet recording the historical fact that Dante came here as ambassador from the Florentines, to make an alliance with the San Gemignanese. This old town is full of picturesque treasures, and has charming views from its gates and from the tops of its towers.

MONTE REGGIONE.

THIS little town is indeed a crown of towers. ("Monte Reggione di torre si corona."—"Inf.," cant. xxxi., ver. 41.) About twenty houses are inclosed within a circular wall which has towers at short intervals. It is, in fact, a fortress. The gates now stand open, the walls are crumbled, the towers fast losing their shape, but the houses within are inhabited. It is a miniature town, a happy inclosure, and a pleasant and fruitful resort for a sketcher. When I visited the place in company with a friend, who gave me the delightful drive from Siena, it was a gray soft day when all was in harmony with the venera-

SAN GEMIGNANO.

ble time-stained ruin; a day without peculiar splendors, yet one of those on which memory sets a seal that it may be never forgotten.

CASENTINO— 1303-1311.

WE come now to the Casentino, which is rich in traces of Dante. This valley lies east of Florence, and is inclosed by the three mountains on which are seated the convents of Vallombrosa, Camaldoli, and Alvernia. It is a favorite performance of the faithful to visit these three important sanctuaries. The valley is a little world within itself. It is from twenty to thirty miles across, and contains within its mountain boundaries hills, rivers, cities, castles, and convents, besides farms and villages. It was on a delightful day in June when a party of friends prepared to explore the Casentino, and to find the castles visited by Dante. We took the railway to Pontassieve, which is about ten miles from Florence, and at that place engaged a carriage for the next four or five days. We drove first to Pelago, where we were to take horses for Vallombrosa, at the top of the mountain, and there pass the first night. It was arranged that our carriage should meet us the next morning at Consuina on the other side of the mountain. At Pelago occurred an instance of faithlessness to a well-understood contract, such as one seldom meets in Italy. The people will overcharge you with the greatest

MONTE REGGIONE.

readiness; but when they have made a contract, written or unwritten, they are usually faithful to it. To-day, we had a new experience. The padrona at the little locanda at Pelago furnishes horses and guides for the mountain of Vallombrosa. We engaged two horses and two guides for L—— and myself, the third of our party, Mr. C——, preferring to walk. The padrona, supported by Franceschino, who, I suppose, was her son, now said that we must take a third man to carry our bags and shawls. We knew the night at Vallombrosa would be cold, and had therefore taken many wraps; but though the luggage was considerable, I thought the two men could easily carry it; and as we could

also take something on our horses, the third man appeared unnecessary. But the padrona insisted, saying the road was so bad that it would require all the attention of the two men to guide the horses. So we agreed to the third man and started, Franceschino proving to be that third. Mr. C—— had walked on before while we were getting mounted, and was already out of sight. The day was delightful, and the horses stepped out bravely. After we had made about a mile, and had not yet begun the ascent, Franceschino stopped the horses, and, coming to me, said:

"*Bon voyage, madame,*" the Italians who consider themselves superior preferring to speak French to strangers.

"But where are you going?"

"To Florence, madame."

"How is that, when you have engaged to go with us?"

"Oh," said this traitor, "there is no need of a third man to go up the mountain."

"But your padrona insisted that we should take you on account of the badness of the road."

"Pardon, madame, the road is excellent. The horses would take you up without guides; they know the road perfectly."

"Very well," said I; "then, of course, I do not pay for three men."

"Oh, yes, madame, you will fulfill your contract."

"What! and you tell me that you are going to break yours?"

"You understand, madame, that you

agreed to pay the padrona so much, and she will expect you to send her that sum."

"No, indeed; if you do not go, I do not pay you."

I could not understand such barefaced assurance. Finding I would not yield, Franceschino said he would take his horses back, and approaching L——, said: "Please to dismount, mademoiselle."

L—— looked at me, and I said: "Yes, he may take his horses, and we will walk up the mountain."

So we dismounted, to the surprise of Franceschino, who, when he realized the situation, said to the men, "Put down the *roba*." They laid the bags and shawls on the road, and led away the horses.

Now, here we were left, in a glorious sea of afternoon sunshine, but with a heavy weight of luggage to carry up the mountain. I thought we could walk up very well, but to carry such a burden was impossible. I called a man at work in the field, and told him I would pay him if he would take our bags and go up the mountain with us. He replied that he could not leave his work. I noticed that the cavalcade, having reached the angle of the road on the way back to Pelago, was concealed by a house, and that it remained concealed a suspiciously long time. I thought I understood the policy of Franceschino. I took out my books and began a sketch. L—— laughed and I laughed, hoping it would end in laughter, of which I did not feel quite sure. Soon Franceschino re-appeared, sauntering leisurely, and smoking a cigar. As he approached, I said:

"What do you want?"

"I want to speak to my friend who is working in the field yonder."

"Do you know," said I, borrowing the Englishman's weapon, "that I am going to England and shall tell Mr. Murray what sort of people you at Pelago are, so that foreigners may not trust you?"

"I am well known to foreigners," said he, with a grand air, "and I do not care what you say to Mr. Murray."

After this he spoke to the man in the field, and then returned to the place where he had left the horses. Immediately the procession re-appeared and approached us. Franceschino led his horse to L—— and begged her to mount, as who should say, "Let there be an end of this fooling."

My man brought my horse, and I too mounted; the men gathered up our effects. Franceschino again wished us *bon voyage*, and without further words we went on. I had felt sure that he would not wish to lose the hire of the horses and men, and so our war,

like many greater wars, ended, leaving things just as they were before it began. Franceschino had his way in leaving us, and I had my way in not paying him.

Presently we saw Mr. C—— returning in great haste to find us. Greatly alarmed at our non-appearance, he feared we had met with brigands, or had fallen from our horses. We had lost more time than we could well spare, and now pushed on briskly. The road proved perfectly good. We mounted and mounted till we came to a forest, or rather a plantation of fir-trees. In their native forests firs are grand and beautiful, and in a shrubbery, mixed with other trees and well grown, they have beauty; but there is a hopeless look about a plantation of firs that is fatiguing. The air grew colder, wild hawks flew screaming above our heads. It seemed as if we had left Italy, for warmth and beauty had both passed away. Only when through the firs we gained a glimpse of the world below and of the valley of the Arno could we keep up our spirits. That beguiling line of Milton—

"Thick as autumnal leaves that strew the brooks
In Vallombrosa"—

had prepared us for delightful deciduous forests in all their glory, and a perfectly straight paved road through the fir woods was a disappointment, and, as yet, there was no convent in sight. The sun was near its setting, the wind howling. At last, something like a church appeared at the end of the avenue. When we reached the gate of the convent it was nearly dark, or appeared so. Still, after ordering our supper from a host who lived outside the convent, we decided to climb to the Paradisino, a small edifice on the top of the rocks behind the church and convent; and as some rays of the setting sun still illuminated it, we were encouraged to go up to see the view. Truly, it was immense and superb; and when we had arrived on its terrace, the sun again rose for us and lighted up a wonderful world below. As twilight darkened the scene, we descended, were shown the great chambers, and were desired to choose for ourselves which we would have. This convent is disestablished, but the guest-chambers still do service, and some of the brothers remain to take care of the conventual buildings. In the morning we visited the church, and then took the other road down the mountain. This road wound agreeably through chestnut woods, and brought us to Consuma.

It was here that we found our carriage and dismissed our guides. They had been very civil, and we gladly gave them a little more than was promised, and charged them to keep it for themselves. We were now in a new

stage of our journey. Consuma is so called to commemorate the fact of a man's having been burned there in punishment for coining. This again brings us into the train of Dantesque associations, for this was Adam of Brescia, met by Dante in the "Inferno," and who says to him:

"There is Romena, where I counterfeited
The currency imprinted with the Baptist,
For which I left my body burned above.
But if I here could see the tristful soul
Of Guido, or Alessandro, or their brother,
For Branda's fount I would not give the sight."
Longfellow Tr. "Inf.," xxx. 71.

These lords of Romena, whose tool this poor fellow was, were Dante's friends, and had their castle in this neighborhood. The little way-side fountain called Fonte Branda is also near at hand. Until lately it was supposed that Master Adam alluded to the great Fonte Branda at Siena, but later scholars have decided that he would more naturally be thinking of the Fonte Branda in the vicinity of Romena.

I must also quote what Ampère says about these lines, which refer to the waters of Casentino:

"The rivulets that from the verdant hills
Of Cassentin descend down into Arno,
Making their channels to be cold and moist."
Longfellow Tr. "Inf.," xxx. 64.

"In these untranslatable verses there is a feeling of humid freshness, which almost makes one shudder. I owe it to truth to say that the Casentin was a great deal less fresh and less verdant in reality than in the poetry of Dante, and that in the midst of the aridity that surrounded me, this poetry by its very perfection made one feel something of the punishment of Master Adam."
Ampère, Voyage Dantesque.

Consuma is a wretched hamlet, though seen from the hill above it is not unpicturesque. An American wonders how it could remain more than five hundred years the same poor little place, neither improving nor disappearing; so unlike our own villages, which in the newer settlements if they cannot grow are abandoned, and if they do grow become cities in a very short time. All things in this valley of the Casentino, should it continue without railroads, may remain as they are another five hundred years. Nowhere can there be a more peaceful seclusion.

On the road leading to Bibbiena, where we propose to pass the night, we come in sight of a majestic cliff, abruptly rising from the plain, with a city and a castle on its top. This is Poppi, and is one of the places visited by Dante after his return from Paris. Here he was a guest of the Contessa Battifolli in the castle. Poppi is on the right bank of the Arno. We did not stop to climb to this castle, for the day was hot and the way was steep. It was left for a later visit, when I ob-

tained a drawing of the castle court, extremely mediæval and picturesque. It is said to have been the model of the Bargello at Florence. At the foot of this hill is the plain where once raged the battle of Campaldino. It now grows wheat, mulberry trees, and grapes. Having passed Poppi, the mountains drew nearer, and one blue peak showed something that looked like a dark forest among the light tints about its head. This proved to be Alvernia, which is to be visited to-morrow. We reached Bibbiena a little before sunset, and found a comfortable inn. We engaged horses and guides to take us to Alvernia the next day, and sunk to sleep in our rustling beds of gran-turco leaves, better known in my country as corn shucks.

The next morning we started early, for it is a good day's work to visit Alvernia. We soon crossed the Corsalone torrent, as every swift and intermittent river is called in Italy. There had been a bridge, now broken; the river was broad and full of rocks, and we had to cross by wading our horses. But this inconvenience was repaid by the new and more picturesque view we had of the river and the mountains seen from its bed. Soon we began the ascent and struck a path leading up to the convent, still hidden from us by the mountain shoulders. The lower part of the road is a long ridge scattered with boulders of large size and strange forms. Deep twisted cavities in these rocks tell of water and pebbles at work, churning holes perhaps during thousands of long-past years. It was noon when we reached the convent, the last part of the road being too steep for the horses. There we came up a little stair-way to a spacious terrace on which the buildings stand. This convent has been spared, owing to some protection it holds from the municipality of Florence. The Franciscan friars are brown-robed, barefooted, with each a cord about the waist. Here was the earliest foundation of St. Francis, unless we count the tiny convent near Assisi, called the Carcere di San Francesco. The place is properly called Alvernia or winter, from its perpetual cold. Even on this June day we perceived an icy quality in the air. Here are wonderful rocks and caves,—rocks which by some earthquake shock have fallen across other rocks and so made caves. The friars tell us that these rocks were rent when Jesus Christ was crucified. One cave overhung with a great rock which had apparently no support, they told us, was the favorite resort of St. Francis, who chose to lie in it as an exercise of faith. They show the little chapel, hewn out of the rock, where he received the stigmata. The spot where he was kneeling at the moment

is covered with an iron grate. We are now three thousand seven hundred and twenty feet above the sea. Above the convent buildings rises more forest, and through this delightful wilderness we climb perpetually, till at the top they tell us that we are now one thousand one hundred and fifty feet above the convent itself. A young friar went with us up the forest-path. He was a gay creature, full of cheerfulness and laughter. There seemed no mortification about him. Dante speaks of this mountain :

"On the rude rock 'twixt Tiber and the Arno,
From Christ did he receive the final seal
Which during two whole years his members bore."
Longfellow Tr. "Par.," xi. 106.

These hospitable monks gave us a fast-day dinner which seemed to us to want nothing. It was served with exquisite neatness—the knives bright and sharp as daggers, as if they had been scoured hundreds of years and kept most carefully. For this dinner of soup made of fish and vegetables, pickled tunny fish, an omelette, good bread and cheese, and excellent coffee, they refused payment, and only accepted what we offered when we begged them to keep it for the use of the convent.

Again at Bibbiena, where we spent the night. Next day we crossed the Arno, left Poppi behind, and came upon the battle-field of Campaldino, where Dante, then twenty-four years of age, fought in the Florentine cavalry, and led a charge. A letter remains in which he describes the battle, and his fears lest his side should be defeated. And now I wish some brave sculptor would take a hint from this bit of history, and make an effigy of this solemn, this terrible poet, not like an old woman, in robes and lappets, but as in his youth he fought at the battle of Campaldino. Make him, O sculptor,

"Helm'd and mail'd,
With sweet, stern face unveiled."

He would seem more at home than in the better known costume. I have been told that those white, three-cornered lappets were worn to protect the face and ears from the rubbing of the helmet. And why were they not laid aside with the helmet, instead of being worn when helmets were no longer in question? Flaxman has imparted such dignity to the robe and lappets that it now appears to be a law of representation that Dante should be allowed no other dress; but

COURT OF POPPI CASTLE.

rebellion against this law is worth trying. I made a sketch of the battle-field, with Poppi in the background. After this we began to inquire for Fonte Branda. Our driver knew nothing of such a place, but the first peasant we met guided us to it. It is a little way-side fountain, flowing within a recess in the wall of brick-work, and from that reservoir trickles a tiny thread of water into a stone basin where cattle may drink. This fountain is not much changed since the time of Dante. About half a mile on the same road comes a little town where Landino, Dante's first commentator, was born and died. His remains are mummified, and are shown on festa days as those of a saint. Next we passed the castle of Romena, where the poet visited his friend Count Alessandro da Romena. It is now a picturesque ruin. A few miles further is the Castle of Porciano, which he also visited, and from which is dated an important letter, thus, "Scritta in Toscana sotto le fonte d'Arno, 16 Avrile, 1311," and addressed to the Florentines. This letter is full of political fury because the Florentines resist the Emperor. This fixes a date, and shows that his second visit to the Casentino was after his return from Paris. The 29th of June, the same year, the Emperor Henry was crowned in Rome, in the Basilica of St. John Lateran.

PERUGIA—1303.

DANTE'S visit to Perugia was probably made when he was so near to it. Perugia

is alluded to in the verses where Assisi is spoken of:

"Between Tupino and the stream that falls
Down from the hill elect of blessed Ubald,
A fertile slope of lofty mountain hangs
From which Perugia feels the cold and heat
Through Porta Sole."
Longfellow Tr. "Par.," xi. 43.

The drawing that I made at Perugia is of something so old that Dante must have seen it. It is called the Augusta Gate, as Augustus on taking Perugia, after failing in

by a row of blank disks such as one sees on Etruscan tombs, and which seem to hint at the mysteries of that occult and inscrutable religion or literature.

Ampère, in his "Voyage Dantesque," says:

"Having been twice at Perugia, I have experienced the double effect of Monte Ubaldo, which the poet says makes the city feel the cold and heat—

'Onde Perugia sente freddo e caldo'
(*"Par.," xi. 46*);

that is, which by turns reflects upon it the rays of the sun and sends it icy winds. I have but too well verified the justice of Dante's observation, particularly as regards the cold temperature which Perugia, when it is not burning hot, owes to Monte Ubaldo. I arrived in front of this city on a brilliant autumnal night, and had time to comment at leisure on the winds of the Ubaldo, as I slowly climbed the winding road which leads to the gates of the city, fortified by a Pope."

The views from every part of Perugia are most enchanting. A sea of mountains of trembling azure rolls below on every side, except on the east, where vast plains stretch away toward the still more distant and vapory mountains of Umbria. It is a heavenly landscape. Perugia has many quite visible Etruscan remains. A curious architectural custom of that old people is perpetuated by their successors in some of the houses in the northern and oldest part of the town. In many

houses a narrow door is still to be seen beside the principal house door. This narrow door was built to carry out the dead, as it was believed that to pass the corpse through the door used by the living would bring ill luck. In some cases the narrow door is still open, but more frequently it is walled up, though plainly visible as a blind arch in the wall, and always close to the principal house door.

ASSISI.

THAT Dante visited his friend Giotto while he was engaged in painting the church of St. Francis at Assisi is conceded. He alludes in the "Paradiso"

quite distinctly to the fresco of the marriage of St. Francis with poverty:

"For he in youth his father's wrath incurred
For certain Dame, to whom, as unto death,
The gate of pleasure no one doth unlock;
And was before his spiritual court
Et coram patre unto her united;
Then day by day more fervently he loved her.
She, reft of her first husband, scorned, obscure,
One thousand and one hundred years and more,
Waited without a suitor till he came."
Longfellow Tr. "Par.," xi. 58.

The fresco represents a woman in rags and standing with bare feet among thorns, in

FONTE BRANDA.

the attempt to burn the gate, had his name inscribed upon it, "*Augusta Perusia.*"

This has been considered an Etruscan work, but the later archæologists deny this early origin, and point out in the tower and supporting stones of the arch certain fragments of Etruscan inscriptions which are put in, not horizontally, as if meant to be read, but diagonally or perpendicularly, as if the builders had made use of old Etruscan stones, without regard to the inscriptions. But the design is more Etruscan than Roman, the grand and massive arch being surmounted

the act of being married to St. Francis, who looks very comfortable in his brown hood and robes. This fresco has been well preserved, but it is only between two and four p. m. that anything of the paintings can be seen in that dark, underground church. At that time the sun streams in at certain small windows and fills the cave-like church with light enough to make the frescoes visible. In a day without sunshine, of course, nothing can be seen. The vast cloisters or galleries of the convent are most interesting. The views over the great plains of Umbria to the mountains are like an enchanted ocean. One can easily fancy Dante and Giotto walking there together and

talking of St. Francis.

Assisi is a very charming old town, very quiet, full of

mediaeval architecture, showing very little that is modern, and streets unusually clean. The families, as in all the Italian towns, pass the summer afternoons in the street; the women spinning with the distaff or sewing, babies sprawling and rolling on the pavement, boys and girls playing, all evidencing a tranquil and happy existence. Santa Chiara is here the other great saint, and her mummy is preserved in her church, and shown to the faithful and also to the curious.

A long and difficult path leads up and around the mountain, and brings one to a tiny convent called *Carcere di San Francesco*. Here are shown recesses in the rock where the saint imprisoned himself, so narrow that, being within, he could not turn himself. A bridge across the ravine leads to the wood where, by some rude steps, one descends to a very picturesque grotto in which the saint is said to have passed much time in prayer. Returning through the little convent, we stopped in the tiny court-yard and drank of the cool pure water of St. Francis's well. A white dove washed himself fluttering in a stone basin; a fresco of the Annunciation glimmered under the little arcade; the tiny con-

CASTLE OF ROMENA.

AUGUSTA GATE.

vent bell hung in the narrow arched entrance, black against the shining trees on the other side of the ravine; all was cool and silent. One can, for the moment, envy the peace of the conventual life in these green retreats; no busy bustling days, no care but to follow the routine prescribed, no responsibility but that of obedience, and, it cannot be denied, much stagnation. Though courteous and hospitable, these monks can seldom answer the simplest question about their own order. Questions are not considered by their minds; routine occupies the time or kills it, and that is sufficient.

Returning to Assisi, we took our last look at the lower church of St. Francis. As the upper church rests upon this, its weight is sustained upon low Gothic arches which are distributed throughout the interior, and determine its architecture. When the great doors are open at noon, the church is filled with reflected light which, echoing through these arched spaces and searching their receding depths, produces the loveliest effects, the mosaics and frescoes enriching every space and border with a soft glimmer of color.

BOLOGNA.

THE Torre di Garisenda at Bologna, mentioned by Dante, and used by him as an illustration in describing the giant Antæus, still inclines as when he looked up at its dangerous tilting, so many years ago.

"As seems the Carisenda, to behold
Beneath the leaning side, when goes a cloud
Above it, so that opposite it hangs;
Such did Antæus seem to me, who stood
Watching to see him stoop, and then it was
I could have wished to go some other way.
But lightly in the abyss, which swallows up
Judas with Lucifer, he put us down;
Nor, thus bowed downward, made he there delay,
But, as a mast does in a ship, uprose."
Longfellow Tr. "Inf.," xxxi. 136.

It is believed that Dante in his youth studied at the University of Bologna. Fraticelli thinks there is no evidence of this, but that he went there during his exile.

GARGNANO—VERONA.

NEAR Verona is the villa at Gargnano, a possession which Dante acquired while at the court of Can Grande. This place is about twelve miles distant from Verona. It must have been at the time of his second residence at Verona that Dante became possessed of this retreat, to which, no doubt, he was glad to escape from the noisy court, and where he must have written many of his verses. The place is still in possession of his descendants. The granddaughter of Dante was the Con-

tessa Sarego, and the villa is still owned and inhabited by the Sarego family. It is a pleasant drive from Verona to the villa, first passing along the banks of the Adige, and then turning off among the hills, the road becoming more and more secluded. Stopping at the iron gate of a modern-looking villa, our driver informed us that this was the Villa Sarego. We inquired if it could be seen, and were invited to enter. Coming to the door of the house, a modern structure, a servant met us and said that the Contessa being ill could not receive us, but made us welcome to look about the place. He took us first into a ground-floor saloon to show us what he called "*i cocchi antichi*." These he showed us, hanging from the beams in the ceiling. They were simply the frames and ribs of two small coaches, without wheels. They were painted in black and gold. These, the servant told us, had been the property of the first Contessa Sarego, who was the granddaughter of Dante. After we had stared respectfully at these relics he asked us to go into the garden and see a "*sasso*." Supposing that we were about to see a stone that Dante loved to sit upon, we gladly followed him, and, when we were presented to the stone, found it to be a monument inscribed with verses addressed to Dante by the poet Monti. There were also three young laurels in front of the stone, and these were planted by the three poets, Monti, Pindamonte, and Da Lorenzo, on the occasion of the sixcentennial celebration of the birth of Dante. The garden was a pleasant, shaded place, not filled with fruit and flowers, but with ilex trees. From an opening in the trees could be seen, on a neighboring hill, an old Roman tower. Since Dante must often have looked at it, I chose it for my sketch. While I was drawing, a young gentleman came into the garden, and, advancing with a courteous gesture, asked if he could do anything for us. My niece, to whom he addressed himself, told him what I was doing, and then he came to me and asked if I wanted anything. I said to him, "Is it true that this place is in possession of the descendants of Dante?" "*Sì, signora*," replied he, "*ed io mi chiamo Dante*." Surprised, I asked him to explain this, and he told me that his ancestress, the Contessa Sarego, left this little place by will to belong always to the eldest son of the Sarego family, with request that he should take the name of Dante. He then presented me with his card, on which was engraved

"*Dante di Sarego Alighieri.*"

"Then the place really belonged to Dante at first?" "Oh, yes," he said, "and this is

TORRE DI GARISENDA.

proved by the title-deed." All this was very interesting to me, and so were other things that he told me. Among other anecdotes was this one. His family being invited to be present at the sixcentennial celebration at Ravenna, his uncle, a physician, was chosen as one of the Royal Commissioners appointed to examine the newly found skeleton of Dante, and to decide on its genuineness. These gentlemen having decided that the skeleton was that of a man of the same age and size as is recorded of Dante, and that the skull answered to the same description in its proportions, the sepulcher was opened and found to be empty, excepting that some phalanges of the fingers, wanting in the newly found skeleton, were lying in the place where the bones should have been. These were found to complete the skeleton, and it was replaced in the sepulcher, and closed securely. There was also some dust found lying with the small bones, and this gentleman, as one of the poet's family, thought he might gather a little of this precious dust in a paper, and preserve it as a relic. He did so, but the same evening many persons came about the house where the commissioners were lodged, saying that they had learned that a portion of the remains had been removed, and that such a thing could not be permitted. The uncle explained that it was but a trifle of the dust of his honored relative

that he had ventured to appropriate, and showed it to the assembled crowd; but they would not be satisfied till he had replaced it with the skeleton. Such jealousy still exists in the city of Ravenna concerning the possession of the poet's remains. The whole story of the discovery of this skeleton will be given in the chapter on Ravenna.

Having finished my sketch of the Roman tower, we prepared to take leave of our young host. While doing so, the old gardener appeared, bearing bouquets of hot-house flowers for the ladies, which we received from the hands of the young Dante, with his kind wishes that we might come again and see his mother; but we could not at this time hope to do so, as we were leaving Verona the next day. It was while making a second visit to Verona that I obtained a sketch of the old staircase in the court-yard of one of the Scaligeri palaces, which is now a prison. The stairs are of rose-colored Verona marble, with traces of twisted columns and marble canopy. In the hall above, to which they lead, there is a richly carved door, which might have been the entrance to a grand reception-room; and Dante, jostled by the crowd of rude courtiers on the stairs, might here have produced the sad, immortal lines,

"Tu proverai sì come sa di sale
Lo pane altrui, e com' è duro calle
Lo scendere e 'l salir per l' altrui scale."
"Par.," xvii. 58.

"Thou shalt have proof how savoreth of salt
The bread of others, and how hard a road
The going down and up another's stairs."
Longfellow.

It was at Verona, in the church of Santa Elena, that Dante, at the request of Can Grande, gave a lecture to the clero Veronese, a philosophic thesis on water and earth.

ROVEREDO — SLOVINO DI MARCO — 1303.

THAT striking passage in the "Inferno," where the land-slide of Roveredo called the Slovino di Marco is described, shows that Dante had seen it himself, and that it impressed his imagination deeply:

"Such as that ruin is, which in the flank
Smote, on this side of Trent, the Adige,
Either by earthquake or by failing stay.
For, from the mountain's top from which it moved,
Unto the plain, the cliff is shattered so,
Some path 'twould give to him who was above;
Even such was the descent of that ravine."
Longfellow Tr. "Inf.," xii. 4.

Dante may have made his excursion into the Italian Tyrol during his first visit to Verona. So Troya believes, and I will place this illustration next in order.

The place is strange, wild, and desolate now, as on the day when Dante looked upon it. The railway of the Brenner Pass runs close beside it, so that something of its strangeness may be seen by the traveler from the train. The scientific study of geology being unknown in 1303, such a guess as Dante made at the cause of this to him unintelligible stretch of scattered stones was all that was possible in that early time. I was fortunate in meeting the geological professor in the Institute at Roveredo, a native of the place. He kindly went over the

flint-stones found in the glacier track. They are cone-shaped, three-sided, worked to a point at one end, the angles rounded, and the whole very smooth. They are sometimes found six inches long, and one of the three sides is always a little more flattened than the others. It is supposed that they have been worn to this shape by attrition and the long-continued grinding force and weight of the glacier, and that the flattened side, being the lowest, had more abrasion to endure. I might also here take exception to what Mr. Ruskin says of Dante being "notably a bad

LAND-SLIDE AT ROVEREDO.

ground with me, and pointed out the course of the land-slide or fall of rocks from the sides of the valley, when the strata were undermined by some flood. He also showed me the stones of an old moraine, which are confused and masked by the stones of the land-slide. This shows that the phrase Dante uses of the *scarco* or *scarico* of stones, signifying an unloading, is precise. Mr. Ruskin thinks it not an elevated or enthusiastic expression, and especially objects to the word *scarco*; but if Dante had witnessed the course of the great prehistoric glacier when it passed that valley, dropping the boulders of its moraine as it slowly melted, and moved on still more slowly, he could not have chosen a better word to describe its action. It was, in fact, a great unloading of stones. Also, when he hazards the guess, "*o per sostegno manco*," or by deficient prop, he is not less happy in his interpretation of appearances, since a part of this strange chaos comes from that very cause. Professor Cobelli, who has made a life study of this phenomenon, showed me also the *triquetri*, or long

climber," and that "he was fond of sitting in the sun, looking at his fair Baptistery, or walking in a dignified manner on flat pavements, in a long robe, and it put him seriously out of his way when he has to take to his hands and knees or look to his feet." When Mr. Ruskin so speaks, he has not considered Dante's long journeys in wild places, mostly if not entirely made on foot, when he traversed Italy from Rome to Siena, Perugia, Assisi, Bologna, Verona, Venice, into the Tyrol to Roveredo, again back to the Gulf of Spezia, along the Cornice road through France to Paris, then to Milan, to the Casentino in Tuscany, to Gubbio, to Avellana, which lies among the steepest mountains of Umbria, and where from Catria, the giant of

the Apennines, you can behold the Adriatic Sea on the one hand, and the Mediterranean on the other; to Urbino and to the castle of Faggiuola, near San Leo; again to Mantua and Verona; to Duino, on the sea near Trieste; into the Austrian Tyrol to Tolmino and the castle of Pagano della Torre; to Rimini and Ravenna, where his wanderings ended. On many hundreds of miles of these journeys no flat pavement was to be found, the roads naturally being rough before any but cart roads had been made, and we may safely believe that the long trailing robes with which painters love to invest Dante were not worn by him as a traveling dress. The castle of Lizzana is near this spot, and is mentioned by the guide-books as a castle visited by Dante. I asked the landlord of the hotel to call a carriage, and said I wished to be taken to the castle of Lizzana. He replied that he knew no such place, and that it could not be at or near Roveredo. While I was explaining to him my reasons for believing that it must be in that vicinity, a man who

had been sitting half asleep near by roused himself and said: "The castle of Lizzana!

STAIR-WAY AT VERONA.

why, don't you know it? That is the old castle where Dante passed a night!" This, then, was the local tradition. The man was a common man, ignorant, but knowing the traditions of his native place, and this point of circumstance—the *one night*—delighted me. This tradition had been preserved ever since Dante passed a night with his friend, the lord of this castle, when no doubt he strolled out in the morning to look at the wonderful *slovino* which lies under the castle cliff, and stretches miles along the valley. The sole remains of the castle are a pile of stones and rubbish, which, with a bit of wall, show where the tower once stood.

URBINO — 1304.

ONE of the castles where Dante was entertained was that of la Faggiuola, the lord of which was his friend Uggucione. I was glad to visit Urbino, the birth-place of Raphael. From here I hoped to reach the castle, which is said to be five leagues west from Urbino, and half-way between Macerata and San Leo, near the source of the river Conca. This direction was sufficiently clear, but inquiries at Urbino produced the information that the mountain-road in that direction was considered impassable on account of recent floods. I was advised to try the road from Rimini, and thus was induced to postpone the excursion. A few days were pleasantly passed in the old town of Urbino, which is high on the mountains, the road being a continual ascent from the coast. The air is excellent, the views superb, and the place full of historical memories. The house of Raphael has, largely by Mr. Morris Moore's exertions, been purchased and made the foundation of a museum and school of art. At present it is adorned with engravings and photographs from the great works of the master. It is well that this beginning is made, as the house will now be securely held to the memory of Raphael and the service of the fine arts. The street in which this house stands goes steeply up the hill to the terrace of the old fortress. From this esplanade we overlook the city on the east, and looking westward we see five ranges of Apennines, separated from each other by the golden haze of afternoon sunshine, and I pleased myself with the thought that Dante must have observed the same effect. I give a sketch of one of the steep, crowded streets, with the palace in the background.

In the "*Inferno*" Dante meets Guido di Montefeltro, who inquires of him whether, when he left that sweet Latin land, he left peace or war behind him.

"If thou art newly fallen to breathe the air
Of this blind world, from Latium's pleasant land,
Whence all the burden of my sins I bear,
Tell me if now Romagna's tribes remain
At peace or war; for I was of the hills,
Betwixt Urbino and the mountain chain
Whence Tiber first unlocks his infant rills."
T. W. Parsons Tr. "*Inf.*," xxvii. 25.

PADUA — 1306.

AT Padua exists one of the most precious of all the trecento monuments. This is the Arena Chapel. The place, as its name indicates, was a Roman theater. In 1303 Enrico Scrovigno, to whom it belonged, built within its precincts the chapel commonly called Santa Maria dell' Arena. It is not known whether it was intended for a domestic chapel, or for the use of the order of the Cavalieri di Santa Maria. Scrovigno employed Giotto, then in his youth, working at Padua, to build and decorate it. The chapel consists of a single aisle with a tribune at its end. The few architectural lines are of the simplest Gothic. It is, in fact, a hall, lined with pictures of the life of the Virgin. The chapel is concealed in a garden crowded with vines and vegetables, and is delightfully withdrawn from the streets. A pomegranate tree was by its door in full flower. These works are a most interesting study, but to describe them all would be too long. When I first visited this chapel in 1850, I was especially struck with the figure of the angel of the Resurrection; and returning after many years, the same figure seems the most beautiful of all.

When we remember that Giotto and Dante passed many hours together in this chapel, we do not require much power of imagination to repeople the place. I spent some time here alone, trying to copy the beautiful angel, but the light was insufficient, and the picture too high on the wall for me. I even procured a permission to put up a scaffold, meaning to spend some days there in copying; but the weather changed, the chapel became too dark for work, and as the rain continued, I gave up my plan.

There is a record of Dante's presence in Padua, being his name as witness to a contract drawn in the house of Donna Amata Papafava. This document is preserved by the Marchese Papafava.

RIMINI — 1307.

FROM Urbino I passed to Rimini, a few hours by diligence. The road is a descent till it reaches the sea. I was prepared to find in Rimini the most antique, the moldi-

IN URBINO.

est, most deserted, ivy-grown city that Italy could show — and never was I more mistaken. I had hoped to find some castle or palace where I could be assured that the sad Francesca had lived, and where the bitter, bloody tragedy of her fate was acted. Inquiring at once for the house of Francesca, I was shown a row of new houses in the busiest part of the city, and told that the house of Francesca

had once stood there! Near by is the cathedral devoted to the memory of Sigismund Malatesta and his wife Isotta, whose ciphers are united with the rose and elephant in a frieze border which surrounds the church. I took a little carriage and desired the driver to take me to the oldest part of the city, hoping to find something of the trecento date; but the driver thought best to take me to the

MALATESTA FORTRESS.

Casino, by the sea, and thus showed me the Rimini that I desired to find, replaced by a noisy resort for summer visitors,—gay

(Concluded in our next.)

music and bathing-houses, and everywhere the vulgar efflorescence that belongs to such places. I despaired of finding anything of old Rimini till I came to the fortress, which is, no doubt, partly at least of the old time. It is now a soldiers' barrack, and new roofs have been added to the old towers to make them habitable; but certain parts of the structure have the look of past ages hanging about them and the colors of sunset and twilight, and the open country beyond, gave dignity to the modernized pile. Though I could not find the house of Francesca, I must give a few of the immortal lines in which she tells the sad story to Dante:

"The land where I was born sits by the sea,
Upon that shore to which the Po descends,
With all his followers, in search of peace.
Love, which the gentle heart soon apprehends,
Seized him for the fair person that was ta'en
From me, and me even yet the mode offends.
Love, who to none beloved to love again
Remits, seized me with wish to please so strong
That, as thou seest, yet it doth remain.
Love to one death conducted us along,
But Caïna waits for him our life who ended."
Lord Byron Tr. "Inf.," v. 97.

VISIONS.

LATELY I drew my little skiff
To the edge of a lovely ocean isle,
And over the tall and wind-swept cliff,
A wanderer, climbed and strayed awhile.
Hither and thither I turned amid
The gray, old groves of beech and birch,
Saw where the brood of the partridge hid,
And startled the gray owl from his perch.
Deeper, anon, in my vagrant mood,
I sought the elder and alder brush,
And followed the rivulet where it wooed,
In its pretty manner, the reed and rush.
The small birds flitting from top to top,
Bowed the heads of the rushes low.
'Mid knotted hemlocks, drop by drop,
I saw the amber distilling slow.

Only a moment—a look askance,
The far-off gleam of a beautiful face,
No more than a maiden's one coy glance—
And then forever an empty place.

Into a thicket dark I bent,
Chasing the rivulet as it wound,
With little to mark the way it went,
Save under the ferns its own sweet sound.
There, of a sudden, betwixt the boughs,
Out in the open, full and clear,
I saw, as it stood with lifted brows,
Half turned to listen, an antlered deer.
It gazed with its great brown girlish eyes,
Till in the thicket they fell on me;
Then, with a look of wild surprise,
It tossed its antlers and turned to flee.
So have I followed a thousand ways,
In cities, some pleasing, idle din,
And then for a moment felt the gaze
Of one I would give the world to win.

James Herbert Morse.

DR. SEVIER.*

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," "Madame Delphine," etc.

XXIII.

WEAR AND TEAR.

THE arrangement for Dr. Sevier to place the loan of fifty dollars on his own books at Richling's credit naturally brought Narcisse into relation with it.

It was a case of love at first sight. From the moment the record of Richling's "little quantity" slid from the pen to the page, Narcisse had felt himself betrothed to it by destiny, and hourly supplicated the awful fates to frown not upon the amorous hopes of him unaugmented. Richling descended upon him once or twice and tore away from his embrace small fractions of the coveted treasure, choosing, through a diffidence which he mistook for a sort of virtue, the time of day when he would not see Dr. Sevier; and at the third visitation took the entire golden fleece away with him rather than encounter again the always more or less successful courtship of the scorner of loans.

A faithful suitor, however, was not thus easily shaken off. He became a frequent visitor at the Richlings', where he never mentioned money; that part was left to moments of accidental meeting with Richling in the street, which suddenly began to occur at singularly short intervals.

Mary labored honestly and arduously to dislike him—to hold a repellent attitude toward him. But he was too much for her. It was easy enough when he was absent; but one look at his handsome face, so rife with animal innocence, and despite herself she was ready to reward his displays of sentiment and erudition with laughter that, mean what it might, always pleased and flattered him.

"Can you help liking him?" she would ask John. "I can't, to save my life!"

Had the treasure been earnings, Richling said,—and believed,—he could firmly have repelled Narcisse's importunities. But coldly to withhold an occasional modest heave-offering of that which was the free bounty of another to him, was more than he could do.

"But," said Mary, straightening his cravat,

"you intend to pay up, and he—you don't think I'm uncharitable, do you?"

"I'd rather give my last cent than think you so," replied John. "Still,"—laying the matter before her with both open hands,— "if you say plainly not to give him another cent, I'll do as you say. The money's no more mine than yours."

"Well, you can have all my share," said Mary, pleasantly.

So the weeks passed and the hoard dwindled.

"What has it got down to, now?" asked John, frowningly, on more than one morning as he was preparing to go out. And Mary, who had been made treasurer, could count it at a glance without taking it out of her purse.

One evening, when Narcisse called, he found no one at home but Mrs. Riley. The infant Mike had been stuffed with rice and milk and laid away to slumber. The Richlings would hardly be back in less than an hour.

"I'm so'y," said Narcisse, with a baffled frown, as he sat down and Mrs. Riley took her seat opposite. "I came to 'epay 'em some moneys which he made me the loan—juz in a fwenly way. And I came to 'epay 'im. The sum-total, in fact—I suppose he nevva mentioned you about that, eh?"

"No, sir; but, still, if——"

"No, and so I can't pay it to you. I'm so'y. Because I know he woon like it, I know, if he fine that you know he's been bawing money to me. Well, Misses Wiley, in fact, thass a *ve'y* fine gentleman and lady—that Mistoo and Misses Witchlin, in fact?"

"Well, now, Mr. Narcisse, ye'r' about right! She's just too good to live—and he's not much better—ha! ha!" She checked her jesting mood. "Yes, sur, they're very peaceable, quiet people. They're jist simply ferst tlass!"

"'Tis t'ue," rejoined the Creole, fanning himself with his straw hat and looking at the Pope. "And they' handsome and genial, as the lite'ati say on the noozpapeh. Seem like they almoze wedded to each otheh."

"Well, now, sur, that's the t'trooth!" She threw her open hand down with emphasis. "And isn't that as man and wife should be?"

* Copyright, 1883, by George W. Cable. All rights reserved.

"You' mighty co'-ect, Misses Wiley!" Narcisse gave his pretty head a little shake from side to side as he spoke.

"Ah! Mr. Narcisse," she pointed at herself, "haven't I been a wife? The husband and wife—they'd aht to jist be each other's guairdian angels! Hairt to hairt, sur; sperit to sperit. All the rist is nawthing, Mister Narcisse." She waved her hands. "Min is different from women, sur." She looked about on the ceiling. Her foot noiselessly patted the floor.

"Yes," said Narcisse, "and thass the cause that they dwess them dif'ent. To show the dif'ence, you know."

"Ah! no. It's not the mortal frame, sur; it's the sperit. The sperit of man is not the sperit of woman. The sperit of woman is not the sperit of man. Each one needs the other, sur. They needs each other, sur, to purify and strinthen and enlaige each other's spiritu'l life. Ah! sur. Doo not I feel those things, sur?" She touched her heart with one backward-pointed finger. "I doo. It isn't good for min to be alone—much liss for women. Do not misunderstand me, sur; I speak as a widder, sur—and who always will be—ah! yes, I will—ha, ha, ha!" She hushed her laugh as if this were going too far, tossed her head, and continued smiling.

So they talked on. Narcisse did not stay an hour, but there was little of the hour left when he rose to go. They had passed a pleasant time. The Creole, it is true, tried and failed to take the helm of conversation. Mrs. Riley held it. But she steered well. She was still expatiating on the "strinthenin'" spiritual value of the marriage relation when she, too, stood up.

"And that's what Mr. and Madam Richlin's a-doin' all the time. And they do ut to perfiction, sur—jist to perfiction!"

"I doubt it not, Misses Wiley. Well, Misses Wiley, I bid you au 'evoi'. I dunno if you'll pummit me, but I am compel to tell you, Misses Wiley, I nevva yeh anybody in my life with such a educated and talented conve'sation like yo'seff. Misses Wiley, at what univussity did you gwaduate?"

"Well, reely, Mister—eh—" She fanned herself with broad sweeps of her purple-bordered palm-leaf—"reely, sur, if I don't furgit the name I—I—I'll be switched! ha, ha, ha!"

Narcisse joined in the laugh.

"Thaz the way, sometime," he said, and then with sudden gravity: "And, by the by, Misses Wiley, speakin' of Mistoo 'Itchlin',—if you could baw me two dollahs an' a half juz till tomaw mawnin—till I kin sen' it you

fum the office—? Because that money I've got faw Mistoo 'Itchlin' is in the shape of a check, and I'm c'owding me a little to pay that whole sum-total to Mistoo 'Itchlin'. I kinsen' it you firs' thing my bank open tomaw mawnin'."

Do you think he didn't get it?

"WHAT has it got down to now?" John asked again, a few mornings after Narcisse's last visit. Mary told him. He stepped a little way aside, averting his face, dropped his forehead into his hand, and returned.

"I don't see—I don't see, Mary—I——"

"Darling," she replied, reaching and capturing both his hands, "who does see? The rich *think* they see; but do they, John? Now, *do* they?"

The frown did not go quite off his face, but he took her head between his hands and kissed her temple.

"You're always trying to lift me," he said.

"Don't you lift me?" she replied, looking up between his hands and smiling.

"Do I?"

"You know you do. Don't you remember the day we took that walk, and you said that after all it never is we who provide?" She looked at the button of his coat which she twirled in her fingers. "That word lifted me."

"But suppose I can't practice the trust I preach?" he said.

"You do trust, though. You have trusted."

"Past tense," said John. He lifted her hands slowly away from him, and moved toward the door of their chamber. He could not help looking back at the eyes that followed him, and then he could not bear their look. "I—I suppose a man mustn't trust too much," he said.

"Can he?" asked Mary, leaning against a table.

"Oh, yes, he can," replied John; but his tone lacked conviction.

"If it's the right kind?"

Her eyes were full of tears.

"I'm afraid mine's not the right kind, then," said John, and passed out into and down the street.

But what a mind he took with him—what torture of questions. Was he being lifted or pulled down? His tastes—were they rising or sinking? Were little negligences of dress and bearing and in-door attitude creeping into his habits? Was he losing his discriminative sense of quantity, time, distance? Did he talk of small achievements, small gains, and small truths as though they were great? Had he learned to carp at the rich, and to make honesty the excuse for all penury? Had he these

various poverty marks? He looked at himself outside and inside, and feared to answer. One thing he knew—that he was having great wrestlings.

He turned his thoughts to Ristofalo. This was a common habit with him. Not only in thought, but in person, he hovered with a positive infatuation about this man of perpetual success.

Lately the Italian had gone out of town, into the country of La Fourche, to buy standing crops of oranges. Richling fed his hope on the possibilities that might follow Ristofalo's return. His friend would want him to superintend the gathering and shipment of those crops—when they should be ripe—away yonder in November. Frantic thought! A man and his wife could starve to death twenty times before then.

Mrs. Riley's high esteem for John and Mary had risen from the date of the Doctor's visit, and the good woman thought it but right somewhat to increase the figures of their room-rent to others more in keeping with such high gentility. How fast the little hoard melted away!

And the summer continued on—the long, beautiful, glaring, implacable summer; its heat quaking on the low roofs; its fig-trees dropping their shriveled and blackened leaves and writhing their weird, bare branches under the scorching sun; the long-drawn, frying note of its cicada throbbing through the midday heat from the depths of the becalmed oak; its universal pall of dust on the myriad red, sleep-heavy blossoms of the oleander and the white tulips of the lofty magnolia; its twinkling pomegranates hanging their apples of scarlet and gold over the garden wall; its little chameleons darting along the hot fence-tops; its far-stretching, empty streets; its wide hush of idleness; its solitary vultures sailing in the upper blue; its grateful clouds; its hot north winds, its cool south winds; its gasping twilight calms; its gorgeous nights,—the long, long summer lingered on into September.

One evening, as the sun was sinking below the broad, flat land, its burning disk reddened by a low golden haze of suspended dust, Richling passed slowly toward his home, coming from a lower part of the town by way of the quadroom quarter. He was paying little notice, or none, to his whereabouts, wending his way mechanically, in the dejected reverie of weary disappointment, and with voiceless inward screamings and groanings under the weight of those thoughts which had lately taken up their stay in his dismayed mind. But all at once his attention was challenged by a strange, offensive odor. He looked up and around, saw nothing,

turned a corner, and found himself at the intersection of Trémé and St. Anne streets, just behind the great central prison of New Orleans.

The "Parish Prison" was then only about twenty-five years old; but it had made haste to become offensive to every sense and sentiment of reasonable man. It had been built in the Spanish style,—a massive, dark, grim, huge, four-sided block, the fissure-like windows of its cells looking down into the four public streets which ran immediately under its walls. Dilapidation had followed hard behind ill-building contractors. Down its frowning masonry ran grimy streaks of leakage over peeling stucco and mold-covered brick. Weeds bloomed high aloft in the broken gutters under the scant and ragged eaves. Here and there the pale, debauched face of a prisoner peered shamelessly down through shattered glass or rusted grating; and everywhere in the still atmosphere floated the stifling smell of the unseen loathsomeness within.

Richling paused. As he looked up, he noticed a bat dart out from a long crevice under the eaves. Two others followed. Then three—a dozen—a hundred—a thousand—millions. All along the two sides of the prison in view they poured forth in a horrid black torrent,—myriads upon myriads. They filled the air. They came and came. Richling stood and gazed; and still they streamed out in gibbering waves, until the wonder was that anything but a witch's dream could contain them.

The approach of another passer roused him, and he started on. The step gained upon him—closed up with him; and at the moment when he expected to see the person go by, a hand was laid gently on his shoulder.

"Mistoo 'Tchlin', I 'ope you well, seh."

XXIV.

BROUGHT TO BAY.

ONE may take his choice between the two, but there is no escaping both in this life: the creditor—the borrower. Either, but never neither. Narcisse caught step with Richling, and they walked side by side.

"How I learned to mawch, I billong with a fiah comp'ny," said the Creole. "We mawch eve'y yeah on the fou'th of Mawch." He laughed heartily. "Thass a 'ime!—Mawch on the fou'th of Mawch! Thass poetwy, in fact, as you may say in a jesting way—ha, ha, ha!"

"Yes, and it's truth, besides," responded the drearier man.

"Yes!" exclaimed Narcisse, delighted at

the unusual coincidence, "at the same time 'tis the t'ooth! In fact, why should I tell a lie about such a thing like *that*? 'Twould be useless. Pe'haps you may 'ave notiz, Mistoo 'Itchlin', thad the noozepapehs opine us fiah-men to be the gaudians of the city."

"Yes," responded Richling. "I think Dr. Sevier calls you the Mamelukes, doesn't he? But that's much the same, I suppose."

"Same thing," replied the Creole. "We combat the fiah fiend. You fine that building ve'y pitto'esque, Mistoo 'Itchlin'?" He jerked his thumb toward the prison, that was still pouring forth its clouds of impish wings. "Yes? 'Tis the same with me. But I tell you one thing, Mistoo 'Itchlin', I assu' you, and you will believe me, I would 'atheh be lock' *outside* of that building than to be lock' *inside* of the same. 'Cause—you know why? 'Tis ve'y 'umid in that building. An thass a thing w'at I believe, Mistoo 'Itchlin'; I believe w'en a building is ve'y 'umid it is not ve'y 'ealthsome. What is yo' opinion consunning that, Mistoo 'Itchlin'?"

"My opinion?" said Richling, with a smile. "My opinion is that the Parish Prison would not be a good place to raise a family."

Narcisse laughed.

"I think yo' opinion is co'ect," he said, flatteringly; then growing instantly serious, he added, "Yessah, I think you' about a-ight, Mistoo 'Itchlin'; faw even if 'twas not too 'umid, 'twould be too confining, in fact,—speshly faw child'en. I dunno; but thass my opinion. If you ah p'ceeding at yo' residence, Mistoo 'Itchlin', I'll juz *continue* my p'omenade in yo' society—if not intooding—?"

Richling smiled candidly. "Your company's worth all it costs, Narcisse. Excuse me; I always forget your last name—and your first is so appropriate." It *was* worth all it cost, though Richling could ill afford the purchase. The young Latin's sweet, abysmal ignorance, his infantile amiability, his artless ambition, and heathenish innocence started the natural gladness of Richling's blood to effervescing anew every time they met, and, through the sheer impossibility of confiding any of his troubles to the Creole, made him think them smaller and lighter than they had just before appeared. The very light of Narcisse's countenance and beauty of his form—his smooth, low forehead, his thick, abundant locks, his faintly up-tipped nose and expanded nostrils, his sweet, weak mouth with its impending smile, his beautiful chin and bird's throat, his almond eyes, his full, round arm, and strong thigh—had their emphatic value.

So now, Richling, a moment earlier borne

down by the dreadful shadow of the Parish Prison, left it behind him as he walked and laughed and chatted with his borrower. He felt very free with Narcisse, for the reason that would have made a wiser person constrained—lack of respect for him.

"Mistoo 'Ichlin', you know," said the Creole, "I like you to call me Narcisse? But at the same time my las' name is Savillot." He pronounced it Sav-*veel*-yo. "Thass a somewot Spanish name. That double I got a twis' in it."

"Oh, call it Papilio!" laughed Richling.

"Papillon!" exclaimed Narcisse, with delight. "The buttehfly! All a-ight; you kin juz style me that! 'Cause thass my natu'e, Mistoo 'Itchlin'; I gatheh honey eve'y day fum eve'y opening floweh, as the bahd of A-von wemawk."

So they went on.

Ad infinitum? Ah, no! The end was just as plainly in view to both from the beginning as it was when, at length, the two stepping across the street-gutter at the last corner between Richling and home, Narcisse laid his open hand in his companion's elbow and stopped, saying, as Richling turned and halted with a sudden frown of unwillingness:

"I tell you 'ow 'tis with me, Mistoo 'Itchlin', I 've p'object that manneh myseff; in weading a book—w'en I see a beacheouz idee, I juz take a pencil"—he drew one from his pocket—"check! I check it. So w'en I wead the same book again, then I take notiz I've check that idee and I look to see what I check it faw. 'Ow you like that invention, eh?"

"Very simple," said Richling, with an unpleasant look of expectancy.

"Mistoo 'Itchlin'," resumed the other, "do you not fine me impooving in my p'onouncement of yo' lang-widge? I fine I don't use such bad lang-widge like biffa. I am shoe you muz 'ave notiz since some time I always soun' that awe in yo' name. Mistoo 'Itchlin', will you 'ave that kine'ness to baw me two-an'-a-alf till the lass of that month?"

Richling looked at him a moment in silence and then broke into a short, grim laugh.

"It's all gone. There's no more honey in this flower." He set his jaw as he ceased speaking. There was a warm red place on either cheek.

"Mistoo 'Itchlin'," said Narcisse, with sudden, quavering fervor, "you kin len' me two dollahs! I gi'e you my honoh the moze sacwed of a gen'leman, Mistoo 'Itchlin', I nevveh hass you agin so long I live!" He extended a pacifying hand. "One moment, Mistoo 'Itchlin',—one moment,—I implo'

you, seh! I assu' you, Mistoo 'Itchlin', I pay you eve'y cent in the worl' on the laz of that month! Mistoo 'Itchlin', I am in indignan' circumstan's. Mistoo 'Itchlin', if you know the distwess—Mistoo 'Itchlin', if you know—'ow bad I 'ate to baw!" The tears stood in his eyes. "Id nea'ly *kill* me to b——" Utterance failed him.

"My friend," began Richling.

"Mistoo 'Itchlin'," exclaimed Narcisse, dashing away the tears and striking his hand on his heart, "I *am* yo' fwend, seh!"

Richling smiled scornfully. "Well, my good friend, if you had ever kept a single promise made to me, I need not have gone since yesterday without a morsel of food."

Narcisse tried to respond

"Hush" said Richling, and Narcisse bowed while Richling spoke on. "I haven't a cent to buy bread with to carry home. And whose fault is it? Is it my fault—or is it yours?"

"Mistoo 'Itchlin', seh——"

"Hush!" cried Richling again; "if you try to speak again before I finish, I'll thrash you right here in the street!"

Narcisse folded his arms. Richling flushed and flashed with the mortifying knowledge that his companion's behavior was better than his own.

"If you want to borrow more money of me," he cried, "find me a chance to earn it!" He glanced so suddenly at two or three street lads, who were the only on-lookers, that they shrank back a step.

"Mistoo 'Itchlin'," began Narcisse once more, in a tone of polite dismay, "you azton-izh me. I assu' you, Mistoo 'Itchlin'——"

Richling lifted his finger and shook it. "Don't you tell me that, sir! I will not be an object of astonishment to you! Not to you, sir! Not to you!" He paused, trembling, his anger and his shame rising together.

Narcisse stood for a moment, silent, undaunted, the picture of amazed friendship and injured dignity, then raised his hat with the solemnity of affronted patience and said:

"Mistoo 'Itchlin', seein' as 'tis you,—a puffic gen'leman, 'oo is not goin' to 'efuse that satisfaction w'at a gen'leman always a-'eady to give a gen'leman,—I bid you—faw the pwesen—good-evenin', seh!" He walked away.

Richling stood in his tracks dumfounded, crushed. His eyes followed the receding form of the borrower until it disappeared around a distant corner, while the eye of his mind looked in upon himself and beheld, with a shame that overwhelmed anger, the folly and the puerility of his outburst. The nervous strain of twenty-four hours' fast, without which he might not have slipped at all, only

sharpened his self-condemnation. He turned and walked to his house, and all the misery that had oppressed him before he had seen the prison, and all that had come with that sight, and all this new shame, sank down upon his heart at once. "I am not a man! I am not a whole man!" he suddenly moaned to himself. "Something is wanting—oh! what is it?" He lifted his eyes to the sky—"What is it?"—when, in truth, there was little wanting just then besides food.

He passed in at the narrow gate and up the slippery alley. Nearly at its end was the one window of the room he called home. Just under it—it was somewhat above his head—he stopped and listened. A step within was moving busily here and there, now fainter and now plainer; and a voice, the sweetest on earth to him, was singing to itself in its soft, habitual way.

He started around to the door with a firmer tread. It stood open. He halted on the threshold. There was a small table in the middle of the room, and there was food on it. A petty reward of his wife's labor had brought it there.

"Mary," he said, holding her off a little, "don't kiss me yet."

She looked at him with consternation. He sat down, drew her upon his lap, and told her, in plain, quiet voice, the whole matter.

"Don't look so, Mary."

"How?" she asked, in a husky voice and with flashing eye.

"Don't breathe so short and set your lips. I never saw you look so, Mary, darling."

She tried to smile, but her eyes filled.

"If you had been with me," said John, musingly, "it wouldn't have happened."

"If—if—" Mary sat up as straight as a dart, the corners of her mouth twitching so that she could scarcely shape a word—"if—if I'd been there, I'd have made you *whip* him!" She flouted her handkerchief out of her pocket, buried her face in his neck, and sobbed like a child.

"Oh!" exclaimed the tearful John, holding her away by both shoulders, tossing back his hair and laughing as she laughed,—“Oh! you women! You're all of a sort! You want us men to carry your hymn-books and your iniquities, too!"

She laughed again.

"Well, of course!"

And they rose and drew up to the board.

XXV.

THE DOCTOR DINES OUT.

ON the third day after these incidents, again at the sunset hour, but in a very differ-

ent part of the town, Dr. Sevier sat down, a guest, at dinner. There were flowers; there was painted and monogrammed china; there was Bohemian glass; there was silver of cunning work with linings of gold, and damasked linen, and oak of fantastic carving. There were ladies in summer silks and elaborate coiffures; the hostess, small, slender, gentle, alert; another, dark, flashing, Roman, tall; another, ripe but not drooping, who had been beautiful, now, for thirty years; and one or two others. There were jewels; there were sweet odors. And there were, also, some good masculine heads: Dr. Sevier's, for instance; and the chief guest's—an iron-gray, with hard lines in the face, and a scar on the near cheek, a colonel of the regular army passing through from Florida; and one crown, bald, pink, and shining, encircled by a silken fringe of very white hair; it was the banker who lived in St. Mary street. His wife was opposite. And there was much high-bred grace. There were tall windows thrown wide to make the blaze of gas bearable, and two tall mulattoes in the middle distance bringing in and bearing out viands too sumptuous for any but a French nomenclature.

It was what you would call a quiet affair; quite out of season, and difficult to furnish with even this little handful of guests, but it was a proper and necessary attention to the colonel; conversation not too dull, nor yet too bright for ease, but passing gracefully from one agreeable topic to another without earnestness, a restless virtue, or frivolity, which also goes against serenity. Now it touched upon the prospects of young A. B. in the demise of his uncle; now upon the probable seriousness of C. D. in his attentions to E. F.; now upon G.'s amusing mishaps during a late tour in Switzerland, which had—"how unfortunately!"—got into the papers. Now it was concerning the admirable pulpit manners and easily pardoned vocal defects of a certain new rector. Now it turned upon Stephen A. Douglas's last speech; passed to the questionable merits of a new-fangled punch; and now, assuming a slightly explanatory form from the gentlemen to the ladies, showed why there was no need whatever to fear a financial crisis—which came soon afterward.

The colonel inquired after an old gentleman whom he had known in earlier days in Kentucky.

"It's many a year since I met him," he said. "The proudest man I ever saw. I understand he was down here last season."

"He was," replied the host, in a voice of native kindness, and with a smile on his high-fed face. "He was; but only for a short time.

He went back to his estate. That is his world. He's there now."

"It used to be considered one of the finest places in the State," said the colonel.

"It is still," rejoined the host. "Doctor, you know him?"

"I think not," said Dr. Sevier; but somehow he recalled the old gentleman in button gaiters, who had called on him one evening to consult him about his sick wife.

"A good man," said the colonel, looking amused; "and a superb gentleman. Is he as great a partisan of the church as he used to be?"

"Greater! Favors an established church of America."

The ladies were much amused. The host's son, a young fellow with sprouting side-whiskers, said he thought he could be quite happy with one of the finest plantations in Kentucky, and let the church go its own gait.

"Humph!" said the father; "I doubt if there's ever a happy breath drawn on the place."

"Why, how is that?" asked the colonel, in a cautious tone.

"Hadn't he heard?" The host was surprised, but spoke low. "Hadn't heard about the trouble with their only son? Why, he went abroad and never came back."

Every one listened.

"It's a terrible thing," said the hostess to the ladies nearest her; "no one ever dares ask the family what the trouble is,—they have such odd, exclusive ideas about their matters being nobody's business. All that can be known is that they look upon him as worse than dead and gone forever."

"And who will get the estate?" asked the banker.

"The two girls. They're both married."

"They're very much like their father," said the hostess, smiling with gentle significance.

"Very much," echoed the host, with less delicacy. "Their mother is one of those women who stand in terror of their husband's will. Now, if he were to die and leave her with a will of her own she would hardly know what to do with it—I mean with her will—or the property either."

The hostess protested softly against so harsh a speech, and the son, after one or two failures, got in his remark:

"May be the prodigal would come back and be taken in."

But nobody gave this conjecture much attention. The host was still talking of the lady without a will.

"Isn't she an invalid?" Dr. Sevier had asked.

"Yes; the trip down here last season was

on her account—for change of scene. Her health is wretched.”

“I’m distressed that I didn’t call on her,” said the hostess; “but they went away suddenly. My dear, I wonder if they really did encounter the young man here?”

“Pshaw,” said the husband, softly, smiling and shaking his head, and turned the conversation.

In time it settled down with something like earnestness for a few minutes upon a subject which the rich find it easy to discuss without the least risk of undue warmth. It was about the time when one of the graciously murmuring mulattoes was replenishing the glasses, that remark in some way found utterance to this effect—that the company present could congratulate themselves on living in a community where there was no poor class.

“Poverty, of course, we see; but there is no misery, or nearly none,” said the ambitious son of the host.

Dr. Sevier differed with him. That was one of the Doctor’s blemishes as a table guest: he would differ with people.

“There is misery,” he said; “may be not the gaunt squalor and starvation of London or Paris or New York; the climate does not tolerate that—stamps it out before it can assume dimensions; but there is at least misery of that sort that needs recognition and aid from the well-fed.”

The lady who had been beautiful so many years had somewhat to say; the physician gave attention, and she spoke:

“If sister Jane were here, she would be perfectly triumphant to hear you speak so, Doctor.” She turned to the hostess and continued: “Jane is quite an enthusiast, you know; a sort of Dorcas, as husband says, modified and readapted. Yes, she is for helping everybody.”

“Whether help is good for them or not,” said the lady’s husband, a very straight and wiry man with a garrote collar.

“It’s all one,” laughed the lady. “Our new rector told her plainly, the other day, that she was making a great mistake; that she ought to consider whether assistance assists. It was really amusing. Out of the pulpit and off his guard, you know, he lisps a little; and he said she ought to consider whether ‘aththithtanth aththithth.’”

There was a gay laugh at this, and the lady was called a perfect and cruel mimic.

“‘Aththithtanth aththithth!’” said two or three to their neighbors, and laughed again.

“What did your sister say to that?” asked the banker, bending forward his white, tanned head, and smiling down the board.

“She said she didn’t care; that it kept her

own heart tender, anyhow. ‘My dear madam,’ said he, ‘your heart wants strengthening more than softening.’ He told her a pound of inner resource was more true help to any poor person than a ton of assistance.”

The banker commended the rector. The hostess, very sweetly, offered her guarantee that Jane took the rebuke in good part.

“She did,” replied the time-honored beauty; “she tried to profit by it. But husband, here, has offered her a wager of a bonnet against a hat that the rector will upset her new schemes. Her idea now is to make work for those whom nobody will employ.”

“Jane,” said the kind-faced host, “really wants to do good for its own sake.”

“I think she’s even a little Romish in her notions,” said Jane’s wiry brother-in-law. “I talked to her as plainly as the rector. I told her: ‘Jane, my dear, all this making of work for the helpless poor is not worth one-fiftieth part of the same amount of effort spent in teaching and training those same poor to make their labor intrinsically marketable.’”

“Yes,” said the hostess, “but while we are philosophizing and offering advice so wisely, Jane is at work—doing the best she knows how. We can’t claim the honor even of making her mistakes.”

“Tisn’t a question of honors to us, madam,” said Dr. Sevier; “it’s a question of results to the poor.”

The brother-in-law had not finished. He turned to the Doctor:

“Poverty, Doctor, is an inner condition—”

“Sometimes,” interposed the Doctor.

“Yes, generally,” continued the brother-in-law, with some emphasis. “And to give help you must, first of all, ‘inquire within’—within your beneficiary.”

“Not always, sir,” replied the Doctor; “not if they’re sick, for instance.” The ladies bowed briskly and applauded with their eyes. “And not always if they’re well,” he added. His last words softened off almost into soliloquy.

The banker spoke forcibly:

“Yes, there are two quite distinct kinds of poverty. One is an accident of the moment; the other is an inner condition of the individual——”

“Of course it is,” said sister Jane’s brother-in-law, who felt it a little to have been contradicted on the side of kindness by the hard-spoken Doctor. “Certainly! it’s a deficiency of inner resources or character, and what to do with it is no simple question.”

“That’s what I was about to say,” resumed the banker; “at least, when the poverty is of that sort. And what discourages kind people is that that’s the sort we com-

monly see. It's a relief to meet the other, Doctor, just as it's a relief to a physician to encounter a case of simple surgery."

"And—and," said the brother-in-law, "what is your rule about plain alms-giving to the difficult sort?"

"My rule," replied the banker, "is, don't do it. Debt is slavery, and there is an ugly kink in human nature that disposes it to be content with slavery. No, sir; gift-making and gift-taking are twins of a bad blood." The speaker turned to Dr. Sevier for approval; but though the Doctor could not gainsay the fraction of a point, he was silent. A lady near the hostess stirred softly both under and above the board. In her private chamber she would have yawned. Yet the banker spoke again:

"Help the old, I say. You are pretty safe there. Help the sick. But as for the young and strong,—now, no man could be any poorer than I was at twenty-one,—and I say be cautious how you smooth that hard road which is the finest discipline the young can possibly get."

"If it isn't *too* hard," chirped the son of the host.

"Too hard? Well, yes, if it isn't too hard. Still I say, hands off. You needn't turn your back, however." Here the speaker again singled out Dr. Sevier. "Watch the young man out of one corner of your eye; but make him swim!"

"Ah-h!" said the ladies.

"No, no," continued the banker; "I don't say let him drown; but I take it, Doctor, that your alms, for instance, are no alms if they put the poor fellow into your debt and at your back."

"To whom do you refer?" asked Dr. Sevier. Whereat there was a burst of laughter, which was renewed when the banker charged the physician with helping so many persons, "on the sly," that he couldn't tell which one was alluded to unless the name were given.

"Doctor," said the hostess, seeing it was high time the conversation should take a new direction, "they tell me you have closed your house and taken rooms at the St. Charles."

"For the summer," said the physician.

As, later, he walked toward that hotel, he went resolving to look up the Richlings again without delay. The banker's words rang in his ears like an overdose of quinine: "Watch the young man out of one corner of your eye. Make him swim. I don't say let him drown."

"Well, I do watch him," thought the Doctor. "I've only lost sight of him once in awhile." But the thought seemed to find an echo against his conscience, and when it floated

back it was: "I've only *caught* sight of him once in awhile." The banker's words came up again: "Don't put the poor fellow into your debt and at your back." "Just what you've done," said conscience. "How do you know he isn't drowned?" He would see to it.

While he was still on his way to the hotel, he fell in with an acquaintance, a Judge Somebody or other, lately from Washington City. He, also, lodged at the St. Charles. They went together. As they approached the majestic porch of the edifice, they noticed some confusion at the bottom of the stairs that led up to the rotunda; cabmen and boys were running to a common point, where, in the midst of a small, compact crowd, two or three pairs of arms were being alternately thrown aloft and brought down. Presently the mass took a rapid movement up St. Charles street.

The judge gave his conjecture: "Some poor devil resisting arrest."

Before he and the Doctor parted for the night, they went to the clerk's counter.

"No letters for you, Judge; mail failed. Here is a card for you, Doctor."

The Doctor received it. It had been furnished, blank, by the clerk, to its writer.

JOHN RICHLING.

At the door of his own room, with one hand on the unturned knob and one holding the card, the Doctor stopped and reflected. The card gave no indication of urgency. Did it? It was hard to tell. He didn't want to look foolish; morning would be time enough; he would go early next morning.

But at day-break he was summoned post-haste to the bedside of a lady who had staid all summer in New Orleans, so as not to be out of this good doctor's reach at this juncture. She counted him a dear friend, and in similar trials had always required close and continual attention. It was the same now.

Dr. Sevier scrawled and sent to the Richlings a line saying that, if either of them was sick, he would come at their call. When the messenger returned with word from Mrs. Riley that both of them were out, the Doctor's mind was much relieved. So a day and a night passed, in which he did not close his eyes.

The next morning, as he stood in his office, hat in hand, and a finger pointing to a prescription on his desk, which he was directing

Narcisse to give to some one who would call for it, there came a sudden hurried pounding of feminine feet on the stairs, a whiff of robes in the corridor, and Mary Richling rushed into his presence all tears and cries.

"O Doctor!—O Doctor! O God, my husband! my husband! O Doctor, my husband is in the Parish Prison!" She sank to the floor.

The Doctor raised her up. Narcisse hurried forward with his hands full of restoratives.

"Take away those things," said the Doctor, resentfully. "Here!—Mrs. Richling, take Narcisse's arm and go down and get into my carriage. I must write a short note excusing myself from an appointment, and then I will join you."

Mary stood alone, turned, and passed out of the office beside the young Creole, but without taking his proffered arm. Did she suspect him of having something to do with this dreadful affair?

"Missez Witchlin'," said he, as soon as they were out in the corridor, "I dunno if you goin' to billiv me, but I boun' to tell you that nodwithstanning that yo' 'uzban' is displeas' with me, an' nodwithstanning 'e's in that calaboose, I h'always fine 'im a puffic gen'laman—that Mistoo 'Itchlin',—an' I'll sweah 'e *is* a gen'laman!"

She lifted her anguished eyes and looked into his beautiful face. Could she trust him? His little forehead was as hard as a goat's, but his eyes were brimming with tears, and his chin quivered. As they reached the head of the stairs he again offered his arm, and she took it, moaning, as they descended:

"Oh, John! Oh, John! Oh, my husband, my husband!"

XXVI.

THE TROUGH OF THE SEA.

NARCISSE, on receiving his scolding from Richling, had gone to his home in Casa Calvo street, a much greater sufferer than he had appeared to be. While he was confronting his abaser, there had been a momentary comfort in the contrast between Richling's ill behavior and his own self-control. It had stayed his spirit and turned the edge of Richling's sharp denunciations. But, as he moved off the field, he found himself, at every step, more deeply wounded than even he had supposed. He began to suffocate with chagrin, and hurried his steps in sheer distress. He did not experience that dull, vacant acceptance of universal scorn which an unresentful coward feels. His pangs were all the more poignant because he knew his own courage.

In his home he went so straight up to the withered little old lady in the dingiest of flimsy black, who was his aunt, and kissed her so passionately, that she asked at once what was the matter. He recounted the facts, shedding tears of mortification. Her feeling, by the time he had finished the account, was a more unmixed wrath than his, and, harmless as she was, and wrapped up in her dear, pretty nephew as she was, she yet demanded to know why such a man shouldn't be called out upon the field of honor.

"Ah!" cried Narcisse, shrinkingly. She had touched the core of the tumor. One gets a public tongue-lashing from a man concerning money borrowed: well, how is one going to challenge him without first handing back the borrowed money? It was a scalding thought! The rotten joists beneath the bare, scrubbed-to-death floor quaked under Narcisse's to-and-fro stride.

"—And then, anyhow!"—he stopped and extended both hands, speaking, of course, in French,—“anyhow, he is the favored friend of Dr. Sevier. If I hurt him—I lose my situation! If he hurts me—I lose my situation!”

He dried his eyes. His aunt saw the insurmountability of the difficulty, and they drowned feeling in an affectionate glass of green-orangeade.

"But never mind!" Narcisse set his glass down and drew out his tobacco. He laughed spasmodically as he rolled his cigarette. "You shall see. The game is not finished yet."

Yet Richling passed the next day and night without assassination, and on the second morning afterward, as on the first, went out in quest of employment. He and Mary had eaten bread, and it had gone into their life without a remainder either in larder or purse. Richling was all aimless.

"I do wish I had the *art* of finding work," said he. He smiled. "I'll get it," he added, breaking their last crust in two. "I have the science already. Why, look you, Mary, the quiet, amiable, imperturbable, dignified, diurnal, inexorable haunting of men of influence will get you whatever you want."

"Well, why don't you do it, dear? Is there any harm in it? I don't see any harm in it. Why don't you do that very thing?"

"I'm telling you the truth," answered he, ignoring her question. "Nothing else short of overtowering merit will get you what you want half so surely."

"Well, why not do it? Why not?" A fresh, glad courage sparkled in the wife's eyes.

"Why, Mary," said John, "I never in my life tried so hard to do anything else as I've

tried to do that! It sounds easy; but try it! You can't conceive how hard it is till you try it. I can't *do* it! I *can't* do it!"

"*I'd* do it!" cried Mary. Her face shone. "*I'd* do it! You'd see if I didn't! Why, John——"

"All right!" exclaimed he; "you sha'n't talk that way to me for nothing. I'll try it again! I'll begin to-day!"

"Good-bye," he said. He reached an arm over one of her shoulders and around under the other and drew her up on tiptoe. She threw both hers about his neck. A long kiss—then a short one.

"John, something tells me we're near the end of our troubles."

John laughed grimly. "Ristofalo was to get back to the city to-day; may be he's going to put us out of our misery. There are two ways for troubles to end." He walked away as he spoke. As he passed under the window in the alley, its sash was thrown up and Mary leaned out on her elbows.

"John."

"Well?"

They looked into each other's eyes with the quiet pleasure of tried lovers, and were silent a moment. She leaned a little farther down, and said, softly:

"You mustn't mind what I said just now."

"Why, what did you say?"

"That if it were I, I'd do it. I know you can do anything I can do, and a hundred better things besides."

He lifted his hand to her cheek. "We'll see," he whispered. She drew in, and he moved on.

Morning passed. Noon came. From horizon to horizon, the sky was one unbroken blue. The sun spread its bright, hot rays down upon the town and far beyond, ripening the distant, countless fields of the great delta, which by and by were to empty their abundance into the city's lap for the employment, the nourishing, the clothing of thousands. But in the dusty streets, along the ill-kept fences and shadowless walls of the quiet districts, and on the glaring façades and heated pavements of the commercial quarters, it seemed only as though the slowly retreating summer struck with the fury of a wounded Amazon. Richling was soon dust-covered and weary. He had gone his round. There were not many men whom he could even propose to haunt. He had been to all of them. Dr. Sevier was not one. "Not to-day," said Richling.

"It all depends on the way it's done," he said to himself; "it needn't degrade a man if it's done the right way." It was only by such philosophy he had done it at all.

Ristofalo he could have haunted without effort; but Ristofalo was not to be found. Richling tramped in vain. It may be that all plans were of equal merit just then. The summers of New Orleans in those times were, as to commerce, an utter torpor, and the autumn re-awakening was very tardy. It was still too early for the stirrings of general mercantile life. The movement of the cotton crop was just beginning to be perceptible; but otherwise almost the only sounds were from the hammers of craftsmen making the town larger and preparing it for the activities of days to come.

The afternoon wore along. Not a cent yet to carry home! Men began to shut their idle shops and go to meet their wives and children about their comfortable dinner-tables. The sun dipped low. Hammers and saws were dropped into tool-boxes, and painters pulled themselves out of their overalls. The mechanic's rank, hot supper began to smoke on its bare board; but there was one board that was still altogether bare and to which no one hastened. Another day and another chance of life were gone.

Some men at a warehouse door, the only opening in the building left unclosed, were hurrying in a few bags of shelled corn. Night was falling. At an earlier hour Richling had offered the labor of his hands at this very door and had been rejected. Now, as they rolled in the last truck-load, they began to ask for rest with all the gladness he would have felt to be offered toil, singing,

"To blow, to blow, some time for to blow."

They swung the great leaves of the door together as they finished their chorus, stood grouped outside a moment while the warehouseman turned the resounding lock, and then went away. Richling, who had moved on, watched them over his shoulder, and as they left turned back. He was about to do what he had never done before. He went back to the door where the bags of grain had stood. A drunken sailor came swinging along. He stood still and let him pass; there must be no witnesses. The sailor turned the next corner. Neither up nor down nor across the street, nor at dust-begrimed, cobwebbed window, was there any sound or motion. Richling dropped quickly on one knee and gathered hastily into his pocket a little pile of shelled corn that had leaked from one of the bags.

That was all. No harm to a living soul; no theft; no wrong; but ah! as he rose he felt a sudden inward lesion. Something broke.

It was like a ship, in a dream, noiselessly striking a rock where no rock is. It seemed as though the very next thing was to begin going to pieces. He walked off in the dark shadow of the warehouse, half lifted from his feet by a vague, wide dismay. And yet he felt no greatness of emotion, but rather a painful want of it, as if he were here and emotion were yonder, down-street or up-street or around the corner. The ground seemed slipping from under him. He appeared to have all at once melted away to nothing. He stopped. He even turned to go back. He felt that if he should go and put that corn down where he had found it, he should feel himself once more a living thing of substance and emotions. Then it occurred to him—no, he would keep it; he would take it to Mary; but himself—he would not touch it; and so he went home.

Mary parched the corn, ground it fine in the coffee-mill, and salted and served it close beside the candle. "It's good white corn," she said, laughing. "Many a time when I was a child I used to eat this in my play-house and thought it delicious. Didn't you? What! not going to eat?"

Richling had told her how he got the corn. Now he told his sensations. "You eat it, Mary," he said at the end; "you needn't feel so about it; but if I should eat it, I should feel myself a vagabond. It may be foolish, but I wouldn't touch it for a hundred dollars." A hundred dollars had come to be his synonym for infinity.

Mary gazed at him a moment tearfully, and rose with the dish in her hand, saying with a smile, "I'd look pretty, wouldn't I!" she set it aside and came and kissed his forehead. By and by she asked:

"And so you saw no work, anywhere?"

"Oh, yes," he replied in a tone almost free from dejection, "I saw any amount of work—preparations for a big season. I think I certainly shall pick up something to-morrow—enough, anyhow, to buy something to eat with. If we only can hold out a little longer—just a little—I am sure there'll be plenty to do—for everybody." Then he began to show distress again. "I could have got work to-day if I had been a carpenter, or if I'd been a joiner, or a slater, or a bricklayer, or a plasterer, or a painter, or a hod-carrier. Didn't I try that and was refused?"

"I'm glad of it," said Mary.

"Show me your hands," said the man to me. I showed them. 'You wont do,' said he."

"I'm glad of it!" said Mary, again.

"No," continued Richling; "or if I'd been a glazier, or a whitewasher, or a wood-sawyer,

or——" he began to smile in a hard, unpleasant way,—“or if I'd been anything but an American gentleman. But I wasn't, and I didn't get the work!"

Mary sank into his lap, with her very best smile.

"John, if you hadn't been an American gentleman——"

"We should never have met," said John.

"That's true; that's true." They looked at each other, rejoicing in mutual ownership.

"But," said John, "I needn't have been the typical American gentleman—completely outfitted for prosperity and totally unequipped for adversity."

"That's not your fault," said Mary.

"No, not entirely; but it's your calamity, Mary. Oh, Mary! I little thought——"

She put her hand quickly upon his mouth. His eye flashed and he frowned.

"Don't do so!" he exclaimed, putting the hand away; then blushed for shame, and kissed away her tear.

They went to bed. Bread would have put them to sleep. But after a long time——

"John," said one voice in the darkness, "do you remember what Dr. Sevier told us?"

"Yes, he said we had no right to commit suicide by starvation."

"If you don't get work to-morrow, are you going to see him?"

"I am."

In the morning they rose early.

During these hard days Mary was now and then conscious of one feeling which she never expressed, and was always a little more ashamed of than probably she need have been, but which, stifle it as she would, would recur in moments of stress. Mrs. Riley—such was the thought—need not be quite so blind. It came to her as John once more took his good-bye, the long kiss and the short one, and went breakfastless away. But was Mrs. Riley as blind as she seemed? She had vision enough to observe that the Richlings had bought no bread the day before, though she did overlook the fact that emptiness would set them astir before their usual hour of rising. She knocked at Mary's inner door. As it opened a quick glance showed the little table that occupied the center of the room standing clean and idle.

"Why, Mrs. Riley!" cried Mary; for on one of Mrs. Riley's large hands there rested a blue-edged soup-plate, heaping full of the food that goes nearest to the Creole heart—*jambolaya*. There it was, steaming and smelling,—a delicious confusion of rice and red pepper, chicken legs, ham, and tomatoes. Mike, on her opposite arm, was struggling to lave his socks in it.

"Ah!" said Mrs. Riley, with a disappointed lift of the head, "ye're after eating breakfast already! And the plates all tleared off. Well, ye air smairt! I knowed Mr. Richlin's taste for jumbalie ——"

Mary smote her hands together. "And he's just this instant gone! John! John! Why, he's hardly ——" She vanished through the door, glided down the alley, leaned out the gate, looking this way and that, tripped down to this corner and looked — "Oh! oh!" — no John there — back and up to the other corner — "Oh! which way did John go?" There was none to answer.

Hours passed; the shadows shortened and shrunk under their objects, crawled around stealthily behind them as the sun swung through the south, and presently began to steal away eastward, long and slender. This was the day that Dr. Sevier dined out, as hereinbefore set forth.

The sun set. Carondelet street was deserted. You could hear your own footstep on its flags. In St. Charles street, the drinking-saloons and gamblers' drawing-rooms, and the barber shops, and the show-cases full of shirt-bosoms and walking-canes, were lighted up. The smell of lemons and mint grew finer than ever. Wide Canal street, out under the darkling crimson sky, was resplendent with countless many-colored lamps. From the river the air came softly, cool and sweet. The telescope man set up his skyward-pointing cylinder hard by the dark statue of Henry Clay, the confectioneries were ablaze and full of beautiful life, and every little while a great, empty cotton-float or two went thundering homeward over the stony pavements until the earth shook, and speech for the moment was drowned. The St. Charles, such a glittering mass in winter nights, stood out high and dark under the summer stars, with no glow except just in its midst, in the rotunda; and even the rotunda was well-nigh deserted. The clerk at his counter saw a young man enter the great door opposite, and quietly marked him as he drew near.

Let us not draw the stranger's portrait. If that were a pleasant task, the clerk would not have watched him. What caught and kept that functionary's eye was that, whatever else might be revealed by the stranger's aspect,—weariness, sickness, hardship, pain,—the confession was written all over him, on his face, on his garb, from his hat's crown to his shoe's sole, Penniless, Penniless. Only when he had come quite up to the counter the clerk did not see him at all.

"Is Dr. Sevier in?"

"Gone out to dine," said the clerk, looking over the inquirer's head as if occupied with

all the world's affairs except the subject in hand.

"Do you know when he will be back?"

"Ten o'clock."

The visitor repeated the hour murmurously and looked something dismayed. He tarried.

"Hem! —— I will leave my card, if you please."

The clerk shoved a little box of cards toward him, from which a pencil dangled by a string. The penniless wrote his name and handed it in. Then he moved away, went down the tortuous granite stair, and waited in the obscurity of the dimly lighted porch below. The card was to meet the contingency of the Doctor's coming in by some other entrance. He would watch for him here.

By and by—he was very weary—he sat down on the stairs. But a porter with a huge trunk on his back told him very distinctly that he was in the way there, and he rose and stood aside. Soon he looked for another resting-place. He must get off of his feet somewhere, if only for a few moments. He moved back into the deep gloom of the stair-way shadow and sank down upon the pavement. In a moment he was fast asleep.

He dreamed that he, too, was dining out. Laughter and merry-making were on every side. The dishes of steaming viands were grotesque in bulk. There were mountains of fruit and torrents of wine. Strange people of no identity spoke in senseless vaporings that passed for side-splitting wit, and friends whom he had not seen since childhood appeared in ludicrously altered forms and announced impossible events. Every one ate like a Cossack. One of the party, champing like a boar, pushed him angrily, and when he, eating like the rest, would have turned fiercely on the aggressor, he awoke.

A man standing over him struck him smartly with his foot.

"Get up out o' this; get up, get up."

The sleeper bounded to his feet. The man who had waked him grasped him by the lapel of his coat.

"What do you mean?" exclaimed the awakened man, throwing the other off violently.

"I'll show you!" replied the other, returning with a rush; but he was thrown off again, this time with a blow of the fist.

"You scoundrel!" cried the penniless man, in a rage; "if you touch me again I'll kill you!"

They leaped together. The one who had proposed to show what he meant was knocked flat upon the stones. The crowd that had

run into the porch made room for him to fall. A leather helmet rolled from his head, and the silver crescent of the police flashed on his breast. The police were not uniformed in those days.

But he is up in an instant and his adversary is down — backward, on his elbows. Then the penniless man is up again; they close and struggle, the night-watchman's club falls across his enemy's head blow upon blow, while the sufferer grasps him desperately, with both hands, by the throat. They tug, they snuffle, they reel to and fro in the yielding crowd; the blows grow fainter, fainter; the grip is terrible; when suddenly there is a violent rupture of the crowd, it closes again, and then there are two against one, and up sparkling St. Charles street, the street of all streets for flagrant, unmolested, well-dressed crime, moves a sight so exhilarating that a score of street lads follow behind and a dozen trip along in front with frequent backward glances; two officers of justice walking in grim silence abreast, and between them a limp, torn, hatless, bloody figure, partly walking, partly lifted, partly dragged, past the theaters, past the lawyers' rookeries of Commercial Place, the ten-pin alleys, the chop-houses, the bunko shows and shooting galleries, on

across Poydras street into the dim openness beyond, where glimmer the lamps of Lafayette Square and the white marble of the municipal hall, and just on the farther side of this, with a sudden wheel to the right into Hevia street, a few strides there, a turn to the left, stumbling across a stone step and wooden sill into a narrow, lighted hall, and turning and entering an apartment here again at the right. The door is shut; the name is written down; the charge is made: Vagrancy, assaulting an officer, resisting arrest. An inner door is opened.

"What have you got in number nine?" asks the captain in charge.

"Chuck-full," replies the turnkey.

"Well, number seven?" These were the numbers of cells.

"The rats 'll eat him up in number seven."

"How about number ten?"

"Two drunk-and-disorderlies, one petty larceny, and one embezzlement and breach of trust."

"Put him in there."

And this explains what the watchman in Marais street could not understand—why Mary Richling's window shone all night long.

(To be continued.)

MRS. FINLAY'S ELIZABETHAN CHAIR.

"WHAT do they want?" said Mr. Finlay. A sunbeam, reflected from the burnished silver of the urn, flicked athwart his face, to emphasize his smile. Mr. Finlay smiled often, for he was not only a good-tempered man, but a man keenly susceptible to humorous impressions. He was a type of domestic happiness this morning, seated in that family temple, the dining-room, his two handsome boys on his knees and the breakfast-table before him. It was a table glittering with silver and cut-glass, and it wore that air of elegant antiquity which pertained to all Mrs. Finlay's house-furnishing, being further adorned with the shell-like blue china brought from over the seas by Mrs. Finlay's great-uncle, old Captain Crowninshield. The room was ample and lofty, fitted up in oak, which had gleams of red and gold in the sunken carvings, to match the red and gold stamped leather on the walls. There were no plaques, no pictures, unless that were a picture revealed by the wide glass doors,—a glimpse of tropical foliage and falling water and the white Diana lifting her lovely arms above the

green. Only a glimpse it was; but it supplied an effect of repose and mystery that the sunshiny room must have lacked else, and added a light touch to the half foreign picturesqueness everywhere, the rows of Venetian glass on the sideboard, the Persian rug on the floor, the fire-place, with its quaint Flemish tiles, the dim and heavy folds of old Italian tapestry draping the windows. Framed by these folds were two more pictures: on one side, an undulating sweep of hills in the fresh beauty of June, brightly painted wooden houses showing through the trees; on the other, a long street, ending in a huddle of factory chimneys and the Mississippi quivering and glittering below. Mrs. Finlay was gazing absently at the river. Her smooth, low brow was darkened by a rare cloud.

"Want?" she repeated. "Oh, everything; a museum in a country town is such an elastic affair. Mrs. Cody says they don't want to confine it to pictures. They were all here, the entire committee, Mrs. Cody, Mrs. Hubbard, and Miss Durham."

"Violet?" said Mr. Finlay, looking interested. "I wish I had seen her; it is an age since I have seen Violet."

"She was looking extremely pretty," said Mrs. Finlay, who had been told long ago that her husband had once wanted to marry Violet Durham. "She picked out most of my Meissen plates; she knew the King's Period at a glance. And they want my old Flemish lace and most of the pictures, and the old sword and the screens, and—oh, yes, they want the chair!"

"Well, you will let them have the things, wont you?"

"Everything but the chair. There *is* a limit, Tom."

"Why not the chair? They wont hurt it; and here's a chance for you to educate the Wrenham taste."

Mrs. Finlay shrugged her pretty shoulders, and said that she had no such ambition.

"Milly," said Tom Finlay, looking at his wife over his son's curly head, "don't you think you are just the least bit hard on Wrenham?"

"On the contrary," she answered coldly, "it is they who are hard on me. They quite disapprove of me, Tom. I have wine at dinner, with my two boys growing up; I have a butler and a coachman; hence I am a snob and ape the English. Don't you remember, Tom, how the boys used to shout after poor John Rogers, whenever he drove out, 'Hi, where's the circus?' I shall be contented if the museum cultivates the Wrenham taste up to the point of tolerating my liveries."

"I don't think it's the liveries that makes the trouble, Milly," said Mr. Finlay, gravely; "it's a notion they have here that you look down on them as uncouth and provincial. Perhaps we are, but we don't like to be despised for it, all the same. I'm not complaining, you know. I realize that it is a bore for you to have to live in Wrenham; but it would really be so much less of a bore if you could like the people, and there is a great deal in them to like when you get at them."

"Probably I have never got at them," said Mrs. Finlay.

Then she was silent. The Finlays were rich enough to have made a figure in New York or Boston, and it was the skeleton in Emily Finlay's closet that she must live in Wrenham, a stupid, censorious, provincial town, where one couldn't even get ice-cream in bricks.

Too well bred to exhibit the skeleton, possibly she did not lock it up securely, since the Wrenham people knew quite well that she never staid a day longer there than she could help. On their side, they repaid this passive

and unexpressed dislike with indignant criticism. They mimicked her accent, ridiculed her hospitality, mocked at her housekeeping.

It was a pity, too, for Mrs. Finlay was a charming woman. She had vivacity as well as repose, and such exquisite taste in dress that she passed for a beauty; although, to be frank, she was simply a graceful creature with a Greek forehead, most beautiful brown eyes, and a delicate mouth a trifle too large for her face.

But grace and charm—both were wasted on Wrenham. Indeed, that the criticism was not more bluntly expressed she owed to her husband. Tom Finlay—so every one called him—was the most popular man in all the country round about; he was liked by the towns-people and the farmers, by the workmen in his coal mines and the clerks in his railroad office; by women and children, for that matter; by the very dogs on the street and the horses in his stable. Nor was such universal affection strange. Tom Finlay was a man at once upright and genial, and he had a singularly gentle and modest manner. He was the descendant of an ancient Scotch family, whose three centuries in America had obliterated their national characteristics. The three centuries had been spent in Philadelphia; but Tom's father had gone to Illinois for his health, and there in Wrenham Tom was born. Inheriting a fortune, he had been rather elaborately educated; but Harvard and Heidelberg could not quite brush away the flavor of the prairies; to the end he was a Westerner; he had a dash of the Western unconventionality and all the Western energy; and there was in him a peculiarly Western blending of sympathy and shrewdness. Nothing human was foreign to him, yet he rarely threw away either his money or his emotions. His attachment to the soil certainly was not Western; it must have come to him from his Scotch ancestors. The original family of Finlays had it also. They abode in Philadelphia still, cherishing the family traditions and the old portraits by Peale and Copley. They mourned over Tom, "who was not like the Finlays." His choice of a wife, they felt, was a direct interposition of Providence. "A Massachusetts Endicott!" they said under their breath, and they welcomed Emily with open arms. She justified their confidence, taking the liveliest interest in Tom's ancestors and reverently admiring the family relics. As for Tom, he laughed openly at the illustrious house of Finlay. The glories of a race, tracing the roots of its ancestral tree down to the stone coffins of the early Scottish kings, were only a joke to this irreverent descendant. "It

was his horrid Western humor," his wife supposed. She dreaded Tom's humor, which found its food everywhere, quiet as it was. Though he was the most generous and tolerant of husbands, she sometimes had the strangest, chilliest sensation of serving as the butt of his silent and secret wit. He never ridiculed her; he was only amused by her, which was worse. Her fears did her husband injustice, but they were so undemonstrative that he never had a chance to dispel them. All the same they did their work well. They cut off the natural simple confidences between husband and wife. They made Emily shy of any vivid expression of feeling. They repressed the very evidences of her affection for Tom, while they made it out of the question for her to confess those vague and passing doubts which trouble the serenest love when the lover is a woman. Besides, she was a New England woman, trained to exaggerate her conscience and underrate her emotions. Therefore, she tried on honest, unworldly Tom tactics which had been better suited to a worn-out man of pleasure. She gave him a beautiful and harmonious home; she won admiration everywhere—except in Wrenham; she never let him see her out of temper; in short, she made him delightfully comfortable. When they were away from Wrenham,—and they were away from Wrenham a great deal,—Tom was told on all sides how fortunate he was in his wife. He agreed heartily; yet, in truth, he was not more satisfied with his married happiness than was she. He would have liked Emily to be more expansive; he longed for those trivial confidences which she withheld as bores; and, on many accounts, it would have gratified him to have had his wife fond of his native town. But, being so tolerant, he reasoned that he could not expect everything from one woman. "Milly is the most charming and sweetest-tempered woman in the world, and the best mother," thought Tom, stroking a rather melancholy smile with his big hand; "and I'm much too ugly and tame for a beautiful woman to fall desperately in love with me. Very likely I'm a trifle provincial in the bargain. Wrenham and I suit each other. It isn't odd we don't just suit her." Therefore, he said nothing of his feelings. To-day, for the first time in years, he had spoken. Now, he was blaming himself for his speech. What was the use? He had merely bothered Milly. Mrs. Finlay, on her part, was disgusted with herself because she had shown a tinge of irritability.

"You see, Tom," she said after a pause, "that chair is my pet weakness."

"Well, I wouldn't send it then," answered Tom, easily.

Mrs. Finlay considered.

Now, the chair was the delight of her eyes—the darling of her pride; a genuine Elizabethan chair of age-blackened oak, given her by the chief of the Finlay clan, who still maintained a faded magnificence in the Highlands. Originally it was an English chair, coming north as part of the bridal portion of the English wife of one of the Finlays; and tradition declared that the hapless Queen of Scots, while visiting her loyal follower, the then Sir Fergus, had made the chair her throne. The Finlay arms were carved on the back and the date,—a sight to awe caviling skeptics. Very dear to Mrs. Finlay was the chair; dearer than her pictures or her rare old engravings or her fragile treasures from Venice, or even the wonderful vase which was possibly "Henri Deux"; dearer by far than her own family heir-looms of sword and clock and china. There was another sword, a Scottish claymore, as well as a battered buckler, further gifts of Sir Fergus; but a haze hung over their history, and Mrs. Finlay, alluding to them, simply gave them the general title of honor, "in the family." Of course, there could be no comparison of such as these with the chair. This was why Mrs. Finlay considered. The children thought it time to join in the conversation. Fergus, the elder, who was nine, wanted to know what kind of a show an art museum was; "did it have an elephant?"

"They only have pictures and things," said his mother; "you may go, if we are here."

"I'd rather go to Barnum's," said Fergus, thoughtfully. "Say, mamma, let's stay and go to Barnum's; you take me. Lots of boys' mammas take them to the circus!"

"Francis will take you, brother, and you may ask that boy you like so much—Jimmy Hubbard, isn't it?"

"I'm 'fraid he wouldn't want to go with me, he's so big," Fergus replied, despondently. Jimmy Hubbard was his boy hero, but he was fifteen, and Fergus worshiped him from afar. "Maybe, though," he continued, brightening, "he might if I had on long pants; I wouldn't look so little then; and, mamma, *honest*, there aint another boy in Wrenham, big as me, wears short pants!"

"Do say trowsers, Fergus. Anyhow, we shan't be in Wrenham much more than a week. You shall see Jumbo, East——"

"Oh, mamma!" said Fergus, reproachfully; and, "Oh, mamma!" echoed little four-year-old Tom.

"My very children desert me and like the place," thought Mrs. Finlay.

"Better stay till this fandango is over, don't

you think, Milly?" said Tom; "it looks more neighborly."

"Very well, dear," said Emily, with a smile which, under the circumstances, was heroic. She turned the talk lightly to something else; but when Tom and the children were gone, and she was alone in the pretty dining-room, she sighed.

Tom Finlay came home to luncheon that day, and ran in upon the "soliciting committee" of the Wrenham Art Museum. They were standing in the hall, around the chair, all three, Mrs. Hubbard, Mrs. Cody, and Violet Durham. Mrs. Hubbard was the president of the library, for the benefit of which the museum was to be. She was a tall woman, with winning manners, and a handsome, care-worn face. Her husband was a district judge. His salary was small, and they had six children; but Mrs. Hubbard was always pressed to serve on church committees and to aid charitable undertakings, because she had so much tact and was "such a worker." Mrs. Cody, the second member, had a more brilliant worldly lot, being the wife of a rich grocer. She was large, florid, and sprightly, and her gleaming black satin gown rattled and sparkled with jet pendants. Violet Durham, the remaining member, leaned over the high chair-back, her pretty face upraised. The wind had roughened her smooth, black braids; one loosened lock curled against her white neck; under the shadow of her hat her great, dark eyes were shining. She wore a simple cambric gown, which had brown figures on a yellowish background, and there were bows of brown ribbon about it, with long ends to flutter when she moved; and a careless bunch of Jacqueminot roses was stuck in her belt. In the light poise of her figure, in the expression of her face, even in the arrangement of her daintily fresh dress, there was an air of cheerful animation; she made one think of prairie flowers when the breeze shakes the dew from them. Tom Finlay gave her a glance of admiration and a half wistful smile. He had known Violet all his life. Her only brother, who died at college, had been his most intimate friend; Mrs. Durham used to call Tom "her other boy"; he was always at their house. Naturally, he fell in love with Violet. It was a boyish passion, never avowed and soon cured; and he married Emily Finlay with no disturbing memories. He did more; he gave substantial aid to the young lawyer whom Violet had preferred to him. She was on the eve of marrying this man when both her father and he were killed in a dreadful railway accident. Colonel Durham left a large property in such a state of confusion that it was feared there

would be nothing left for Violet and her mother. Then Tom Finlay came forward; his advice and energy, and the loan he insisted upon making them, rescued a modest independence from the tangle. Mrs. Durham and Violet went abroad, and were gone five years. Tom wanted his wife to take these good friends of his to her heart; therefore, praising himself for Machiavelian wile, he was very reticent about them, and said not a word of his little romance. So the story came to Mrs. Finlay in bits, to be pieced together by her fancy. She did not take the Durhams to her heart. She was perfectly courteous; she asked them to the house whenever Tom suggested; but the pleasant, informal intercourse that he had planned never came. He did not complain; indeed, what cause for complaint had he? Mrs. Finlay did all he asked; but there was a sore spot in his regret. To-day, as he greeted Violet, he was thinking how seldom he saw the Durhams in his home, and how welcome he had always been made to theirs. A hundred trivial, touching recollections of his childhood helped to bring that wistful curve to his lips. Instantly it was gone, and he was greeting the ladies with most commonplace politeness; but his wife had seen it before it went.

The moment the salutations were over, Mrs. Cody, who had been speaking, continued:

"Yes, indeed, I know your feeling, Mrs. Finlay. When they asked me for my Jackson chair,—it was given to Mr. Cody by the General himself, you know, and he said it was a hundred years old,—well, when they asked for that, it didn't seem as though I *could* let it go. But we're so interested in the library, and of course it's different with you; you can't be expected, as I told the ladies, to feel an interest. It aint as though you belonged to the town."

"I hope you don't think of us as *not* belonging to Wrenham," said Tom; "I'm a regular Wrenham boy."

Mrs. Cody waved her plump hand. "Oh, you, of course, Mr. Finlay; but gentlemen are different; you have your business here. But we see so little of Mrs. Finlay, we feel she is quite a stranger."

Mrs. Cody had a marvelous faculty for saying stinging things. Charitable people held that she was simply heedless; the less charitable said her shafts were too well aimed for shots in the air. Mrs. Hubbard hurried into the conversation.

"Mrs. Finlay always shows she is not a stranger by her kindness," she said; "she has let us have such a quantity of beautiful things."

"That's right," said Tom, cordially; "can't you think of something else?"

"Only the chair," Mrs. Cody replied, solemnly.

Mrs. Finlay looked from the speaker to her husband.

"If you really think the chair will help the museum, you are quite welcome to it," she said.

The visitors broke into a confusion of thanks.

"It is *very* kind of you, Mrs. Finlay," cried Violet Durham. "I will look after the chair myself."

"We will *all* look after it," said Mrs. Cody.

"And now, Mrs. Finlay, you encourage us to ask one favor more: wont you come on to our general committee?"

Again Emily glanced at her husband; there was a familiar twinkle in his eye.

"I fear I shan't be any help to you," she answered, gravely, "but—yes, certainly, if you wish it."

It must be confessed that, though the committee professed unbounded gratitude and satisfaction over this last boon, they looked rather blank; Mrs. Finlay guessed that they had expected a refusal. She urged them to stay to luncheon, a courtesy which had its natural effect, the hastening of their departure.

After they were gone, Tom Finlay said: "You were very good-natured, Milly."

"It was not good nature, Tom," she answered; "it was—well, I am not sure I know what it was myself."

She walked upstairs, leaving him whistling softly.

The Wrenham Art Museum opened its doors two weeks later. For days the workers had toiled over a chaos of old books, pictures, and bric-à-brac. The result exceeded their hopes. But even in riches there is embarrassment. The usual procession of petty trials had filed through the days. A sad amount of ill-feeling was caused by a few slips of memory, some ladies not being asked to help at all, and others being asked too late. Careless remarks about the objects of art had wounded sensitive souls. Disputes had arisen in the committees. There was the quarrel about the building, happily settled at last by Mr. Cody's generous offer of his late grocery shop, free of rent. To be sure, the vigilant nose could still sniff odors of salt fish, kerosene oil, and molasses, despite the labors of the scrub-women; and it never had been considered a well-lighted shop. But a gift horse should not be looked in the mouth; it was a large, convenient, inexpensive museum hall, and the committee accepted it gratefully, as was their duty.

The selection of a janitor was not so

easily made. Mrs. Cody proposed a retainer of her own, an old fellow named Judson, who picked up a precarious livelihood, mowing lawns, running of errands, and working out poll-taxes, while his wife made up the deficiencies in the family income by taking in washing. Judson had lately joined a temperance society, but a particularly unsavory past marred his reputation.

This was Miss Durham's objection to him.

"He may get drunk and burn us all up," said she; "besides, he is a weak old man, and couldn't fight a burglar!"

"He belongs to the Sons of Temperance," Mrs. Cody returned stiffly; "he don't drink a drop, and he will have a pistol."

A mild little woman here said that she guessed he did need the place; his wife had been sick most of the winter.

"For my part," said Mrs. Cody warmly, "I think that when anybody repents and is struggling to do better, they ought to be encouraged and not trampled on!"

"That's so," another member of the committee agreed. "Besides, we want to have Mrs. Judson to clean, and it will be much more convenient. She can come in the mornings, too, and sweep and dust. She oughtn't to charge much, if we have him. We can make all the cleaning part of his business; then she'll come and do it."

In vain Violet pleaded the danger of Judson's relapsing into his old habits; mercy and thrift combined carried the day; Mrs. Finlay was the single member voting with her.

Mrs. Finlay came to most of the meetings. She said little and noticed much. Mrs. Hubbard, "for her sins," Violet said, was the chief ruler of the artistic council. Mrs. Finlay used to marvel at her unfailing patience. She thought her own politeness, well trained as it was, would have trembled beneath the awful responsibilities of china, the charges of express companies, the delays of printers, the assaults of irate owners of pictures which were not hung to their taste, and of distracted hanging committees and amateur artists with pictures of their own to show, who had the "artistic temperament" to such a degree that they could scarcely be trusted in the same room together. But Mrs. Hubbard never winced, she only looked rather more tired at times. Her son and Violet were her great helpers. Jimmy Hubbard was young Fergus Finlay's hero, a tall lad of fifteen, whose wrists were always growing out of his jacket sleeves. He was devoted to Violet, and Violet was devoted to Jimmy's handsome, overworked mother. They did a little of nearly everything that was to be done, from scrubbing show-cases to writing advertisements.

"Only," said Violet, "I trust a confiding public doesn't believe the wild tales owners of antiquities tell about their things. If this exhibition lasts much longer, I shall lose my soul—I've got into such a way of lying!" Jimmy's specialty was painting placards. He made beautiful letters, but his spelling was not beyond reproach. He enjoyed the museum immensely. "Such fun!" said Jimmy; "those people in the picture-room are just going it! Mrs. Cody had somebody's picture took down and hers hung in the same place; said her picture needed that light and t'other one didn't. And now the other woman, she's come back, and—oh, aint they having a circus, though! And up in the room where they have the Japanese things, they've lost all the labels; they tumbled off and got mixed up, and they're putting 'em back by guess. Folks 'll open their eyes when they see the catalogue. And down-stairs in the china-room, somebody's hooked their show-case, so the china's standing round on the floor; and they say they can't do nothing till they get another show-case, so they've gone off to dinner, and there aint nobody in the room 'cept a dog!"

"A dog!" cried Mrs. Hubbard, while Mrs. Finlay turned pale; "I must go this instant——"

"Oh, I coaxed him out," said Jimmy; "I thought it didn't look just healthy for the china. Guess he hadn't broke much; some of it was broke to start with, wasn't it?"

Poor Mrs. Hubbard hurried away. Violet laughed.

"I think I must hunt them up a show-case," said she. "Take our old books out, Jimmy, and let us give them that."

"But you spent all the morning arranging them," said Mrs. Finlay; "and you brought the show-case yourself. It is quite too bad!"

"Oh, it doesn't matter," answered Violet, gayly; "it's all for the public good." She was always cheerful. "I suppose I have no proper pride," she said once; "nobody wants me to be chairman of anything; my valuable suggestions have been uniformly rejected and still, Jimmy, we are happy!"

"I wish that Mrs. Cody wasn't chairman of our committee, though," said Jimmy; "she never does a thing—just sails round and bosses!"

"But she has been very liberal. Think of the things she has sent us; think of the Jackson chair!"

"It aint half as pretty as Mrs. Finlay's," said Jimmy, unwitting that Mrs. Finlay stood behind him; "and she makes ten times as much fuss. No Cody in mine, thank you."

Mrs. Finlay smiled as she walked away, feeling more friendly than she would have believed possible toward Violet and Jimmy. She had been as good as her word and sent the chair. Francis, the butler, attended to its safe delivery. He remained while Violet removed the wrappings.

"Mrs. Finlay said as how you would look after it yourself, Miss," he remarked, in a tone of deep solemnity, adding, as if from the imperious promptings of his own conscience, "She sets the world by that chair, and I wouldn't have it hurt for nothing whatsoever!"

"It shan't be my fault if it gets hurt, Francis," Violet answered.

On the appointed day the museum was opened. The Cody chair stood beside Mrs. Finlay's on a kind of dais of honor, and to many minds was the nobler chair of the two. Like the Finlay chair, it was of imposing proportions. Its substance was mahogany, and—again like the Finlay chair—it had arms. Indeed, at first view there was a general resemblance of form, if not of color, between the two chairs, although that of Mrs. Finlay was ornamented with florid carving as behooved an Elizabethan chair, while the lines of the other were chastely plain.

From the first the exhibition was a triumph. It went victoriously on to its close. One day, somewhere near the middle of its career, Violet Durham walked through it with her mother. The rooms were almost empty, for the time was early in the morning. The two women paused before a screen of Mrs. Finlay's, a marvel of embroidery on dull gold plush.

"Hasn't she ravishing taste?" said Violet; "all her things are so lovely. Why did fate direct Mrs. Cody to hang that horror of a crazy-quilt directly over it? Mrs. Finlay will faint when she sees it; it will be the last straw. I wish you could see her in the committees, so disgusted with our vulgarities, but so invincibly polite. She never says a word, but anything more deadly superior than her silence I never did encounter. I never am with her, anyhow, that I don't feel myself so hopelessly provincial that I almost don't want to live."

"You are unjust, Violet," said Mrs. Durham, a placid gentlewoman, with soft gray hair and a grave sweet smile; "Mrs. Finlay isn't a bit of a snob——"

"Oh, I don't mean she is. What I do think is that she is rather narrow-minded. She can't conceive of people being nice who aren't nice in just her way, who haven't just such manners, for instance, and just such ways of thinking, and haven't been to Europe just so many times. Tom deserves a woman

cut on a larger pattern. It makes it hard for him."

"He seems perfectly satisfied," said Mrs. Durham, smiling. And then they passed on.

Now, Mrs. Finlay was behind the screen. It was purely an accident. She happened to be standing there looking at some articles on the wall. She did not think of their discussing any personal matter, and after they had begun to speak and she understood, she was too surprised and embarrassed to go forward.

The conversation was a revelation. Her first emotion was a shock. She felt as though she had been shown to be brutally rude. True, she did believe her ways of living and thinking vastly better than those of a country town; but her sense of superiority was so deeply rooted that it was hardly visible to her own consciousness; to manifest it to its objects seemed to her unutterably indelicate. Her cheeks were burning as she stepped forth from her involuntary hiding-place.

Was she narrow-minded, she who prided herself upon her cosmopolitan toleration? Had her distaste for life in Wrenham made it hard for Tom? Did *he* think her narrow-minded? Such thoughts made her miserable for days. "The worst of it, too," she said to herself, "is that it is no use my trying to pacify them. Whatever I do, they are bound to misunderstand me!" Nevertheless, she went again and still another time to the museum. The children went, and Tom and Francis, and John Rogers (who was very much bored), and Élise, Mrs. Finlay's maid, and the cook, and the other maids, and the gardener with all his family. "I will say she spends her money on us," said Mrs. Cody.

To the very end the weather was propitious; but the day after, the clouds distilled a gentle, unremitting drizzle. Most of the owners of articles sent for them notwithstanding. Francis and John Rogers appeared at five o'clock, having waited until then in the vain hope of sunshine. They took the pictures and the china, but there was not room for the chair. Therefore they wrapped it in the tarpaulin they had brought and left it in Violet's charge—Francis saying, with his air of decent gloom, "Mrs. Finlay told me to bring the pictures first and take the chair on another load. I'll be back to-night if I can. Are *you* going to stay here, may I ask, Miss?"

"I shall stay until dark, Francis; but Judson will be here all night."

Francis turned a gloomy eye upon old Judson, who was shambling about, getting Mrs. Cody's property together.

"Thank you, Miss; but I'd rather come back if I can," said he.

"Now, I wonder," said Violet to Jimmy

Hubbard, later, "I wonder what he meant by *that*."

Old Judson had gone upstairs, the other people had gone home, and they were alone in the room.

"Ask me an easier one," said Jimmy.

"He is sober enough to-night, isn't he?" Violet asked, looking up into Jimmy's face with that anxious reliance on the masculine judgment in such matters which confirms a boy's opinion of his sex.

"Oh, straight as a string," said Jimmy, re-assuringly; "but he was on a toot Thursday, if you want to know. Say, Judson, come down and light up."

Judson lighted a single burner, and listened silently to Violet's warnings and injunctions, scowling to himself. Then Jimmy and she went home. The last thing they noticed in the room was a group of the two chairs, standing on their dais, island-wise, amid a sea of crumpled wrapping-paper. Mrs. Cody's chair was undraped, but Mrs. Finlay's, in its white tarpaulin, looked like a clumsy ghost.

By this time the rain had ceased and the stars were shining. They walked to Mrs. Durham's house very cheerfully. Jimmy was prevailed upon to enter and be refreshed with tea. Perhaps an hour had passed before they were startled by the clangor of bells.

"Fire!" cried Violet.

"Hope it aint *us*!" said Jimmy, with more good-will than grammar.

The Wrenham fire-bells rang in a startling but not systematic fashion, as fast as they could go; and the fire companies—volunteers, mostly of tender years—assembled in their respective engine-houses, and ran about the streets inquiring for the fire until it made enough headway to be seen. The bells themselves afforded no clew. Jimmy ran out into the street for information, at the same time yelling "Fire!" at the top of his voice. "Fire! fire! Say, Mister, where's the fire?"

"Cass street," yelled back a running boy; "Cody's old grocery store."

"Mercy!" cried Mrs. Durham from the door-way, "the museum! Violet——"

But Violet was gone. With the first word she had sped swiftly after Jimmy, nor did she stop until they saw the smoke pouring out of the museum windows.

"Mrs. Finlay's chair!" she gasped; "Jimmy, we *must* save it!"

"All right," said Jimmy; "just you wait!" He dashed through the crowd that shouted after him: "Come back!" "The door's locked!" "It's all afire!" Unheeding, he unlocked the door—he had his mother's key with him—and ran into the smoke. Horrible smoke it was—dense, blinding, stifling. His

eyes were stung; his ears stunned; the murky air seemed to roar all about him. But he saw the white tarpaulin through his smoky tears, and staggered up to it. Somebody caught the other side: they dragged the chair out together—not a second too soon, for the wainscoting of the room was blazing. Safe on the sidewalk, he saw that his unknown helper was Violet, who said:

"We're a couple of fools, but we've saved the chair. Now, let us get it out of the way!"

They carried it across the street just in time to avoid the charge of a fire company. They came with a rush and a cheer, and with their coming the whole street brightened into a kind of lurid gayety. The flames leaped up in the museum windows. Upstairs, where the fire had started, they were all aglow. In the street, the boys were shouting, the water splashing, the firemen swearing, and apparently everybody ordering somebody else to do something. Violet scanned the crowd, trying to discover old Judson; but she saw no sign of that aged reprobate, and began to fear he was burning up in the building. Suddenly, two men laid hands on the chair. One of them spoke—roughly, but not unkindly:

"You'll have to get outer this, ma'am: they want to lay the hose here. Here, hurry up! This way!"

Resolutely clinging to the chair, Violet and Jimmy were pushed down the street.

"We'll have to carry the chair home ourselves, Jimmy," said Violet; "there's no use trying to look for a wagon—good gracious!"

"What's the matter?" cried Jimmy. "Confound the fools!"

It was only that some sportive souls among the firemen had turned the hose on their comrades over the street; Violet and Jimmy, being in a direct line with the comrades, were drenched to the skin.

"Nothing but water!" said Violet; "but I never did fancy shower-baths. Jimmy, the man was right; we'd better get away from here."

Jimmy looked at the chair. "It's awful heavy; let's leave it in a saloon; they're open."

"Never," said Violet; "it's not going out of my sight again. Here, boy," addressing a stout lad in the crowd, "I'll give you a dollar if you'll help us carry this chair home."

"All right!" said the boy.

He grinned at Jimmy, whom he knew, and took the chair by the arm. They forced their way to the corner. The boy's stout lungs and ready profanity cleared a passage, assisted as they were by his skillful use of the chair corners as a battering-ram. Violet was

a devout churchwoman, but she did not tell him not to swear; she had a desperate feeling that anything was allowable, in the present crisis, to rescue the chair. Torn, disheveled, dripping with muddy water, the three—say rather the four, for does not the chair count as one?—emerged from the din into the quiet and star-lit streets where there was no fire. Violet's own plight was deplorable. Little streams of water drained from her soaked skirts; her hat was crushed into a shapeless bunch, through an unintentional collision with a hook-and-ladder company. She had a great bruise on her cheek (side lunge of the chair), and a never explained scratch across her nose. But she was in high spirits—her wooden ward was safe! Almost jubilantly she paid the boy at Mrs. Durham's gate; she answered her mother's anxious inquiries with a kiss and a laugh.

"I've been a fireman, mamma; I've helped save portable property. Jimmy, take off the tarpaulin, please."

Jimmy pulled it off with a flourish; then he gave a shout: "Oh, thunder!"

Violet uttered a deep groan. She leaned against the side of the house like one about to faint. Poor Mrs. Durham caught her in her arms.

"Oh, it's nothing, mamma," said Violet, in a hollow voice; "only, we've made a mistake, and saved the wrong chair!"

I draw a veil over the remainder of the night.

THE explanation is simple enough. Old Judson had beguiled the tedium of the night-watches with whisky. After he had pretty well drowned his feeble wits, he took a notion to inspect the chairs, and put the tarpaulin on Mrs. Cody's chair. Then he departed to get more whisky, leaving his lighted pipe upstairs, among the wrapping-papers. And Mrs. Finlay's idol was ashes!

MRS. FINLAY had a headache the night of the fire, and slept undisturbed through the fire-bells. Languid but unsuspecting, she came down to a late breakfast. Tom and the boys were gone, but Francis was in waiting, looking absolutely tragic in his solemnity. Mrs. Finlay took up the Wrenham paper. Francis, with a plate of oatmeal in one hand and the cream-jug in the other, stood watching her. "Ah!" cried Mrs. Finlay. She held the paper higher; Francis could not see her face. He made a gesture of despair with the cream-jug.

"Were you at the fire last night, Francis?" came from behind the paper.

"Yes, ma'am, I was, ma'am," said Francis,

his pent-up feelings relieving themselves in a heavy and irrepressible sigh. "It aint no use, ma'am; it's all gone! When I got there, everything was blazing. And they say, ma'am, the janitor set it afire hisself. He was a-reeling round there drunk's a lord—begging your pardon, ma'am; and he locked the door, so they couldn't get in!"

Mrs. Finlay put the paper down. She might have been a shade paler, but Francis could see no change in her expression. Yet, behind this calm mask a sharp struggle was going on. This stupid and barbarous town, after railing at her and slandering her for years, had capped its exasperations by destroying her most precious possession! Her nerves tingled with irritation. But the blood of generations of Puritans did not flow in Emily Finlay's veins for nothing. She had as robust a conscience as the best of them, although it was illumined by most unpuritanic lights. After all, she reasoned, the Wrenham people had burned up their own treasures as well as hers; certainly, they had intended no harm.

"Miss Durham," announced Francis, interrupting the inward colloquy between anger and justice.

"Show her in here," said Mrs. Finlay. She remembered that Violet had opposed old Judson's appointment, and greeted her with actual warmth.

"You see, I know all," she said, touching the newspaper. "I am so very sorry for you."

Violet looked pale and dejected; she did not lift her eyes; her voice trembled as she answered:

"But your chair is gone; I was down there this morning, and couldn't find even a piece of it. And we persuaded you to send it!"

"But you couldn't know what was to happen," said Mrs. Finlay, gently; "it wasn't your fault——"

"Master James Hubbard," said Francis, appearing again in the door-way. Jimmy had unceremoniously followed the butler, and was at his heels. He began a carefully conned speech in breathless haste. He was sorry to come so early in the morning; but he saw Miss Durham and wanted to come, also "because," cried Master Jimmy, growing red in the face and forgetting his speech, "I knew she wouldn't say anything about what she did, and it was all old Judson's fault, 'cause he changed the tarpaulin, and we couldn't see through the smoke, and we hauled it out, and she got wet through, and the hose-cart smashed her hat, and Fritz Müller and she and me, we carried it to her house, and then, after all, it was Mrs. Cody's chair!"

Mrs. Finlay listened with evident emotion.

"Do you mean you ran into the burning building for my chair?" she cried. "Risked your lives?"

"That's about the size of it," said Jimmy. Then more in detail he recounted the night's adventures. When he finished, Mrs. Finlay turned to Violet.

"How brave you were!" she exclaimed.

"I promised to take care of the chair," said Violet, with a little rueful smile, "and you see I failed, after all."

"What could you have done more?"

"Well, we might have picked out the right chair, you know," said Jimmy, impartially; "but it was so smoky."

"You took the one with the tarpaulin; you couldn't know. Believe me, I am most grateful for—why, Miss Durham!"

For Violet, overcome by the long strain on her nerves, and the reaction after a night spent in picturing her reception, each picture portraying more humiliating explanations than the last, had sunk into a chair and turned very white. Jimmy, in distress, threw the contents of the cream-jug in her face; happily the jug was almost empty, and Mrs. Finlay instantly repaired damages with a finger-bowl.

"Don't—bother," implored Violet faintly; "I'm not going to—do anything. But I was so sorry, and you are so kind, and it is all so—different!"

"We thought you'd be awful mad," Jimmy explained, with calm suavity.

"We were unjust to you," said Violet; "I—I think I have always been unjust to you."

"We have been unjust to each other," answered Mrs. Finlay. "Can't we try all our acquaintance over again, don't you think?"

She looked up into Violet's face with a charming smile, but her eyes were wet; and when Violet took the hand that was extended to her, she could not speak because of the lump in her throat.

Then Jimmy, who had been absorbed in meditation, remarked:

"Well, I guess there wont be any trouble 'bout getting the insurance; that's one good thing."

Violet must either laugh or cry; it was just as well she should laugh. Mrs. Finlay laughed with her. "And then," said Jimmy, describing the interview to his mother afterward, "then Mr. Finlay came in, and they wanted us to sit down and have breakfast; but, of course, I wouldn't. And, mother, I'm going there to luncheon to-morrow. And I don't believe Mrs. Finlay cared much about the chair, 'cause she didn't say another word about it."

When they were all gone, Tom Finlay put

his arm around his wife's waist. He was smiling; but, for once, she found nothing to quarrel with in his smile. He only said:

"Milly, I was in the conservatory, and heard it all. I am tremendously proud of you."

"Because I wasn't cross?" said Emily.

"But I had no right to be cross."

"Milly, you are a very just woman."

"Don't say that, Tom," cried his wife, with a quick movement; "I have been horrid about Wrenham and about—about Miss Durham. Tom, I wish you had told me that you asked her to marry you."

Tom opened his eyes.

"But I never did, Milly. I thought of doing it once; but I found out she liked somebody else better, so I held my tongue. Then I saw you, and was glad enough I had. Milly, you weren't——"

"Yes, I was, Tom," murmured Emily, hiding her head on his shoulder; "I was just so stupid."

Tom held her close; she felt the quickened beating of his heart, and she said:

"I shall never be—stupid about Miss

Durham again. She is so nice, and she was so brave about the chair."

"The poor chair!" said Tom. "Milly, I am sorry."

Mrs. Finlay pulled her husband's head down to her own level and kissed his hair.

"If you are sorry, Tom," she whispered, "then I do not mind."

Nevertheless, she is not ungrateful to the chair's memory. It is perhaps a fanciful notion, but she feels as though the chair died for her happiness. A water-color sketch of it hangs in her chamber, and she has, when she looks at it, an emotion of almost personal gratitude. She returned the insurance money (which duly came to her) to the managers of the museum, accompanying the money with a sympathetic note. The note made a favorable impression. Wrenham has come to the conclusion that Mrs. Finlay has her good points. It only remains to add that Tom Finlay has no cause to complain of his wife's coolness to the Durhams; and that James Hubbard is the proud possessor of a new and most gorgeous gold watch.

Octave Thanet.

A HUNT FOR THE NIGHTINGALE.

WHILE I lingered away the latter half of May in Scotland, and the first half of June in northern England and finally in London, intent on seeing the land leisurely and as the mood suited, the thought never occurred to me that I was in danger of missing one of the chief pleasures I had promised myself in crossing the Atlantic, namely, the hearing of the song of the nightingale. Hence, when on the 17th of June I found myself down among the copses near Hazlemere on the borders of Surrey and Sussex, and was told by the old farmer to whose house I had been recommended by friends in London that I was too late, that the season of the nightingale was over, I was a good deal disturbed.

"I think she be done singing now, sir; I aint heered her in some time, sir," said my farmer, as we sat down to get acquainted over a mug of the hardest cider I ever attempted to drink.

"Too late!" I said in deep chagrin, "and I might have been here weeks ago."

"Yeas, sir, she be done now; May is the time to hear her. The cuckoo is done too, sir; and you don't hear the nightingale after the cuckoo is gone, sir."

(The country people in this part of England *sir* one at the end of every sentence, and talk with an indescribable drawl.)

But I had heard a cuckoo that very afternoon, and I took heart from the fact. I afterward learned that the country people everywhere associate these two birds in this way; you will not hear the one after the other has ceased. But I heard the cuckoo almost daily till the middle of July. Matthew Arnold reflects the popular opinion, when in one of his poems ("Thyrsis") he makes the cuckoo say in early June,

"The bloom is gone, and with the bloom go I!"

The explanation is to be found in Shakspeare, who says,

"—— the cuckoo is in June
Heard, not regarded,"

as the bird really does not go till August. I got out my Gilbert White, as I should have done at an earlier day, and was still more disturbed to find that he limited the singing of the nightingale to June 15th. But seasons differ, I thought, and it can't be possible that any class of feathered songsters all stop on a given day. Then, when I looked further, and found that White says the chaffinch ceases to sing the beginning of June, I took more courage, for I had that day heard the chaffinch also. But it was evident I had no time to lose; I was just on the dividing line, and any day might witness the cessation of the last songster.

For it seems that the nightingale ceases singing the moment her brood is hatched. After that event, you hear only a harsh chiding or anxious note. Hence the poets, who attribute her melancholy strains to sorrow for the loss of her young, are entirely at fault. Virgil, portraying the grief of Orpheus after the loss of Eurydice, says :

"So Philomela, 'mid the poplar shade,
Bemoans her captive brood; the cruel hind
Saw them unplumed, and took them; but all night
Grieves she, and, sitting on a bough, runs o'er
Her wretched tale, and fills the woods with woe."

But she probably does nothing of the kind. The song of a bird is not a reminiscence, but an anticipation, and expresses happiness or joy only, except in those cases where the male bird, having lost its mate, sings for a few days as if to call the lost one back. When the male renews his powers of song, after the young brood has been destroyed, or after it has flown away, it is a sign that a new brood is contemplated. The song is, as it were, the magic note that calls it forth. At least, this is the habit with other song-birds, and I have no doubt it holds good with the nightingale. Destroy the nest or brood of the wood-thrush, and if the season is not too far advanced, after a week or ten days of silence, during which the parent birds, by their manner, seem to bemoan their loss and to take counsel together, the male breaks forth with a new song, and the female begins to construct a new nest. The poets, therefore, in depicting the bird on such occasions as bewailing the lost brood, are wide of the mark; he is invoking and celebrating a new brood.

As it was mid-afternoon, I could only compose myself till night-fall. I accompanied the farmer to the hay-field and saw the working of his mowing-machine, a rare implement in England, as most of the grass is still cut by hand, and raked by hand also. The disturbed sky-larks were hovering above the falling grass, full of anxiety for their nests, as one may note the bobolinks on like occasions at home. The weather is so uncertain in England, and it is so impossible to predict its complexion, not only from day to day but from hour to hour, that the farmers appear to consider it a suitable time to cut grass when it is not actually raining. They slash away without reference to the aspects of the sky, and when the field is down trust to luck to be able to cure the hay, or get it ready to "carry" between the showers. The clouds were lowering and the air was damp now, and it was Saturday afternoon; but the farmer said they would never get their hay if they minded such things. The farm had seen better days; so had the

farmer; both were slightly down at the heel. Too high rent and too much hard cider were working their effects upon both. The farm had been in the family many generations, but it was now about to be sold and to pass into other hands, and my host said he was glad of it. There was no money in farming any more; no money in anything. I asked him what were the main sources of profit on such a farm.

"Well," he said, "sometimes the wheat pops up, and the barley drops in, and the pigs come on, and we picks up a little money, sir, but not much, sir. Pigs is doing well naow. But they brings so much wheat from Ameriky, and our weather is so bad that we can't get a good sample, sir, one year in three, that there is no money made in growing wheat, sir." And the "wuts" (oats) were not much better. "Theys as would buy haint got no money, sir." "Up to the top of the nip," for hill, was one of his expressions. Tennyson had a summer residence at Black-down not far off. "One of the Queen's poets, I believe, sir." "Yes, I often see him riding about, sir."

After an hour or two with the farmer, I walked out to take a survey of the surrounding country. It was quite wild and irregular, full of bushy fields and overgrown hedge-rows, and looked to me very nightingaly. I followed for a mile or two a road that led by tangled groves and woods and copses, with a still meadow trout-stream in the gentle valley below. I inquired for nightingales of every boy and laboring man I met or saw. I got but little encouragement; it was too late. "She be about done singing now, sir." A boy whom I met in a foot-path that ran through a pasture beside a copse said, after reflecting a moment, that he had heard one in that very copse two mornings before—"about seven o'clock, sir, while I was on my way to my work, sir." Then I would try my luck in said copse and in the adjoining thickets that night and the next morning. The railway ran near, but perhaps that might serve to keep the birds awake. These copses in this part of England look strange enough to American eyes. What thriftless farming! the first thought is; behold the fields grown up to bushes, as if the land had relapsed to a state of nature again. Adjoining meadows and grain-fields there will be an inclosure of many acres covered with a thick growth of oak and chestnut sprouts, six, or eight, or twelve feet high. These are the copses one has so often heard about, and they are a valuable and productive part of the farm. They are planted and preserved as carefully as we plant an orchard or a vineyard. Once in so many

years, perhaps five or six, the copse is cut and every twig is saved; it is a woodland harvest that in this country is gathered in the forest itself. The larger poles are tied up in bundles and sold for hoop-poles; the fine branches and shoots are made into brooms in the neighboring cottages and hamlets, or used as material for thatching. The refuse is used as wood.

About eight o'clock in the evening I sallied forth, taking my way over the ground I had explored a few hours before. The gloaming, which at this season lasts till after ten o'clock, dragged its slow length along. Nine o'clock came, and, though my ear was attuned, the songster was tardy. I hovered about the copses and hedge-rows like one meditating some dark deed; I lingered in a grove and about an overgrown garden and a neglected orchard; I sat on stiles and leaned on wickets, mentally speeding the darkness that should bring my singer out. The weather was damp and chilly, and the tryst grew tiresome. I had brought a rubber water-proof, but not an overcoat. Lining the back of the rubber with a newspaper, I wrapped it about me and sat down, determined to lay siege to my bird. A foot-path that ran along the fields and bushes on the other side of the little valley showed every few minutes a woman, or girl, or boy, or laborer, passing along it. A path near me also had its frequent figures moving along in the dusk. In this country people travel in foot-paths as much as in highways. The paths give a private, human touch to the landscape that the roads do not. They are sacred to the human foot. They have the sentiment of domesticity, and suggest the way to cottage doors and to simple, primitive times.

Presently a man with a fishing-rod, and capped, coated, and booted for the work, came through the meadow, and began casting for trout in the stream below me. How he gave himself to the work! how oblivious he was of everything but the one matter in hand! I doubt if he was conscious of the train that passed within a few rods of him. Your born angler is like a hound that scents no game but that which he is in pursuit of. Every sense and faculty were concentrated upon that hovering fly. This man wooed the stream, quivering with pleasure and expectation. Every foot of it he tickled with his decoy. His close was evidently a short one, and he made the most of it. He lingered over every cast, and repeated it again and again. An American angler would have been out of sight down stream long ago. But this man was not going to bolt his preserve; his line should taste every drop of it. His eager, stealthy movements denoted his enjoyment

and his absorption. When a trout was caught, it was quickly rapped on the head and slipped into his basket, as if in punishment for its tardiness in jumping. "Be quicker next time, will you." (British trout, by the way, are not so beautiful as our own. They have more of a domesticated look. They are less brilliantly marked, and have much coarser scales. There is no gold or vermilion in their coloring.)

Presently there arose from a bushy corner of a near field a low, peculiar purring or humming sound, that sent a thrill through me; of course, I thought my bird was inflating her throat. Then the sound increased, and was answered or repeated in various other directions. It had a curious ventriloquial effect. I presently knew it to be the night-jar or goat-sucker, a bird that answers to our whip-poor-will. Very soon the sound seemed to be floating all about me—*Jr-r-r-r-r*, or *Chr-r-r-r-r*, slightly suggesting the call of our toads, but more vague as to direction. Then as it grew darker they ceased; the fisherman reeled up and left. No sound was now heard—not even the voice of a solitary frog anywhere. I never heard a frog in England. About eleven o'clock I moved down by a wood and stood for an hour on a bridge over the railroad. No voice of bird greeted me till the sedge-warbler struck up her curious nocturne in a hedge near by. It was a singular medley of notes, hurried chirps, trills, calls, warbles, snatched from the songs of other birds, with a half-chiding, remonstrating tone or air running through it all. As there was no other sound to be heard, and as the darkness was complete, it had the effect of a very private and whimsical performance—as if the little bird had secluded herself there, and was giving vent to its emotions in the most copious and vehement manner. I listened till after midnight, and till the rain began to fall, and the vivacious warbler never ceased for a moment. White says that, if it stops, a stone tossed into the bush near it will set it going again. Its voice is not musical; the quality of it is like that of the loquacious English house sparrows; but its song or medley is so persistently animated, and in such contrast to the gloom and the darkness, that the effect is decidedly pleasing.

This and the night-jar were the only nightingales I heard that night. I returned home, a good deal disappointed, but slept upon my arms, as it were, and was out upon the chase again at four o'clock in the morning. I passed down a lane by the neglected garden and orchard, where I was told the birds had sung for weeks past; then under the railroad by a cluster of laborers' cottages, and along a road with

many copses and bushy fence-corners on either hand, for two miles, but I heard no nightingales. A boy of whom I inquired seemed half frightened, and went into the house without answering.

After a late breakfast I sallied out again, going farther in the same direction, and was overtaken by frequent showers. I heard many and frequent bird songs,—the lark, the wren, the thrush, the blackbird, the white-throat, the greenfinch, and the hoarse, guttural cooing of the wood-pigeons, but not the note I was in quest of. I passed up a road that was a deep trench in the side of a hill overgrown with low beeches. The roots of the trees formed a net-work on the side of the bank, as their branches did above. In a frame-work of roots, within reach of my hand, I spied a wren's nest, a round hole leading to the interior of a large mass of soft green moss, a structure displaying the taste and neatness of the daintiest of bird architects, and the depth and warmth and snugness of the most ingenious mouse habitation. While lingering here, a young countryman came along whom I engaged in conversation. No, he had not heard the nightingale for a few days; but the previous week he had been in camp with the militia near Guildford, and while on picket duty had heard her nearly all night. "Don't she sing splendid to-night?" the boys would say." This was tantalizing; Guildford was within easy reach, but the previous week—that could not be reached. However, he encouraged me by saying he did not think they were done singing yet, as he had often heard them during haying-time. I inquired for the black-cap, but saw he did not know this bird, and thought I referred to a species of tomtit, which also has a black cap. The wood-lark I was also on the lookout for, but he did not know this bird either, and during my various rambles in England I could find no person who did. In Scotland it was confounded with the titlark or pipit.

I next met a man and boy, a villager with a stove-pipe hat on—and, as it turned out, a man of many trades, tailor, barber, painter, etc., from Hazlemere. The absorbing inquiry was put to him also. No, not that day, but a few mornings before he had. But he could easily call one out, if there were any about, as he could imitate them. Plucking a spear of grass, he adjusted it behind his teeth and startled me with the shrill, rapid notes he poured forth. I at once recognized its resemblance to the descriptions I had read of the opening part of the nightingale song, what is called the "challenge." The boy said, and he himself averred, that it was an exact imitation. The *chew, chew, chew*, and some other

parts, were very bird-like, and I had no doubt were correct. I was astonished at the strong, piercing quality of the strain. It echoed in the woods and copses about, but, though oft repeated, brought forth no response. With this man I made an engagement to take a walk that evening at eight o'clock along a certain route where he had heard plenty of nightingales but a few days before. He was confident he could call them out; so was I.

In the afternoon, which had gleams of warm sunshine, I made another excursion, less in hopes of hearing my bird than of finding some one who could direct me to the right spot. Once I thought the game was very near. I met a boy who told me he had heard a nightingale only fifteen minutes before, "on Polecat Hill, sir, just this side the Devil's Punch-bowl, sir!" I had heard of his majesty's punch-bowl before, and of the gibbets near it where three murderers were executed nearly a hundred years ago, but Polecat Hill was a new name to me. The combination did not seem a likely place for nightingales, but I walked rapidly thitherward; I heard several warblers, but not Philomel, and was forced to conclude that probably I had crossed the sea to miss my bird by just fifteen minutes. I met many other boys (is there any country where boys do not prowl about in small bands of a Sunday?) and advertised the object of my search freely among them, offering a reward that made their eyes glisten for the bird in song; but nothing ever came of it. In my desperation, I even presented a letter I had brought to the village squire, just as, in company with his wife, he was about to leave his door for church. He turned back, and, hearing my quest, volunteered to take me on a long walk through the wet grass and bushes of his fields and copses, where he knew the birds were wont to sing. "Too late," he said, and so it did appear. He showed me a fine old edition of White's "Selborne," with notes by some editor whose name I have forgotten. This editor had extended White's date of June 15th to July 1st, as the time to which the nightingale continues in song, and I felt like thanking him for it, as it gave me renewed hope. The squire thought there was a chance yet; and in case my man with the spear of grass behind his teeth failed me, he gave me a card to an old naturalist and taxidermist at Godalming, a town nine miles above, who, he felt sure, could put me on the right track if anybody could.

At eight o'clock, the sun yet some distance above the horizon, I was at the door of the barber in Hazlemere. He led the way along one of those delightful foot-paths with which this country is threaded, extend-

ing to a neighboring village several miles distant. It left the street at Hazlemere, cutting through the houses diagonally, as if the brick walls had made way for it, passed between gardens, through wickets, over stiles, across the highway and railroad, through cultivated fields and a gentleman's park, and on toward its destination,—a broad, well-kept path, that seemed to have the same inevitable right of way as a brook. I was told that it was repaired and looked after the same as the highway. Indeed, it was a public way, public to pedestrians only, and no man could stop or turn it aside. We followed it along the side of a steep hill, with copses and groves sweeping down into the valley below us. It was as wild and picturesque a spot as I had seen in England. The foxglove pierced the lower foliage and wild growths everywhere with its tall spires of purple flowers; the wild honeysuckle, with a ranker and coarser fragrance than our cultivated species, was just opening along the hedges. We paused here, and my guide blew his shrill call; he blew it again and again. How it awoke the echoes, and how it awoke all the other songsters! The valley below us and the slope beyond, which before were silent, were soon musical. The chaffinch, the robin, the blackbird, the thrush—the last the loudest and most copious—seemed to vie with each other and with the loud whistler above them. But we listened in vain for the nightingale's note. Twice my guide struck an attitude and said, impressively, "There! I believe I 'erd 'er." But we were obliged to give it up. A shower came on, and after it had passed we moved to another part of the landscape and repeated our call, but got no response, and as darkness set in we returned to the village.

The situation began to look serious. I knew there was a nightingale somewhere whose brood had been delayed from some cause or other, and who was therefore still in song, but I could not get a clew to the spot. I renewed the search late that night and again the next morning; I inquired of every man and boy I saw.

"I met many travelers,
Who the road had surely kept;
They saw not my fine revelers,—
These had crossed them while they slept;
Some had heard their fair report,
In the country or the court."

I soon learned to distrust young fellows and their girls who had heard nightingales in the gloaming. I knew one's ears could not always be depended upon on such occasions, nor his eyes either. Larks are seen in buntings, and a wren's song entrances like Philomel's. A young couple of whom I inquired in

the train, on my way to Godalming, said yes, they had heard nightingales just a few moments before on their way to the station, and described the spot, so I could find it if I returned that way. They left the train at the same point I did, and walked up the street in advance of me. I had not noticed them till they beckoned to me from the corner of the street, near the church, where the prospect opens with a view of a near meadow and a stream shaded by pollard willows. "We heard one now, just there," they said, as I came up. They passed on, and I bent my ear eagerly in the direction indicated. Then I walked farther on, following one of those inevitable foot-paths to where it cuts diagonally through the cemetery behind the old church, but I heard nothing save a few notes of the thrush. My ear was too critical and exacting. Then I sought out the old naturalist and taxidermist to whom I had a card from the squire. He was a short, stout man, racy both in look and speech, and kindly. He had a fine collection of birds and animals, in which he took great pride. He pointed out the wood-lark and the blackcap to me, and told me where he had seen and heard them. He said I was too late for the nightingale, though I might possibly find one yet in song. But he said she grew hoarse late in the season, and did not sing as a few weeks earlier. He thought our cardinal grosbeak, which he called the Virginia nightingale, as fine a whistler as the nightingale herself. He could not go with me that day, but he would send his boy. Summoning the lad, he gave him minute directions where to take me—over by Easing, around by Shackerford church, etc., a circuit of four or five miles. Leaving the picturesque old town, we took a road over a broad, gentle hill, lined with great trees, beeches, elms, oaks, with rich cultivated fields beyond. The air of peaceful and prosperous human occupancy which this land everywhere has seemed especially pronounced through all this section. The sentiment of parks and lawns, easy, large, basking, indifferent of admiration, self-sufficing, and full, everywhere prevailed. The road was like the most perfect private carriage-way. Homeliness, in its true sense, is a word that applies to nearly all English country scenes; home-like, redolent of affectionate care and toil, saturated with rural and domestic contentment; beauty without pride, order without stiffness, age without decay, etc. This people love the country, because it would seem as if the country must first have loved them. In a field I saw for the first time a new species of clover, much grown in parts of England as green fodder for horses. The farmers call it

trifolium, probably *trifolium incarnatum*. The head is two or three inches long, and as red as blood. A field of it under the sunlight presents a most brilliant appearance. As we walked along, I got also my first view of the British blue-jay—a slightly larger bird than ours, with a hoarser voice and much duller plumage. Blue, the tint of the sky, is not so common and is not found in any such perfection among the British birds as among the American. My boy companion was worthy of observation also. He was a curious specimen, ready and officious, but, as one soon found out, full of duplicity. I questioned him about himself. "I helps he, sir; sometimes I shows people about, and sometimes I does errands. I gets three a week, sir, and lunch and tea. I lives with my grandmother, but I calls her mother, sir. The master and the rector they gives me a character, says I am a good, honest boy, and that it is well I went to school in my youth. I am ten, sir. Last year I had the measles, sir, and I thought I should die; but I got hold of a bottle of medicine, and it tasted like honey, and I takes the whole of it, and it made me well, sir. I never lies, sir. It is good to tell the truth." And yet he would slide off into a lie as if the track in that direction was always greased. Indeed, there was a kind of fluent, unctuous obsequious effrontery in all he said and did. As the day was warm for that climate, he soon grew tired of the chase. At one point we skirted the grounds of a large house, as thickly planted with trees and shrubs as a forest; many birds were singing there, and for a moment my guide made me believe that among them he recognized the notes of the nightingale. Failing in this, he coolly assured me that the swallow that skimmed along the road in front of us was the nightingale! We presently left the highway and took a foot-path. It led along the margin of a large plowed field, shut in by rows of noble trees, the soil of which looked as if it might have been a garden for untold generations. Then the path led through a wicket, and down the side of a wooded hill to a large stream and to the hamlet of Easing. A boy fishing said indifferently that he had heard nightingales there that morning. He had caught a little fish which he said was a gudgeon. "Yes," said my companion in response to a remark of mine, "theys little; but you can eat they if they *is* little." Then we went toward Shackerford church. The road, like most roads in the south of England, was a deep trench. The banks on either side rose fifteen feet, covered with ivy, moss, wild flowers, and the roots of trees. England's best defense against an invading foe is her sunken roads. Whole armies might be ambushed in

these trenches, while an enemy moving across the open plain would very often find himself plunging headlong into these hidden pitfalls. Indeed, between the subterranean character of the roads in some places and the high-walled or high-hedged character of it in others, the pedestrian about England is shut out from much he would like to see. I used to envy the bicyclists, perched high upon their rolling stilts. But the foot-paths escape the barriers, and one need walk nowhere else if he choose.

Around Shackerford church are copses, and large pine and fir woods. The place was full of birds. My guide threw a stone at a small bird which he declared was a nightingale; and though the missile did not come within three yards of it, yet he said he had hit it, and pretended to search for it on the ground. He must needs invent an opportunity for lying. I told him here I had no further use for him, and he turned cheerfully back, with my shilling in his pocket. I spent the afternoon about the woods and copses near Shackerford. The day was bright and the air balmy. I heard the cuckoo call, and the chaffinch sing, both of which I considered good omens. The little chifchaff was chifchaffing in the pine woods. The white-throat, with his quick, emphatic *Chew-che-rick* or *Che-rick-a-rew*, flitted and ducked and hid among the low bushes by the roadside. A girl told me she had heard the nightingale yesterday on her way to Sunday-school, and pointed out the spot. It was in some bushes near a house. I hovered about this place till I was afraid the woman, who saw me from the window, would think I had some designs upon her premises. But I managed to look very indifferent or abstracted when I passed. I am quite sure I heard the chiding, guttural note of the bird I was after. Doubtless her brood had come out that very day. Another girl had heard a nightingale on her way to school that morning and directed me to the road; still another pointed out to me the white-throat and said that was my bird. This last was a rude shock to my faith in the ornithology of school-girls. Finally, I found a laborer pounding stone by the road-side,—a serious, honest-faced man, who said he had heard my bird that morning on his way to work; he heard her every morning, and nearly every night too. He heard her last night after the shower (just at the hour when my barber and I were trying to awaken her near Hazlemere), and she sang as finely as ever she did. This was a great lift. I felt that I could trust this man. He said that after his day's work was done, that is, at five o'clock, if I chose to accompany him on

his way home, he would show me where he had heard the bird. This I gladly agreed to; and remembering that I had had no dinner, I sought out the inn in the village and asked for something to eat. This unwonted request so astonished the landlord that he came out from behind his inclosed bar, and confronted me with good-humored curiosity. These back-country English inns, as I several times found to my discomfiture, are only drinking places for the accommodation of local customers, mainly of the laboring class. Instead of standing conspicuously on some street corner, as with us, they usually stand on some by-way, or some little paved court away from the main thoroughfare. I could have plenty of beer, said the landlord, but he had not a mouthful of meat in the house. I urged my needs, and finally got some rye bread and cheese. With this and a glass of home-brewed beer I was fairly well fortified. At the appointed time I met the cottager and went with him on his way home. We walked two miles or more along a charming road, full of wooded nooks and arbor-like vistas. Why do English trees always look so sturdy, and exhibit such massive repose, so unlike, in this latter respect, to the nervous and agitated expression of most of our own foliage? Probably because they have been a long time out of the woods and have had plenty of room in which to develop individual traits and peculiarities; then in a deep fertile soil, and a climate that does not hurry or overtax, they grow slow and last long, and come to have the picturesqueness of age without its infirmities. The oak, the elm, the beech, all have more striking profiles than in our country.

Presently my companion pointed out to me a small wood below the road that had a wide fringe of bushes and saplings connecting it with a meadow, amid which stood the tree-embowered house of a city man, where he had heard the nightingale in the morning; and then, further along, showed me near his own cottage where he had heard one the evening before. It was now only six o'clock, and I had two or three hours to wait before I could reasonably expect to hear her. "It gets to be into the evening," said my new friend, "when she sings the most, you know." I whiled away the time as best I could. If I had been an artist, I should have brought away a sketch of a picturesque old cottage, near by, that bore the date of 1688 on its wall. I was obliged to keep moving most of the time to keep warm. Yet the "nosee-ems," or midges, annoyed me, in a temperature which at home would have chilled them speechless and biteless. Finally, I leapt the smooth masonry of the stone wall and ambushed myself amid

the tall ferns under a pine-tree, where the nightingale had been heard in the morning. If the keeper had seen me, he would probably have taken me for a poacher. I sat shivering there till nine o'clock, listening to the cooing of the wood-pigeons, watching the motions of a jay that, I suspect, had a nest near by, and taking note of various other birds. The song-thrush and the robins soon made such a musical uproar along the borders of a grove, across an adjoining field, as quite put me out. It might veil and obscure the one voice I wanted to hear. The robin continued to sing quite into the darkness. This bird is related to the nightingale, and looks and acts like it at a little distance; and some of its notes are remarkably piercing and musical. When my patience was about exhausted, I was startled by a quick, brilliant call or whistle, a few rods from me, that at once recalled my barber with his blade of grass; and I knew my long-sought bird was inflating her throat. How it woke me up! It had the quality that startles; it pierced the gathering gloom like a rocket. Then it ceased. Suspecting I was too near the singer, I moved away cautiously and stood in a lane beside the wood, where a loping hare regarded me a few paces away. Then my singer struck up again, but I could see did not let herself out; just tuning her instrument, I thought, and getting ready to transfix the silence and the darkness. A little later, a man and boy came up the lane. I asked them if that was the nightingale singing; they listened, and assured me it was none other. "Now she's on, sir; now she's on. Ah! but she don't stick. In May, sir, they makes the woods all heccho about here. Now she's on again; that's her, sir; now she's off; she won't stick." And stick she would not. I could hear a hoarse wheezing and clucking sound beneath her notes, when I listened intently. The man and boy moved on. I stood mutely invoking all the gentle divinities to spur the bird on. Just then a bird like our hermit-thrush came quickly over the hedge a few yards below me, swept close past my face, and back into the thicket. I had been caught listening; the offended bird had found me taking notes of her dry and worn-out pipe there behind the hedge, and the concert abruptly ended; not another note; not a whisper. I waited a long time and then moved off; then came back, implored the outraged bird to resume; then rushed off, and, as it were, slammed the door indignantly behind me. I paused by other shrines, but not a sound. The cottager had told me of a little village three miles beyond, where there were three inns, and where I

could probably get lodgings for the night. I walked rapidly in that direction; committed myself to a foot-path; lost the trail, and brought up at a little cottage in a wide expanse of field or common, and by the good woman, with a babe in her arms, was set right again. I soon struck the highway by the bridge, as I had been told, and a few paces brought me to the first inn. It was ten o'clock, and the lights were just about to be put out, as the law or custom is in country inns. The landlady said she could not give me a bed, she had only one spare room, and that was not in order; and she should not set about putting it in shape at that hour; and she was short and sharp about it, too. I hastened on to the next one. The landlady said she had no sheets, and the bed was damp and unfit to sleep in. I protested that I thought an inn was an inn and for the accommodation of travelers. But she referred me to the next house. Here were more people and more the look and air of a public house. But the wife (the man does not show himself on such occasions) said her daughter had just got married and come home, and she had much company and could not keep me. In vain I urged my extremity; there was no room. Could I have something to eat, then? This seemed doubtful, and led to consultations in the kitchen; but, finally, some bread and cold meat were produced. The nearest hotel was Godalming, seven miles distant; and I knew all the inns would be shut up before I could get there. So I munched my bread and meat, consoling myself with the thought that perhaps this was just the ill wind that would blow me the good I was in quest of. I saw no alternative but to spend a night under the trees with the nightingales; and I might surprise them at their revels in the small hours of the morning. Just as I was ready to congratulate myself on the richness of my experience, the landlady came in and said there was a young man there going with a "trap" to Godalming, and he had offered to take me in. I feared I should pass for an escaped lunatic if I declined the offer; so I reluctantly assented, and we were presently whirling through the darkness, along a smooth, winding road, toward town. The young man was a drummer; was from Lincolnshire, and said I spoke like a Lincolnshire man. I could believe it, for I told him he talked more like an American than any native I had met. The hotels in the larger towns close at eleven, and I was set down in front of one just as the clock was striking that hour. I asked to be conducted to a room at once. Just as I was about getting in bed there was

a rap at the door, and a waiter presented me my bill on a tray. "Gentlemen as have no luggage, etc.," he explained; and pretend to be looking for nightingales, too! Three-and-sixpence; two shillings for the bed and one-and-six for service. I was out at five in the morning, before any one inside was astir. After much trying of bars and doors, I made my exit into a paved court, from which a covered way led into the street. A man opened a window and directed me how to undo the great door, and forth I started, still hoping to catch my bird at her matins. I took the route of the day before. On the edge of the beautiful plowed field, looking down through the trees and bushes into the gleam of the river twenty rods below, I was arrested by the note I longed to hear. It came up from near the water, and made my ears tingle. I folded up my rubber coat and sat down upon it, saying, Now we will take our fill. But—the bird ceased, and, tarry though I did for an hour, not another note reached me. The prize seemed destined to elude me each time just as I thought it mine. Still, I treasured what little I had heard. I perceived clearly the surprising quality of this bird's song.

It was enough to satisfy me of its superior quality, and make me more desirous than ever to hear the complete strain. I continued my rambles, and in the early morning once more hung about the Shackerford copses and loitered along the highways. Two school-boys pointed out a tree to me in which they had heard the nightingale, on their way for milk, two hours before. But I could only repeat Emerson's lines:

"Right good will my sinews strung,
But no speed of mine avails
To hunt up their shining trails."

At nine o'clock I gave over the pursuit and returned to Easing in quest of breakfast. The landlady and her daughter, of the only large and comfortable-looking inn, were washing windows, and would not listen to my request for breakfast. The fires were out and I could not be served. So I must continue my walk back to Godalming; and in doing so, I found that one may walk three miles on indignation quite as easily as upon bread.

In the afternoon I returned to my lodgings at Shotter Mill, and made ready for a walk to Selborne, twelve miles distant, part of the way to be accomplished that night in the gloaming, and the rest early on the following morning to give the nightingales a chance to make any reparation they might feel inclined to for the neglect with which they had treated me. There was a foot-path over the hill and through Lechmere bottom to Liphook, and to this,

with the sun half an hour high, I committed myself. The feature in this hill scenery of Surrey and Sussex that is new to American eyes is given by the furze and heather, broad black or dark-brown patches of which sweep over the high rolling surfaces, like sable mantles. Tennyson's house stands amid this dusky scenery, at a place east of Hazlemere called Blackdown. The path led through a large common, partly covered with grass and partly grown up to furze — another un-American feature. So precious as land is in England, and yet so much of it given to parks and pleasure-grounds, and so much of it left unreclaimed in commons! These commons are frequently met with; about Selborne they are miles in extent, and embrace the Hanger and other woods. No one can inclose them or appropriate them to his own use. The landed proprietor of whose estates they form a part cannot; they belong to the people, to the leaseholders. The villagers and others who own houses on leased land pasture their cows upon them, gather the furze, and cut the wood. In some places the commons belong to the crown and are crown lands. These large uninclosed spaces often give a free and easy air to the landscape that is very welcome. On the border of Lechmere bottom I sat down above a straggling copse, aflame as usual with the foxglove, and gave eye and ear to the scene. While sitting here, I saw and heard for the first time the black-capped warbler. I recognized the note at once by its brightness and strength and a faint suggestion in it of the nightingale's. But it was disappointing: I had expected a nearer approach to its great rival. The bird was very shy, but did finally show herself fairly several times, as she did also near Selborne, where I heard the song oft repeated and prolonged. It is a ringing, animated strain, but as a whole seemed to me crude, not smoothly and finely modulated. I could name several of our own birds that surpass it in pure music. Like its congeners, the garden warbler and the white-throat, it sings with great emphasis and strength, but its song is silvern, not golden. "Little birds with big voices," one says to himself after having heard most of the British songsters. My path led me an adventurous course through the copses and bottoms and open commons, in the long twilight, but brought me safely to Liphook at ten o'clock. I expected and half hoped the inn would turn its back upon me again, in which case I proposed to make for Wolmer Forest a few miles distant, but it did not. Before going to bed, I took a short and hasty walk down a promising-looking lane, and again met a couple who had heard night-

ingales. "It was a nightingale, was it not, Charley?"

If all the people of whom I inquired for nightingales in England could have been together and compared notes, they probably would not have been long in deciding that there was at least one crazy American abroad.

I proposed to be up and off at five o'clock in the morning, which seemed greatly to puzzle mine host. At first he thought it could not be done, but finally saw his way out of the dilemma and said he would get up and undo the door for me himself. The morning was cloudy and misty, though the previous night had been of the fairest. There is one thing they do not have in England that we can boast of at home, and that is a good masculine type of weather; it is not even feminine; it is childish and puerile, though I am told that occasionally there is a full-grown storm. But I saw nothing but petulant little showers and prolonged juvenile sulks. The clouds have no reserve, no dignity; if there is a drop of water in them (and there generally are several drops), out it comes. The prettiest little showers march across the country in summer, scarcely bigger than a street watering-cart; sometimes by getting over the fence one can avoid them, but they keep the hay-makers in a perpetual flurry. There is no cloud scenery, as with us, no mass and solidity, no height nor depth. The clouds seem low, vague and vapory,—immature, indefinite, inconsequential, like youth.

The walk to Selborne was through mist and light rain. Few bird-voices, save the cry of the lapwing and the curlew, were heard. Shortly after leaving Liphook the road takes a straight cut for three or four miles through a level, black, barren, peaty stretch of country, with Wolmer Forest a short distance on the right. Under the low, hanging clouds the scene was a dismal one—a black earth beneath and a gloomy sky above. For miles the only sign of life was a baker's cart rattling along the smooth, white road. At the end of this solitude I came to cultivated fields and a little hamlet and an inn. At this inn (for a wonder!) I got some breakfast. I sat at the table with the family, and had substantial fare. From this point I followed a foot-path a couple of miles through fields and parks. The highways for the most part seem so narrow and exclusive, or inclusive, such penalties seem to attach to a view over the high walls and hedges that shut you in, that a foot-path was always a welcome escape to me. I opened the wicket or mounted the stile without much concern as to whether it would further me on my way or not. It was like turning the flank of an enemy. These well-kept fields and

lawns, these cozy nooks, these stately and exclusive houses that had taken such pains to shut out the public gaze—from the foot-path one had them at an advantage, and could pluck out their mystery. On striking the highway again, I met the postmistress, stepping briskly along with the morning mail. Her husband had died, and she had taken his place as mail-carrier. England is so densely populated, the country is so like a great city suburb, that your mail is brought to your door everywhere, the same as in town. I walked a distance with a boy driving a little old white horse with a cart-load of brick. He lived at Hedleigh, six miles distant; he had left there at five o'clock in the morning, and had heard a nightingale. He was sure; as I pressed him, he described the place minutely. "She was in the large fir-tree by Tom Anthony's gate, at the south end of the village." Then, I said, doubtless I shall find one in some of Gilbert White's haunts; but I did not. I spent two rainy days at Selborne; I passed many chilly and cheerless hours loitering along those wet lanes and dells and dripping hangers, wooing both my bird and the spirit of the gentle parson, but apparently without getting very near to either. When I think of the place now, I see its hurrying and anxious hay-makers in the field of mown grass, and hear the cry of a child that sat in the hay back of the old church, and cried by the hour, while its mother was busy with her rake not far off. The rain had ceased, the hay had dried off a little, and scores of men, women, and children, but mostly women, had flocked to the fields to rake it up. The hay is got together inch by inch, and every inch is fought for. They first rake it up into narrow swaths, each person taking a strip about a yard wide. If they hold the ground thus gained, when the hay dries an hour or two longer, they take another hitch, and thus on till they get it into the cock or "carry" it from the windrow. It is usually nearly worn out with handling before they get it into the rick.

From Selborne I went to Alton, along a road that was one prolonged rifle-pit, but smooth and hard as a rock; thence by train back to London. To leave no ground for self-accusation in future, on the score of not having made a thorough effort to hear my songster, I the next day made a trip north toward Cambridge, leaving the train at Hitchin, a large picturesque old town, and thought myself in just the right place at last. I found a road between the station and the town proper, called Nightingale Lane, famous for its song-

sters. A man who kept a thrifty looking inn on the corner (where, by the way, I was again refused both bed and food) said they sang night and morning in the trees opposite. He had heard them the night before, but had not noticed them that morning. He often sat at night with his friends, with open windows, listening to the strain. He said he had tried several times to hold his breath as long as the bird did in uttering certain notes, but could not do it. This, I knew, was an exaggeration; but I waited eagerly for night-fall, and when it came paced the street like a patrolman, and paced other streets, and lingered about other likely localities, but caught nothing but neuralgic pains in my shoulder. I had no better success in the morning, and here gave over the pursuit, saying to myself, It matters little, after all; I have seen the country and had some object for a walk, and that is enough.

Altogether I heard the bird less than five minutes, and only a few bars of its song, but enough to satisfy me of the surprising quality of the strain.

It had the master tone as clearly as Ten-nyson, or any great prima donna, or famous orator has it. Indeed, it was just the same. Here is the complete artist, of whom all these other birds are but hints and studies. Bright, startling, assured, of great compass and power, it easily dominates all other notes; the harsher *chur-r-r-r-r-g* notes serve as foil to her surpassing brilliancy. Wordsworth, among the poets, has hit off the song nearest:

"Those notes of thine—they pierce and pierce;
Tumultuous harmony and fierce!"

I could easily understand that this bird might keep people awake at night by singing near their houses, as I was assured it frequently does: there is something in the strain so startling and awakening. Its start is a vivid flash of sound. On the whole, a high-bred, courtly, chivalrous song; a song for ladies to hear leaning from embowered windows on moonlight nights; a song for royal parks and groves—and easeful but impassioned life. We have no bird-voice so piercing and loud, with such flexibility and compass, such full-throated harmony and long-drawn cadences; though we have songs of more melody, tenderness, and plaintiveness. None but the nightingale could have inspired Keats's ode—that longing for self-forgetfulness and for the oblivion of the world, to escape the fret and fever of life,

"And with thee fade away into the forest dim."

John Burroughs.

TOPICS OF THE TIME.

A Chinese Wall for American Art.

THE advocates of a tariff on the works of foreign artists are, at least, not without consistency. They regard art as a mercantile commodity, which must be "protected" in order to thrive at home; and furthermore, when they are told that American art-students and artists residing abroad are suffering socially from the action of Congress in increasing the tariff, and are also in peril of being turned out of the art-schools where they are being freely educated at the cost of foreign governments, they retort that it is all the better for American art that they should be turned out.

But we think that Congress takes a great responsibility when it virtually legislates American art-students out of their present privilege of studying their profession where it can best be studied—namely, in foreign schools and museums. From the time that the young Longfellow went to Europe for travel and study, before assuming a professorship at Bowdoin, American advanced students of all the arts and sciences have generally found it convenient to gain some part of their instruction in the Old World. Even when the time arrives that American students of medicine, of philosophy, of all the various sciences, strictly so called, will not need to study abroad, it will still be necessary that some part of the student life of artists shall be spent in the galleries, museums, and schools of the Old World. Shakspeare can be read nearly if not quite as intelligently in New York as in London; a student of anatomy can find as good a subject to dissect in Philadelphia as in Paris. But a student of art can find not one Greek statue in America; not one work of Michael Angelo; not one supreme example of any of the great periods of artistic production! Even when our art-schools and museums are improved in the matter of apparatus and examples, it will still be always desirable for the art-student and archæologist to spend a certain proportion of his time among the art monuments of the Old World.

Any one who does not comprehend these considerations does not understand the essentials of art, and is therefore incompetent to discuss wisely any æsthetic question,—much less to legislate, or to intelligently influence legislation, concerning art. It is true that art should, in a certain sense, be national; but before being *national*, it must first be *art*. The art of the American savage was protected by the laws of nature for many thousand years, and yet the painting and sculpture of the Indians can hardly compete with those of Italy. And if Italian art had been "protected" against that of Greece, where would have been the Renaissance? We get our language, our religion, our ancestors (some of the most patriotic among us get even ourselves), from abroad. Why should we be ashamed to receive instruction in art from the same quarter? The gentlemen, or gentleman, who sprang the thirty-per-cent. Chinese Wall tariff on the country should, in order to be ideally consistent, eschew the

European coat and trowsers so prevalent in our Eastern States especially, and return to the native American garb of the Indian Territory.

The tariff on art is legislation that discriminates against the poor man. The rich man can afford to have the picture of his choice, no matter what the tariff may be; in fact, the higher the tariff the rarer the gem with which his wall is adorned. The free admission of pictures intended for public galleries, in a law which taxes all other picture importations, is a delusion. The public galleries, by means of loans and bequests, are constantly benefited by the treasures of art owned by private individuals; and, besides, a good picture hung upon a poor man's wall, or in any private gallery, has an influence that cannot be measured.

There are some who would like to arrange the tariff so as to exclude "bad pictures." What nonsense! Who is to judge whether or not a picture is "bad"? Your "bad" may be my "good." If you pick up a Millet in Paris while Millet is comparatively unknown, has the cheapness of the purchase anything to do with the art-value of the painting?

The fact is, art should be free—free as air, free as sympathy, free as thought and imagination. Art should be fostered,—not "protected" by the clumsy devices of a tariff,—and the way to foster art is to give it liberty. Any attempt to restrict the free interchange of art throughout the world is an attempt to impede its development. As we have said above, the aborigines had this country a good while to themselves: what did they do for American art? Unless we are to go back to savagery, we must admit no impediment to the free and stimulating entrance into America of the art of the Old World.

"The Christian League of Connecticut."

DR. GLADDEN'S "Christian League of Connecticut," both in magazine and book form, has been received with a welcome that is one of the healthiest signs of the times. It has often been charged that the churches are responsible for sectarian division and strife; in these chapters Dr. Gladden proves the charge, and that his words have been so well received indicates in the churches a mind ready for repentance, even if not quite ready yet to do the works that are meet for repentance.

The evils of sectarianism, foretold by the prophets of the New Testament, forewarned against by Christ himself, are so great and so apparent that the most enthusiastic sectary seldom ventures to deny or even to belittle them. The energies of the church of Christ, which should be wholly devoted to battling against superstition, ignorance, intemperance, covetousness, lust, and all forms of selfishness and worldliness, are diverted into controversies about forms, symbols, rites, and formularies of doctrine. While Hercules's right hand is busy contending with his left, the ser-

pents threaten to destroy him; to destroy them he needs all the strength of both his hands. This spirit of sectarianism is, by the confession of all missionary workers, the greatest obstacle to successful Christian work in our own land, and to missionary work abroad. The rival sects compete for congregations in the new towns of the West with a rivalry as intense and sometimes almost as unscrupulous as that of trade. In a single village in Kansas, numbering not over a thousand souls all told, there are, or were a few years ago, three Presbyterian churches,—a Northern, a Southern, and a Cumberland Presbyterian. Of course, other denominations were also represented in this very churchly but very unsanctified community. At the same time there are, or were, one hundred and fifty miles of railroad, with small villages scattered along its line, and not a single Protestant meeting-house of any description from one end to the other. Mormonism is an army; Romanism is an army; the liquor traffic is an army; all three are well organized and officered. That Protestantism, broken up into independent companies of minute-men, produces any effect whatever in checking the advance of these three great armies, is due not to the miserable methods which it employs, but to the magnificent divine endowment of truth with which it has been intrusted, and which it cannot utterly despoil of its power. Abroad, the effect of sectarianism on Christian progress is less disastrous, because the foreign missionary is rarely, if ever, a sectary, and pays as little attention to sectarian distinctions as he can do and avoid conflict with the churches from which he draws his support at home. But in spite of this fact, sectarianism is the chief obstacle to the progress of foreign missions. Mr. Mazoomdar, being told that he is only in the vestibule of Christianity, replies with a sarcasm, which, despite its exaggeration, has enough truth in it to be humiliating to the Christian, that, when he looks within the open door and sees the gladiators fighting with one another in the arena, he is more inclined to flee from the vestibule than to pass within the amphitheater of the church itself.

When these evils of sectarianism have been brought before the Christian public in the press or on the platform, the answer of the sectary has, at least of late, been in the nature of what the lawyers call a demurrer. "I grant," he has said, "that all you say is true; still, there is no cause of complaint and no ground of condemnation. If you allow that right of private judgment which is our inheritance from the Reformation, you must accept the evil with the good, in the faith that the evil will prove temporary and the good permanent. The Baptist cannot abandon his immersion, nor the Episcopalian his orders, nor the Presbyterian his organization, nor the Congregationalist his independency, nor the Methodist his Arminianism, nor the Calvinist his doctrine of decrees. These are matters of conscience with each of us, and we must hold fast to them. We cannot abandon our church organizations; we must work within our church lines; and we must be content to wait until free discussion and friendly fellowship, in Evangelical Alliance meetings and the like, shall, in some far remote period of time, obliterate our differences and bring us to see and to feel alike. What would you have? What practical remedy can you propose which does not involve either

the abandonment of the right of private judgment or the disregard of those conscientious conclusions to which the exercise of that right brings each individual soul?"

To this question Dr. Gladden, in "The Christian League of Connecticut," has furnished a reply. He shows how the Christian churches in any town can unite their forces for a common work against a common enemy without abandoning the right of private judgment, without violating the conscientious convictions to which it has brought them, and without destroying or even weakening their respective church organizations. He does this by a story which is so common-sense in its principles and so realistic in its art that it is not strange that many readers took it to be history. It ought to be history. Indeed, the only criticism which the sectary makes on Dr. Gladden's plan for a community of Christian work is that it is ideal and impracticable, and to the average sectary this criticism seems entirely conclusive. In fact, the first epithet is one only of praise; and the second, though it is a severe criticism, is a criticism on the sectary himself and not on the book which he criticises. The function of the minister of Christ is to hold up ideals of life. He is appointed to do this very work for the community; to set over against the average home, with its petty ways, its selfishnesses, its drudgery, and its bickerings, the ideal home inspired by hope and radiated by love; to set over against the actual state, with all the jealousies and the mean ambitions of practical politicians, the kingdom of God—the ideal democracy in which he only is accounted great who is the servant of all; to set over against the common industries of life, with all their grasping and their greed, the unselfish industry whose motto is, "My father worketh hitherto, and I work"; to set over against the actual church of Christ, with its strife and debate, the united church of Christ—many members, but one body. To say, as some do, that Dr. Gladden has painted in "The Christian League of Connecticut" an ideal Christianity, is to give him the highest praise. It is to say that he has done for Protestant Christianity in America what Moses did for the ethical life of all times when he preserved in the tables of stone the Ten Commandments, and what Jesus Christ did for the spiritual life of the individual of all times when he gave to his apostles the Sermon on the Mount. We should not ourselves agree to so high a praise as this. Dr. Gladden's Christian League falls short of our ideal, and we venture to think that it falls considerably short of Dr. Gladden's own ideal; but it is one step toward an ideal, and toward one which is not necessarily impracticable; that is, there is nothing in it which violates the essential and ineradicable principles of human nature. If it is impracticable, we may well ask whether this is not because the pride, and petty ambitions, and mean jealousy, and ignoble self-will, in a word, the unchristian selfishness of the Christian churches and the Christian ministry, make it so. If all ministers and all churches were as Christian in spirit as the ministers and churches of New Albion, there is no reason why Protestantism should not unite in a Christian League for its common Christian work by methods which undoubtedly would differ from, but on principles which would as certainly be essentially like, those of Dr. Gladden's "Christian League of Connecticut."

The Independent Voter in the Next Campaign.

In his paper on "The Next Presidency," in the present issue of *THE CENTURY*, Mr. Wayne MacVeagh has presented some general considerations concerning the approaching political contest which are likely to outlast in usefulness the important occasion which gives them reason for existence. It will be long before such suggestive writing will cease to have proper interest for intelligent Americans of either party or of none. But it remains to make a little closer application of those excellent principles of political action which are held by Mr. MacVeagh in common with a large and increasing minority of voters; in short, to make more account of the personal equation in the political problem. In what we venture to say on this head below, we must not, however, be understood as advocating any one of the gentlemen named as a candidate. There is no public exigency that would warrant any such expression of preference in these columns at this time. We have simply chosen two well-known public men, of two well-defined classes, as types of the tendencies which are at work to shape the nominations.

We think it is quite safe to assume that Mr. MacVeagh is right in his belief that neither party will nominate anybody whose record or opinions would put his party on the defensive and require an apologetic or explanatory canvass in his behalf. The Democrats will not be foolish enough to name a man whose disloyalty during the war was sufficiently flagrant to offend the loyalty of the North, and revive the sectional issue; nor will they nominate a free-trader, as such a nomination, it is now clear, would inevitably split the party into two factions, and leave it as hopeless in the approaching contest as it was in that of 1860. On the other hand, the Republicans will not be foolish enough to name a man of the high protectionist school, so as to drive off the North-west; nor will they split themselves into two factions by reviving, in the person of their candidate, the fierce animosities which divided them in the spring and summer of 1881. What preceded the assassin's pistol-shot, and the prolonged sufferings of Garfield which followed it, will be allowed to rest as they now are—not talked about, but not forgotten. It is quite evident, therefore, that a good many men whose names are now frequently mentioned in connection with the Presidency will not be seriously considered when the necessity of an election as well as of a nomination is taken into account. The politicians composing the conventions may be trusted to avoid blunders which would be equivalent to suicide.

The Democrats will probably be reduced to choose between the two classes of public men represented. Let us say, in the Democratic party by Judge Thurman and by Mr. Bayard, and the Republicans will probably be reduced to choose between the two classes of public men represented, let us say, in the Republican party by General Logan and by Mr. Edmunds. We do not mean that either party will restrict itself to these individuals; but we do believe that when the conventions face the responsibility of naming a man likely to be elected, they will be restricted to the two classes represented fairly enough by these names.

Judge Thurman and General Logan are both reliable

partisans of their respective parties, and both, we believe, possess records untarnished with any suspicion of corruption. They were both unsound on the currency question; but so were a great many other public men, and their unsoundness was, no doubt, due as much to their desire to keep their party on what was supposed to be the popular side as to their ignorance of the merits of the question. Neither of them occupies a radical position on the question of the tariff; and they both believe in "taking the boys in out of the cold and warming their toes." They are honest but unintelligent political partisans; and if either party could this year elect a man who was an honest but unintelligent political partisan, there is no reason why either or both of them should not be put in nomination.

Mr. Bayard and Mr. Edmunds, on the other hand, are statesmen of whom the best portion of the American people, without regard to party, are justly proud. This pride is not due to the fact that they are more free from suspicion of conscious wrong-doing than Judge Thurman or General Logan; but it is because they are really high-minded, able, and pure statesmen, who are always reasonably sure to be found on the right side of every non-partisan question. They stood shoulder to shoulder fighting for honest money, year after year, when it seemed a losing and hopeless battle. They have always been recognized as the relentless opponents of bad men and bad measures. The "spoils" system did not defile them in the days of its power; they never set up as "bosses," and everybody knew in advance that any practical movement for the reform of the civil service of the country would find in them ardent and resolute advocates. The simple truth is that these two men represent the high-water mark in American public life at present, and it is from this class or from the other that the candidates will be taken.

One thing more is sure: The independent voter will be "abroad" in 1884 as he never was before. Now, suppose the Republican party nominates a man like Mr. Edmunds, and the Democratic party nominates a man like Judge Thurman,—on which side will the independent voter be found? Or suppose the Republican party nominates a man like General Logan and the Democratic party nominates a man like Mr. Bayard,—on which side will the independent voter be found?

We wish it distinctly understood, and we here repeat, that the names of the four gentlemen mentioned are used merely as types, and not to advance or retard any movements or influences concerned merely with them as individuals. This is especially to be remembered in respect to the two names here most favorably mentioned. There are other public men who would represent the principles of the "independent voter" equally well with Messrs. Bayard and Edmunds, and in some ways perhaps even more satisfactorily than either of them. But we venture, thus early, two predictions: One is that the independent voter will be found on the side of the candidate whose past life gives the best guarantee that he is in sympathy with the convictions and aims of the independent voter, and the other is that the candidate supported by the independent voter will be the next President of the United States.

"The American Copyright League."

"THE American Copyright League is an association organized by American authors, the object of which is to urge a reform of American copyright law, and, primarily, the abolition, so far as possible, of all discriminations between the American and the foreign author."

The above is the brief but satisfactory platform of what we believe to be the largest association of American writers yet formed in furtherance of the principle of international copyright. It will be remembered that Dr. Edward Eggleston, in an article on "The Blessings of Piracy," in *THE CENTURY* for April, 1882, wrote: "If the present movement should fail, the next will probably be a far more comprehensive one, made by men of letters themselves, who are the real

principals in the case. It is hard to organize authors as such; there are too many questions of literary position involved. But we can readily organize, on a business basis, an association of producers of literary property."

The prophesied movement of "producers of literary property" has begun. American authors, in demanding justice for the pillaged foreigner, are incidentally asserting their own rights at home and abroad in the products of their brains. Through its executive committee, the American Copyright League is now besieging both Congress and the State Department. All writers and others who wish to help on this good cause are requested to write to their representatives in both branches of Congress, and also to send their names to the secretary of the Executive Council, Mr. G. P. Lathrop, The Benedick, 80 Washington Square, New York.

OPEN LETTERS.

Organs and Orchestras in Church.

GAVAZZI is reported as having once said: "The best music in the world is in Scotland, and without embarrassment of organs." Now, this deliverance of the great orator would not of itself establish the fact it seems to assert; for taste does not always bend to logic, and never yields to the authority of a mere opinion. As an offset to such a remark of the old patriot, which was forced to play a conspicuous part in the rather tumultuous discussions of the recent anti-organ convention at Allegheny City, it is amusing to recall a remark of one of our tourist party in 1877, a typical Scotchman in every feature of his enthusiasm. He was sitting with us to listen to a congregation of the Free Italian Church in Genoa,—the body of Christians whose cause Father Gavazzi pleads,—and while they sang, with the accompaniment of an organ, "Safe in the arms of Jesus," to our American tune, his emotion kept gathering head, until, when the pathetic strain ceased, he wiped the tears from his eyes and exclaimed, "That is the most effective music I ever heard in any church. How finely Italians sing; what sweet melodies they have!"

It is evident that a prejudice is growing up on both sides of this question concerning the use of organs and orchestras in the public services of the Lord's Day. The debate is sometimes too violent for edification. A party in the Scotch churches is fairly determined to bring in the despised "chests of whistles" to help in the rendering of even Rouse's psalms. There are some also who are not in such a religious connection, but dwelling among others who tolerate instruments clear to the verge of uttermost charity, who wish the trustees had the money back which, in the early days, they paid for the swell and the pedal, the great diapason, the vox humana, and the bells.

Now, most musical people like organs; some like other combinations of instrumental helps in the singing. One would imagine the cornet had become a means of grace. When I was only a boy of seventeen, I my-

self became a member of a village group of players, which sat for years in what we appropriately called the *orchestra* of the church. We had two flutes, two violins, a bass-viol, a double-bass, a tenor trombone, and an ophicleide. It would not be of any use at this late day for artists to laugh at that kind of accompaniment in divine service; the sounds we made were well enough in their way, and most of those musicians are out of reach of criticism long ago. The beloved conductor of the volunteer choir was the leader of a military band to which some of us belonged, and was no mean musician for those simple-hearted times; but he had weaknesses. He often composed our piece of music during "the long prayer," and handed it around in penciled parts for us to render at the regular time for the hymns. Of course, we, by instinct, kept all this part of the service as far as possible away from the congregation; for they were likely to interfere with what we considered artistic if they should try to sing. When I recall this impertinent wickedness,—I recognize it now, we did not know it then,—it seems to me I can understand why some of those devout people in the recent convention hated instruments so violently: they felt in danger of being deprived of their rights. So they spoke out in terms unmistakable: "We must withhold fellowship from those who use organs; if organs come in, we must go out." They gave what they considered reasons for a conclusion so revolutionary. "We charge that the use of instruments is at the expense of spirituality," so said one of the speakers, according to the printed report of the proceedings. "If I can make or find a church of a better kind, I will not stay in a church that sanctions instrumental music," so said another, with equal frankness and force.

These Christian men were in earnest. Is there any ground for the sober apprehensions with which they regard instruments in church? It is of no use to argue the case; taste is out of the reach of ordinary logic; this is a question of fact, and of taste too. Let us draw upon the experience of those who are ac-

quainted with music as it is now managed in modern congregations. How does this plan of ours work? Do organs destroy spirituality in worship?

Everybody would have some story to tell, if he had a chance to ease his feelings on this point. I have many to choose from. Once I preached on exchange for a neighboring minister. In that congregation the organist was the leader of the choir, and hence was responsible for the music altogether; and he had ordinarily his way. The opening piece occupied, by the time-piece directly fronting me on the organ case, seventeen minutes. During this performance we all sat and patiently listened, or watched each other impatiently; we had nothing to do with selecting it, with singing it, or with understanding it. Then I was at liberty to commence divine worship with the customary prayers of the people. After this a hymn was offered to the congregation, the verses of which were driven hopelessly apart by an interlude of wonderful construction on the instrument. The organist paused deliberately after each stanza, leaving us to stand and watch him, while in leisurely silence he contemplated the position, decided what, under the circumstances, he would do, then pulled out such stops as he deemed the fittest for his present venturesome undertaking, and, when he got ready, went on to play a strain of interlude as far away as perverse ingenuity could invent from the chosen music which was printed before us in the book. When he came home from his wandering, he quirked up a little sharp note, to start the choir out of inattention, and gave us another verse. So the hymn was jerked through eight minutes of ups and downs and offs and ons. By and by I gave out the second one, which was to be sung by the quartet alone. I shortened it to four stanzas, in a sort of trepidation; but they spent twelve minutes on it, and I never heard such full ranges of a church organ before. Those singers waited at each vacancy until their leader had, by every imaginable dexterity on the keyboard, settled the Sunday-school question, "Oh, what can little hands do?" Then a finale of orchestral intricacy wound up the performances, and the stillness gave us a season of peace. At the close of the services I used the Doxology, as the safest relief to my apprehensions; and then we were stunned out of church with nothing less than violence.

This is no caricature. I am not ashamed to say I felt indignant; I was hindered, embarrassed, annoyed. It seemed to me as if the congregation would be destroyed by such a parade of amazing and insufferable conceit. Does any one imagine that that man had the least reference conceivable to the wants and purposes of the worshipping assembly by whom he was trusted? I was truly saddened to see how he betrayed them in order to display himself. And now I have to add that the next day I received a letter early in the morning from this very organist. He said he would be pleased to secure an engagement as leader in our church; for although some particulars pleased him in the place he was filling, he desired a position where he "could have more liberty"! With such a reminiscence in my mind, I think I can understand why an exasperated president of a college should exclaim in the convention: "We are commanded to sing with the spirit and with the understanding; and an organ is incapable of either."

It is of no use to try to break the force of the argument in this illustration by asserting that this person was positively an exception in the profession. It is to be admitted in all charity that he combined more of the offensive characteristics of modern organists in his own person than any man of his class who ever came within my observation. But he was representative of possibilities which our Scotch friends have reason to dread. In the utter disregard of the congregation, both in the choice and rendering of the music; in the interminable prolongation of the services for the sake of personal display; in the hopeless heartlessness of the whole performance as a mockery of what was put forward as the worship of God; in these things that choir-leader was a representative of many, many, in his profession.

There are other infelicities more common still. Not long ago I was walking out of a neighboring church, into which, in one of my rare chances of worshipping without officiating, I had found my way. A gentleman whom I met there was speaking to me kindly, giving me cordial welcome. I tried to listen, but the roar of the organ drowned his voice. "Oh, I wish you would stop the awful noise up there!" I said; for the racket of tubes shook a chandelier over our heads, and rattled the glass in the windows. And my friend answered: "Well, he is in one of his loud moods now, that is a fact; but he is a splendid player. He is a little funny sometimes when he sends us home good-natured; very adroit and careful, but he makes me laugh now and then. He will begin an opera air, and go on with it half a dozen notes, until you are scared a little; he just touches it and leaves it, and, before he gets caught, away he goes off into something else. He is at 'Lohengrin' now, he will be in 'Lucia' in a minute, and will end up in some solemn old oratorio; and the elders never seem aware of what he is giving the congregation!"

Unfortunately, some of them do know it by the smirk which they see on the faces of the ribald ones who laugh at their innocence; and the minister knows it also; but what can they do? The chief trouble is not in the tubes and the reeds, nor even in the whistles, but in the living human being who sits responsibly in the throne to manage them, and is himself unmanageable.

Here, again, we are interrupted by the asseveration that a man who will do such things is a charlatan; he ought to be cashiered; the profession are not responsible for him. Let us see. The question is concerning voluntaries with which to open or to close the services, concerning choice of tunes for singing, and concerning interludes between the stanzas. Charles Fox used to say, "Great authorities are arguments." It may be helpful to quote from Mr. Richard Storrs Willis, to whom the musical profession have been accustomed to look with deference:

"The artist has his own sphere,—an art-sphere,—into which neither clergyman nor people have any right to intrude. For instance, the question of a voluntary being decided, and its length, if you will, no one has a right to dictate what the quality or style of that voluntary shall be. If the musical taste of the artist do not suit the society, let them dismiss him, and get another; he is master in his own field, and is right in rebelling against all dictation as to the manner

of managing an organ. When a society engage an artist they run this musical risk. And thus, after the number of hymns is decided, the number of verses to be sung, and where the hymns are to be introduced, no one has a right to dictate what music shall be sung, or how it shall be sung. Here, again, the artist is master in his own field. The only proper redress for dissatisfaction is dismissal. Again, the question of interludes being decided,—how many and of what length,—the quality and style of those interludes are solely at the discretion of the artist; and he may stun with sub-bass; he may torture with fancy-stops; he may rattle on without the slightest reference to the sense of the preceding or succeeding verse; and no one in the church has any official right to interfere. If the music committee have hired so crude an organist, it devolves upon them and the society patiently to bear with the same, until they can procure a better. It is as well to have this subject understood; for nothing, perhaps, has been the cause of so much dissonant feeling in the church as the church's harmony—generally arising from trespass on the one part or the other."

Let us assume, therefore, that the subject is at last "understood." Some of us have understood a good deal of it for quite a long time; but let us put our information into form. An organist may construct his voluntaries out of operatic snatches in the slyest sort of way, he may choose his tunes from unfamiliar collections or compose them in prayer-time, and in his interludes he is specially to be allowed to "stun," to "torture," and to "rattle on without the slightest reference to sense." And all we can do to relieve so excruciating a position is to give him warning of dismissal at the end of his fiscal year, or wait for him to lose his health. We cannot even arrest him by the police, as we could any other disturber of divine worship. If we interfere before his time is out, he will sue the church in a justice's court for heavy damages for dues and defamation; we had better bear patiently, and not trespass on his rights.

Well, "Art is long; life is short." But it strikes ordinary thinkers, especially Scotchmen, that art is getting too long, slightly tedious, perhaps; and life is vanishing swiftly amid so much stunning and torturing and rattling clear down to the end of the twelve-month—which is the shortest engagement that even a "crude" organist will make with a modern music committee. If these be the acknowledged principles upon which the "artist" proceeds, who is to say that the profession is not responsible for much of what oppresses the worshiping people of God? Can any one blame the gentlemanly Christian pastor who in the convention said: "If my brother insists that I must part with my convictions, I must part from him."

Is this declaration of Mr. Willis the "common law" of the musicians? This utterance which I have quoted was published as admirable and authoritative in one of the chief musical periodicals; and it now stands at the conclusion of an argument in the volume, "Our Church Music: a Book for Pastors and People," long before the public under his name. If it has ever been challenged, I do not know it, and I am perfectly sure no modern organist ever dreamed it ought to be; why should he?

I would like to state two facts, however, before I leave the point; I think I shall feel easier afterward:

A church which I have served as pastor once turned a drunken organist out of his seat before the end of the year, and the earth did not give signs of woe that all was lost; and once afterward they dismissed an organist who grew disagreeable, and paid him his salary to the end of the engagement. It is not always necessary, therefore, to endure tortures and stunnings and rattlings still in possible reserve.

Up to this stage of discussion, I confess all appears to be melancholy, and looks unfair. But why do not the noble men and true, who are Christian worshipers themselves, and serve God with highest acceptableness in praise with their instruments, come forth and restate the doctrine of relations between people and players? There are organists who preach as well as a minister, in their own way and according to their chances. Not one of them doubts the confidence and affection with which we in the pulpits turn to them for their aid and guidance. At the funeral of our dear old friend George B. Bacon, there was one organist who took the service into his own hands, while the minister was content to be silent for a space. William Mason made that dumb instrument speak as (so it seemed to me, and not to me alone) no articulate voice could have spoken. Some hearts which heard that dirge, that comfort, that triumph, that celestial song from the keys, forgot the player, and the playing, and the instrument, only to recall them afterward—as I do now—with a wondering, grateful, glad sense of help in an hour of trial. Sometimes clear, sweet, gentle music, all alone, can lift mourners' sadness better than words. It is a pity that cheats and charlatans should prejudice a profession which has its promised place even in God's sanctuary above: "the players on instruments shall be there."

George Macdonald, in one of his best stories, makes David Elginbrod say: "I always think that if I could hear Milton playing on his organ, it would be more like the sound of many waters than anything else I can think of." It would seem as if an instrument which, if properly managed, could prove itself so capable for good, ought to receive a brighter welcome and a more charitable judgment than is implied in those closing resolutions of the convention to which we have referred so pleasantly: "According to the standards of our church, the use of instrumental music is unlawful." Pity 'tis, 'tis true. Madame de Staël suffers her Corinne to say, what has been actually supposed to be the fact by many of the most devout people that ever lived: "Among all arts music alone can be purely religious."

There was once such fear of mere æsthetic feeling in divine worship, that at the Council of Trent it was fiercely debated whether any music, other than the simplest Gregorian chants, should be permitted in the house of God. It is curious to note that the next religious convention to discuss a similar prohibition is a denomination of Protestant Christians in the nineteenth century.

If the vexation proceeds from the man who manages the instrument, would it not be better to suppress the vexation than to banish the instrument he abuses? If helps hinder, is it an impossible thing to hinder the helps from hindering?

Charles S. Robinson.

National Aid to Education.

THE vast amount of illiteracy in the country has attracted much attention of late, and has led to the proposal that national aid shall be given to the public schools of the States. The census of 1880 shows that there were in the country at that time nearly five million persons over ten years of age who were unable to read, and six and a quarter millions unable to write. The chief centers of illiteracy are in the Southern States, in some of which the proportion of illiterate persons is over forty per cent, and among the Irish, the French-Canadians, and some other foreign-born inhabitants of the North.

The existence, among us of such a mass of ignorance is a very unpleasant fact, and the illiterate vote is justly regarded as dangerous to the political well-being of the country. The ease with which ignorant voters can be corrupted and led astray has often been illustrated in our political history, and is sure to receive further illustration hereafter, unless effective means are taken to prevent it; and no means will be effective except the public education of the whole people. As the maintenance of schools, however, requires large sums of money, and as many of the States are slack in appropriating it, it is proposed that the national government shall assist in the work; and a bill for this purpose was introduced into Congress last winter. By this bill it was provided that the national government should give to the States several million dollars a year for a series of years, for the support of public schools, distributing it among the several States in proportion to the numbers of their illiterate population, the expenditure and application of the money being left to the States themselves. The bill was not acted upon last winter; but as it will probably be brought forward again, it ought to receive at once such consideration as the importance of the subject demands.

That something ought to be done to remove the ignorance of the people and its attendant dangers is certain; but there is grave reason to doubt whether the proposed scheme for national aid to the public schools is either a lawful or a wise measure for attaining this end. An obvious objection to the bill, and one that has already been urged, is its doubtful constitutionality; and unless this point can be settled in favor of the bill, the question of its expediency and adaptability to its purpose is of little importance. The Constitution nowhere authorizes the national government to make provision for education; and unless the power to do so can be inferred from some authority that is given, it does not exist at all. The government of the United States is not a government of naturally unlimited powers restricted by constitutional provisions; it has no powers at all except such as the Constitution expressly gives it; for the Constitution itself declares that "the powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively or to the people." Unless, therefore, authority to use the national money for educational purposes is implicitly contained in some express grant of power to Congress, no such authority exists, and national aid to education cannot be lawfully given.

Now, I believe the only provision of the Constitu-

tion on which the advocates of the measure rely is that about promoting the general welfare, which, it is contended, will justify Congress in granting the aid proposed; and we must therefore examine the provision in question to see if this interpretation is correct. The expression about the general welfare occurs in the Constitution twice. The first occurrence is in the preamble, which declares that one of the objects for which the Constitution is established is to "promote the general welfare." The preamble, however, would not be cited by any one as containing a grant of power, it being, in fact, a mere rhetorical introduction to the Constitution, and of no binding force whatever. But a similar expression occurs in section eight of the first article, which contains an express grant of power to Congress; and it is this clause that is relied upon by the advocates of national aid to education as a justification of the measure. The clause in question reads as follows: "Congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States." The first part of this clause empowers Congress to lay and collect taxes, while the second part specifies the purposes for which the money so obtained may be used. Now, it is contended that Congress is here authorized to appropriate money to promote the general welfare of the people, and that in virtue of this authority it may make an appropriation in aid of public schools; and on the correctness of this interpretation the constitutionality of the proposed measure must rest.

In considering this question, I remark in the first place that, if the clause here cited really means what it is said to mean, it is of the utmost importance that we should know it; for such an interpretation leads to some rather startling conclusions, and, if generally adopted, may lead to startling political action. If Congress has unlimited power to spend money in providing for the welfare of the people, we may expect to see before long the reign of paternal government fully inaugurated. Public schools are not the only means of promoting the general welfare, and if one such means may be lawfully used without express authority to do so, it is hard to see how the use of others can be objected to as unconstitutional. If Congress may appropriate money for public schools in the States, why not for public libraries also? nay, why may it not give every citizen a private library of his own, which would be even more conducive to the general welfare than public ones would be? Then the national treasury might be drawn upon for the support of paupers in the States, and in times of commercial distress national workshops might be established, like those that were opened in France after the revolution of 1848. It is obvious, also, what demands might be made for national aid to commercial and manufacturing enterprises; and it is hard to see what objection could be made on constitutional grounds to any of these projects, if the bill for national aid to education is constitutional. Indeed, if Congress has unlimited power to spend money in promoting the general welfare of the people, there is not one of the many schemes now in the air for making everybody rich at the public expense that it may not be asked to adopt.

If, however, we read the clause under discussion with proper care, we shall see that no such interpre-

tation is admissible. It authorizes Congress to "provide for the general welfare," not of the people, but "of the United States." Now the term "United States" has a very definite meaning; it denotes a body politic, a federal union of States, and it is the welfare of this body politic, and not that of its citizens, that Congress is authorized to provide for. That this is the true meaning is evident from the context. The clause, as a whole, empowers Congress to lay and collect taxes "to pay the debts and provide for the common defense and general welfare of the United States." Here it is clear that the term "United States" qualifies all three of the preceding terms in the same member of the sentence; and, therefore, if the general welfare referred to is the welfare of the citizens, the debts referred to are the debts of the citizens, and Congress may appropriate money to pay all our private debts. But such an interpretation is absurd; equally absurd, then, is the doctrine that money may be appropriated to provide for the general welfare of the people.

The object of this constitutional provision undoubtedly is to provide for all the financial requirements of the national government, chief among which are the payment of its obligations and the necessary expenditures for the national defense; but as these two objects are not the only ones for which money is required, the others, instead of being specified, are grouped together under the provision for the general welfare of the United States. As for the welfare of the people, the national government does, of course, promote it in various ways, but only by discharging the specific functions imposed upon it by the Constitution; and it is in the discharge of these functions alone that the national money may be lawfully employed. To my mind, at least, this interpretation is the only one consistent with the rules of the English language or with the general spirit of the Constitution.

Nor will it avail to say that a grant of money in aid of education would be a grant to the States and not to individual citizens; for Congress may not lawfully give money to the States. The national government did, indeed, soon after the Constitution was adopted, assume the debts of the States, which was equivalent to giving them money; but these debts had been incurred in defense of the Union, and it was therefore eminently proper that the Government of the Union should assume and pay them. But Congress has no right whatever to give money or money's worth to the States for State purposes; and though the Constitution has in this respect been violated, that is not an excuse for violating it again. Under the administration of President Jackson, the sum of thirty-seven million dollars was distributed among the States, ostensibly as a "deposit," but really as a free gift; but by what authority this was done I am unable to see. Surely it is not lawful to use the national money except for national purposes, and Congress has no more right to give it away to New York, Virginia, and the rest, than it would have to give it to Great Britain or to France. Congress did, indeed, in 1812, give a sum of money to "promote the general welfare" of Venezuela, which country had lately suffered from an earthquake; and there is no knowing what extravagances may not be committed unless strict regard is paid to the fundamental law.

We conclude, then, that there is no constitutional authority for using the national money to assist the States in their proper business, nor to provide for the general welfare of the people, save only so far as this object is effected by the performance of the specific duties of the national government. But here, perhaps, the friends of the measure may present a new argument. Suppose it granted, they may say, that Congress may not lawfully use the national money except for national purposes, and that among these purposes the promotion of the general welfare of the citizens is not included; yet we maintain that the education of the people is a matter of national importance, and that the welfare of the United States, as a body politic, depends in no slight degree upon it. In a free country, where the people in the last resort are the rulers, the security and good conduct of the government itself are dependent on the wisdom and morality of the voters; and we, therefore, maintain that in giving money for the support of public schools, Congress is promoting the welfare of the Union itself.

To this I reply, in the first place, that the Constitution gives both the control of education and the regulation of the suffrage to the States, and by so doing deprives the national authorities of all voice in the matter. In regard to the suffrage, it provides that those persons may vote for Presidential electors and members of the House of Representatives who are permitted to vote for members of the most numerous branch of the State Legislature, thus leaving it for the States to say who shall vote in national affairs. Having thus deprived itself of all control of the suffrage, and of education too, the nation has no right to complain if the voters furnished by the State are not to its liking; and if it wishes to remove the difficulty, it must do it by amending its own Constitution, and not by appropriating money in violation of it. But, secondly, if the promotion of education is a national object, and the appropriation of money for that purpose is for the benefit of the United States, the money must be expended and applied by the President. The Constitution places the whole executive power in the hands of the President and his subordinates, and neither he himself nor Congress may delegate his authority to the officers of the States. If, therefore, the national money is to be appropriated for the support of public schools, on the ground that this is a national object, then the entire control of that money and its application to its purpose must be in the hands of the President. But this would involve the assumption by the President of the general management of the public schools all over the country, which is obviously impossible. It follows, therefore, that so long as the Constitution gives the national government no control over education, the national money may not lawfully be employed for educational purposes, and that whatever is done toward removing illiteracy must be done in other ways.

If, then, the proposed measure is unconstitutional, it ought to be abandoned, and the question of its expediency becomes of little importance. To my mind, however, its expediency is only less doubtful than its constitutionality. The bill proposed last winter provided no guarantees for the faithful use of the money by the States; and though the measure may be amended in this respect, it is hard to see how any

effectual guarantees can be obtained without national supervision of the schools themselves. Moreover, if national aid is to be given, it would seem that it ought to be distributed among the States in some proportion to merit. It might be well to give some preference to those States in which illiteracy most abounds, since the removal of illiteracy is the object in view; but surely some preference should also be given to those that are most earnest in the work themselves, and prove their earnestness by the liberality of their appropriations and the efficiency of their schools. But, under the measure that has been proposed, the States that do the least for education, and have in consequence the largest illiterate population, would receive the largest share of the national bounty, and the longer they allowed their people to remain illiterate the more money they would receive. In short, the effect of the measure would be to put a premium on ignorance; and it is hard to see how the cause of popular education can be subserved by such means as that.

Meanwhile, if the nation at large wishes to do something for the removal of illiteracy, there are various legitimate ways in which it may do so. One of the best would be to amend the Constitution so as to prohibit any person from voting, either in national or in State affairs, unless he can read and write. Another and equally useful amendment would be one providing that members of the House of Representatives should be apportioned among the States, not, as at present, in proportion to their whole population, but in proportion to that part of their population that can read and write. A third measure, no less useful than either of these, and not requiring a change in the Constitution, would be a law prohibiting the naturalization of any person that cannot read and write. It may be well that our country should be a refuge for the oppressed of all lands; but there is no good reason why it should be the refuge of the ignorant and worthless of all lands, as it practically is to-day. By such measures as these the cause of popular education would be far more effectually promoted than by gifts of money from the national treasury; for they would compel both the States themselves and their illiterate population to do their best to remove the ignorance that now so widely prevails.

J. B. Peterson.

The Temperance Question.

SUGGESTIONS REGARDING TEMPERANCE WORK.

ONE of the greatest hinderances in the way of our temperance reform is the indifference of those whom we are pleased to call our "reputable citizens." This sin of indifference, for it may be characterized by such a grave term, cannot be placed at the door of saloon-keepers and politicians. They are *ever* watching *their* interests, and pushing them with all their powers. We sincerely hope that the discussion of the various phases of the temperance reform now going on throughout our country will awaken the sluggish and indifferent among our better classes to action, and create enough public sentiment to establish in all parts of the land associations with the specific object of enforcing the laws.

The liquor business, like a huge giant, comes out with his heavy coat of mail—political influence—and defies the arms of virtue and of right. Who shall dare to resist this modern Goliath? He sends out his challenge, and we must either find a David to oppose him or be overcome. Suppose we believe that we have at last found our David. The next point is, how shall David fight, and what shall constitute his armor? Some will say, "Let religion be his coat of mail"; others, "moral suasion"; and others, "prohibition." But David declines all this cumbrous armor for his first venture, strong and invincible as it may be under some circumstances. So, taking his sling, he selects five smooth stones from the brook Experience, and, thus armed, goes to meet the foe. But now for a moment he hesitates. Which stone shall he throw first? The first stroke must not fail; else the giant may cast his spear in contempt, and David and his cause be overthrown at the very outset. At length he resolves to throw first his smallest stone, *No sale of liquor to minors*. His practice with this insures his lodging it somewhere in his enemy. A fair blow with this stone will sink it so deep that the giant will lose most of his blood; and while he is falling, David will throw his second stone, *No sale of liquor to drunkards*. This will draw more life-blood. Then *No sale of adulterated liquors* will bring the haughty giant to his knees. Quickly following up these strokes with *No music in saloons* and *High license*, and Goliath is forsooth ready to die. Then will David advance, and with the sword of *Prohibition* cut off the dying monster's head.

Some will say the sword should be used first. But the reply comes: It has been tried; but the attempts only wounded instead of killing, and the giant hid away for a time in the dark, feigning to be dead, only to make his appearance again when his strength returned.

Prohibition, to be successful, must take away the demand for liquor. The Women's Christian Temperance Union, of Chicago, in a recent call, acknowledge that, after nine years of reform work, they are convinced that the only means of stopping intemperance is by educating the young; and to this end they urge the organization of Bands of Hope all over the country. Keep the growing youth out of the saloons, and the demand for liquor in a very few years must cease.

There is no community that will not support organizations that seek to enforce the law against the sale of liquor to minors and drunkards. When this is done, you have taken away from the liquor-dealers four-fifths of their customers. If you, then, enforce the law against selling adulterated liquors, you take away nearly all *their profits*, as well as all *their liquors*. Then enforce the law against music and stage performances in saloons, and you will drive away most of the remaining fifth of their patrons.

There will be a few saloon-keepers who may live off the moderate drinker's appetite; but the number will be so small that their influence in politics will count for naught, and your mayor will close them up quickly when requested by the reputable citizens, *whose favor and influence he will then court*.

One of the great mistakes of the temperance reform to-day is, that we try to accomplish too much at one time. The liquor business did not grow up in

a night. Neither can it be put down in a night. "Nothing wins like success." It does not pay to risk *all* in a first encounter with the enemy. Hence it is better to gain some little vantage-ground by light skirmishing before attempting the "grand assault." Our cause may be just, but the means to accomplish the end still remains a hard problem to solve.

The Citizens' Law-and-Order Leagues have done much toward the solution of this problem. We have reason to hope that the battles they are now fighting in the enforcement of the laws, together with the education of the young in temperance principles, may lead before long to the grand Prohibition assault upon the forces of Intemperance.

Permit a word as to the kind of men needed in the carrying on of a Law-and-Order League. If possible, you should find such a man for president as Mr. Franklin, in Dr. Gladden's "Christian League of Connecticut," a man of enthusiasm, but neither rash nor impracticable. Then you want, as his associates, the men described by Dr. Holland,—

"Men whom the spoils of office cannot buy;

Men who can stand before a demagogue,
And damn his treacherous flatteries without winking!
Tall men, sun-crowned, who live above the fog
In public duty and in private thinking;
For while the rabble, with their thumb-worn creeds,
Their large professions and their little deeds,
Mingle in selfish strife, lo! Freedom weeps,
Wrong rules the land, and waiting Justice sleeps!

J. C. Shaffer,

Sec. Nat. Law-and-Order League.

126 WASHINGTON STREET,
CHICAGO, ILL.

HIGH LICENSE.

NO SERVICE could be more valuable, or contribute more to the solution of the temperance question, than the discussions of its many phases now carried on in the "Open Letters" department of THE CENTURY MAGAZINE. But the article entitled "More about Law-and-Order Leagues" closes with a sentence which seems to me misleading, though unintentionally so, I doubt not, in that it conveys the impression of the vigorous efficiency of the high license law now operative in Illinois. The sentence reads as follows: "This law is now being vigorously enforced." That it is not being vigorously enforced in Chicago may be discovered any day at the City Hall, where the books will show that nearly four thousand saloons are paying into the city treasury one hundred and three dollars each for the year ending April 1, 1884. The City Council took pains before the law came into effect (July 1, 1883) to issue these licenses for the period named at double the old municipal rates, and the Attorney-General of the State has given an opinion favorable to this evasion of the intent and purposes of the act.

At least a dozen other towns and cities whose operations have come under my own observation have adopted the same device for making the law of none effect, and probably this number might be multiplied tenfold by persons equally cognizant of the facts in the case. All of which must be considered a large abatement in the vigorous enforcement of the law.

That it has been and is in many places enforced, as well as the laws it has superseded, will doubtless be conceded by all; but this is a weak recommendation surely, when Law-and-Order Leagues have been found necessary to secure this enforcement. In a few conspicuous instances it has considerably diminished the number of the saloons; but it is nowhere claimed, to my knowledge,—and I have been at much pains to arrive at the truth,—that it has lessened drunkenness or the sales of liquor.

The high license law is regarded by the Women's Christian Temperance Union, first, as *unjust*, because tending to create a monopoly in liquor-selling—to build up the powerful dealers who already do the most harm, and to crush out the weak ones who do the least; secondly, as *unwise financially*, because if the dealer pays \$500, instead of \$100, for his permit to engage in the business, he must certainly prosecute his trade more vigorously to win back the extra \$400 which has gone into the city's coffers, thus producing more misery, poverty, and crime; thirdly, as *unwise morally*, since it lends respectability and tone to the dealers who can afford the tax, and increases their ability to lure "the weak brother" and the sons of respectable homes and parentage; fourthly, as *un-Christian*, because it is, like all license laws, a recognition and permission of a traffic which is a crime against civil and a sin against divine government. It is also such a recognition and indorsement as tends to perpetuate rather than weaken or overthrow the system.

These are the views of nearly one hundred thousand mothers of our land. The palace saloon is our terror. Make the dens of sorrow, vice, and shame less respectable if you can, rather than raise their level to the pathway where our sons walk unsuspecting and guarded by every device which a mother's love can suggest.

Mary B. Willard.

PROHIBITION IN KANSAS.

I HAVE read with some interest the articles which have appeared in late numbers of THE CENTURY on the temperance question, and I have wondered if the editor, or Mr. Walter Farrington, or the Rev. Washington Gladden, had any direct knowledge of the workings of constitutional prohibition in Kansas.

It would not be an easy task to the thoughtful observer, denied personal contact with citizens of this State, to explain satisfactorily why a public sentiment which was strong enough in 1879 to force constitutional prohibition on the State of Kansas is so shamefully weak and impotent to-day. But, in mingling with the people, one readily finds a solution to the moral problem.

One citizen, seemingly and presumably intelligent as regards most questions of State or national interest, admits that he did not fully understand the magnitude of the question nor its vital relation to society; but he voted for constitutional prohibition because, in the abstract, it was desirable; and another citizen, representing another class, reckless of the great responsibility which would be thrown upon the State, voted for the amendment because he "wanted to see it tried." To these two classes, more criminally careless, it may

be, in the handling of their suffrage, than wanting in intelligence, Kansas owes its present constitutional amendment prohibiting the manufacture, sale, or barter of intoxicating liquors.

The amendment, then, does not owe its existence to a strong, healthy public sentiment, but to the carelessness of easy-going, experiment-loving citizens. As a consequence, when the extreme difficulty of its enforcement first began to be apparent, we found these two classes of citizens (the classes which gave the amendment its majority) the first to drop the measure and inveigh against its practicability.

And as a further consequence of this heavy desertion from Prohibition ranks, the law has never been seriously enforced in any part of the State, if we may except those communities where public sentiment is really opposed to liquor; and in those communities practical prohibition would be a fact under any law.

Here in Abilene, a town of some four thousand inhabitants and one of the most thriving, intelligent, and moral communities in the State, we have six saloons and one wholesale liquor house. They are run in open defiance of the law and in spite of the opposition of the radical Prohibitionists. Practically, there is no attempt on the part of authorities or citizens to close these saloons, and free beer and whisky are sold *ad libitum*. A similar condition of affairs exists in all parts of the State, and this utter disregard of law must of necessity bring shame and reproach upon the Commonwealth, and be an active source of danger to its integrity and authority. And instead of getting better, the condition of things is growing worse.

The most unfortunate thing which has happened to this question is the dragging of it into politics, and no one can fully understand the situation unless he is found in the heat and dust of the conflict. Political questions are subordinated to this Prohibition and anti-Prohibition craze, and men are elected or defeated according to their expressed views on this one subject. Even those prosecutions which we do have are started through party interests and exigencies, and it is frequently the case that saloon men who "stand in" with the dominant local party are protected, while others, who happen to be on the "wrong side of the fence," suffer from a discriminating and therefore unjust prosecution.

So far has this intolerant spirit been carried, that Prohibition in Kansas has become nothing more than a screaming farce, and it would seem that the quicker the amendment is resubmitted to the people and repealed, the better it will be for the morals and peace of mind of the State. Fancy a condition of things which impels the thirsty resident of Kansas City, suffering from the Downing law which closes Missouri saloons on Sundays, to cross the State line into Prohibition Kansas for the purpose of supplying himself with all the liquor he wants! In an article of this kind it is impossible to speak of the strife between neighbor and neighbor, the perjuries of the witness-box, and the disregard of official oaths, which are directly traceable to the Prohibition amendment.

It is the candid opinion of your correspondent, considering the present state of public morals and public appetite, that the liquor question is to be successfully handled only by high license and local option.

S. K. Strother.

"The Bread-Winners."

A LETTER FROM THE AUTHOR.

FOR several months I have listened in silence to a chorus of vituperation which seems to me unjust and unfounded, until my original purpose of replying to no form of misrepresentation has been so far shaken that I beg for a little space to correct some errors and to justify at least my intentions.

The charges of my critics may be divided into three heads:

1. "The Bread-Winners" is conceived from an aristocratic point of view.

2. It is not well written. The incidents are extravagant and untrue to nature.

3. It is a base and craven thing to publish a book anonymously.

The first charge seems to me too absurd to be considered seriously. I hardly know what is meant by an aristocratic point of view. I am myself a working man, with a lineage of decent working men; I have been accustomed to earning my own living all my life, with rare and brief holidays. I have always been in intimate personal relations with artisans and with men engaged in trade. I do not see how it is possible for an American to be an aristocrat; if such a thing exists, I have never met it. But because, in my little book, more attention is bestowed upon certain dangerous or vicious tendencies among the poor than upon the faults incident to wealth, I am called an aristocrat, or a snob,—a name equally vague and senseless, which, so far as I can discover, merely denotes that the man using it does not like the man to whom it is applied. The question may be asked, Why do I talk more about the failings of the poor than about those of the rich? Simply because I know more about them.

The germ of "The Bread-Winners" was a remark made to me by a friend of mine, a carpenter of Detroit. He said one day, when we were walking past the High School and talking of social matters, "There is hardly a carpenter's daughter in this town who will marry a carpenter." The image of Miss Maud Matchin then formed itself in my mind. A few days later I met Mr. Offitt in a railway train, and afterward, I came to know him well in a boarding-house we both frequented. Almost without my consciousness the story took shape as it was written. The hero of the tale is Offitt, not Farnham; the heroine is Maud, and not Alice. I care little about Farnham. It is true I gave him a fine house and a lot of money,—which cost me nothing,—but that was only because Miss Matchin would never have looked at him otherwise. He is a commonplace soldier, with a large property; he pretends to be nothing else. Some of my critics, to my amazement, have said, as if they were making a great discovery, that there is nothing remarkable about him. I never intended there should be. I probably could not have made him wise or learned or witty if I had tried,—but I certainly never tried. I wanted him to be a gentleman, and I think he is; but that I cannot discuss, for I have never known two people to agree upon a definition of a gentleman.

The only other rich people at all kindly treated in the book are Mrs. Belding and her daughter. And here another astonishing criticism has been made. This comes from the Boston "Transcript." The writer

rebukes me for aristocratic leanings, and then goes on to discover a glaring inconsistency in the fact that Miss Belding is a nice sort of person, while her mother is not especially refined, and her father was a successful mechanic. My gentle, though wabbling critic, was it not I who decided that this nice young person should be a daughter of the people as well as Miss Matchin? and is it not possible that I knew what I was about as well as you? The same critic, whom I cite more than once because he is more than usually comic, decides that I am a Western man, because of a certain "raw Americanism" he sees in me, and because my personages lack grandfathers, as a rule. An Eastern man's personages, he says, "would have a more remote traditional background." If I shared his interest in the habitat of authors, I should say *his* ancestral home was in Connaught. The brain that evolved these startling syllogisms has been nourished by the potato and not by the bean.

I find that in Ohio the book has given deep offense because of a supposed unfairness to the laboring class. One editor says—and seems to think my work is condemned by that sentence—"There are five thousand men in Springfield to-day, honest, industrious, intelligent toilers, who earn their bread by the sweat of their faces, but who move in the very best social circles, and are as highly esteemed as any class of people we have among us." Because I have not described these five thousand honest working men, who move in the best social circles, I am anathematized as a libeler of the poor. Because I choose to talk about Miss Matchin, to whom the High School was of little service, I am unjust to the thousands of girls who get great advantage from our public schools. I am told my picture is one-sided. Of course it is—most pictures are. If I paint your face well, you do not complain that I have not done justice to your back. A man says he met a viper in the woods. You do not call him a liar because he says nothing about the singing birds which are there. I attempted to describe certain types of moral perversion which I have found among our working people, and I am denounced for not having filled my book with praises of the virtues which also abound among them. This is certainly a new canon of literature. May I not speak of Nero without writing the life of Brutus? Is it not legitimate for me to describe Justus Schwab without contrasting him with Peter Cooper? I have been unjust, it seems, to the labor unions. This is a gratuitous assumption. I have expressed no opinions about labor unions. I have told about a little society, organized for his own ends by a criminal, who uses the labor reformers' slang and something of their methods to swindle a few workmen out of their money. If any one says this is not true, he simply shows his ignorance of what is going on about him in every city of considerable size. I have not discussed the Labor problem at all. It was not in my province. A newspaper in Western Massachusetts, once edited by Samuel Bowles and now carried on by I know not what hysterical person, says I have left that question "without a word of sympathy or even pity" for the toilers. I can inform my falsetto deemster that the robust toilers of this country care as little for my sympathy as for his. The most intelligent and most prosperous laboring class in the world can live and

flourish without the patronage of novelists or *larmoyant* journalists.

2. I can defend myself but feebly against the charge that my book is ill written. I have little technical skill in writing, and no experience whatever in writing of this kind. The fact that my purpose and feeling have been so widely misunderstood is itself the condemnation of my style and method. If people think I meant to represent Arthur Farnham as an ideal hero, or that I have any sentiment but profound admiration and respect for the great mass of American working men, I admit that I have expressed myself with singular and lamentable awkwardness. If it be true also that what I have written has seemed in any point exaggerated or untrue, then I have fallen again far wide of the mark. I had but one thought in writing "The Bread-Winners"—to give an absolutely truthful picture of certain phases of our social life which I had never seen in print. The method by which I proposed to attain this end was perhaps faulty from an artistic point of view, but it was the only one I knew. I determined not to put a trait nor an incident into my story which was not strictly true—of which I was not clearly certain of my own knowledge. The personages, with the exception of Offitt, are not portraits of real people. But every trait I have described I have myself encountered, and a life-long observation of a good many kinds of society has, I think, kept me from mingling discordant traits in the same character. As to the incidents of the story which have been called overcharged, they have all been read in the daily papers and forgotten, and some of them narrated by the very editors who now call them impossible. For instance, the speech of Bott inciting the mob to sack Algonquin Avenue I took almost word for word from a Cleveland paper of July, 1877. The escape of Sleeney from jail I found in the same paper. The scene of the mob at Farnham's house was closely paralleled during the strikes of 1877 at Louisville, Kentucky; and far more tragic horrors than anything I have ventured upon were repeated over and over at Pittsburg. The sketch of the Mayor of Buffland has been called a malignant caricature. I do not know who held that office at the time of the riots, and I meant no personal allusion. But in a Cleveland paper, which I have begun of late to read with diligence if not with edification, I have found this paragraph, which shows what sort of a chief magistrate they now possess in that city:

"A special meeting of the Police Board was held yesterday afternoon. In the course of a general discussion, street beggars and tramps were referred to. Mayor F—— made a remark to the effect that the poor fellows ought not to be molested. 'Are you in favor of street-begging, your honor?' asked Mr. B——. 'If I was hungry,' was the reply, 'and had no money with which to buy bread, I would beg for it; and if nobody would give me anything, I would knock down some fellow who was smaller than I, and get some money. An empty stomach knows no law.'"

All this, I admit, is a very inadequate defense against the charge that I have written an inartistic book. No matter how true it is, if the effect is untrue, the book has been badly written; but I, at least, contend that the book *is* true, and written with an honest purpose.

3. The idea that there is anything morally wrong in publishing a novel anonymously is entirely new

to me. I had never heard it advanced until it was made the basis of censure upon me in several newspapers. I will not refer to the numerous instances of reputable men and women who have committed this sin without loss of character in past and present times. I will simply leave it to the common sense of readers to say whether there is anything flagitious in withholding one's name from an entirely impersonal work of fiction. It was hard for me to understand why there should be such a feeling about so trifling a matter, until I saw an elaborate article on the subject in "The Critic." One phrase I will quote, showing with what gentle persuasion the writer, in the words of the nursery song, woos anonymous authors who write poor books "to come and be killed." "The whole world," he says, "calls upon you for your name, that it may avoid, condemn, mistrust, destroy you." Even this appeal, I think, will not be sufficient to tempt me out of my incognito.

My motive in withholding my name is simple enough. I am engaged in business in which my standing would be seriously compromised if it were known that I had written a novel. I am sure that my practical efficiency is not lessened by this act; but I am equally sure that I could never recover from the injury it would occasion me if known among my own colleagues. For that positive reason, and for the negative one that I do not care for publicity, I resolved to keep the knowledge of my little venture in authorship restricted to as small a circle as possible. Only two persons besides myself know who wrote "The Bread-Winners." One of these is an eminent man of letters, who had the kindness to read my manuscript, and whose approval encouraged me to print it. I am absolutely sure of the discretion of both these gentlemen, and, I hope I may add, of my own. I offered to give my name to Messrs. Harper & Brothers, who have published the story in book-form, if they should require it, but they had the kindness and consideration to decline. I am aware that this assertion is not in accordance with current rumors. I have met several persons who tell me they have talked with the author about the book, and two who gave me to understand, in the strictest confidence, that they wrote it themselves. But the unimportant truth is as I have stated it. I am ashamed to say so much about a matter of such infinite insignificance, but I would like, if possible, to put a stop to a discussion which has become ridiculous.

In conclusion, I beg to offer my sincere apologies to two or three distinguished writers who have been compelled to defend themselves against the accusation of having written "The Bread-Winners." Perhaps it may please them, hereafter, when suffering under undeserved strictures, to reflect upon the absurdity of *this* charge and the worthlessness of criticism which could ever have ascribed such a book to such names.

The Author of "The Bread-Winners."

NEW YORK, February 1, 1884.

The Lorillard-Charnay Collection of Central American Antiquities.

M. DÉSIRÉ CHARNAY'S words, written in the "North American Review" in 1882, have come true. Speaking of his labors in Central America, particularly

at Lorillard City, and the impressions of inscriptions and mural ornaments which he made there, he says: "We have taken casts of some superb bas-reliefs, and when they are put on exhibition in Washington and Paris they will excite no little astonishment." The collection which has recently arrived at the National Museum arouses not only the astonishment but the enthusiasm of the archaeologists of Washington, as it will of all intelligent beholders when the hall shall be thrown open to the public.

M. Charnay first visited Central America in 1857, under authority of the French Government, and, in 1863, published the results of his investigations, in his work upon the "Cités et Ruines Américaines," together with a large series of photographs. In 1880 he was made chief of a much more elaborate expedition, undertaken at the instance of Mr. Pierre Lorillard, and sustained by the munificence of that gentleman and of the governments of France and the United States. He has visited in succession the antique cities of Mexico, Guatemala, and Yucatan, everywhere taking casts of inscriptions and carvings, photographing temples and statues, making measurements and notes, and submitting all things to the closest scientific scrutiny. With the aid of a force of twenty or thirty hired laborers, supplemented by others liberally furnished at various times by the Mexican Government, temples and palaces were exhumed, tombs explored, fallen columns reërected, inscriptions cleansed, and all the details of a rigorous survey carefully attended to.

The collection which is now being installed in the National Museum represents the first-fruits of his endeavors. It consists of a series of casts of some of the most interesting stone carvings which adorn the ruined antique palaces and temples of the Toltecs. They are from Palenque and Mexico, from Chichen-Itza and Merida and Lorillard City, and from other noted localities. There are in all eighty-two pieces of various shapes and sizes, the majority being in the form of rectangular tablets of inscriptions. The remainder are walls and altars, columns and capitals, door-ways and steps, and other similar objects. To describe them all would be impossible in this communication, but the reader may not weary if the salient features of a few are pointed out. Perhaps the richest part of the collection is from Palenque. Among the casts from this locality we find the altar of the famous Temple of the Cross, regarding the significance of the central emblem of which so much discussion has been aroused. This altar, which is now being restored in the Museum to conform as nearly as possible to the original, is not easily described. For those who have glanced at the figures in Waldeck or Rau or Bancroft it is unnecessary. In the center is a cross of almost Latin proportions, surrounded by a variety of irregular and fantastic ornaments, and surmounted by a large bird, whose head is also wrapped in an unintelligible mass of plumes and pendants. This bird is believed to be the royal trogon, or "quetzal," although I have heard it facetiously termed the "old rooster." On the right of and facing the cross is the figure of a priest, in scant clothing and ponderous head-dress, who holds in his outstretched arms a curious, elongate, bird-like object. On the opposite side of the cross is a shorter person of self-possessed mien, who stands on a small, square block, and holds loosely

in his hand, in a vertical position, a short, irregularly shaped rod. Behind each figure is a tablet covered with elaborate inscriptions in large hieroglyphics. These, as well as all the other inscriptions in the collection, are undecipherable at the present time, although several archaeologists in Washington and Paris believe themselves far on the road toward the discovery of their true meaning.* It is probably well known that the original right-hand tablet of this celebrated altar has been in the National Museum for many years. On the front face of the two side walls, which stand out at right angles from the back of the altar, are two additional nearly life-size figures, known as the "old man" and the "young man"—names which are significant of their attitudes and bearing.

A second altar, having a remarkable resemblance to the preceding, but in which the positions of the large and small human figures and of the bird are reversed, was described by a traveler in 1879 as having been discovered by him in a small building at a stone's throw from the well-known temple. His story found little credence among archaeologists; but to-day there stands in the National Museum a cast which is undoubtedly that of the group which he described and the truthfulness of his narrative is confirmed.

Another very similar altar with inscriptions is that of the so-called "Temple of the Sun." The sun takes the place of the cross of the preceding shrines, and is represented by a rotund face, hung like a shield at the intersection of two spears which cross.

The carvings from the circumference of the "sun stone" of Mexico City, which so narrowly escaped being pounded into paving-stones not many years ago, form an interesting object. Fifteen men of about half natural size hold fifteen others of equal proportions by the hair. Gama would have us believe that they represent religious dancers; but the mind at once recognizes in the attitudes of the figures the probable correctness of Berra's view, that they depict the conquerors and the conquered. "The central cavity in the center of this stone (at the top)," says Charnay, "which formerly received the hearts of the victims offered to the sun god, is now used as a bath by the doves which frequent the court-yard of the Museum (of Mexico)."

Another procession of warriors is from the walls of one of the great chambers of the "Tennis-court" at Chichen-Itza in Yucatan. The wall is sixteen feet in

height and more in length. There are five rows of warriors, one above another, many carrying in the one hand three or more arrows or rods, and in the other a curiously formed object, believed by M. Charnay to be a sacrificial knife.

The columns and capitals of Chichen-Itza look heavy and unskillfully formed, when we remember the fair proportions of those of Greece, but we must not be too ungracious in our comparisons.

A curious small bas-relief from Lorillard City represents two persons approaching each other, each bearing in his outstretched hand a large cross of peculiar shape. The arms of the crosses end in round knobs, and from the summit of each extends a long curved feather. The significance of the group is unknown.

A vein of resemblance runs through all the sculptures. There are warriors and priests, conquerors and slaves, spears and arrows and feathers. The profiles of all the faces show much similarity, the features having a strong Semitic cast.

But the interest of the observer centers at last in the odd hieroglyphics of the inscriptions. Their very inscrutability arouses in the mind an ardent desire to know their meaning. The mysterious dots and bars, the rudely carved faces and circles, provoke profound meditation.

Who shall say what new light may be thrown upon the history of American civilization when the inscribed tablets, now mute, shall be made to speak? Perhaps we shall learn only of names of gods and of seasons and feast days; but we hope for more. If the conjectures of M. Charnay should be established as facts, we must bring the period of the rise and downfall of the Toltec civilization in Central America within seven centuries. It may be childish to desire a thought-confounding antiquity. The tendency to-day, among the leading students of India and Egypt and China, and even among geologists, is in the opposite direction. The doctrine of the slow development of a people is no dogma; but to ascribe to works of human art an antiquity, in comparison with which the hills are young, would seem to be a manifest absurdity.

The hall in which the casts are now being arranged is scarcely suited for exhibiting them properly, and it is probable that in course of the winter they will be transferred to another room.

Frederick W. True.

SMITHSONIAN INSTITUTION.

*The reader who is interested in this subject is referred to a paper by Prof. Edward S. Holden, in this magazine for December, 1881, entitled "The Hieroglyphs of Central America," in which the writer lays down principles for the study of these inscriptions. The illustrations of that paper include cuts of several of the pieces now in the National Museum. It should be borne in mind, however, that, although the majority of them are from the drawings of a no less skillful artist than Catherwood, they do not represent the originals with photographic accuracy. A number of important errors occur in the delineations of the glyphs of the inscriptions.

BRIC-À-BRAC.

A Seville Love-Song.

(BY THE AUTHOR OF "THE DANUBE RIVER.")

I.

LOOK down from your window, dearest:
The mists of night are fled,
Venus, of stars the clearest,
Burns just above your head.
I am not at your sweet eyes' level,
Nor above, where the jasmines blow
Round the golden towers of Seville,—
I am here, at your feet, below!

II.

Send me a flower, dearest,
A word from that common speech,
To all mankind the clearest,
Which peasant, like king, may reach.
I am here, as it were, in December,
And you are in May, up above—
Oh! send me a bud to remember
The spring's first promise of love!

Hamilton Aidé.

Nocturne.

I LOVE thee as the steeple loves the star
Above it, wooing in the sparkling night,
When the duenna moon is out of sight,
And gossip planets wend their course afar.

So worship I, though frowns thy beauty mar,
Like clouds wind-strewn between me and thy height,
As on poor earth fair heaven would put a slight,
While yet I gaze unceasing where you are.

Hath Love no bow can fling a shaft to scar
Thy calm heart, skied in maiden constancy—
Mocking the archer with its flashing light?

Ah, this I know: Thou art the zenith star
Of a celestial sphere whose canopy
Covers a heart that's in the old, old plight.

Clarence Clough Buel.

The Fault-Demon.

I'VE seen a white-robed maiden
With flowing gold hair laden,
As heavy-burdened body as she could bear,
And there came a wild black raven,
So eager and so craven,
And hid himself all silent in her fair gold hair.

When she cried, "Thou misbehave!"
"Caw!" said the wild dark raven,
And all her tedious life he only said "Caw!"
Yet sate he on her shoulder,
This heavy black bird-bowler,
And moved not, would not leave her, for patience
or for law.

Now, on her tomb was graven
"The Maiden of the Raven,
Who peered from her long tresses for all to see:—
Some said that it was pride
Gave the bird so long a ride."
But he left her when the church-bell rang sonorously.

Rose Hawthorne Lathrop.

Uncle Esek's Wisdom. (New Series.)

WHAT the country wants the most just now is less religion and more piety, less advice and more example, less politics and more patriotism, and less pedigree and more pluck.

A very stubborn man is often wrong, but seldom dishonest.

A strong intimacy may exist between two fools, but friendship never.

Let us be kind to each other here on earth; it will save us much confusion when we meet in heaven.

Silence is a good place to hide, but fools can't find the place.

There are many people who have got a great deal more religion than common sense. Religion is excellent, but it is n't a substitute for common sense.

There are plenty of people who know how to make money, and how to waste it, but few who know how to spend it.

The symptoms of patience and laziness are so near alike that it would bother many people to tell which disease they have the more of.

If there were no fools, this world would be a dreary place to live in.

One enemy can work you more of evil than two friends can do you of good.

There is nothing that shows strength of character more than eccentricity if it is natural, and nothing that shows weakness more if it is artificial.

A crank is a fool, with more brains than he knows what to do with.

There is wisdom even in the crooks of a dog's tail, though sometimes we can see the crooks plain enough, but can't see the wisdom.

Take all the luck there is in the world, and you couldn't make a half dozen genuine successes out of it.

The man who is always anxious to take the chances, invariably takes one chance too many.

Aphorisms from the Quarters.

DE candy-pullin' kin call louder dan de log-rollin'.
De bes' apples float on de top o' de peck medjer.
De steel-trap know when to talk.
Hailstones don't pick hard heads to drap on.
De young rooster dat crow too loud is 'lectioneerin' for a lickin'.

Tall tree make de squ'el sassy.
De redbird lub to drink whar he kin see hisse'f in de water.

De top o' de hill is harder to find dan de bottom.
De wood-pile 'fraid o' de norf wind.
De s'ingle-tree got to stan' heap o' kickin'.
Dus' don't settle on de meal-box.

A shot-gun kin outvote a good-size' cump'ny o' watermilion hunters.

A man dat cut his finger don't brag on his knife while de blood runnin'.

De rabbit kin make de bes' time when he trabblin' for his health.

Dar's a bad streak in folks dat think de whole wul' is a pen'tench'ry.

One dead bee-martin is wuf a hundred live ones.

De shirt-buttons he'p de looks o' things, but de gal-lus-buttons do de solid wuk.

De right sort o' 'ligion heaps de half-bushel.

De steel hoe dat laughs at de iron one is like de man dat is 'shamed o' his grand-daddy.

'Taint wuf findin' out who gits de bes' of a goat swap.

When de bait is wuf mo' an' de fish,' tis time to stop fishin'.

Old Satan couldn't git 'long widout plenty o' he'p.

De buggy whip can't make up for light feed in de horse trough.

A mule kin tote so much goodness in his face dat he don't hab none lef' for his hind legs.

De price o' tame coons don't pester many folks.

Some grabble walks may lead to de jail.

De bes' bravery is de sort dat aint skeered o' de hot sun.

De lead steer know when de whip-cracker mended.

De billy-goat gits in his hardes' licks when he look like he gwine to back out o' de fight.

Better not pull down de empty jail.

Little hole in your pocket is wusser'n a big one at de knee.

Gap in de ax show itse'f in de chip.

De dog on three legs aint always lame.

'Tis mighty easy to run de track ob a roasted possum.

Appetite don't reggerlate de time o' day.
Some smart folks don't know how de fros' git on de
bottom o' de chip.

De quagmire don't hang out no sign.
One pusson kin th'ead a needle better'n two.
De pint o' de pin is de easiest en' to find.
De green top don't medjer de price o' de turnup.
Muzzle on de yard dog unlocks de smoke 'ouse.

J. A. Macon.

"Something Humorous."

It's a terrible temptation, for of course I need the
money,
But, take it altogether, can I possibly be funny?
Oh, I need not sit and meditate—he'd not have had
to urge,
If he'd asked me for an epitaph, or begged me for a
dirge!

The house-maid leaves next Monday, the cook week
after next,
After all my frantic struggles to prevent their being
vexed;
And Augustus—once he fancied that I *could* do
nothing wrong—
Went sulking off, because, forsooth, the coffee was not
strong!

The plumbers come to-morrow; an important pipe
has burst.
Of the sum of human miseries, are plumbers not the
worst?
I found two moths this morning on the largest easy-
chair,
And another on the sofa—I am sure they're in the
hair.

Talk of "little" cares and worries—why, there are
no little things;
A wasp is not a large affair, but patience! how he
stings!
Yet the world, which likes to laugh with us, or at us,
gives a growl,
And hasn't time to listen if one ventures on a howl.

Yet there is a *way* of howling which the public likes
to hear—
Yes, I'll seize my opportunity, the whole affair grows
clear;
I will tell my tribulations as if each one were a joke,
And my welcome, like the house-maid's young affec-
tions, is "bespoke."

Margaret Vandegrift.

Rosa no Mar!

(FROM THE PORTUGUESE OF A. GONÇALVES DIAS.)

Rosa, rosa de amor purpurá é bella,
Quem entre os goivos te esfolhan da campa!

ON the sand-beach gray and lonely
Wanders only
One fair maid, with dreamy paces;
Wanton winds come laughing, playing,
Loosely straying
Through her unbound raven tresses.
Shadows light as fairy lightness
Dim the brightness
Of her brow, and pass so swiftly

That she knows not of their coming;
Like the roaming
Of the winds that fan her softly.

Vaguely questioning, ne'er replying,
Vaguely sighing,
Fears and smiles are mingled ever;
Smiles as sweet as summer gladness,
Shades of sadness,
Never bitter, darkening never.

Where the beach is wide and dreary,
Solitary,
Comes she daily, fancy-driven;
There the sea-waves, almost sleeping,
Softly creeping,
Moan along the sands at even.

Now, as ever, slowly wandering,
Vaguely pondering,
Buried in her dreamings vagrant,
She has placed upon her bosom
One fair blossom,
One moss-rose, bedewed and fragrant.

In her careless walk, the maiden—
Fancy-laden—
Drops the rose from out her bosom;
And the ripples, ever wayward,
Draw it seaward,
Bear away with them the blossom.

On the blue waves gleaming whitely
The rose floats lightly,
Washed about in the ebb and flow;
And the maid, with softest laughter,
Follows after,
Close to the fearful undertow!

Now the wave comes laughing nearer,
Quick to bear her
Once again her stolen treasure;
Now it flies her eager fingers;
And she lingers—
Will not cease her vain endeavor.

Many times the rose deceives her—
Ever leaves her—
Yet she will not give it over;
Chasing nearer, and more fearless—
Growing careless
Of the sea that bears her rover.

In the hateful water gleaming,
Backward streaming,
White robes float an instant only;
Then the sea, all smooth and smiling,
Fear beguiling,
Plays along the sand-beach lonely.

And they sought her, hoping, fearing,
Yet despairing,
All the night with footsteps weary;—
Only found the moss-rose lying,
Crushed and dying,
On the sand-beach gray and dreary.

Herbert H. Smith.

The Rhyme of the Hercules Club.

BEING A BALLAD OF TO-DAY, DESIGNED TO ILLUSTRATE THE
PRINCIPLE OF REACTION, AND TO SET FORTH HOW
THERE MAY BE TOO MUCH OF AN
EXCELLENT THING.

THERE was once a young man of the medium size,
Who, by keeping a ledger, himself kept likewise.
In the matter of lunch he'd a leaning to pies,
And his chronic dyspepsia will hence not surprise;
And his friends often told him, with tears in their
eyes,
Which they did not disguise, that a person who
tries
To live without exercise generally dies,
And declared, for the sake of his family ties,
He should enter the Hercules Club.

Tom Box and Dick Dumbell would suavely say,
If they met him by chance in the roar of Broadway,
"It's bad for a fellow, all work and no play;
Come, let us propose you! You'll find it will pay
To belong to the Hercules Club!"

And he yielded at last, and they put up his name,
Which was found without blame; and they put down
the same
In a roll-book tremendous; and straight he became
A Samson, regarding his tame past with shame;
Called for "Beef, lean and rare!" and cut off all his
hair,
Had his shoulders constructed abnormally square,
And walked out with an air that made people declare,
"He belongs to the Hercules Club!"

And he often remarked, in original way:
"It's bad for a fellow, all work and no play;
Without recreation, sir, life doesn't pay!
And I for my part am most happy to say
I belong to the Hercules Club."

And frequently, during a very hot "spell,"
In thick woolen garments clad closely and well,
"Reducing,"—for he was resolved to excel,—
He rowed in the sun at full speed, in a shell
That belonged to the Hercules Club.

And for weeks, while the dew on the racing-track
lay,
He ran before breakfast a half mile a day,
Improving his style and increasing his "stay";
And was first at the finish, and fainted away,
At the games of the Hercules Club.

Six nights in succession he sat up to pore
"The Laws of Athletics" devotedly o'er
(Which number ten thousand and seventy-four),
With a view to proposing a very few more
In a speech to the Hercules Club.

And his coat upon festal occasions was gay
With medals on medals, marked "H. A. A. A.,"*
With a motto in Greek (which, my lore to display,
Means "Pleasure is business"), a splendid array
Of the spoils of the Hercules Club.

But acquaintances not of the muscular kind
Began to observe that his brow was deep-lined,
Too brilliant his eye, and to wander inclined;
He appeared, in a word (early English), "fore-
pined";

* "H. A. A. A.": Hercules Amateur Athletic Association.

And one morning his ledger and desk he resigned,
Explaining, "I can't have my health undermined
By this 'demnition grind'; and I'm getting behind
In my duties as Captain" (an office defined,
Page hundred and two, in the by-laws that bind
With red tape the great Hercules Club).

And he further remarked, in most serious way:
"Give it up, did you say? 'Twill be frigid, that
day!†
Why, without relaxation, sir, life wouldn't pay!
And I, for my part, will remain till I'm gray
On the roll of the Hercules Club!"

You perceive, gentle reader, the rub.
Is it nobler to suffer those arrows and slings
Lack of exercise brings—or take clubs, and let things
Unconnected with matters athletic take wings;
Till all interests beside, like the Arabs, shall glide
From the landscape of life, once a plain free and
wide,
But now fenced for the "Games" which we lightly
began,
Grown our serious aims and the chief end of Man?
There's an aureate mean these two courses between,
But I humbly submit that it seldom is seen,
With all proper respect for that organization
Of benevolent purpose and high reputation,
The excellent Hercules Club!

Helen Gray Cone.

To My Love.

(BALLADE.)

OUTSIDE, the blasts of winter blow
Across the city clad in white;
Each flake of madly driven snow
A demon seems, with teeth that bite;
The windows rattle as with fright,
And winds the chimney whistle through:
Alone with memory, to-night,
I'm happy, thinking, love, of you.

Within, I watch the embers glow,
The slender flames in sudden flight
Leap from the crackling logs, and throw
Around the room a golden light;
Romantic tales their tongues recite,
And mellow songs, as if they knew,
Alone with memory, to-night,
I'm happy, thinking, love, of you.

From Dreamland all my fancies flow;
My friendly books, with faces bright,
Return my listless gaze, and show
No sign of sorrow at the slight.
Hark! from the steeple's dizzy height
The bells the air with echoes strew:
"Alone with memory, to-night,
I'm happy, thinking, love, of you."

ENVOY.

Love, let this valentine invite
Your sweeter voice to echo too:
"Alone with memory, to-night,
I'm happy, thinking, love, of you."

Frank Dempster Sherman.

Sidney Lanier.

THE CENTURY MAGAZINE.

VOL. XXVII.

APRIL, 1884.

No. 6.

THE WHITE HOUSE.

THERE is a deal of architecture in Washington—Doric, Ionic, Corinthian, Composite, Elizabethan, Gothic, Norman, African too,—an amazing jumble of styles borrowed from all nations and all ages; but among it all there is no building quite as satisfying to my eye as the White House, with a reservation to the prejudice of the northern portico, which was added when the structure was repaired after the British invasion of 1814; but happily the portico is half hidden by the foliage of noble trees.

There is no sham or pretense about the house; none of the straining after striking effects, which is the fault of so many of our modern constructions; no effort to look like a temple, or a cathedral, or a castle. It tries to be a spacious and dignified dwelling and nothing more, and in this it is entirely successful. The public-office feature, which has converted many of its rooms into tramping and lounging places for office-seekers and political plotters, was no part of the original plan, but has come from the modern system, introduced in a small way by President Jackson, and since grown to monstrous dimensions, under which nine-tenths of a President's working hours are devoted to hearing and considering the applications of place-hunters. The mansion would now be adequate to all the domestic and social uses of a republican chief magistrate, if other quarters were found for the business of the Executive office.

When James Hoban, the Irish architect, who had established himself in Charleston, and was building substantial houses on the Battery for South Carolina planters and tradesmen of that town, received notice that his plan for the President's house had been adopted, he hastened to Washington to claim the prize of five hundred dollars, and to take

charge of the erection of the building. Hoban had not seen much of the world, and had modeled his plan pretty closely upon one of the best houses he knew—that of the Duke of Leinster, in Dublin. The Duke's house was in imitation of one of those spacious and stately villas which the Italians learned to build when the rest of Europe was living in uncouth piles of brick or gloomy fortified castles. Indeed, the world has not improved much to this day on the Italian house of the middle ages, save in inventions for water-pipes, warming, and lighting. Thick walls secured warmth in winter and coolness in summer; the windows were made to admit plenty of air and sunlight, the wide doors for ingress and egress, without jostling, of people walking by twos or threes; the stairs were easy to climb, the rooms high, well-proportioned, and of a size fitted for their several uses. Thus was the White House built. The corner-stone was laid in 1792, in a bare field sloping to the Potomac, the Masons conducting the ceremonial and George Washington gracing the occasion. At first it was proposed to call it the Palace, but against this suggestion a lively protest was made by people who feared the young Republic would be governed by an aristocracy aping the ways of courts and kings; so it was determined by Congress that the building should be officially named the "Executive Mansion"—mansion being then a term of common use for the better-class dwellings of the gentry in Virginia and Maryland. It would be hard to say when the name White House was first applied to it, but it did not, probably, gain currency until the edifice was rebuilt after the British soldiers had partly destroyed it, and was painted white to hide the black traces of smoke and flame upon the freestone walls.

President John Adams, Washington's immediate successor, was the first occupant of the Mansion; and everybody has read, in Mrs. Adams's letters, how she used the unfinished East Room for drying clothes, and of the literal "house-warming" she made to take the dampness out of the walls, with no end of trouble to obtain fire-wood enough for the purpose. This East Room, by the way, was intended for a banqueting hall; and here we have a souvenir of the aristocratic notions of the Virginians and South Carolinians of that day. Hoban must have been encouraged in his idea that a President of the United States would occasionally give a mighty feast, like those given by kings and princes and powerful noblemen in the Old World. Probably neither he nor Washington, whom he must have consulted, imagined that the room would be needed, and besides be much too small, for the miscellaneous crowd which, in another generation, would overflow the Mansion at public receptions.

When the British army, under General Ross and Admiral Cockburn, came marching across the country from the Patuxent River, in August, 1814, scattering like sheep the militia drawn up at Bladensburg, and taking possession of the raw, rambling, uncouth village of Washington, the White House was still unfinished—an unsightly pile standing in the midst of ill-kept grounds, surrounded by a cheap paling fence. After the soldiers had burned the Capitol, and just as they were about to countermarch to their ships, having

pillaged the house quite at their leisure for twenty-four hours, they brought fire from a beer shop and set it ablaze, and then trudged off quite merrily in the light of the conflagration till caught in the historic thunderstorm of that summer night, which so pelted and battered them that they thought it was the wrath of Heaven upon their vandalism. There is only one memento of the fire in the House to-day—the picture of Washington which hangs in the East Room—once called a Gilbert Stuart, but now known to be the work of an English artist of no fame, who copied faithfully Stuart's style. The fraud was not discovered until some time after the original had been shipped to England—too late to recover it. Every visitor is told that Mrs. Madison cut this painting out of its frame with a pair of shears, to save it from the enemy when she fled from the town; but in her own letter describing the hasty flight, she says that Mr. Custis, the nephew of Mrs. Washington, hastened over from Arlington to rescue the precious portrait, and that a servant cut the outer frame with an axe, so that the canvas could be removed, stretched on the inner frame. The story of the shears is a pretty one, but, like so many other entertaining historical anecdotes, is a fiction.

There is probably no building in the world where, in less than a century, more of history has centered than in this shining, white mansion, screened by trees on the city side, and looking out from its southern windows

REAR VIEW OF THE WHITE HOUSE, FROM NEAR THE GREENHOUSE—TREASURY BUILDING IN THE DISTANCE

THE WHITE HOUSE, FROM THE FRONT.

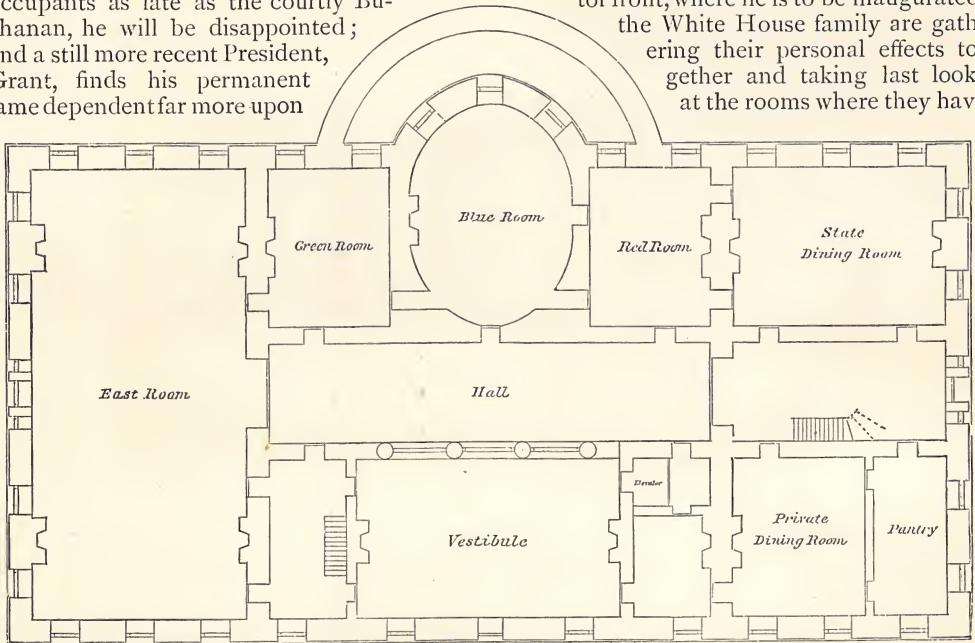

across the placid Potomac to the red Virginian hills. Twenty-one Presidents have lived in it, and two have died in it. One went from its Red Room with a group of friends, at the close of the four years' civil war, to be struck down by an assassin's bullet in a theater, and to be carried unconscious to a death-bed in a strange house. One, in full mid-current of life, sturdy of brain and body, and glowing with patriotic purposes, was shot in a railway station and carried up the vine-bordered steps shown in the picture, to languish through weeks of pain, struggling manfully with death, all the world looking on with a universal sympathy never before shown to mortal man, to be borne, as a last hope, to the sea-side, and there to die.

There have been marriages and merry-makings too, jovial feasts, and ceremonial banquets; grave councils of state that shaped the destiny of the nation; secret intrigues and midnight conclaves that made or unmade political parties; war councils that flashed forth orders, on telegraphic wires, which moved great armies and set lines of battle in deadly front. The history of the White House is a governmental and political history of the United States from 1800 to this day; it is also a history of the domestic lives, the am-

bitions, and the personal traits of twenty-one Presidents, their families, and their near friends and advisers. I shall attempt no part of it here, and shall only remark, in passing to a survey of the building itself, that it has left few traces behind in the way of memories or traditions in the Mansion. The history must be sought out piecemeal in libraries. One cannot even learn which was the room where Harrison died, after his brief four weeks of power, or where bluff, honest Zachary Taylor, the "Rough and Ready" of the Mexican war, breathed his last. The few traditions that cling to the house are incongruous mosaics of tragedy and gayety. "Here," says an attendant, pointing to a particular place on the carpet in the East Room, "is where Lincoln lay in his coffin; and here"—moving a few steps away—"is where Nellie Taylor stood when she was married to the young Englishman, Sartoris." Your attention is called to the smoked-blue color of the furniture in the Blue Room, and you are informed that at such a place the President usually stands at receptions, and in the next breath are told that "this is the window where they brought poor Garfield in after he was shot, taking him up the back-stairs because of the crowd in front."

It seems as if the memory of the two martyred Presidents were alone destined to haunt the White House, all others fading away with the lapse of time. Indeed, if one wants to find some trace of the angular and resolute personality of Jackson, or of the polite and graceful Van Buren, or of that hardy soldier Zachary Taylor, or even of occupants as late as the courtly Buchanan, he will be disappointed; and a still more recent President, Grant, finds his permanent fame dependent far more upon

packing of the effects of an outgoing President just before the fateful fourth of March which ends his power. After noon of that day the family has no more right there than the passing stranger on the street; and while the cannon are firing salvos of welcome to the new President, and the long procession is moving up Pennsylvania Avenue to the Capitol front, where he is to be inaugurated, the White House family are gathering their personal effects together and taking last looks at the rooms where they have

his career as a general than on that as chief magistrate, and has left in the building he occupied for eight years few memories that are still fresh. The White House is, in fact, an official hotel. The guests come and go, and when they leave they take with them, along with their trunks, whatever of personality they diffused through its stately apartments while they remained. Some have lived in the house in the spirit of a freehold owner, sure of undisturbed possession; some, like short-term tenants, never feeling quite at home. Of the latter were the family of President Johnson, one of whose daughters said: "We are plain people from the mountains of Tennessee, called here for a time by a great national calamity. We hope too much will not be expected of us." Whether proud or modest in their temper or belongings, however, the Presidents, when once they have surrendered the reins of power, soon drop back into the dim and ghostly procession of their predecessors. One of the saddest spectacles connected with official life in Washington, and one to which no pen has done adequate justice, is the hasty

been honored and courted and flattered for years, the delightful sense of greatness and power they have enjoyed so long now cut short in a single day.

In earlier times the hotel character of the Mansion was

well reflected in the stiff, formal, half-furnished appearance of the rooms. It was thought enough to have thick carpets on the floors, and strong furniture and a few decorative pieces, too heavy to be carried off by servants during the quadrennial migration; but of late Mr. Louis C. Tiffany's decorative association has metamorphosed the place, and made the smaller rooms look like the abode of people of luxurious tastes. Perhaps the most successful of all this new work is in the long corridor, which leads from the East Room to the Conservatory, and from which open the Red, Green, and Blue Rooms. The light coming through the partition of wrinkled stained-glass mosaic makes a marvelously rich and gorgeous effect, falling upon the gilded niches where stand dwarf palmetto trees, the silvery net-work of the ceiling, and the sumptuous furniture. Indeed, the

GROUND PLAN OF THE WHITE HOUSE.

THE WAITING-ROOM.

only dark tints in the apartment are found in the portraits, which become the more conspicuous by reason of their contrast with their brilliant setting. Only one of these need arrest our attention now—the full-length portrait of Garfield, by Andrews. The artist, seeking to give the face the dignified statesman-like expression which is supposed to be essential in Presidential portraits, has almost lost sight of the genial, buoyant, warm-hearted character which lay at the bottom of the man's nature. No one looking at the picture of Lincoln in the Red Room would gather from the face the hearty love of jest and anecdote, the tender pity for suffering and distress, and the warm fraternal sympathy, which lit up the homely features with the interior beauty of a kindly soul; and I fear coming generations of visitors who pass through this grand corridor will see nothing in the stern, sad face of Garfield to remind them that here was a man who loved to play croquet and romp with his boys upon his lawn at Mentor, who read Tennyson and Longfellow at fifty with as much enthusiastic pleasure as at twenty, who walked at evening with his arm around the neck of a friend in affectionate conversation, and whose sweet, sunny, loving nature not even twenty years of political strife could warp.

The Red Room, used as a reception parlor by the ladies of the President's household,

already had a home-like look, from the presence of a piano, a handsome embroidered fire-screen (a present from the Austrian commissioners at the Centennial Exhibition), and some small adornments; and in the recent general renovation of the Mansion, it has been given an imposing carved-wood mantel of thirteenth century style, set off with tiling of tortoise-shell glass. Some beautiful work has been done, besides, in the ceiling and in the walls, and the whole effect of carpet, furniture, and wall-tints is exceedingly rich and warm. Opening from this room is the State Dining-room, only used when large companies are entertained at dinner—a rather chilling apartment, in spite of the glowing yellows Mr. Tiffany has given to the walls. In early times this room was called the “company dining-room,” to distinguish it from the family dining-room across the hall. The long table seats thirty-eight persons. In the middle sits the President, and opposite him the mistress of the Mansion. No order of precedence is observed in going in to dinner, or in seating the guests. Something of this sort was attempted in early times, but abandoned as not practicable, and perhaps also as not sensible, in a country with democratic institutions. These state dinners are rather dull affairs. The cold-water régime lasted four years, and has left behind an interesting souvenir in the fine portrait of Mrs. Hayes, by Huntington,

which stands in the Green Room, and was presented to the Government by the Women's National Temperance Association, the money (\$3,500) being raised by a general subscription. With the exception of a small picture of Mrs. Tyler, which hangs in the corridor on the second floor, this is the only portrait of a President's wife to be found in the Mansion.

If a description of upholstery were of any interest, we might linger in the Green and Blue rooms to speak of the manner in which their

proached by two stair-ways, one leading from the grand corridor, used only by the family and their guests, and the other coming down from the office part of the building to the small hall between the vestibule and the East Room, forming a general passage-way for all people having business with the President or his secretaries. A broad hall runs from end to end of the second story, terminating in semicircular windows; but the fine effect of the ample length and width of this corridor is

THE WHITE HOUSE BY NIGHT.

historic hues have been preserved in the invasion of the modern zeal for decoration. The East Room has not been much changed since President Grant's time, when the ceiling was broken into three panels by heavy beams supported by columns, and the profuse gilding was done. The ebony and old-gold furniture and the "greenery gallery" carpet are new. Gilding and color have been lavished of late all over the White House. Even the heavy iron railings in front of the house are tipped with gold, and the bomb-shells, supported on iron tripods, glisten like the balls of a pawnbroker's shop. In one of these bombs, during the war-time, a pair of birds built a nest, and gave John James Piatt a theme for his well-known poem.

The upper floor of the Mansion is ap-

spoiled by two low cross partitions: one long ago put in as a necessity to keep the throng of Congressmen and place-hunters from blundering into the family rooms, the other a cheap affair, looking as if it came second-hand from some junk-shop, erected lately to gain an additional office-room. It was no part of the plan of the White House, as we have said, that it should be a public office; but with the growth of the country and of the political patronage system, the proper use of the building as a dwelling for the chief magistrate has been more and more subordinated to its official use as a bureau of appointments and a rendezvous for the scheming politicians of the two Houses of Congress, who claim the Government offices in their States as their personal property, to

IN THE RED ROOM.

be parceled out by the President in accordance with their wishes. It will doubtless surprise many people to learn that hospitality, save in the restricted sense of giving dinners, is almost an impossibility to the President of the United States, for the reason that he has no beds for guests. There are only seven sleeping rooms in the Mansion, besides those of the servants on the basement floor. If a President has a moderately numerous household, as General Grant, Mr. Hayes, and Mr. Garfield had, he can hardly spare for guests more than the big state bedroom. A President may wish to invite an ambassador and his family, or a party of distinguished travelers from abroad, to spend a few days at the White House, but he cannot do so without finding lodgings elsewhere for members of his own household. It has been said over and over again, in the press, that Congress should either provide offices for the President, or should build for him a new dwelling, and devote the Mansion exclusively to business purposes; but Congress is in no hurry to do either.

The present office system in the White House is an affair of quite recent growth. Before President Johnson's time, no records or files were kept, and there were no clerks. President Lincoln had two secretaries, Mr. Nicolay and Colonel Hay; but the law recognized only one, the other being an army officer detailed for special service,—any extra clerical work being done by clerks detailed from one of the departments. Now there are four rooms occupied by the private secretary and his staff of clerks. Big ledgers of applications for office are posted up daily, numerous pigeon-holes are filled with letters and peti-

tions, the newspapers are read and scrap-books made, one room is devoted to telegraph and telephone service; in short, here are all the paraphernalia of a busy public office. One of the files of letters would furnish curious reading to students of human nature. It is called the eccentric file, and contains the epistles of advice, warning, and "gush" mailed to the President by cranks, fanatics, absurd egotists, and would-be philanthropists; and how numerous these peculiar people are, only those in high station know. A President gets two or three hundred letters a day, and probably not one-fourth of them are upon any subject that can properly be brought directly to his personal notice.

One might well suppose that in the White House, where the clerks and servants come into close relations with the President, there would be numerous changes with each new administration; indeed, there would be more excuse for rotation in office here than in any other branch of the Government, for a President might naturally prefer to have old friends in whom he had learned to confide in care of his house and correspondence; but the wise rule of service during good behavior obtains here to a greater extent than in any one of the departments, except perhaps the Department of State. One of the servants dates back to Fill-

more's administration, and has seen thir-

A CORNER OF THE STATE DINING-ROOM.

ty years of service; one of the clerks and one of the door-keepers were appointed by Lincoln; others came in under Grant. The private secretary is, of course, always the personal friend and confidant of the President, and goes out with his chief; but the rest of the staff remains, as a rule, and constitutes an efficient working force, familiar with the precedents, customs, and etiquette

warden of the private secretary's door. Their business must be explained to the secretary, and few of them ever get any nearer to the seat of power. The hours for callers are from ten to one, save on the days of regular Cabinet meetings. In the afternoon the President sees visitors by special appointment, and most of his evenings are filled in the same way,—the business in ninety-nine cases out of

IN THE CONSERVATORY.

of the Presidential office, and very valuable on this account to a man entering upon its trying duties.

Visitors who have business with the President wait in the antechamber, or walk impatiently back and forth in the hall. The President receives in the Cabinet Room—not the historic room where Lincoln signed the Proclamation of Emancipation. Mr. Johnson converted that into the private secretary's room, and took the former anteroom for the Cabinet meetings. At the door stands a quiet, sagacious, gray-haired man, who has an instinct for distinguishing people of consequence from the general multitude. Senators, judges, governors, and other men of note find their cards taken directly to the President; persons of small account are referred to a polite man of color, who is the

a hundred concerning the disposition of offices. The late President Garfield once said that he was obliged to see an average of about thirty persons for every office to be filled. If the question was one of removal, the number was much greater, including the friends of the incumbent as well as the candidates for the place. There is an amusing story, not a new one by any means, of the method Mr. Lincoln adopted to settle a contest over a postmastership which had greatly annoyed him. There were two candidates in the field, and petition after petition had poured in upon the weary President, and delegation after delegation had rushed to the White House to argue the claims of the rival aspirants. Finally, after he had been bored for half an hour by a fresh delegation, Mr. Lincoln said to his secretary, "This matter has got to end somehow. Bring

THE LIBRARY.

a pair of scales." The scales were brought. "Now put in all the petitions and letters in favor of one man, and see how much they weigh, and then weigh the other candidate's papers." It was found that one bundle was three-quarters of a pound heavier than the other. "Make out the appointment at once for the man who has the heaviest papers," ordered the President, and it was done.

There is no necessity for a President giving up nine-tenths of his working hours to

the consideration of claims to office, thus unfitting himself for the study of public questions, and depriving himself of time which should be given to social intercourse with men of ideas and high public station. The Constitution says he shall make appointments, but it also says he shall be commander-in-chief of the army. He is no more required to examine petitions and hear applications concerning all the post-offices, consulates, and collectorships, than he is to buckle on a saber, mount a horse, and maneuver the troops. All the details of

THE WHITE HOUSE, FROM NEAR THE TREASURY.

THE PORTICO.

appointment business should be left to the members of the Cabinet, whose recommendations should be final, except in relation to a few of the most important offices, such as foreign missions, high posts in the military and naval service, and perhaps a few of the great collecting agencies in the chief cities which supply the Treasury with the greater part of its funds. Some day there will come to the White House a man of strong will and of a lofty patriotic purpose, with no relish for wielding personal power in the distribution or refusal of official favors; and he, revolutionizing the customs of the Executive office, which are stronger than law, will resolutely shut his door upon all place-hunters and their advocates in Congress, and be the President of the people and not the President of the office-seekers and office-holders.

SOCIAL life at the White House varies with different administrations. A tendency toward making it less public and more discriminating is noticeable of late years. President Johnson gave a public reception once a week during the winter season, and even in the stress and agony of the war-time President Lincoln shook hands with a mob of two or three thousand people surging through the Mansion as often as once a fortnight. Now,

one or two public receptions during a session of Congress are thought a sufficient concession to the democratic principle. A New-Year's Day reception is demanded by the unbroken custom of three-quarters of a century. First, the members of the diplomatic corps present themselves in all the splendors of court dress—the only occasion when they can display the uniforms, cocked hats, gold lace, and decorations of that costume, without being mistaken for people on their way to a masquerade ball; then come the Sena-

tors and Congressmen, officers of the army and navy, and last, the public in general and in mass, going in at the door and out of a window on a temporary bridge. Once or twice each season, a reception to Senators and Representatives in Congress and their families is given. For these occasions cards are usually sent out. Not long ago this custom was disregarded, and in place of cards an announcement of the event was published in one of the newspapers. The witty wife of an Eastern member of Congress, who attended the reception, said, when presented to the host, "Mr. President, you advertised for me, and I am here."

Formerly it was thought the duty of the President to invite each Senator and member of Congress to dinner once a year; but as the two Houses have grown in their membership,

WEST WINDOW. (NEW DESIGN.)

this burdensome custom has fallen into disuse. President Johnson was the last to adhere to it. If a President's dinner invitations include, in a single season, the Senators, the Justices of the Supreme Court, the members of the Cabinet, the foreign ministers, and a sprinkling of influential members of the lower House and distinguished officers of the army and navy, he is now thought to have done his duty in this direction with sufficient liberality. Much the best of White House sociability is found at informal dinners and lunches, at which only a few guests are present with the President's family, and at evenings "at home," for which no cards are sent out. Then there is conversation and music, and

one may meet a score of famous men with their wives and daughters. Some Presidents are remembered for the number of their state dinners, others for their receptions, and others for the cordial social tone they gave to the life of the Mansion by small entertainments, by being accessible to all the world, and by making people feel at home. Each Presidential household has modified in some degree the customs of the place to suit its own tastes and habits. Perhaps the most important innovation on long-established precedent was made by General Grant, who broke through the traditional etiquette which forbade a President to make visits. Formerly a President saw the inside of no house but his own, and was in

some sort a prisoner during his term of office. He could drive out or go to the theater, but he could not make a social call, or attend a reception at a friend's house. Now he goes to weddings and parties, makes calls, and dines out, as freely as any other citizen. Indeed, the tendency of White House customs is toward less formality, and more ease and freedom of social intercourse, rather than in the other direction; and this is remarkable at

its coachman and footmen in powdered wigs and its white horses with blackened hoofs, would make a sensation on Pennsylvania Avenue in these modern times. It is safe to say that no chief magistrate nowadays, entertaining any hope of reelection, would venture to make a display in servants, equipage, or mode of living. The ado made over Martin Van Buren's gold spoons in the political campaign of 1840 has not been forgotten.

CORNER OF THE EAST ROOM.

a time when our new moneyed aristocracy is aping the manners of courts and surrounding itself with liveried flunkies. No servant at the White House wears a livery, unless the coachman's coat can be called such. It is often easier to get an interview with the President of the United States than with the editor of a metropolitan daily newspaper, or the president of a great railroad company. The ways of the Executive Mansion are much simpler now than in the days of the first Presidents. Washington's gilded coach, with

The country is wiser than it was then, and makes no outcry about the sumptuous decorations or elegant table furniture in the White House; but if the servants who attend the front door should appear one day in livery, the innovation would be condemned. Presidents no longer smoke corn-cob pipes as Andrew Jackson did, or take whisky at dinner, or put their feet on the table while talking with visitors—a rudeness I have myself seen within the last twenty years; but they are expected to be quiet, unpretentious

THE CABINET ROOM.

gentlemen in their manners and surroundings, and nothing more nor less. Wielding more real power to-day than any sovereign in Europe, save the Czar and the Sultan, they must avoid all the pomp and ceremony of courts, and meet people face to face with a shake of the hand and a "How d'ye do?" like plain citizens. No coats of arms adorn their coach panels, and no soldiers clear the way or ride at their heels. In the war period, when Lincoln rode out to his summer residence on the hills near the city, he was attended by a cavalry detachment; but this was necessary for his protection in a time of raids, surprises, and murderous plots. Since the war, no President has had a body-guard. Even the two cavalymen who used to wait at the White House portal, to ride with messages to the Capitol or the departments, have disappeared since the telephone came into use.

Looking at the portraits of the "Ladies of the White House" in a volume recently published, and reading the meager annals of their lives, one cannot resist the conclusion that Presidents' wives, with few exceptions, have been simple matrons who on their elevation to the first social station in the country have performed their duties creditably, with that ready adaptation to new conditions which is so marked a peculiarity of

American women. In recent times there has been a mistress of the Mansion who taught her boys Latin and Greek and read the best of current literature, and another who is remembered for her kindly and cordial ways and earnest interest in charities and reforms. One has left a tradition of elegant manners; one never appeared in public, but lived in seclusion, devoted to domestic duties, and making with her own hands butter from the milk of a favorite cow.

Coming back now from the social life of the White House to the house itself, let us note that the family sitting-room and parlor is the oval library above the Blue Room—a spacious and comfortable apartment; that the second room beyond is the bedroom occupied by Lincoln and Grant, and the one made historic by Garfield's long suffering; that President Arthur occupies as a bedroom a chamber across the hall looking toward Pennsylvania Avenue, and has fitted up for a private office one of the adjoining chambers, where he works late at night; and that the broad corridor between the two lines of sleeping-rooms is used as picture gallery, promenade, and smoking-room. The Executive Mansion, in these modern days of wealth, luxury, and display, appears a small and modest dwelling for the chief magistrate of fifty millions of people.

SIDNEY LANIER, POET.

SIDNEY LANIER. (ENGRAVED BY H. VELTEN FROM A PHOTOGRAPH BY KUHN & CUMMINGS.)

THERE are few to whom is due the creative name of poet. The forest of newspaper and magazine is full of birds. They chirp on every bough. But the true artist-singers are very rare and very dearly to be prized. Such a one was Sidney Lanier.

The sparrow and the lark are both birds, and both have their song; and there is a sense in which every writer who can marry beautiful thoughts to beautiful words, with skill enough to please, is a poet, even though thought and form have been heard a thousand times. They sing with easy variations the old songs which we have learned to understand, and they give us pleasure. The cleverness is not in the theme, but in the variation; and most of us are satisfied with clever-

ness. There is not much else in the literary world. Literature comes chiefly by knack and practice and facility. Little of it requires fresh eyes, or a passion for the truth one sees for himself, or a soul that tells the world what is beauty, and is not content to be told. And so it happens that pupils do not flock to the new teacher. He does well if he finds twelve disciples. He must live long enough to teach a second generation, or be content with his own silent confidence that the poetry is good poetry, the art good art, and that the world will find it out by and by. Is human nature so much more hospitable to the new, or is criticism so much keener-eyed than in the days of Shakspeare, or Milton, or Keats, that nowadays the singer of a new song will

find room and welcome and be heard? I am not sure.

I venture to say that Sidney Lanier was a poet; something other than a rhymers of clever convention. While we do not talk so much now about genius as we did thirty years ago, we can yet recognize the difference between the fervor of that divine birth and the cantering of the common Pegasus forth and back, along the common post-roads over which facile talent rides his daily hack. The poems on which Lanier's fame will rest are not numerous, nor are they yet gathered into a volume. He is better known by his two courses of lectures in Baltimore, "The Science of English Verse" and "The English Novel," and by "The Boy's Froissart," "The Boy's King Arthur," and "Mabinogion," three books belonging to a series he had planned which should teach again our boys and girls the old tales of chivalry. But these were only his interludes, tasks which he set himself,—tasks, though done with much love, for the day's bread. His best heart was put, as daily toil would allow, on higher work.

Sidney Lanier's father was a lawyer in Macon, Georgia, where our poet was born, February 3d, 1842. As a child his first passion was for music, and it was his last. He never quite settled in his own mind whether poetry or music is the higher art. While still a boy he played the flute, banjo, guitar, violin, piano, and organ. On the flute he was recognized as one of the most brilliant performers in the country. The revelation of music came to him before that of poetry. It seemed to him the larger part of life. How it is to be explained psychologically I do not pretend to say; but he seemed to hear music always sounding in his ears, and he had only to withdraw his attention from other thoughts for a moment, to listen to strains that came without will of his. In the one novel that he wrote, at the age of twenty-five, he makes one of his characters say:

"To make a *home* out of a household, given the raw materials,—to wit, wife, children, a friend or two, and a house,—two other things are necessary. These are a good fire and good music. And inasmuch as we can do without the fire for half the year, I may say music is the one essential." "Late explorers say they have found some nations that had no God; but I have not read of any that had no music." "Music means harmony, harmony means love, love means — God!"

At the age of fifteen young Sidney entered the Sophomore class of Oglethorpe College, Midway, Ga., from which he graduated with the valedictory honors three years later, in 1860. He was immediately called to a tutorship in the same institution, where he remained during that eventful year before the

outbreak of the civil war, devoting his studies to languages and philosophy, and trying his hand at verse. He was a hungry student all his life. He did not believe that art comes all by instinct without work. In one of his keen criticisms of poets, he said of Edgar A. Poe, whom he esteemed more highly than his countrymen at large are wont to do: "The trouble with Poe was that he did not *know* enough. He needed to know a great many more things in order to be a great poet." Lanier had a passion for the exact truth, and all of it. When the opportunity came to him at last to study, and the Peabody library was opened to him in the winter of 1874 and 1875, he worked with the eagerness of a famished man; and that date formed an epoch in his literary growth. Here he made himself a profound student of Anglo-Saxon and early and later English poetry, developed his keen critical power, and prepared himself for his courses of lectures on the Science of English Verse, the English Novel, and Shakspeare, which he delivered the three last years of his life before the Peabody Institute and the Johns Hopkins University.

The war closed the colleges of the South, and at the age of nineteen Lanier went eagerly from the class-room to the camp. When a child, he had formed a military company of boys from eight to twelve years old, armed with bows and arrows; and so thoroughly did he drill them that they had an honored position assigned them in the anniversary parades of the city military organizations. He served as a private in the Confederate army through the whole war. Three times he was offered promotion and refused it, because it would separate him from his younger brother, who was his companion in arms, as their singularly tender devotion to each other would not allow them to be parted. The first year of service in Virginia was easy and pleasant, and he spent his abundant leisure in music and the study of German, French, and Spanish. He was in the battles of Seven Pines, Drewry's Bluff, and the seven days' fighting about Richmond, culminating in the terrible struggle of Malvern Hill. After this campaign he was transferred with his brother to the signal service, the joke among his less fortunate companions being that he was selected because he could play the flute. His head-quarters were now for a short period at Petersburg, where he had the advantage of a small local library, but where he began to feel the premonitions of that fatal disease, consumption, against which he battled for fifteen years. The regular full inspirations required by the flute probably prolonged his life. In 1863 his detachment was mounted,

and did service in Virginia and North Carolina. At last the two brothers were separated, it coming in the duty of both of them to run the blockade. Sidney's vessel was captured, and he was for five months in Point Lookout prison at Fortress Monroe, until he was exchanged (with his flute, for he never lost it) near the close of the war. Those were very hard days for him, and a picture of them is given in a chapter of his "Tiger Lilies," the novel which he wrote two years afterward, published by Hurd & Houghton. It is a luxuriant unpruned work, written in haste for the press within the space of three weeks, but one which gave rich promise of the poet. A chapter in the middle of the book, introducing the scenes of these four years of struggle, is wholly devoted to a remarkable metaphor which becomes an allegory and a sermon, in which war is pictured as "a strange, enormous, terrible flower," which "the early spring of 1861 brought to bloom, besides innumerable violets and jessamines." He tells how the plant is grown; what arguments the horticulturists give for cultivating it; how Christ inveighed against it, and how its shades are damp and its odors unhealthy; and what a fine specimen was grown the other day in North America by "two wealthy landed proprietors, who combined all their resources of money, of blood, of bones, of tears, of sulphur, and what not, to make this the grandest specimen of modern horticulture." "It is supposed by some," says he, "that seed of this American specimen (now dead) yet remain in the land; but as for this author (who, with many friends, suffered from the unhealthy odors of the plant), he could find it in his heart to wish fervently that this seed, if there be verily any, might perish in the germ, utterly out of sight and life and memory, and out of the remote hope of resurrection, for ever and ever, no matter in whose granary they are cherished!"

When peace was declared, Mr. Lanier returned to his father's home in Macon; and after nearly three years spent in teaching and other pursuits, he entered upon the study of the law, and was associated with his father in the practice of that profession until December, 1872.

It was not merely because he felt that his sphere was something else than law that he escaped from it. His health had become exceedingly precarious, and, leaving his wife and little family, he went to San Antonio, Texas, hoping to recover his strength in an outdoor life. But he found no benefit from it, and, now fully determined to give himself wholly to music and literature so long as he could keep death at bay, he sought a land of books.

After some months in New York, he settled down in Baltimore in 1874, where he made his home, except for absences in search of health, until his death, September 7th, 1881.

If poetry is the wedding of music and high thought, the union of beautiful sentiment and beautiful expression, not all poets have had the fine art of marrying the two in equal wedlock. The soul of Emerson's poems gave Sidney Lanier the keenest delight, the purest exaltation; he called him the wisest of his contemporaries; but his poetic form he found very deficient, especially in the sense of music. Our own age is recovering in Tennyson and Swinburne this music of verse, almost lost since Milton's youth. Not only did Lanier have their keen sense of it, but he made it a scientific study, as no other poet or critic has ever done, and devoted to it a whole course of lectures before the Peabody Institute, which are published in his "Science of English Verse." It is well within the truth to say that it is the most complete and thorough original investigation of the formal element in poetry in existence. It breaks away from the classic grammarian's tables of trochees and anapests, and discusses the form of poetry in terms of music, treating of rhythm as measured time, and of feet as the equal divisions on a bar, and showing how the recurrence of euphonic vowels and consonants secures that rich variety of tone-color which music gives in orchestration. I think these investigations in the science of verse bore their fruit in the poems written in the last three or four years of his life, during which time his sense of the solemn sacredness of Art became more profound, and he acquired a greater ease in putting into practice his theory of verse. And this made him thoroughly original. He was no imitator either of Tennyson or of Swinburne, though musically he is nearer to them than to any others of his day. We constantly notice in his verse that dainty effect which the ear loves, and which comes from deft marshaling of consonants and vowels, so that they shall add their suppler and subtler reinforcement to the steady infantry tramp of rhythm. Of this delicate art, which is much more than mere alliteration, which is concerned with dominant accented vowels as well as consonants, and with the easy flow of liquids and fricatives, and with the progressive opening or closing of the organs of articulation, Tennyson's "Brook" is an example for minute study perhaps unequalled in English verse, though some verses in Milton's youthful "Hymn to the Nativity" are well worthy to be compared with it. Of the same rare quality Lanier quotes as a brief illustration two wonderful lines from "The Princess":

"The moan of doves in immemorial elms,
And murmuring of innumerable bees."

As an example of this same merit, Mr. Lanier's own "Song of the Chattahoochee" deserves a place beside Tennyson's "Brook." It strikes a higher key, and is scarcely less musical. The river is singing how it escaped the luring dalliance of weed and pebble that would hold its streams as they hurried from their mountain sources to turn the mills and water the parched plains below :

"All down the hills of Habersham,
All through the valleys of Hall,
The rushes cried, 'Abide, abide,'
The willful water-weeds held me thrall,
The laving laurel turned my tide,
The ferns and the fondling grass said 'Stay,'
The dewberry dipped for to work delay,
And the little reeds sighed, 'Abide, abide,
Here in the hills of Habersham,
Here in the valleys of Hall.'"

The last poem he ever wrote, his "Sunrise on the Marshes," penciled while lying in what seemed the death-fever from which he could not rise, when too weak to lift his food to his mouth, the largest and perhaps the greatest of his mature poems, is full of this elusive beauty. Take these lines which describe the steady sinking away of the eastern horizon as the sun rises out of the sea :

"Not slower than majesty moves, for a mean and a measure
Of motion, not faster than dateless Olympian leisure
Might pace with unblown ample garments from pleasure to pleasure,
The wave-serrate sea-rim sinks, unjarring, unreeling,
Forever revealing, revealing, revealing,
Edgewise, bladewise, halfwise, wholewise—'tis done!
Good-morrow, lord Sun!"

As another example of the highest art in the sound-element of poetry, we may take from the same poem the lines which find the poet standing by the open forest marshes, in the overarching beauty and tense silence of a starry morning, before a sign has come of the dawn which he expects and awaits :

"Oh, what if a sound should be made?
Oh, what if a bound should be laid
To this bow-and-string tension of beauty and silence
a-spring,
To the bend of beauty, the bow, or the hold of
silence, the string!
I fear me, I fear me yon dome of diaphanous gleam
Will break as a bubble o'erblown in a dream;
Yon dome of too tenuous tissues of space and of
night,
Overweighted with stars, overfreighted with light,
Oversated with beauty and silence, will seem
But a bubble that broke in a dream,
If a bound of degree to this grace be laid,
Or a sound or a motion made."

Mr. Stedman, poet and critic, raises the question whether Lanier's extreme conjunc-

tion of the artistic with the poetic temperament, which he says no man more clearly displayed, did not somewhat hamper and delay his power of adequate expression. Possibly; but he was building not for the day, but for time. He must work out his laws of poetry, even if he had almost to invent its language; for to him was given the power of analysis as well as of construction, and he was too conscientious to do anything else than to find out first what was best and why, and then tell and teach it as he had learnt it, even if men said that his late spring was delaying bud and blossom. The sharp criticism and unthinking ridicule which his Centennial Cantata received from those who did not understand its musical purpose made him believe, sometimes, that he could not hope to be understood generally without educating his audience; and the task was irksome to him. But so long as "the poetic art was suffering from the shameful circumstance that criticism was without a scientific basis for even the most elementary of its judgments," he believed his study of art and form necessary for the world if not for himself.

But it would be a great mistake to find in Lanier only, or chiefly, the artist. He had the substance of poetry. He possessed both elements, as Stedman says, "in extreme conjunction." He overflowed with fancy; his imagination needed to be held in check. This appeared in "Corn," and still more in "The Symphony," the first productions which gave him wide recognition as a poet. Take these chance lines from the latter poem :

"But presently
A velvet flute-note fell down pleasantly
Upon the bosom of that harmony,
And sailed and sailed incessantly,
As if a petal from a wild rose blown
Had fluttered down upon that pool of tone
And boatwise dropped o' the convex side,
And floated down the glassy tide,
And clarified and glorified
The solemn spaces where the shallows bide.
From the warm concave of that fluted note
Somewhat half song, half odor, forth did float,
As if a rose might somehow be a throat."

The intense sacredness with which Lanier invested Art held him thrall to the highest ethical ideas. To him the most beautiful thing of all was the Right. He loved the words, "the beauty of holiness," and it pleased him to reverse the phrase and call it "the holiness of beauty." When I read Lanier I think of two writers, Milton and Ruskin. These two men, more than any other great English writers, are dominated by this beauty of holiness. Lanier was saturated with it. It shines in every line he wrote. It is not that he never wrote a maudlin line, but that every thought

was lofty. Hear his words to the students in Johns Hopkins University :

"Cannot one say with authority to the young artist, —whether working in stone, in color, in tones, or in the character forms of the novel,—so far from dreading that your moral purpose will interfere with your beautiful creation, go forward in the clear conviction that unless you are suffused —soul and body, one might say—with that moral purpose which finds its largest expression in love—that is, the love of all things in their proper relation—unless you are suffused with this love, do not dare to meddle with beauty; unless you are suffused with beauty, do not dare to meddle with love; unless you are suffused with truth, do not dare to meddle with goodness; in a word, unless you are suffused with beauty, truth, wisdom, goodness, *and* love, abandon the hope that the ages will accept you as an artist."

And so it came into his verse,—a solemn, reverend, worshipful element, dominating it everywhere, and giving loftiness to its beauty. For he was the democrat whom he described in contrast to Whitman's mere brawny, six-foot, open-shirted hero, whose strength was only that of the biceps:

"My democrat, the democrat whom I contemplate with pleasure, the democrat who is to write or to read the poetry of the future, may have a mere thread for his biceps, yet he shall be strong enough to handle hell; he shall play ball with the earth; and albeit his stature may be no more than a boy's, he shall still be taller than the great redwoods of California; his height shall be the height of great resolution, and love, and faith, and beauty, and knowledge, and subtle meditation; his head shall be forever among the stars."

Illustrations could be taken at random from his poems. I select the shortest I can find, a pure lyric, the "Ballad of the Trees and the Master," intended first for an interlude in his partly completed "Hymns of the Marshes." The communion of the trees suggests their sympathy with the Master in Gethsemane:

"Into the woods my Master went,
Clean forspent, forspent;
Into the woods my Master came,
Forspent with love and shame.
But the olives, they were not blind to Him,
The little gray leaves were kind to Him,
The thorn-tree had a mind to Him,
When into the wood He came.

"Out of the woods my Master went,
And He was well content;
Out of the woods my Master came,
Content with death and shame.
When death and shame would woo Him last,
From under the trees they drew Him last:
'Twas on a tree they slew him—last
When out of the woods He came."

Though not what would be called a religious writer, Lanier's large and deep thought took him to the deepest spiritual faiths, and the vastnesses of Nature drew him to a trust in the Infinite above us. How naturally this

finds expression in his "Marshes of Glynn," the "Marshes" being, as ever, the wide coast marshes of Georgia, with their belts of live oaks and their reaches of sand and sea-grass:

"Tolerant plains, that suffer the sea and the rain and the sun,
Yet spread and span like the Catholic Man who hath mightily won
God out of knowledge, and good out of infinite pain,
And sight out of blindness, and purity out of a stain.

"As the marsh-hen secretly builds on the watery sod,
Behold I will build me a nest on the greatness of God!
I will fly in the greatness of God as the marsh-hen flies
In the freedom that fills all the space 'twixt the marsh and the skies.

"By so many roots as the marsh-grass sends in the sod
I will heartily lay me a-hold on the greatness of God;
Oh, like to the greatness of God is the greatness within
The range of the marshes, the liberal marshes of Glynn."

It is this quality, high and consecrate, as of a palmer with his vow, this knightly valiance, this constant San Grail quest after the lofty in character and aim, this passion for Good and Love, which fellows him rather with Milton and Ruskin than with the less sturdily built poets of his day, and which puts him in sharpest contrast with the school led by Swinburne,—with Rossetti and Morris as his followers hard after him, and Oscar Wilde far behind,—a school whose reed has a short gamut, and plays but two notes, Mors and Eros, hopeless death and lawless love. But poetry is larger and finer than they know. Its face is toward the world's future; it does not maunder after the flower-decked nymphs and yellow-skirted fays that have forever fled—and good riddance—their haunted springs and tangled thickets. It can feed on its growing sweet and fresh faiths, but will draw foul contagion from the rank mists that float over old and cold fables. For all knowledge is bread to a genius like Lanier. A poet genius has great common sense. He lives in to-day and to-morrow, not in yesterday. Such men were Shakspeare and Goethe. The age of poetry is not past; there is nothing in culture or science antagonistic to it. Milton was one of the world's great poets, but he was the most cultured and scholarly and statesmanlike man of his day. He was no dreamer of dead dreams. Neither was Lanier a dreamer. He came late to the opportunity which he longed for, but when he came to it he was a tremendous student, not of music alone, but of language, of science, and of philosophy. He had all the instincts and ambitions of this nineteenth century. But that only made his range of poetic thought wider, and its success

deeper. The world is opening to the poet with every question the crucible asks of the elements, with every spectrum the prism steals from a star. The old he has and all the new.

But how short was his day, and how slight his opportunity! From the time that he was of age he waged a constant hopeless fight for life. For months he could do no work. He was driven to Texas, to Florida, to Pennsylvania, to North Carolina, to try to recover health from pine breaths and clover blossoms. He was supported by the implicit faith of his devoted wife, who fully believed in his genius, and was willing to suffer everything if he could only find his opportunity; but there was, from the time he left Macon, the constant pitiful struggle not for health alone, but for bread which he must earn for his babes. Notwithstanding the generous help of his father, which was more than could be asked, there were long periods of the very slenderest support from chance writing for a magazine, or a few lectures or lessons when his strength would allow. But his courage and that of his wife never failed. He still kept before him first his ideal and his mission, and he longed to live that he might accomplish them. It must have been in such a mood that he wrote to his wife in 1874:

"So many great ideas for art are born to me each day, I am swept away into the Land of All Delight by their strenuous, sweet whirlwind; and I feel within myself such entire, yet humble, confidence of possessing every single element of power to carry them all out save the little paltry sum of money that would suffice to keep us clothed and fed in the mean time.

"I do not understand this."

As also the following sketch for a poem which he never put into rhyme:

"O Lord, if thou wert needy as I,
If thou shouldst come to my door as I to thine,
If thou hungered so much as I
For that which belongs to the spirit,
For that which is fine and good,—

Ah, Friend, for that which is fine and good,—
I would give it to thee if I had power.
For that which I want is first bread—
Thy decree, not my choice, that bread must be first;
Then music; then some time out of the struggle for
bread to write my poems;
Then to put out of care Henry and Robert, whom I
love.
O my God, how little would put them out of care!"

At last, when his strength was utterly gone, he seemed to have conquered success enough to assure him a livelihood, and a chance to write his poems. Then he died. It was with a terror, almost, that his friends listened to the last course of his lectures, fearing he might not live out the hour. He had risen from the sick-bed which he was not expected to leave, and with great pain and in much weakness he wrote out his notes. He was taken in a close carriage to the University, read the lectures sitting in the chair, too weak to rise, and then suffered a chill of exhaustion on the way home. Three months after, he died. Why was no Mæcenæ found who would gladly give the cost of an evening's party to supply him the rest which might prolong a life worth millions of common lives?

A man with real genius must know it, just as we know we have talent or shiftiness or resource. In 1874, at the very time of his new baptism into art, he wrote to his wife:

"It is of little consequence whether *I* fail; the 'I' in the matter is a small business; '*Que mon nom soit flétri, que la France soit libre!*' quoth Danton; which is to say, interpreted by my environment: Let my name perish; the poetry is good poetry, and the music is good music; and beauty dieth not, and the heart that needs it will find it."

How many hearts need it and will find it, it may be too soon to guess. For my part, I believe it will find a larger and a yet larger audience, and that his short half-dozen years of literary life, though much hindered, will fill a great space in our history of poetry and art.

William Hayes Ward.

[As we go to press, a complete edition of the poems of Sidney Lanier is announced by his publishers, Messrs. Charles Scribner's Sons. The volume will be edited by his wife, and Dr. William Hayes Ward will furnish an introduction.—EDITOR.]

HOW WILKES BOOTH CROSSED THE POTOMAC.

THE most dramatic of historical assassinations has had, until now, an unrelated interval. The actor John Wilkes Booth shot President Abraham Lincoln about ten o'clock Friday night, April 14th, 1865. Near midnight he and his uninteresting road pilot, David E. Herold, called at Surratt's tavern, about ten miles south-east of Washington, and obtained the arms, field glass, etc., previously prepared for them there. Saturday morning they were at Dr. Samuel A. Mudd's, twenty miles farther on, where Booth's broken ankle was set and a crutch made for him; and that evening the two fugitives were guided in a roundabout way to the gate of Samuel Cox, a prosperous Southern sympathizer, about fifteen miles south-west.

The last witness in Maryland ended here. The Government, in its prosecution of the conspirators, took up the fugitive next at the crossing of the Rappahannock River in Virginia, on the 24th of April, having failed to trace Booth a single step farther in Maryland, although he did not cross the Potomac until Saturday night, April 22d. A whole week remains unaccounted for; and for the first time the missing links of the connection are here made public. Probably not half a dozen people are alive who have ever heard the narrative fully told.

When Annapolis was a greater place than Baltimore, and the Patuxent Valley the most populous part of Maryland, the main roads and ferries to all-powerful Virginia were on the lower Potomac, instead of being, as now, above Washington City. The most important of these ferries crossed at a narrow part of the river, where it is from two to three miles wide, near a stream on the Maryland side called Pope's Creek. Just below this spot, and not far above it, there are deep indentations from the river which narrow the open ground over which its banks are reached. A railroad, built since the war, for this reason has its terminus at Pope's Creek. About five miles north of the terminus is Cox's Station, which is about six miles south of the old courthouse village of Port Tobacco. A short distance east of Cox's Station is Samuel Cox's house; a short distance west of Cox's Station, perhaps two or three miles, is the old Catholic manor house of St. Thomas's, by an ancient church which gives the name to "Chapel" Point. Here the Potomac sends up Port Tobacco River, a broad tidal stream,

naturally indicated at the beginning of the war as the nearest safe point for spies and go-betweens to reach broad water from Washington. Mathias Point, on the Virginia side, makes a high salient angle into the waters of Maryland here, and is almost in the direct line from Washington to Richmond.

In this old region of the Calvert Catholics, a civilization existed at the close of the last century probably comparable with that of tide-water Virginia. The Episcopal Church, tobacco, and large landed estates, with slaves, were features of the high bluff country, which was plentifully watered with running streams amidst the hills of clay and gravel. But the Revolution emancipated the Catholic worship originally planted on the lower Potomac by the founders of Maryland, and a curious English society took root, with its little churches surmounted by the cross, its slaves attendants upon mass and confession; and much of the country, originally poor, was covered with decaying estates, old fields grown up in small pines, and deep gullies penetrating to the heart of the hills. The malaria almost depopulated the little towns and hamlets, tobacco became an uncertain crop, slavery kept the people poor, and intercourse fell off with the rest of the world, possibly excepting some of the old counties in Virginia in Washington's "Northern Neck."

Soon after the year 1820 Mr. Cox was born in the district below Port Tobacco, and his mother dying, he was put to nurse with a Mrs. Jones, the wife of a plain man, possibly an overseer, who inhabited the house. She had a son, Thomas A. Jones, who grew up with young Cox; they were playmates and attended the same log school-house, and Cox, as life progressed, had the ruling influence over Jones, who was a cool, brave man, but without the self-assertion of his comrade, who soon developed into one of the most energetic men in that region.

A portrait of Samuel Cox shows him to have been of an indomitable will, strengthened by that consumptive tendency which often gives desperation to men fond of life. At the breaking out of the war Mr. Cox had thirty to forty slaves, plenty of land, a large house with out-buildings, negro quarters, woodlands, and a superior appearance for those parts. He became the captain of a volunteer company, which he drilled at Bryantown, a small settlement in the eastern part of the county,

where the lands were unusually good and the neighbors plentiful in slaves. Hardly one of them an original secessionist, the course of events forced most of those slave-holders into sympathy with the South, if not through their sensitiveness about their slave property, yet from the fact that their sons often hastened to cross the river into the Confederate army, while in many cases their negroes slipped off in the opposite direction within the Federal lines. The responsibility for disloyalty did not rest with these humble people off the great highways of life, but followed from the political consequences of breaking the Union asunder, and leaving them on the Union frontier with all the necessities and traditions of slavery. The Government paid but little attention to them, seeing that they were below the line of military operations, divided by a broad river from the ragged peninsulas of the rebellion; and, therefore, there almost immediately sprang up in lower Maryland, a system of contraband travel and traffic which soon demoralized nearly everybody.

Thomas A. Jones, who had somewhat risen in the world and had a few slaves, sympathized warmly with the South; he owned a farm right at Pope's Creek, the most eligible situation of all for easy intercourse with Virginia. His house was on a bluff eighty to one hundred feet high, from which he could look up the Potomac to the west, across Mathias Point, and see at least seven miles of the river-way, while his view down the Potomac was fully nine miles.

The moment actual war broke out, and intercourse ceased at Washington and above it with Virginia, great numbers of people came to the house of Jones and to that of his next neighbor on the bluff, Major Roderick G. Watson, asking to be sent across the Potomac. These fugitives were of all descriptions: lawyers, business men, women, resigned army officers, adventurers, suspected persons, — even the agents of foreign bankers and of foreign countries.

Major Watson had a large frame house, relatively new, two stories high, with dormer windows in the high roof, and with a servants' wing. He had a son in the Confederate army, and grown-up daughters; and his house became the signal station for the Confederates across the river, one of his daughters setting the signal, which consisted of a shawl or other black object, put up at the dormer window, whenever it was not safe to send the boat across from Virginia. This window was kept in focus from Grimes's house on the other side, about two miles and a half distant, — a small low house, planted at the water's edge, from which the glass could read the signal,

which no Federal officer, whether in his gun-boat or ashore, could suspect. Major Watson was somewhat advanced in years, and died while his neighbor Jones was serving an imprisonment in the Old Capitol prison.

On Jones's return to his home, he therefore became the most trusted neighbor of the Watson family, and they accommodated him as he assisted them. The young lady in the family was as enthusiastic for the Confederate cause, and as discreet in all her talks and walks as Jones himself, on whose countenance no human being could ever read what was passing within his mind. He had attended to his fishery and his farm until the war broke out, without having had an incident to mark his life; but suddenly there was an incursion of strangers to whose needs his rooted ideas of hospitality, no less than his sympathy for the Confederates, led him to hearken. His farming was almost broken up, and he took to crossing the river nearly every night, and sometimes twice or more of a night, with boats, sometimes rowed by two pairs of oars, at others by three, while he steered with an oar in the stern. The interlopers could ride down from Washington to Pope's Creek in six or seven hours, and Jones could put them at Grimes's house opposite in less than an hour. The idea of making money in this traffic never seems to have occurred to the man at all: he regarded these strangers as intrusted to his care by Providence or pity; and although his liberty was constantly in danger, he seldom received more than a dollar or two for taking anybody across. Some persons argued with him that he did not charge enough, and told him to look out for his family and the future; but, as the sequel will show, he did a vast amount of hard and dangerous labor for next to nothing, and in the end the Confederate Government also left him unpaid.

The original rebel route from Pope's Creek to Richmond was through Fredericksburg; but this being considerably to the west, a new route was opened over the old road to Port Royal on the Rappahannock River. Adventurers were taken by Jones or his neighbors across to Grimes's, who, assisted by one or two of his neighbors, carried them by vehicles in three or four hours to Port Conway, where a ferry was maintained across the Rappahannock River to Port Royal, and eighteen miles beyond it the high road from Washington to Richmond was open. Mr. Jones says that he may have crossed the Potomac one hundred times before he was arrested, but has no record of the days.

In the latter part of June, 1861, General Sickles came with troops to the lower Po-

tomac to keep a watch on the contraband intercourse. Grimes was found on the Maryland shore and sent to Fort Delaware. Jones was arrested when he returned from his second visit to Richmond and sent to the Old Capitol prison at Washington, and kept there six months. He was allowed to write to his family, subject to the inspection of his letters, and to talk to any of them when an officer was by. This imprisonment, together with his adventurous cruises previously, sharpened his wits, increased his knowledge of men and the world, and educated him for the official position he was soon afterward to occupy of chief signal agent of the Confederacy north of the Potomac. Misfortunes, however, attended his affairs. His wife, who had a large family of children, was taken sick through care and confinement while he was absent, and died. His farm was mortgaged, and, not pursuing the regular vocations of peace, the mortgage slowly ate up the farm, and near the close of the war he had to remove from his river-side residence to an old place called Huckleberry, about two miles and a half inland.

Mr. Jones was released in March, 1862, by a general jail delivery ordered by Congress under the belief that the prisons were full of innocent men. He took an oath that he would not communicate with the enemy again, and was informed of the penalty of breaking it. He returned to his house on the river bluff, and soon an armed patrol and steam vessels were maintained on the river, and the Federal officers boasted that they had a spy on every farm. One of the fine old mansions on the river, Hooe's house, which had been the almost immemorial ferry-house, was set on fire by the Federal flotilla and burnt, for having given harborage to one of Grimes's boat parties.

Grimes again communicated with Jones, and asked him to go into an undertaking to carry the Confederate mail from Canada and the United States to Richmond. Jones replied that the risk was too great, and that his duty to his children required him to stay at home, although his heart was in the Confederate cause, and he would give it any assistance possible. Upon this, the Confederate signal officer, Major William Norris, who had been a Maryland man and is still alive, held an interview with Jones, and asked him to take charge of the rebel communications, stating that they were of the utmost consequence to the management of the Confederate cause and its intercourse with the outer world, the Federal blockade now being well maintained and every portion of the border closely watched, while the broad Potomac River and the pine-covered hills of lower Maryland afforded almost a sure crossing-place. Finally, Jones said that if he

were given absolute control, not only over the ferry, but over all agents to be retained in Maryland, the names of none of whom he should be called upon ever to mention, he would undertake the work. He said to the Confederate agent: "It is useless to expect me to maintain a boat service with you. You must keep the boat on the Virginia side, cross to my beach, and bring and take the mail there, so that I cannot be suspected." He then indicated a post-office in the hollow of an old tree which grew near the foot of his bluff.

His previous observations on the river had shown him that toward evening, when the sun had fallen below the Virginia woods, there was a certain grayness on the surface of the water, increased by the shadows from the high bluffs, which nearly erased the mark of a boat floating on the Potomac. The pickets that were now maintained along the bluffs were not set till toward night. Therefore it was arranged that the Virginia boat should come in just before the pickets were set, and its navigator noiselessly take out the mail from the old tree and deposit the Virginia packet, and then, with scarcely a word whispered or a sign given, slip back again to his Virginia cove. Generally the boat was hauled ashore in Virginia out of the observation of the patrol gun-boats and their launches, and sometimes it was kept back of Grimes's house, but sometimes back of Upper Machodoc Creek, which is six miles due south of Pope's Creek, and only about twelve miles from Port Royal.

When the rebel mail had been left in the stump, Jones obtained it, either in person or by one of his faithful slaves. It is a singular fact that not only were women the best co-operative agents in this spy system, but the slaves, whose interests might be considered as opposed to a Southern triumph, frequently adhered to their masters from discipline or affection. Jones had a slave named Henry Woodland, still alive, who not only pulled in his boat to Virginia during the early months of the war, but, imitating the habits of his master, was discreet down to the time that Booth escaped, while probably suspecting, if he did not know, all that was going on. He and his master seldom informed each other upon anything, and did not need even to exchange glances, so well did they know each other's ways. The negro was nearly a duplicate of his master in methods, went about his work without speech, and asked no questions. Two other negroes, named John Swan and George Murray, pulled oars in Jones's boats in the early part of the war. One of these, it is believed, turned spy upon his master, and finally ran away, but was sent back

to Jones by the commandant of the camp, received a flogging, and some time afterward deserted to a vessel in the river.

When the rebel mail had been put ashore, Jones would sometimes get it by slipping down through some of the wooded gullies cutting the bluff. The Federal patrol walked on the top of the bluff, and as the night grew dark would be apt to avoid these dark places, from which a shot might be fired or an assassin spring. Jones sometimes ran risks getting down the bluff, which was almost perpendicular, and after a time he constructed a sort of stairs or steps down one portion of it. His foster-brother Cox, who was more noisy and expressive, had contrived early in the war a set of post-offices for the deposit of the mail as it came up from the river, in stumps, etc. One of these post-offices was pointed out to me where the railroad now goes through a cutting below Cox's Station. The Maryland neighbors, however, became so careless about sending their letters through these stump post-offices, that when Jones made his agreement with the Confederate Government, he dispensed with that system altogether, and relied upon more ordinary methods. Having no passion for mere glory or praise, contented to do his work according to his own ideas of right and expediency, he merely made use of substantial, plain people, whose hearts were in the Confederate cause, but whose methods were all discreet. Thus he had a young woman to hoist his signal of black, and it never was hoisted if the course was open and clear on the river. He arranged that no mail matter should come close to his home, not even to Port Tobacco, which was perhaps ten miles distant. It was generally sent to Bryantown, fifteen to twenty miles distant, and collected there, or dispatched from that office, and it was carried by such neighbors as Dr. Stowten S. Dent, who died in 1883, at the age of eighty. This old gentleman had two sons in the Confederate army, and was a practicing physician, riding on his horse from place to place, and it seemed to be the case that some person in Major Watson's family was generally sick. There the good old doctor would go, wearing a big overcoat with immense pockets, and big boots coming high toward his knees. Everybody liked him, the Federal officers and soldiers as well as the negroes and neighbors, for he was impartial in his cures. At the greatest risk, even of his neck, the old man carried the rebel mail which Jones had delivered to him, and frequently went all the way to Bryantown with it. He would stuff his pockets, and sometimes his boots, with letters and newspapers.

There were one or two other persons some-

times made available as mail-carriers. Perhaps Mr. Cox himself would do a little work of this kind. A man on the opposite side of the river, by the name of Thomas H. Harbin, who now lives in Washington, was a sort of general voluntary agent for the Confederacy, making his head-quarters now in Washington and now in Richmond, and again on the river bank. In his desire to accommodate everybody, Harbin sometimes put too much matter in the mail; and Jones's cautious soul was much disturbed to find, on one occasion, two large satchels filled with stuff not pertinent to the Confederate Government. He sent word over that there must be more sense in the putting up of that mail, as it would be impossible to get it off if it grew larger.

Jones's house at this time was of dark, rain-washed plank, one story high, with a door in the middle, an outside chimney at each end, and a small kitchen and intervening colonnade which he added himself. The house was about thirty yards from the edge of the bluff. His farm contained five hundred and forty acres. Besides his neighbors the Watsons below, Mr. Thomas Stone had a place just above him, across Pope's Creek, on a high hill, called "Ellenborough," the mansion of which was one of the largest brick buildings in this region. Next above Stone's, on Port Tobacco River, was George Dent, who also had an interesting mansion. The third farm to the north was Brentfield, and back of it Huckleberry, from which Booth departed.

Mr. Jones himself is a man of hardly medium height, slim and wiry, with one of those thin, mournful faces common to tide-water Maryland, with high cheek-bones, gray-blue eyes, no great height or breadth of forehead, and thick, strong hair. The tone of his mind and intercourse is slow and mournful, somewhat complaining, as if the summer heats had given a nervous tone to his views, which are generally instinctive and kind. Judge Frederick Stone told me that he once crossed the river with Jones, when a Federal vessel suddenly loomed up, apparently right above them, and in the twinkling of an eye, the passenger said, he could see the interior of the Old Capitol prison for himself and all his companions; but at that moment Jones was as cool as if he had not noticed the vessel at all, and extricated them in an instant from the danger. Jones's education is small. He does not swear, does not smoke, and does not drink. When he was exposed on the river, he says, he sometimes took a little spirits to drive away the cold and wet; but he has few needs, and probably has not changed any of his habits since early life.

Born poor, somewhat of the overseer class, and struggling toward independence without greed enough ever to accomplish it, he was eminently made to obey instructions and to keep faith. His neighbor Cox was more subtle and influential, and, although he was rough and domineering, seldom failed to bring any man to his views by magnetism or persuasion. Jones's judgment often differed from Cox's, and in the end his courage was altogether superior; but still, from early habits, the humble farmer and fisherman always yielded at last to what Cox insisted upon.

Mr. Jones was not alone in his operations during the war, but he was the only trusted man in Maryland with whom the Confederate Government had an official relation. His very humility was his protection. He impressed the Federal officers and Union men generally as a man of rather slow wits, of an indolent mind, with but little intelligence or interest in what was going on around him. Yet a cunning which had no expression but acts, a devotion which never asked to be appreciated, and perseverance to this day remarkable, were his. Some of his neighbors were running boats across the river for hire or gain. In the little village of Port Tobacco most of the mechanics and loungers had become demoralized by this traffic, and among these was George A. Atzerodt, a coach-maker, of but little moral or physical stamina, who was afterward hanged among the conspirators. This man left his work after the war began, and took to the business of pulling a boat down Port Tobacco River to Virginia. Among the persons who occasionally crossed the river was John H. Surratt, a country boy of respectable aspirations until some time after the breaking out of the war, when he, too, was caught in the meshes of the contraband trade, and, possessing but little mind and too much vanity, was carried away with his importance. Jones went to Richmond once or twice toward the close of the war, and on one of these occasions Surratt and a woman under his care crossed in the same boat. Sometimes these boats would go so heavily laden that a gale on the broad river would almost capsize them. One portion of Jones's business was to put the New York and Northern newspapers every day into Richmond. These newspapers would go to Bryantown post-office, or sometimes to Charlotte Hall post-office, and would generally reach the Potomac near dusk, and being conveyed all night by the Confederate mail-carriers, by way of Port Royal, would be in the hands of the rebel Cabinet next morning, twenty-four hours only after the people in New York were reading them; and Jones says that there was

hardly a failure one day in the year to take them through.

The Federal authorities never had a tithe of the thoroughness of suspicion and violation of personal liberty which the Confederates always exercised. Hence the doom of Abraham Lincoln was slowly coming onward through these little country-side beginnings, starting without origin and ending in appalling calamity.

About the third year of the war, Jones understood that a very important act had been agreed upon, namely, to seize the President of the United States in the city of Washington, and by relays and forced horses take him to the west side of Port Tobacco Creek, about four miles below the town of that name, and dispatch him across the Potomac a prisoner of war. I possess the names of the two persons on Port Tobacco Creek who, with their sons, were prominent in this scheme; but the frankness with which the information was given to me persuades me not to print them. A person already named, in Washington, was in the conspiracy; and it was given out that "the big actor, Booth," was also "in it." Jones heard of this about December, 1864. It was not designed that he should take any part in the scheme, though he regarded it as a proper undertaking in time of war. From the time this scheme was proposed until the very end of the war, the bateau which was to carry Mr. Lincoln off was kept ready, and the oars and men were ever near at hand, to dispatch the illustrious captive.

That winter was unusually mild, and therefore the roads were particularly bad in this region of clay and marsh, and did not harden with the frost—a circumstance which perhaps spared Mr. Lincoln the terrors of such a desperate expedition. Inquiries were made from time to time as to when the thing was to be done, and it was generally answered that the roads were too heavy to give the opportunity. The idea Jones has of this matter is that Mr. Lincoln was to be seized, not on his way to the Soldiers' Home, but near the Navy Yard, and gagged quietly, and the carriage then driven across the Navy Yard bridge or the next bridge above, while the captors were to point to the President and wave their hands to the guards on the bridge, saying, "The President of the United States." When we consider that he was finally killed in the presence of a vast audience, and that his captors then crossed the same bridge without opposition and without passes, the original scheme does not seem extraordinary. There is no doubt but that in this original scheme the late Dr. Samuel A. Mudd was to play some part. Booth had

made his acquaintance during that fall or winter on his first visit to the country, and some of Dr. Mudd's relatives admit that he knew Booth well, and probably was in the abduction scheme. The calculation of the conspirators was that the pursuers would have no opportunity to change horses on the way, while the captors would have fresh horses every few miles and drive them to the top of their speed, and all they required was to get to the Potomac River, seven hours distant, a very little in advance. The distance was from thirty-six to thirty-eight miles, and the river could be passed in half an hour or little more with the boat all ready. Jones thinks that this scheme never was given up, until suddenly information came that Booth had killed the President instead of capturing him, and was supposed to be in that region of country. Jones had never seen Booth, and had scarcely any knowledge of him.

When Jones went to Richmond, just before the assassination, it was to collect his stipend, which he had confidently allowed to accumulate until it amounted to almost twenty-three hundred dollars, presumably for three years' work. He reached Richmond Friday, and called on Charles Caywood, the same who kept the signal camp in the swampy woods back of Grimes's house. The chief signal officer said he would pay five hundred dollars on Saturday, but if Jones would wait till Tuesday the whole amount would be paid him. Jones waited. Sunday night Petersburg fell, and on Monday Richmond was evacuated, so the Confederacy expired without paying him a cent. Moreover, he had invested three thousand dollars in Confederate bonds earlier in the war, paying for them sixty-five cents on the dollar, and keeping them till they were mere brown paper in his hands.

Jones heard of the murder of Lincoln on Saturday afternoon, April 15th, at or near his own farm of Huckleberry. Two Federal officers or cavalymen came by on horseback, and one of them said to Jones, "Is that your boat a piece above here?" "Yes," said Jones. "Then you had better take good care of it, because there are dangerous people around here who might take it to cross the river." "That is just what I am thinking about," said Jones, "and I have had it pulled up to let my black man go fishing for the shad which are now running." The two horsemen conferred together a minute or two, and one of them said:

"Have you heard the news from Washington?" "No." "Our President has been murdered." "Indeed!" said Jones, with a melancholy face, as if he had no friend left in the world. "Yes," said the horseman;

"President Lincoln was killed last night, and we are looking out for the men, who, we think, escaped this way."

On Sunday morning, the 16th of April, about nine o'clock, a young white man came from Samuel Cox's to Jones's second farm, called Huckleberry, which has been already described as about two and a half miles back from the old river residence, which Jones had been forced to give up when it appeared probable that the Confederate cause was lost. The Huckleberry farm consisted of about five hundred acres, and had on it a one-story and garret house, with a low-pitched roof, end chimneys, and door in the middle. There was a stable north of the house, and a barn south of it, and it was only three-quarters of a mile from the house to the river, which here runs to the north to make the indentation called Port Tobacco Creek or river. Although Jones, therefore, had moved some distance from his former house, he was yet very near tide-water. The new farm was much retired, was not on the public road, and consisted of clearings amidst rain-washed hills with deep gullies, almost impenetrable short pines, and some swamp and forest timber. Henry Woodland, the black servant, who was then about twenty-seven years old, was still Jones's chief assistant, and was kept alternately farming and fishing.

The young man who came from Cox's was told, if stopped on the road, to say that he was going to Jones's to ask if he could let Cox have some seed corn, which in that climate is planted early in April. He told Jones that Colonel Cox wished him to come immediately to his house, about three miles to the north. The young man mysteriously intimated that there were very remarkable visitors at Cox's the night before. Accustomed to obey the summons of his old friend, Jones mounted his horse and went to Cox's. The prosperous foster-brother lived in a large two-story house, with handsome piazzas front and rear, and a tall, windowless roof with double chimneys at both ends; and to the right of the house, which faced west, was a long one-story extension, used by Cox for his bedroom. The house is on a slight elevation, and has both an outer and inner yard, to both of which are gates. With its trellis-work and vines, fruit and shade trees, green shutters and dark red roofs, Cox's property, called Rich Hill, made an agreeable contrast to the somber short pines which, at no great distance, seemed to cover the plain almost as thickly as wheat straws in the grain field.

Taking Jones aside, Cox related that on the previous night the assassin of President Lincoln had come to his house in company

with another person, guided by a negro, and had asked for assistance to cross the Potomac River; "and," said Cox to Jones, "you will have to get him across." Cox indicated where the fugitives were concealed, perhaps one mile distant, a few rods west of the present railroad track, and just south of Cox's station. Jones was to give a signal by whistling in a certain way as he approached the place, else he might be fired upon and killed. Nobody, it is believed, ever saw Booth and Herold after this time in Maryland, besides Cox's overseer, Franklin Roby, and Jones. Cox's family protest that the fugitives never entered the house at all; his adopted son, still living, says Booth did not come into the house. Herold, who was with Booth, related to his counsel, as the latter thinks, that after they left Mudd's house they never were in any house whatever in Maryland. The negro who was employed to guide Booth from Dr. Mudd's to Cox's testified that he saw them enter the house; but as the Government did not use him on the trial, it is probable that he related his belief rather than what he saw.

But there is no doubt of the fact that when Dr. Mudd found Booth on his hands on Saturday, with a broken ankle, and the soldiery already pouring into Bryantown, he and Booth and Herold became equally frightened, and in the early evening the two latter started by a road to the east for Cox's house, turning Bryantown and leaving it to the north, and arriving about or before midnight at Cox's. There the negro was sent back. Herold advanced to the porch and communicated with Cox, and Booth sat on his horse off toward the outer gate. The two men cursed Cox after they backed out to where the negro was,—he remaining at the outer gate,—and said that Cox was no gentleman and no host. These words were probably intended to mislead the negro when they sent him back to Dr. Mudd's. This negro was arrested, as was a colored woman in Cox's family, and, with the same remarkable fidelity I have mentioned, the woman confronted the negro man and swore that what he said was untrue.

Nevertheless, Booth and Herold were sent into the short pines, and there Jones found them. He says that as he was advancing into the pines he came upon a bay mare, with black legs, mane, and tail, and a white star on the forehead; she was saddled, and roving around in a little cleared place as if trying to nibble something to eat. Jones took the mare and tied her to a tree or stump. He then advanced and gave what he calls the countersign, or whistle, which he does not precisely remember now, though he thinks it was two whistles in a peculiar way, and a whistle after

an interval. The first person he saw was Herold, fully armed, and with a carbine in his hand, coming out to see who it was. Jones explained that he had been sent to see them, and was then taken to Booth, who was but a few rods farther along.

Booth was lying on the ground, wrapped up in blankets, with his foot supported and bandaged, and a crutch beside him. His rumpled dress looked respectable for that country, and Jones says it was of black cloth. His face was pale at all times, and never ceased to be so during the several days that Jones saw him. He was in great pain from his broken ankle, which had suffered a fracture of one of the two bones in the leg, down close to the foot. It would not have given him any very great pain but for the exertion of his escape, which irritated it by scraping the ends of the broken bone perhaps in the flesh; it was now highly irritated, and whichever way the man moved he expressed by a twitch or a groan the pain he felt. Jones says that this pain was more or less continuous, and was greatly aggravated by the peril of Booth's situation—unable to cross the river without assistance, and unable to walk any distance whatever. Jones believes that Booth did not rise from the ground at any time until he was finally put on Jones's horse to be taken to the water-side some days afterward.

Booth's first solicitude seemed to be to learn what mankind thought of the crime. That question he put almost immediately to Jones, and continued to ask what different classes of people thought about it. Jones told him that it was gratifying news to most of the men of Southern sympathies. He frankly says that he himself at first regarded it as good news; but somewhat later, when he saw the injurious consequences of the crime to the South, he changed his mind. Booth desired newspapers if they could be had, which would convey to him an idea of public feeling. Jones soon obtained newspapers for him, and continued to send them in; and Booth lay there, where the pines were so thick that one could not see more than thirty or forty feet into them, reading what the world had to say about his case. He seemed never tired of information on this one subject, and the only thing besides he was solicitous about was to get across the river into Virginia.

Jones says Booth admitted that he was the man who killed Lincoln, and expressed no regret for the act, knowing all the consequences it involved. He harped again and again upon the necessity of his crossing the river. He said if he could only get to Virginia he could have medical attendance.

Jones told him frankly that he would receive no medical attendance in Maryland. Said he: "The country is full of soldiers, and all that I can do for you is to get you off, if I can, for Cox's protection and my own, and for your own safety. That I will do for you, if there is any way in the world to do it."

When I received this account from Mr. Jones, I asked him question after question to see if I could extract any information as to what Booth inquired about while in that wilderness. I asked if he spoke of his mother, of where he was going when he reached Virginia, of whether he meant to act on the stage again; whether he blamed himself for jumping from the theater box; whether he expressed any apprehensions for Mrs. Surratt or his friends in Washington. To these and to many other questions Jones uniformly replied: "No, he did not speak about any of those things. He wanted food, and to cross the river, and to know what was said about the deed." Booth, he thinks, wore a slouched hat. At first meeting Booth in the pines, he proved himself to be the assassin by showing upon his wrist, in India ink, the initials J. W. B. He showed the same to Captain Jett in Virginia. Jones says Booth was a determined man, not boasting, but one who would have sold his life dear. He said he would not be taken alive.

Mr. Jones went up to Port Tobacco in a day or two to hear about the murder, and heard a detective there from Alexandria say: "I will give one hundred thousand dollars and guarantee it to the man who can tell where Booth is." When we consider that the end of the war had come, and all the Confederate hopes were blasted and every man's slaves set free, we may reflect upon the fidelity of this poor man, whose land was not his own, and with inevitable poverty before him perhaps for the rest of his days, when the next morning he was told that to him alone would be intrusted that man for whom the Government had offered a fortune, and was increasing the reward. Mr. Jones says it never occurred to him for one moment that it would be a good thing to have that money. On the contrary, his sympathies were enlisted for the pale-faced young man, so ardent to get to Virginia and have the comforts of a doctor.

Said he to Booth: "You must remain right here, however long, and wait till I can see some way to get you out; and I do not believe I can get you away from here until this hue and cry is somewhat over. Meantime I will see that you are fed." He then continued to visit them daily, generally about ten o'clock in the morning. He always went alone, taking with him such food

as the country had—ham, whisky, bread, fish, and coffee. Part of the way Jones had to go by the public road, but he generally worked into the pines as quickly as possible. His intercourse at each visit with the fugitives was short, because he was in great personal danger himself, was not inquisitive, and was wholly intent on keeping his faith with his old friend and the new ones. He says that Herold had nothing to say of the least importance, and was nothing but a pilot for Booth. Not improbably Cox sent his own overseer into the pines sometimes to see these men or to give them something, but he took no active part in their escape. The blankets they possessed came either from Cox's or from Dr. Mudd's.

Booth, as has been said, rode a small bay mare from the rear of Ford's Theater to Cox's pines. Herold rode a horse of another color. These horses were hired at different livery stables in Washington. Jones is not conversant with all the facts about the shooting of these horses, but the testimony of Cox before he died was nearly as follows: After Booth entered the pines he distinctly heard, the next day or the day following, a band of cavalry going along the road at no great distance, and the neighing of their horses. He said to Herold: "If we can hear those horses, they can certainly hear the neighing of ours, which are uneasy from want of food and stabling." When Jones on Sunday morning came through the woods and found one of the horses loose, he told Cox, as well as Booth, that the horses ought to be put out of the way. Cox had Herold advised to take the horses down into Zekiah Swamp, and shoot them both with his revolver, which he did.

The weather during those days and nights was of a foggy, misty character—not cold, but uncomfortable, although there was no rain. At regular intervals the farmer got on his horse and went through the pines the two or three miles to the spot where still lay the yearning man with the great crime behind him and the great wish to see Virginia. Booth had a sympathetic nature, and seldom failed to make a good impression; and that he made this impression on Jones will presently appear. No incident broke the monotony of these visits for days. Jones sent his faithful negro out with the boat to fish with gill-nets, so that it should not be broken up in the precautions used by the Federals to prevent Booth's escape. Jones was now reduced to one poor boat, which had cost him eighteen dollars in Baltimore. He had lost several boats in the war, costing him from eighty to one hundred and twenty-five dollars apiece. This little gray or lead-colored skiff was the only

means by which the fugitives could get across the river. Every evening the man returned it to the mouth of the little gut or marsh called Dent's Meadow, in front of the Huckleberry farm. This is not two miles north of Pope's Creek, and from that spot Booth and Herold finally escaped.

Monday, Tuesday, Wednesday and Thursday passed by, and more soldiers came in and began to ride hither and thither, and to examine the marshes; but they did not penetrate the pines at all, which at no time were visited. The houses were all examined, and old St. Thomas's brick buildings, of a venerable and imposing appearance, above Chapel Point, were ransacked. The story went abroad that there were vaults under the priests' house, leading down to the river, and finally the soldiers tore the farm and terraces all to pieces. Yet for six nights and days Booth and Herold kept in the woods, and on Friday Jones slipped over to a little settlement called Allen's Fresh, two or three miles from his farm, to see if he could hear anything. A large body of cavalry were in the little town, guided by a Marylander, and while Jones in his indifferent way was loitering about, he heard the officer say: "We have just got news that those fellows have been seen down in St. Mary's County." The cavalry were ordered to mount and set out. At that time it was along toward the gray of the night, and instantly Jones mounted his horse and rode from Allen's Fresh by the road and through the woods to where Booth and Herold were.

Said he, with decision: "Now, friends, this is your only chance. The night is pitch dark and my boat is close by. I will get you some supper at my house, and send you off if I can." With considerable difficulty, and with sighs and pain, Booth was lifted on to Jones's horse, and Herold was put at the bridle. "Now," whispered Jones, "as we cannot see twenty yards before us, I will go ahead. We must not speak. When I get to a point where everything is clear from me to you, I will whistle so," giving the whistle. In that way he went forward through the blackness, repeating the signal now and then; and although the wooded paths are generally tortuous and obstructed, nothing happened. For a short distance they were on the public road; they finally turned into the Huckleberry farm, and about fifty yards from the house the assassin and his pilot stopped under two pear-trees.

At this moment a very pathetic incident took place. Jones whispered to Booth: "Now I will go in and get something for you to eat, and you eat it here while I get something for myself." Booth, with a sudden longing, ex-

claimed: "Oh, can't I go in the house just a moment and get a little of your warm coffee?" Jones says that he felt the tears come to his eyes when he replied: "Oh, my friend, it would not be safe. This is your last chance to get away. I have negroes at the house; and if they see you, you are lost and so am I." But Jones says, as he went in, he felt his throat choked. To this day he remembers that wistful request of the assassin to be allowed to enter a warm habitation once more before embarking on the wide and unknown river.

The negro, Henry Woodland, was in the kitchen stolidly taking his meal, and neither looking nor asking any questions, though he must have suspected from the occurrences of a few days past that something was in the wind. "Henry," said Jones, "did you bring the boat back to Dent's meadow where I told you?" "Yes, master." "How many shad did you catch, Henry?" "I caught about seventy, master." "And you brought them all here to the house, Henry?" "Yes, master."

Jones then took his supper without haste, and rejoined the two men. It was about three-quarters of a mile to the water-side, and, although it was very dark, they kept on picking their way down through the ravine, where a little, almost dry stream ran off to the marshes. Not far from the water-side was a strong fence, which they were unable to take down.

Booth was now lifted from the horse by Herold and Jones, and they got under his arms, he with the crutch at hand, and so they nearly carried him to the water. The boat could be got by a little wading, and Jones brought it in. Booth took his place in the stern. He was heavily armed, and Jones says had not only his carbine, as had Herold, but revolvers and a knife. Herold took the oars, which had been left in the boat, and sat amidships. Jones then lighted a piece of candle which he had brought with him, and took a compass which Booth had brought out from Washington, and by the aid of the candle he showed Booth the true direction to steer. Said he: "Keep the course I lay down for you, and it will bring you right into Machodoc Creek. Row up the creek to the first house, where you will find Mrs. Quesenberry, and I think she will take care of you if you use my name."

They were together at the water-side an unknown time, from fifteen minutes to half an hour. At last Booth, with his voice full of emotion, said to Jones: "God bless you, my dear friend, for all you have done for me." The last words Jones thinks Booth said were: "Good-bye, old fellow!" There was a moment's sound of oars on the water, and the fugitives were gone.

For the danger and the labor of those six days Jones received from Booth seventeen dollars in greenbacks, or a little less than the cost of the boat which Jones had to surrender forever. Booth had about three hundred dollars in his possession, and he told Jones that he was poor, and intimated that he would give him a check or draft on some one, or on some bank. "No," said Jones; "I don't want your money. I want to get you away for your own safety and for ours."

It was not until months after this that Jones ascertained that the fugitives did not succeed in crossing the river that Friday night. They struck the flood tide in a few minutes, were inexperienced in navigating, and when they touched the shore sometime that night and discovered a house near by, to which Herold made his way, the latter saw something familiar about the place, he knowing all that country well. It was the residence of Colonel John J. Hughes, near Nanjemoy Stores, in Maryland, directly west of Pope's Creek, about eight or nine miles. The Potomac is here so wide, and has so many broad inlets, that in the darkness the Virginia shore and the Maryland shore seem the same. Herold went to the house and asked for food, and said that Booth was in the marsh near by, where they had pulled up the boat out of observation. The good man of the house was much disturbed, but gave Herold food, and it is supposed that after lying concealed that day they pushed off again in the evening, and this time successfully made the passage of the river, though they had to come back twelve to fourteen miles. The keeper of the house at Nanjemoy became frightened after they left, and rode into Port Tobacco and told his lawyer of the circumstance, who took him at once before a Federal officer.

Some time on Sunday morning, the ninth morning after the assassination, the fugitives got to Machodoc Creek, at Mrs. Quesenberry's, with whom they left the boat. It is not sure that they entered her house, but they went to the house of a man named Bryan on the next farm, and probably revealed themselves. Bryan next day took them to the summer-house of Dr. Richard Stewart, which is two or three miles back in the country. This Dr. Stewart was the richest man in King George County, Virginia, and had a very large brick house at Mathias Point on the river; but on account of the malaria and heat he went in summer to a large barn-like mansion back in the woodlands, a queer, strange house two stories high, with a broad passage. He was entertaining some friends just returned from the Confederate service, and was much annoyed to find

that on his place were the assassins of President Lincoln, after the war was all over. The men were not invited into the house, but were sent to an out-building of some kind, either the negro quarters or the barn; and Booth was so much chagrined at this welcome to Virginia that he took the diary which was found on his dead body and wrote a letter in lead pencil to Dr. Stewart, sorrowful rather than angry, saying that he would not take hospitality extended in that way without paying for it, and sending three dollars.

Booth procured a conveyance, or one was procured for him, from Dr. Stewart's to Port Conway: it was driven by a negro named Lucas. He probably spent Sunday in Bryan's house, and got to Dr. Stewart's house, it is said, on Monday, where he asked for breakfast, and the same day reached the Rappahannock River and went across with Captain Jett. This crossing was made on Monday, the twenty-fourth of April. That afternoon he was lodged at Garrett's farm three miles back. He spent the next day at this house and slept in the barn. Being informed that a large body of Federal cavalry had gone up the road this Tuesday, he became much distressed. On Wednesday morning, soon after midnight, the cavalry returned, guided by Captain Jett. The barn was set afire and Booth shot soon after three o'clock in the morning. He died a little after sunrise on Wednesday.

I may recapitulate Booth's diary during those days as Jones has indicated it. At ten o'clock Friday night, April 14th, Booth shot the President. A little after midnight he was at Surratt's tavern, where he received his carbine and whisky. (I forgot to say that, among the articles of comfort given to Booth by Jones when he went to the boat, was a bottle of whisky.) In gray dawn of Saturday morning Booth was at Dr. Mudd's, where he had his leg set, and a laboring white man there whittled him a crutch. On Saturday night, near midnight, he was at Cox's house, and some time between that and morning was lodged in the pines, where he remained Sunday, Monday, Tuesday, Wednesday, Thursday and Friday; and Friday night, between eight and nine o'clock, he started on the boat, spent Saturday in Nanjemoy Creek, and arrived some time Saturday night or before light on Sunday at Mrs. Quesenberry's. It is understood that on the Virginia side he was welcomed by two men named Harbin and Joseph Badden, the latter of whom is dead. The boat in which Booth crossed the river he gave Mrs. Quesenberry, who was arrested. The boat was put on a war vessel and probably carried to Washington.

A few days after Booth crossed the river and had been killed, suspicion turned upon both Jones and Cox. The negro who had taken the fugitives to Cox's gate gave information. Negroes near Jones's farm said he had recently concealed men, and showed the officers a sort of litter or camp about two hundred yards from his house. Here, in reality, quite a different fugitive had hidden some time before. Jones looked at it in his mournful way, and expressed the opinion that it was nothing but where a hog had been penned up. He was arrested and taken to Bryantown, and kept there eight days in the second story of the tavern where Booth had stopped, and in sight of the country Catholic church where Booth first met Dr. Mudd and others, six months before. Cox was there, but was in two or three days sent to Washington. The detectives from all the cities of the East sat in the street under Jones, and described how he was to be hanged. He remarks of Colonel

Wells: "He were a most bloodthirsty man, and tried to scare out of me just what I'm tellin' of you now." In eight days Jones was sent to the old Carroll prison, Washington. There he contrived to communicate with Cox, who was completely broken in spirit, and told him by no means to admit anything; and when Jones, in about a month, saw Swan, the negro witness, going past his window toward the Navy Yard bridge with a satchel, Jones said to Cox: "You have nothing to fear." The Government soon released these men, who indeed had taken no part in Mr. Lincoln's death, though they may have been accomplices after the fact. Jones was kept six and Cox seven weeks.

Mr. Jones is married again, and now has ten children. He has filled some places under the Maryland and Baltimore political governments, and now keeps a coal, wood, and feed yard in North Baltimore.

George Alfred Townsend.

EVENING.

I.

It is that pale, delaying hour
When Nature closes like a flower,
And in the spirit hallowed lies
The silence of the earth and skies.

The world has thoughts she will not own
When shades and dreams with night have flown;
Bright overhead, the early star
Makes golden guesses what they are.

II.

A light lies here, a shadow there,
With little winds at play between;
As though the elves were delving where
The sunbeams vanished in the green.

The softest clouds are flocking white
Among faint stars with centers gold,—
Slowly from daisied fields of night,
Heaven's shepherd fills his airy fold.

John Vance Cheney.

NOTES ON THE EXILE OF DANTE.*

FROM HIS SENTENCE OF BANISHMENT WHILE IN ROME, 1302, TO HIS DEATH IN RAVENNA, 1321.

II.

CONVENT OF SANTA CROCE DI CORVO—1309.

TO VISIT this ruined convent, which is situated on the promontory that bounds the Gulf of Spezia on the east, the best way is to get a carriage at Sarzana and drive to a point on the river Magra where a boat can be taken to its mouth. I had a little basket-carriage, rough and strong, and a sturdy pony which suited the tangled and marshy road. The white and not carefully groomed pony was called Nina, and she was perpetually appealed to by her driver, with every modulation of which the Italian voice is capable. He never struck Nina, but he spoke to her often, putting into her name encouragement, reproof, coaxing, comforting, stimulating, warning,—all expressed in the one word Nina. It really appeared as if Nina paid very little attention to the voice of her mentor, so incessantly heard, but jogged on at the pace she liked best. The drive must have been three or four miles from Sarzana to the Magra, and then, following the wooded bank half a mile farther, we came upon a boat which appeared to be waiting for us, for up started from the bushes two boatmen, and much noisy talk ensued. Meantime I settled myself in the boat, and was pleased to find the driver was to go with us, leaving a boy in charge of the carriage. Two miles of rowing brought us to the place where the river opens into the sea, and we soon were on the little path leading up, under ilex trees, to the convent ter-

race. Of the building only a piece of the cloister wall remains. The terrace is a vineyard with fig-trees, children playing, and clothes hung to dry; for, built into the ruin is an apartment where the guardians of this interesting place have shelter. From here came the letter known to Dantean scholars as the Ilarian letter. In 1759 there was discovered and published a part of a letter from Fra Ilario, who was prior of this convent in the time of Dante. It was addressed to the friend of the poet, Uguccone da Faggiuola. It describes the visit of Dante to this place in 1308, and relates that he had consigned the completed manuscript of the "*Inferno*" to the prior, with direction that he should read it, and, after making such notes as should occur to him, that he should send it to Uguccone. The translation of this letter is here given as it is found in the *Illustrations to Longfellow's translation of the "Divina Commedia."* It is taken from Arrivabene, "*Comento Storico*," p. 379:

"Hither he came, passing through the diocese of Luni, moved either by the religion of the place, or by some other feeling, and seeing him, as yet unknown to me and to all my brethren, I questioned him of his wishings and his seekings there. He moved not, but stood silently contemplating the columns and arches of the cloister, and again I asked him what he wished and whom he sought. Then, slowly turning his head, and looking at the friars and me, he answered: '*Peace!*' Thence, kindling more and more the wish to know him and who he might be, I led him aside somewhat, and having spoken a few words with him I knew him; for although I had never seen him till

* THESE notes with pen and pencil were made to commemorate a pilgrimage of the author to the cities, convents, and castles that gave Dante refuge in exile, and to some other places known to have been visited by the poet, or that are mentioned in his verses. The order of his wanderings has been kept as nearly as possible, but the notes are necessarily incomplete.—S. F. C.

The illustrations are nearly all from Miss Clarke's drawings, which have been redrawn for engraving by Mr. Harry Fenn.—Ed.

that hour, his fame had long since reached me; and when he saw that I hung upon his countenance, and listened to him with strange affection, he drew from his bosom a book, did gently open it, and offered it to me, saying: 'Sir Friar, here is a portion of my work, which peradventure thou hast not seen. This remem-

This letter opens a glimpse into the life of Dante, delightfully picturesque and dramatic. We have here the scene almost as it existed more than five hundred and fifty years ago: the little terrace, the broken wall of the

CLOISTER WALL, CONVENT OF ST. CROCE DI CORVO.

it with great love. But I, beholding there the vulgar tongue, and showing by the fashion of my countenance my wonderment thereat, he asked the reason of the same. I answered that I marveled that he should sing in that language; for it seemed a difficult thing, nay, incredible that those most high conceptions could be expressed in common language; nor did it seem to me right that such and so worthy a science should be clothed in such plebeian garments. 'You think aright,' he said, 'and I myself have thought so; and when at first the seeds of these matters, perhaps inspired by Heaven, began to bud, I chose that language which was most worthy of them; and not alone chose it, but began forthwith to poetize therein after this wise:

"Ultime regna canam fluido contermina mundo,
Spiritus quæ lata patent; quæ præmia solvunt
Pro meritis cuicumque suis."

But when I recalled the condition of the present age, and saw the songs of the illustrious poets esteemed almost as naught, and knew that the generous men for whom in better days these things were written had abandoned, ah, me! the liberal arts into vulgar hands, I threw aside the delicate lyre which had armed my flank, and attuned another more befitting the ear of moderns; for the food that is hard, we hold in vain to the mouths of sucklings.' Having said this, he added with emotion that, if the occasion served, I should make some brief annotations upon the work, and thus appareled should forward it to you. Which task, in truth, although I may not have extracted all the marrow of his words, I have, nevertheless, performed with fidelity, and the work required of me I frankly send you, as was enjoined upon me by that most friendly man; in which work, if it appear that any ambiguity still remains, you must impute it to my insufficiency, for there is no doubt that the text is perfect in all points."

brance I leave with thee. Forget me not.' And when he had given me the book, I pressed it gratefully to my bosom, and in his presence fixed my eyes upon 'cloister, with its lancet windows, and the blue Mediterranean shining all around. We can easily fancy the poet coming up the winding hill-path and the frate watching him. The little ruined convent and the fragment of a letter are both infinitely precious, each sustaining the evidence of the other. Many Dantean scholars have doubted the authenticity of this letter, but others believe in it, and give perhaps as good reasons for doing so as those which are brought against it.

CORNICE ROAD—1309.

"Twixt Lerici and Turbia the most desert,
The most secluded pathway is a stair,"
Easy and open when compared to this."
Longfellow Tr. "Purg.," cant. iii. ver. 50.

It appears not unlikely that Dante passed along the Cornice road on his way to Paris. This was at that time the most practicable road, and when he speaks of the way between Lerici and Turbia as being rough and lonely, he speaks as one who knows the whole road between the two places. The "Purgatory" may have been partly written in Paris, and certain beautiful passages in the beginning of that part of the poem show that his mind was full of the scenery and images of the sea:

"The dawn had chased the matin hour of prime
Which fled before it, so that from afar
I spied the trembling of the ocean stream."
Cary Tr.

And the exquisitely touched sketch of a boat, a few lines further:

—"and he came to shore
With a small vessel very swift and light,
So that the water swallowed naught thereof."
Longfellow Tr.

ON THE CORNICE ROAD.

Then when an angel comes, it is like the sun's light shining on the water and refracted into one's eyes. Finding himself dazzled, he raises his hands to screen his eyes:

Whereat toward the summit of my brow
I raised my hands, and made myself the visor
Which the excessive glare diminishes;
As when, from off the water or a mirror,
The sunbeam leaps unto the opposite side,
Ascending upward in the self-same measure
That it descends, and deviates as far
From falling of a stone in line direct
(As demonstrate experiment and art).

Longfellow Tr.

Here is a morning scene:

"When I, who something had of Adam in me,
Vanquished by sleep, upon the grass reclined
There where all five* of us already sat,
Just at the hour when her sad lay begins
The little swallow, near unto the morning,
Perchance in memory of her former woes."

Longfellow Tr.

And what a morning picture in few words is this:

"I rose; and full already of high day
Were all the circles of the sacred mountain,
And with the new sun at our back we went!"

Longfellow Tr.

*"Virgil, Sordello, Dante, Nino, and Conrad. And here Dante falls upon the grass, and sleeps till dawn. There is a long pause of rest and sleep between this line and the next, which makes the whole passage doubly beautiful. The narrative recommences like the twitter of early birds just beginning to stir in the woods."
From Longfellow, Translator's Notes.

THROUGH
FRANCE TO
PARIS—1309.

It may be that there are many traces of this journey through France. A friend sends me an extract from Frédéric Mistral about

the grottoes near Arles, called L'Enfer, which place is supposed to have suggested to Dante the wild scenery described in the "Inferno."

It may easily have been that Dante looked on these weird rocks, and they would natu-

RUE DU FOUARRE, PARIS.

rally fascinate his somber imagination; but, as the "Inferno" was completed before he made the journey through France, it could not be that he then and there conceived and realized the idea and plan of the "Inferno." Indeed, there is scarcely a wild, rocky gorge, or chaos of rocks, that is not called in its neighborhood by some name that fixes its proprie-

torship on his Satanic Majesty. The devil's footstep, the devil's punch-bowl, his garden, his throne, his bridge, his castle are a few of these tributes to his power. Many such places have the credit of having suggested to Dante the form and character of his "Inferno." But these conjectures are idle. The poet's mind is a laboratory where all material is melted in

CAPRAIA AND GORGONA, FROM THE LEANING TOWER OF PISA.

the crucible of imagination, in which it crystallizes into new and more imposing shapes, and is charged with a new vitality from having passed through his mind. It should be said that Dante does, however, mention the tombs at Arles, "Inf.," ix., 112.

PARIS—1309.

"It is the light eternal of Sigieri,
Who, reading lectures in the street of straw,
Did syllogize invidious verities."*
Longfellow Tr. "Par.," cant. x. ver. 136.

It was much to be feared that the little old street would have been Haussmanized or Prussianized out of existence before one could reach Paris and make a sketch of it, but I found it quite uninjured. One can stand at one end and see Notre Dame and its

* Or, as we moderns say, declared unpopular truths.

"Vico degli Strami" where they were held. This was a straw-market in that time, and was called Rue du Fouarre, or Straw street. It is said that the students of the Sorbonne used to buy here bundles of straw, on which they sat for lack of benches. This street has also been called the cradle of the university. Its houses are old, but probably nothing is left of the year 1309. The tall old houses are occupied in their basements by the small shops that fill up the narrow streets and passages of Paris. I sat in the little carriage, looking through the dark tunnel of the street to Notre Dame in the light beyond, and made my sketch undisturbed. Dante, so far away from Italy, and coming here like a modern student for the advantage of the lectures, seemed even nearer than in Italy, where he stands like an ever-repeated figure woven into the ideal memorial tapestry that hangs about that land. Boccaccio seems to have been of opinion that Dante went also to England.

PISA—1317.

"Let the Capraia and Gorgona move,
And make a hedge across the mouth of Arno,
That every person in thee it may drown."
Longfellow Tr. "Inferno," xxxiii. v. 82.

WISHING to get a sketch of the two islands from the top of the leaning tower of Pisa, from which they may easily be seen in fair

THE RAMPARTS OF LUCCA.

weather, and from which point they appear nearly close together, opposite "*the mouth of Arno*," I went from Florence for that special purpose. On that day, however, there was no admittance to the tower. As this exclusion occurs only twice in a year, on the occasion of certain church festas, I was much annoyed. Again I went by the road that passes Pisa on my way to Rome, and on this second occasion an envious mist overspread the landscape and the sea, and I saw nothing. Only on the third attempt, six months later, was I successful; and even on that day there was a little mistiness in the usually clear atmosphere. But I succeeded in getting

THE railway from Leghorn to Rome passes Talamone, the ancient Telamon, where Marius landed on his return from Africa. It is on the coast and two miles from the station, where are no houses. The first time I passed the spot, and heard the guard call out Talamone, what a picture lay before me! It was just after sunset, and, breaking the shoreline, there were the old towers and walls of Telamon. The burning sky behind darkened the towers till they stood against it in beautiful relief. The train stopped two minutes, and if I had been prepared I might have got an outline. The next year, returning to Rome by the same road, and at nearly the

TALAMONE.

the outline that I wanted; yet he must have seen the islands from some other tower, since from the leaning tower they do not appear near enough to each other to suggest the fancy of bringing them quite together, closing up the river and driving the waters back to destroy the city. This burst of wrath was excited by the cruel treatment of Ugolino and his innocent grandchildren. At that time Pisa bristled with towers, now mostly removed.

TALAMONE.

"Them wilt thou see among that people vain,
Who hope in Talamone, and will lose there
More hope than in discovering the Diana;
But there still more the admirals will lose."

"Purg.," cant. xiii. ver. 152.

same date, I took the same train, hoping to reach Talamone at sunset, and having pencil and sketch-book ready to secure my prize. All happened as I had arranged. The train stopped as before, just where I caught the old town against the sunset sky, and, before it moved on, the outline was secured, and the gradations of light noted. The station was but a grassy track, so that I could not have stopped longer there, yet I had obtained all I wanted.

LUCCA—1317.

FROM Paris Dante returned to Italy, it is believed, by way of Milan. He made another visit in the Casentino, and then it is probable that he remained a long time with Can

Grande at Verona. He is thought to have been at Lucca between 1314 and 1317.

"This one appeared to me as lord and master,
Hunting the wolf and whelps upon the mountain
For which the Pisans Lucca cannot see."
Longfellow Tr. "Inf.," xxxiii. ver. 28.

Ampère says:

"To go from Pisa to Lucca you must pass the foot of Mount St. Julien, that mountain which prevents the two cities from seeing each other.

'Perchè il Pisan veder Lucca non ponno,'

as Dante said with his accustomed geographical precision. Lucca is placed in the center of a delicious country. There is nothing fresher, nothing more gracious than the environs of Lucca. It is a lake of verdure incased in admirable mountains. The city rises in the midst. The ancient ramparts have been changed into a promenade that completely surrounds it, and commands the elegant landscape.

"Lucca was not so gracious in the time of Dante. When his protector and friend Uguccone della Faggiola, to whom he wished to dedicate the 'Inferno,' after having oppressed Lucca, was driven from it by Castracani, that Thrasybulus of the middle ages of whom Macchiavelli was the Plutarch, its fields were not so well cultivated as they are to-day, the vine did not suspend its verdant draperies along both sides of a road which resembles the avenue of a villa. This now tranquil promenade was a high wall crowned with towers and flanked with bastions. However, at this epoch the industry of Lucca was, I believe, more flourishing than in our century. The industrial activity of this so stormy middle age is a remarkable fact. The trades were pursued in the midst of assaults and civil wars. During the residence of Dante there were three thousand weavers at Lucca, and about the same epoch the wool merchants of Florence raised at their own expense the cathedral that Michel Angelo emulated.

"It was probably here that Dante wrote his noble answer to the offer that was made him in 1317 of returning to his country, which he *saw in his dreams*, if he would submit to a sort of *amende honorable* that custom sanctioned, but to which the lofty soul of the poet could not bend."

Ampère, "Voyage Dantesque."

The following is the letter refusing amnesty on the terms proposed:

"In the latter part of the year 1316 Florence offered conditions of pardon and restoration to the exiles and banished men. The conditions were these: To pay a certain sum of money, and then, humbled and abased, with paper miters on their heads (a sign of infamy) and holding a wax torch, they should walk in procession behind the car of the mint to the Church of San Giovanni, and here make the offering to the saint in expiation of their crimes. It was an ancient custom of Florence to pardon certain malefactors, offering them to the saint, their patron; but to subject the political exiles to conditions, which put them on a level with robbers and homicides, was making them pay too dearly for a pardon. Notwithstanding this, many of Dante's companions in exile, such as the Tosenghi, the Rinucci, the Manelli, submitted to these humiliating conditions, and at the Feast of St. John (June 24th, 1317) received their

enfranchisement. But not so those who prized their own self-respect, that is to say, Dante; and to a friar, his relative, who sent him notice of the decree, begging him at the same time to return, he nobly answered as follows:

"From your letter, received by me with reverence and affectionate thanks, I have with careful consideration and a grateful spirit learned how much you desire my return to my country; for this I am so much the more obliged to you that it rarely happens to exiles to find friends.

"And if my answer cannot be such as the pusillanimity of some might wish, I beg of you affectionately that, before condemning, you will maturely consider it. Behold, then, that which through the letters of your and my nephew, besides those of other friends, is made known to me; namely, the decree lately issued in Florence concerning the pardon offered to the banished citizens: that if I will pay a certain quantity of money and suffer public shame, I may be absolved and presently return. In which, O father, to speak plainly, there are two ridiculous and ill-considered things. I mean ill-considered by those who so expressed themselves, since your letter, more discreetly and wisely conceived, contained nothing of the sort.

"Is this, then, the glorious mode by which Dante Alighieri is recalled to his country after the anguish of an exile of nearly three lusters? Does his innocence, well known to all, merit this? Is this the fruit of toil and sweat and fatigue in the hardest studies? Far from a man familiar with philosophy be this baseness of a heart of mud that he, like a certain Ciolo and other men of ill fame, should suffer himself, like a criminal in chains, to be offered for ransom!

"Far be it from the man known as a proclaimer of justice, that he, the injured one, should pay tribute to his injurers, as if they were his benefactors!

"Not this the way to return to my country, O father; but if another, through you or through others, can be found, whereby the fame and honor of Dante be not tarnished, I will promptly set out upon it. But if through an honorable road I cannot enter Florence, then I will never enter there. And why? Can I not from any corner of the earth behold the sun and stars? Can I not under any region of the sky speculate on sweetest truth, without first showing myself as a man deprived of glory and ignominious before the people and the city of Florence? Nor will bread, I trust, fail me.

Fratellucci's Life of Dante, cap. 7.

The date of Dante's visit to Lucca being known, Pisa and Talamone may be placed next in order. When at Lucca, being near the coast, he probably took that time to visit those old cities.

GUBBIO — 1318.

FROM Perugia is but five hours to Gubbio, and with a party of friends I made the excursion, engaging a carriage for a week. We began immediately to ascend and wind among the mountains where Gubbio is hidden. At Fratta, where we stopped to rest the horses and dine, we found a cattle fair, and such a show of the beautiful Umbrian oxen was well worth taking the journey to see. These cattle are white, short-horned, compact, and symmetrical. They are like the oxen in the

Greek sculptures, and a thousand times more beautiful than the long-horned, exaggerated creatures of the Roman Campagna. The younger ones, hardly as yet full grown, show their pink skin under the white hair as they move. They are beautifully proportioned, they move gracefully, and their large and liquid eyes recall and justify the Greek epithet, "ox-eyed Juno." It was a great pleasure to see so many of them together, and of

Higher on the hill we come to a terrace, where stands the wonderful town-hall on one side, on the other the library. This Palazzo Pubblico is a most picturesque building, but seems now to be unused. The grand hall of entrance is dusty and desolate, and the streams of sunshine that found their way through the side windows made a ghostly glimmer on the clouds of dust that our footsteps raised. We went up the grand stair-

THE TOWN-HALL OF GUBBIO.

the large number that filled the great square every one was white.

By the rugged mountain road we reached Gubbio some time after dark. We had wasted time in the morning, as our driver was late; we had wasted time at Fratta among the white oxen; and we had stopped along the road to sketch, for the mountain views and blue distances were enticing, and we arrived late. The town, like so many others, hangs on the side of a steep hill; but we did not climb it to-night, for our hotel was found in the large Piazza di San Francesco, near the gate. There is a desolation and slovenliness about these old Italian cities rather depressing to the traveler, but with a party of gay friends one soon laughs off the feeling. In the morning we began at once to climb the steep streets and seek for traces of Dante's residence. A street bears his name, and on a house is a tablet with this inscription:

HIC MANSIT
DANTES ALEGHIERIUS POETA,
Et carmina scripsit
Federicus Falcutius
Virtuti et Poster. P.

case, as invited, and looked over the city from a Gothic loggia. There is something everywhere in this old city, in its silent streets, its few inhabitants, and those few looking like strayed specters of the past, that is inexpressibly desolate. It has more remains of Etruscan walls than even Perugia. It seems like a corpse of the old time, just stirring, but neither alive nor yet quite dead.

We crossed the square and knocked at the door of the library, which was opened for us. This library is of some importance, especially as containing a piece asserted to be of Dante's handwriting. This is a sonnet addressed to his friend Bosone, the lord of Gubbio. This treasure is thoroughly believed in by those who guard it, the librarian and his assistant. It is framed and under glass. The writing is quite legible, and the sonnet is usually found in the collections of Dante's minor poems. Scholars do not believe in it, nor do they believe that any autograph of the poet exists. Ampère, in his "Voyage Dantesque," scoffs at its pretensions, as it is headed in this way:

DANTI ALIGHIERI A BOSONE D'AGOBIO.

THE CASTLE OF COLMOLLARO.

This critic says: "It may be supposed that Dante knew how to write his own name." Perhaps he did, and perhaps we do not. This does not seem a sufficient reason against the authenticity of the document. We know that Shakspeare wrote his name in three different ways in his own will. Fraticelli gives authorities for twenty-two different ways of writing the name of Dante, one of which is *Danti Alegerii*. All these different spellings are derived from old documents referring to the poet. The sonnet came into possession of the library from the family of Bosone d'Agobbio, to whom it was addressed. With the exception of one or two signatures, this sonnet is the only autograph known remaining of the man who wrote so much. Asking the librarian where the Castle of Colmollaro, mentioned as one of the refuges of Dante, might be found, to my joy he told me it was the castle of this very Bosone, and only seven miles away. The next day we visited Colmollaro. After a drive of four miles we reached a farm-house, and here the carriage road ended, and we took an ox-cart to go through the woods to the castle. This was not unwellcome. We liked the cart, which was painted with Etruscan figures, and we liked the beautiful white oxen, their heads decorated with scarlet tassels, which were to draw us. The forest was like the beautiful oak openings of

Wisconsin, the trees with plenty of space for air and sunshine to play among them. It was like America and like Greece. After three miles of this Arcadian progress, we came to the edge of a ravine, into which the road sank and rose again, to reach the castle. It is much ruined, and is used as a farm-house. The strong ivy-clad tower still stands; the court is entire; hay-ricks are planted about the castle, and pigs and chickens dispute the way. The farm wife was civil, and took us up the broken stairs to see the old rooms. It is all confused and infirm, but it is a veritable Dantean castle, and holds by its traditions. Beyond this ridge flows the river Linci, and that and the wooded hills both appear in the sonnet. It seems that the author had been engaged in teaching the son of Bosone Greek and French, and in the verses predicts that his pupil will become distinguished.

DANTE TO BOSONE D'AGOBPIO.

TRANSLATION, BY CHARLES LYELL, OF SONNET IN THE LIBRARY OF GUBBIO.

O thou who tread'st the cool and shady hill
Skirting the river which so softly glides,
That gentle Linceus 'tis by natives called,
In its Italian, not its German name,

Contented sit thee down at morn and eve,
 For thy beloved child already bears
 The fruit desired, and his march hath been
 Rapid in Grecian and in Gallic lore.

Genius, alas! no longer holds her throne
 In that Hespera, now the abode of woe,
 Whose gardens once such noble promise gave.

None fairer than thy Raphael; then rejoice,
 For thou shalt see him float amid the learned,
 Admired as a galliot on the wave.

AVELLANA — 1318.

FINDING that the convent of Avellana, where Dante passed several months, and within whose shelter he is supposed to have written much of the latter portion of his great work, could be conveniently visited from Gubbio, I persuaded one of my friends to accompany me on this rather difficult excursion. The carriage conveyed us early in the morning to a certain village, where we were to take asses and guides to help us to penetrate still deeper into the passes of the Apennines. This village had points of interest which we could not stop to enjoy, for the five hours' ride before us must be performed before sunset in the shortening September day; we must allow a little time for resting the asses and for possible delays, and our guides were impatient and spoke much of the accidents that might befall us *on such a road*. This was alarming, but our hearts were firmly fixed on the adventure; and we sent back the carriage with messages to our friends, and gave orders that it should meet us the next day in the afternoon at the same place, and then plunged into the wilderness. On these excursions much trust is required. The guides might be brigands, or the allies of brigands, for aught we knew; but we hoped they were honest men, seeking only the price of the two days' work. Soon the wild beauty of the road occupied our attention, and we put away our doubts and fears. We passed through two or three mountain villages, and saw beautiful women and still more beautiful children, who came out to look at the travelers. One boy, holding up a huge bunch of grapes, I shall never forget—he was of such superb beauty, a dark infant Bacchus. After an hour we came upon the path which leads along the edge of a deep ravine all the rest of the way. Charcoal-burners were at work far below us; and if we had fallen, we should have rolled into their fires, for the descent was perpendicular. We met vast flocks of pretty white goats, which were scrambling along the rocks below; and inquiring of our guides where such multitudes of *capretti* could be found, we were answered that they were all going to Rome. About half way we

found it convenient to dismount and walk awhile, and then had our lunch on the grass, making a party with our guides, and found much refreshment in a few minutes' rest. The guides would not allow us much time, since it was necessary to reach the convent before dark, the last part of the road being *stupendo*. We remounted unwillingly, and about half an hour before sunset came to the end of the long ravine, and reached a plateau, from which we saw the convent, superbly seated among the mountains, whose lower slopes, hitherto bare, were suddenly clothed with large trees, oaks and chestnuts. There was just time for a very hasty sketch from this point. We had now to descend a zigzag path through the woods to the bottom of another ravine, where a small stream was tumbling noisily along; and then to cross it and climb the opposite steep, where, on a mountain terrace, stood the immense pile of conventual buildings. As we mounted and came toward the level of the terrace, we saw something white moving among the bushes. "It is Fra Ubaldo trying to catch a chicken for your supper," cried the guide with much interest. The white-robed figure came forth, but without the chicken, and went toward the arched entrance to receive us. He was quite alone in the vast convent, which was disestablished, and had but two monks left to take care of the buildings. One of these had gone away on some business, and Fra Ubaldo was left to do the best he could for us, without assistance. The sun had now set, and he took us immediately to see the cell once occupied by Dante. I looked with deep interest on this little stone room where Dante lived seven months, and in which it is believed that he wrote much of his poem. From the little window are seen only mountain tops, now darkening in the twilight. Unfortunately the room, vaulted in stone, like all the rooms of this well-built convent, has been daubed with coarse fresco decorations, making it look like a fifth-rate *caffè*. Fra Ubaldo simply said that this had been done because so many people came to see it! I made a sketch from the window through which the poet must so often have looked, and near which he must have sat to write. We saw the library, but the books had all been removed, and it had been modernized with new shelves. They have here a marble bust of Dante, and a tablet recording his visit. As it was now nearly dark, Fra Ubaldo invited us into the refectory to partake of soup and pigeons. These birds had not, like the chickens, been able to avoid their fate. We ate from the long and broad carved oaken tables, sitting on the heavy oaken benches, and

CONVENT OF AVELLANA

wondered to find ourselves here. Then the good friar took the lamp, and proposed to show us to our bedroom. Passing through corridors heaped with grain, spread to dry, he showed us to a tiny cell which looked very clean and comfortable; and bidding us knock on the wall if we should want anything, he vanished. The strangeness of our situation in that vast, lonely convent, and the memories and almost the presence of Dante, made sleep nearly impossible. At day-break, Fra Ubaldo knocked and told us we would find a cup of coffee in the refectory. We hastily dressed, and already felt much invigorated by the keen and sweet mountain air. This convent stands on very high ground, and from the neighboring peak of Monte Catria you may discern the sea on both sides of Italy. I desired to see the outside of Dante's window, and went by a back door to that end of the convent just on the verge of the ravine. I had difficulty in finding a spot far enough from the wall to make a tiny sketch, so closely did the ravine crowd the convent; but at last found a projection that supported me. We now bade good-bye to our kind host, and had some difficulty in

persuading him to accept a trifle "for the use of the convent." This man was very kindly and very modest. He could not answer our many questions about the convent, even did not know its age, and lamented that he was not *capace* for those things, and that the other brother was not at home, who might have satisfied us. The morning was brilliant, the air so sweet and pure that we wished only to stay longer and enjoy it. The situation of this convent is magnificent, and sheltered on the east, north, and west by mountains; it is only open on the south. It was a delight, this early ride, climbing and scrambling through the forest; and when we had passed down to the bed of the stream, and climbed the opposite bank, and wound through the forest pathways till we came to the place where we must lose sight of this wonderful old building, we could hardly persuade ourselves to leave it. Some part of the building is very old; all the rooms are of stone and vaulted; no plaster or other inferior material is seen. There is no carriage-road leading to it. There are but three paths by which you can reach Avellana, and one of these, the best, is a rough cart-road. I give the passage in the "Paradiso" where Dante speaks of this retreat:

"Betwixt two shores of Italy rise cliffs,
And not far distant from thy native place,
So high the thunders far below them sound,
And form a ridge that Catria is called,
'Neath which is consecrate a hermitage,
Wont to be dedicate to worship only."

Longfellow Tr. "Par.," cant. xxi. 106-111.

DUINO CASTLE—1319.

It has been believed by some that in this old castle, on the Adriatic Sea, Dante was the guest of Ugone, Conte di Duino. This place is not far from the Venice and Trieste Railway, and Monfalcone is the station where one must descend to reach it. I came to it from Görz the day after leaving Tolmino. As it rained when I left Görz early in the morning, I put my luggage in for Trieste, and gave up my intention of visiting Duino that day. But, being arrived at Monfalcone, I found the sun shining, and again I changed my plans and descended. I found at the station one carriage, old and dusty, a wretched horse, and a ragamuffin driver. This man said that Duino Castle was eight miles away, and that he could bring me there in half an hour. We started and dragged over a dreary country, very ridgy and stony, and without any vegetation. Had it been more level, the sea would have been visible, for it was all around us; but the rough face of the country impeded the view everywhere. The driver

vexed me by perpetually teasing his wretched horse with the whip; I assured him I was in no haste, but he only laughed stupidly, as if he thought I must be joking. Finding he gave no heed to what I said, I remarked:

side of which was a wall, pierced with arched openings, with vines and pots of flowers decorating them, and showing the sea very near. Surprised, I said to the driver, "But this castle is inhabited! Who lives here?"

WINDOW OF THE CELL OCCUPIED BY DANTE IN THE CONVENT OF AVELLANA.

"Take care, or some fine morning you will wake and find yourself a horse! How would you like that? Even the Madonna could not help you then." He looked rather scared, laughed uneasily, used the whip less frequently, and now and then he glanced furtively at me, as if to see if I looked like a sorceress, of which I fear he found no signs. After four or five miles we came to a rather poor-looking village, beyond which was a large and high wall without windows, over which peeped a tower. This, the driver said, was Duino Castle, and asked, "did I want to go up to it?" Of course I did, both to see the ruin, and to find a good spot for sketching it. Now the guide-book says there is Duino Castle by the sea, and near it a modern *château*. We had already passed a smart-looking villa, which I supposed was the *château* referred to, and drew up to the high wall I have spoken of. As we turned the end of the wall we came into an avenue, one

"The Princess H." Then I stopped the carriage and walked into the court of the castle, where I found flower-beds, vines, and sculpture, and an old Roman tower rising out of a bed of ivy. I looked for a servant, and one presently appeared who would not take my message, but went for another, who also declined to receive it and called a third, the lady's maid. She took my message to her mistress, asking permission for me to make a drawing of the old tower, and adding that it was because Dante had been there that I wished to do it. The woman returned immediately with a cordial answer. The Princess begged me to draw what I pleased, and said a lady who spoke English would come down immediately. Just as I had fixed my seat for making a sketch of the tower, Madame de W., the English governess, accompanied by her pupil, the young Princess, came to me. They were full of kindness and interest, and presently the lady of the

castle herself appeared. She was very courteous, and thought it a charming work in which I was engaged, and inquired in perfectly good English how I came to think of anything so delightful. I explained that my interest in Dante, my interest in Italy, and my love of drawing had made it quite natural for me to undertake this enterprise, and that I found the quest more and more interesting. After a little conversation, she reminded me that there was no train to Trieste till evening, and invited me very cordially to dine and pass the day. I then remembered, with dismay, my dusty traveling dress, which I had thought quite suitable to meet the owls and bats of a ruined castle, and that I had no means to make a decent toilet for the dinner-table. But the lady would not admit my excuses, but would have me as I was, saying that she lived without ceremony, dining at one o'clock, and that she wished to show me her castle, Dante's balcony, Palladio's staircase, the picture gallery, and Paul Veronese's dome, and kindly adding, "I am sure you will enjoy this more than sitting at the station all day. You must remain." And I was easily conquered by such sweet and cordial kindness. The governess and her charge had returned to

Indians, and whether they were not very beautiful and very good. I could only say that they were sometimes so considered, remembering our own young enthusiasms. I ought to have had my friend H. H. by my side to describe their virtues and their wrongs; she would have found a willing listener. I was then asked to name a book that would tell all about these Indians. I could only think of Catlin's work on this subject; but, of course, it could not be procured at Duino. But there was a book that I was sure might be found there, and mentioned Longfellow's "Hiawatha," though fearing it might be somewhat too mythical food to offer to a young mind hungry for facts. The young lady declared that she would read it before to-morrow. "And why such haste? Why before to-morrow?" "Oh, because my brothers are coming home to-morrow, and I want to tell them all about the Indians." My young lady was a charming enthusiast of sixteen, as fair and fresh as a wild rose, and full of life, impatience, and gayety.

After dinner I was shown the castle. The young lady led me through the darkened library, and pushed open the shutters of a window which disclosed a wide stone balcony,

DOUBLE CAVE AT TOLMINO.

their studies, and when my sketch was finished the Princess came again, and herself walked with me through the castle, explaining its points of interest, and left me at the room where I was to make myself comfortable. Presently came Madame de W., who assisted me to prepare for dinner. We were here joined by the French governess and went together to the dining-room. The young Princess placed herself next to me, and asked many questions about the forests that she imagined still surrounded New York, about the poet Longfellow, and about the American

still called Dante's. From it is seen a most enchanting sea view. Something white glitters in the blue distance; that is Trieste. Nearer, a point is shown as Miramar. A line of cliffs, beginning near the castle, marks the shore till it is lost in the airy line of distance. The sea had that wonderful glitter, like blue diamonds, that it often has in hot and breezy weather; and if Dante saw it softened by a silvery mist, as it was to-day, it must have chased away even his gloom. Then came the interior of the castle, Palladio's circular staircase, and a fresco by Paul Veronese in

the dome above it. After this the picture gallery, where were many good Venetian pictures, and among them a very precious portrait by Vandyke. This gallery is very rich in good pictures for a private collection. I was then shown the state apartments and the chapel, and, lastly, the boudoir of the Princess, with all her favorite souvenirs, and a loggia filled with flowers and overlooking the beautiful Adriatic. There is a ruin on the shore, but it is of a much older castle than this one, and it must have been a hopeless ruin even in the time of Dante. This princess is the last of that Della Torre family to which Dante's hosts belonged, and I think the old Roman tower in the court-yard must have given the name to this family; but this is my own conjecture.

After this we came into the castle court and had coffee under the arcade, and one more pleasant hour was passed before leaving Duino; and, with many hopes of meeting again, I parted from these kind hosts, and ended a day which seemed as if I had passed it with old friends. On turning to take one last look at the castle, I noticed that it was almost immediately hidden behind the high wall, above which only the Roman tower now showed its head. This screen is on the north side of the castle, as the sea is on its south. I have no doubt that it was built as a protection against the bitter and furious north wind which sometimes sweeps that region. It is called the Bora, and must come from the Tyrolese Alps, being drawn over the Adriatic as through a tunnel. The head of the sea is much exposed to its fury. It is said that it can overthrow loaded wagons, and that even a railroad train has been upset by it. In Trieste some streets are supplied with ropes, by means of which pedestrians are glad to save themselves from being blown away. At Duino Castle the tutor and governess pleased themselves with the notion that Dante studied the horrible cries of the "Inferno" from the sounds the winter winds made in roaring through its passages. They, at least, thought no sounds could be more infernal.

VENICE — 1320 — TOLMINO.

THERE does not remain much in the old arsenal of that which kindled Dante's imagination — the boiling pitch, the black smoke, the laboring artisans. It is now a museum of curiosities, illustrating the naval achievements of Venice when she was a great power on the sea.

"As in the Arsenal of the Venetians
Boils in the winter the tenacious pitch
To smear their unsound vessels o'er again :

For sail they cannot; and instead thereof
One makes his vessel new, and one recalls
The ribs of that which many a voyage has made;
One hammers at the prow, one at the stern,
This one makes oars, and that one cordage twists,
Another mends the mainsail and the mizzen."
Longfellow Tr. "Inf.," cant. xxi. ver. 7.

Tolmino, where Dante is said to have visited Pagano della Torre, is in the Austrian Tyrol, thirty miles north of the Venice and Trieste Railway. At Görz I took the Austrian mail-coach for Vienna, which passes through Tolmino. At a quarter to four A.M. I was at the coach office, where all was still darkness and silence. The coach was hauled out, the horses attached, the driver mounted, and the guard, helmeted and trumpeted, placed himself on the coach. Then at last the door was unlocked and the passengers permitted to enter. Now there appeared nothing to detain us, but still there was no movement; five minutes passed in darkness and silence. Then the clock struck four, and at the fourth stroke the horses moved. All this system and discipline was Austrian, in sharp contrast to the Italian way of doing things, not many feet away on the southern side of the same railway. We moved on in the darkness. Soon a streak of dawn gave a glimpse of the river by which the road passes. This is the Isonzo. In the dusky morning it could be seen rolling far below us, and the mountains rising high in air beyond it, shutting off the eastern sky. The impression was mysterious and lonely; but as the

DANTE'S TOMB AT RAVENNA.

light stole softly into this darkness, the world began to awake and every object to be touched with a strange, fresh beauty. I have often had occasion to observe the charm that comes from a partial privation of light. As Corot said of his morning wanderings in the mist, "You can see nothing, but everything is there; when the sun comes up, you can see everything, and nothing remains." That is to say, the imagination has no more interest in the scene. But here, only when the sky became full of light could be seen the wonderful beauty of this little river. It rolls in its rocky bed like a shining green serpent, and its curves and its surprises are endless. The color, a milky green, contrasts with the deep shadowy tints of the forest that clothes the mountains above it.

At Canale we had a cup of coffee, and the other passengers left the coach. Here the conductor entered and took a seat. He seemed to be a person of a certain importance. He had seen from the way-bill that I was American, and had many questions to ask about my country. He was very curious. After a short silence, he would break out with something like this: "In America people can buy land, I have heard. Is it so, madame?" "Oh, yes, as much as they can pay for." "But you must pay much for such rich, good land, is it not so?" "On the contrary, very little. And you can take some of the best land and not pay for it till it is offered for sale by the Government, so that you can have it two or three years literally for nothing, while you live upon it and improve it; this gives you the first title to buy it. The price is fixed, and so low that I do not know how to say it in your currency; but if the settler has the money ready, he, and no one else, can buy it." "And you say he can buy as much as he can pay for!" This was what astonished the friendly conductor, who looked as if he could hardly believe me. He was accustomed to see the forests and large tracts of lands owned by the crown and the nobles, and no poor man allowed to buy more than a small holding. "In America, I have heard that every man votes. Is that so, madame?" "Oh, yes; that requires neither money nor wisdom." "Is it possible!" The man seemed to have no thought of going to this wonderful country—it seemed to him so far off, so mythical. It was evident that he but half believed my assertions regarding the privileges enjoyed by our citizens. He had friends who had gone to America, and he had heard of them no more; and when he mentioned their names to me, an American, and recently arrived from that country, I could not say that I had ever heard of them. He was unsur-

prised at this, not because America is a vast country, and I could not be expected to know every one there, but because it confirmed his skepticism about a land where such impossible advantages are promised to any poor man.

The last half of the way was charming—always the same wild beauty, and the serpent river ever more fantastic. At eleven we arrived at Tolmino. Here I must remain till the same time to-morrow, when the return coach would take me back to Görz. I found a guide who spoke a little Italian, and ascended the sugar-loaf shaped mountain, where at the very top may be seen the foundations of Pagano della Torre's castle, where he entertained Dante.

This mountain is covered with trees, and a pleasant path winds round and round it, till in about an hour we reach the top. Here one sees some walls and one or two chambers still remaining, and bits of pavement here and there. One chamber has in it a hole, down which it is supposed prisoners were lowered in the olden time. I suppose that a gentleman who owned a castle and a wine-cellar also provided himself with a private dungeon where he could place such unwelcome guests as he did not choose to invite to his table. From this terrace, raised so high above the world, all the lower landscape seemed of ideal beauty, and I thought of the poor prisoner in that dungeon, away from the glimpses of the beautiful world, and kept there at the pleasure of his tyrant, who, even were he the Patriarch of Aquileja and the friend of Dante, might be remorselessly cruel even as he was irresponsibly powerful.

Looking north-east from the mountain, my guide pointed out to me a distant spot, where he said was a cave frequented by Dante. There was not time to go to it and return to-day, but I arranged with the guide to come for me early in the morning, that I might visit that point also. The morning proved fine, and I had a delightful walk on the banks of the river in a path used by the country people, winding up and down, and avoiding all tameness.

Near the foot of the mountain, in the side of which is the cave, the path sinks into a rocky gorge, crosses the stream by a foot-bridge, and then begins to wind up to the cave. It is the tradition of the place that Dante loved this walk, and that he came every day from the castle to sit in the cave. The rock appears to be of limestone, which is so often hollowed into caves, and this one is double, one cave within another, so that, being in the first, you look on one side into a still darker cavern, and from the other hand you see through the mouth of the cave the world of light and sunshine.

charming as the afternoon lights replaced those of midday. Every object borrowed momentarily new beauty; but just before we reached Görz the sun dropped behind the hills, and all was cold and gray.

RAVENNA—1320-21.

"He saw through life and death, through good and ill,
He saw through his own soul.
The marvel of the everlasting will
An open scroll
Before him lay."—*Tennyson's*. "The Poet."

RAVENNA, apart from its association with the memories of Dante, has a pecu-

PINES OF RAVENNA.

From here you see the sugar-loaf mountain where the castle stood, as well as the valley and range of mountains. Here I rejoiced in seeing what Dante loved to look upon, and in treading the pretty path he daily trod. The drive to Görz became

liar gloom ever hanging over it, that distinguishes it even in that historic land where each old city has an individual character, a character stamped at its origin, and that has shaped its growth. Ravenna, with its magnificent Byzantine monuments, and its ancient and poet-

haunted pine forest by the sea, is quite unlike any other city, and was a fit surrounding for the closing scene of a tragic and stormy life. And here the most Italian of poets came to rest and to die. He, more than others, was

"Dowered with the hate of hate, the scorn of scorn,
The love of love."

He, more than others, was capable of joy and sorrow, of tender, ideal love and of bitter hatred, of haughtiest pride, and most abased humility. His fervidly religious soul was free from the bonds of superstition and bigotry; superstition, indeed, he detested with a cordial hatred. In this fiery nature were bound together all the elements that make a man great. But in him these elements were warring energies which the struggling soul must by self-government fuse into harmony. Only thus could the great work of life go on, only thus could the sad soul be saved from despair. His burning, baffled patriotism must have consumed his life, had it not concentrated and kindled it into poetry.

The forest begins not far from Ravenna, and follows the sea for many miles along the southern shore. It is gloomy and wild where the sea-winds have tortured the trees. There are desolate ravines formed by the long-continued throwing up of sand by the sea, and these are often found filled with a growth of enormous pines, forming most inaccessible solitudes. Farther inland, the wood is full of beauty and tender grace. Dante often alludes to this wood. From the "Purgatory" I take the following beautiful lines:

"A softly breathing air, that no mutation
Had in itself, upon the forehead smote me
No heavier blow than of a gentle wind.
Whereat the branches, lightly tremulous,
Did all of them bow downward toward that side
Where its first shadow casts the holy mountain;
Yet not from their upright direction swayed,
So that the little birds upon their tops
Should leave the practice of each art of theirs;
But with full ravishment the hours of prime,
Singing, received they in the midst of leaves,
That ever bore a burden to their rhymes,
Such as from branch to branch goes gathering on
Through the pine forest on the shore of Chiassi,
When Eolus unlooses the Scirocco.
Already my slow steps had carried me
Into the ancient wood so far, that I
Could not perceive where I had entered it."
Longfellow Tr.

The "Divina Commedia," though begun in Florence before his banishment, had been almost forgotten by Dante, or perhaps it was only that he had abandoned the hope of seeing it again, when, being in exile, he received the manuscript from Madonna Gemma, his wife, who had found it while searching a chest for some necessary law papers. He

then resumed the work, and, through all the weary vicissitudes of his wandering years, he continued to write, and finished the "Paradiso" in his last days at Ravenna.

And here we may fitly conclude with the story, related by Boccaccio, of the finding of the last cantos after the death of Dante:

"And those friends he left behind him, his sons and disciples, having searched at many times and for several months everything of his writing to see whether he had left any conclusion to his work, could find in no wise any of the remaining cantos; his friends generally being much mortified that God had not at least lent him so long to the world that he might have been able to complete the small remaining part of his work; and having sought so long and never found it, they remained in despair. Jacopo and Piero were sons of Dante, and, each of them being rhymers, they were induced by the persuasions of their friends to endeavor to complete, as far as they were able, their father's work, in order that it should not remain imperfect; when to Jacopo, who was more eager about it than his brother, there appeared a wonderful vision which not only induced him to abandon such presumptuous folly, but showed him where the thirteen cantos were which were wanting to the 'Divina Commedia,' and which they had not been able to find. . .

"A worthy man of Ravenna, whose name was Pier Giardino, and who had long been Dante's disciple, grave in his manner and worthy of credit, relates that, on the eighth month after his master's death, there came to his house before dawn Jacopo di Dante, who told him that that night, while he was asleep, his father Dante had appeared to him, clothed in the whitest garments, and his face resplendent with an extraordinary light; that he, Jacopo, asked him if he lived, and that Dante replied, 'Yes, but in the true life, not our life.' Then he, Jacopo, asked him if he had completed his work before passing into the true life, and, if he had done so, what had become of that part of it which was missing, which they none of them had been able to find. To this Dante seemed to answer, 'Yes, I finished it,' and then took him, Jacopo, by the hand, and led him into that chamber in which he, Dante, had been accustomed to sleep when he lived in this life, and, touching one of the walls, he said: 'What you have sought for so much is here;' and at these words both Dante and sleep fled from Jacopo at once. For which reason Jacopo said he could not rest without coming to explain what he had seen to Pier Giardino, in order that they should go together and search out the place thus pointed out to him, which he had retained excellently in his memory, and to see whether this had been pointed out by a true spirit or a false delusion. For which purpose, although it was still far in the night, they set off together, and went to the house in which Dante resided at the time of his death. Having called up its present owner, he admitted them, and they went to the place thus pointed out; there they found a blind fixed to the wall, as they had always been used to see it in past days; they lifted it gently up, when they found a little window in the wall, never before seen by any of them, nor did they even know it was there. In it they found several writings, all moldy from the dampness of the walls, and, had they remained there longer, in a little while they would have crumbled away. Having thoroughly cleared away the mold, they found them to be the thirteen cantos that had been wanting to complete the 'Commedia.' " *"

AN AVERAGE MAN.*

BY ROBERT GRANT,

Author of "The Little Tin Gods on Wheels," "Confessions of a Frivolous Girl," etc.

IX.

ONE evening, within a week after Remington's dismissal, Woodbury Stoughton was sitting on the piazza of the Ocean House at Newport. He had just lighted a cigar, and, having obtained a purchase with his feet against the solid railing, was gently tilting his chair to the rhythm of his own reflections. He was sufficiently in shadow to escape the scrutiny of those who still strolled up and down the broad veranda, listening to the music wafted thither from the not far distant Casino. It was about midnight, but the form of entertainment known as a "hop" was therein progress, despite the heat of the atmosphere; and the attendant carriages of the revelers, seen through the foliage, passing and repassing each other, like huge solemn glow-worms, upon the avenue which fronts the hotel, gave a murmur to the darkness.

Woodbury would on the morrow be congratulated as one of the luckiest fellows going. Miss Isabel Idlewild, the only daughter of the rich banker, had plighted him her troth to-day, and he had just returned from an interview with the family, supplemented by a passage with her in the parlor. The old man, as his would-be son-in-law mentally styled Peter Idlewild, had thrown no obstacles in the way of an immediate engagement. Any disposition he might have had to complain at Stoughton's lack of means had been silenced by his wife, who took it upon herself to expound the advantages of the young man's social position. The lover had accordingly found the interview less terrible than convention painted it. The banker had declared Isabel's happiness to be his own.

"My daughter tells me, sir, that you and she have kind o' come to terms," he said, when he had taken the young man into the library and shut the door. This kind of thing was foreign to the experience of the ex-circus manager. He felt all at sea, and was doubtful whether propriety demanded from him a jocular or a sedate attitude.

"Yes, Mr. Idlewild, I believe so; that is, of course, with your consent. I love Miss Idlewild, and I have reason to think she is not indifferent to me."

"Well, sir," continued the father, with a curious smile, "I don't see that my consent has much to do with it. If you love Isabel, and she loves you, you're bound to get married somehow, aren't you? That's the way they did things when I was a boy. However, if my consent is all that stands in the way, I guess you won't have much trouble!"

Stoughton expressed his gratitude in an appropriate word or two.

"How old are you?" inquired the other, scrutinizing the young man's handsome face and genteel person.

"Just twenty-six."

"Humph! In the law, aren't yer?"

"Yes, sir; I have been practicing about two years."

"I suppose you don't make a very big income yet." There was a twinkle in the capitalist's eye, and Stoughton, in replying, blushed with some confusion. This question of money was one which he had dreaded to touch upon.

"No, sir, I can't say the law is very lucrative just yet. It's rather hard sledding for a young man at first, but I'm beginning to see my way ahead a little. There's plenty of room on the top benches, they say," he added, with an effort to be sprightly.

"I've a small property of my own, Mr. Idlewild," he continued presently.

"How much?"

"About fifteen thousand dollars."

"Humph! Well," the banker remarked, after a short pause, "I guess I sha'n't let my daughter come to want. How much now'll you need to set up with? I suppose a hundred thousand will keep you going for a year or two."

"You are very liberal, sir. I did not expect anything of the sort. I shall do my best to make your daughter happy," Stoughton went on to say, feeling perhaps, in his satisfaction, that something of the sort was incumbent on him.

"Very good, young man. If she's happy, I shall be." The millionaire paused a moment, and then with a relaxation of his dry tone, as if mindful that, after all, this was he whom his child had chosen for a husband, "She's a good girl, Mr. Stoughton,—a good girl. The man who gets her, gets a gold mine. If she's

fond of you, that's all I want. You have my consent, and I've money enough for you both."

There was a short silence, and Peter Idle-wild rose with a quizzical smile. "I guess you don't want to see me much longer, Mr. Stoughton; there's somebody waiting for you in the parlor."

In the parlor the successful suitor found his *fiancée*. She rose and stepped forward to meet him. Her face was somewhat pale, but her eyes sparkled with a happy brightness. "Was pa very terrible?" she asked, with a joyous laugh, as he grasped her fingers.

"He made no objection. He seems quite willing that we should be married, Isabel."

"Dear old pa! I knew he wouldn't say no. And are you quite happy?" she continued, as they sat down together on the sofa. "It is so funny to think we are actually engaged. Do you believe it will surprise people? Oh, how strange it all seems!"

"Doesn't it, dear?" and Stoughton reached out and took in his the girl's dimpled hand.

She turned her face toward him. "Do you truly, truly love me? And you will never laugh at me again?"

"Laugh at you? Isabel, do you think I would laugh at you? What I told you yesterday was true, every word of it. You are dearer than everything in the world to me. I love you, — I worship you, — I adore you. Isabel, Isabel, — look at me, tell me you believe me."

There was nothing of disordered passion in the young man's manner. His words were spoken in a low, sweet tone; and as he waited for a response, he threw his arm around her form in a caressing fashion. She trembled convulsively, and half sought to elude his embrace; but his grasp detained her.

She looked at him with a timid but fond playfulness. "Shall I believe you? You see, I really know you so little." She paused an instant. "Yes, I believe you," she said, softly and shyly.

He took her face between his palms with a delighted air. "Repeat now after me, 'I love you, Woodbury.'"

"Oh, I couldn't!" She disengaged herself, and turned away with an embarrassment that was charmingly coy.

"Yes, you can. Please." And the young man renewed his hold.

"Oh, I couldn't!" She trembled slightly again, and for a while was silent. Then at last, with a downcast glance and a diffident little laugh, she said, so low that it fell from her lips like a whisper, "I — I like you very much, — Woodbury."

"You darling!" and the lover pressed an ardent kiss upon her lips. Her eyes were bent upon her lap. Her breath came and

went quickly. She turned suddenly, and, shaking herself free from his pressure, bent her gaze full upon him. There was a strange light of joy on her face. He leaned forward toward her, and with a low cry she suffered herself to be clasped in his arms.

"Oh!" she cried, as she nestled her head against his shoulder, "and you do really love me, don't you, dear? For I love you so, — Woodbury," and she hid her shamefaced eyes again at the sound of his name.

He patted her hair softly. "I never thought I should care for any one but pa; but I do, you find." And she laughed with a happy, blissful glee.

These memories were present to Stoughton as he sat smoking on the hotel piazza. He had parted from Isabel an hour before. What his own sensations were he scarcely knew. He was very fortunate, and he ought to feel very happy; so he said to himself, as he watched the wreaths of smoke dissolve into the darkness. And yet, what meant this strange weight about his heart, which oppressed him? Had he not won what he had been striving for, accomplished what he had planned and desired? He was in love with Isabel, and he was going to marry her. She would make him very happy. She was a fine girl. He would be well off, and able to satisfy his ambition. He ought to be perfectly contented and happy. He *was* perfectly contented. Was he? Why, then, did he not feel a wild transport, a desire to throw his cap into the air and proclaim his rapture to the world? A man just engaged should be bubbling over with bliss, and here he was musing in a corner. That interview with Isabel should have driven away the last vestige of doubt, she was so sweet, so confiding, so full of love for him. Yes, and he — he had sat there, conscious that he was kissing her as a doll, as a beautiful toy, — conscious, though he had striven to banish the impression, that he regarded her in the light of an inferior being. And yet he had acted with his eyes open and of his own free will. Pshaw! these repinings were but the last throes of his subdued romanticism, resembling the muscular action which makes hens run about the barn-yard after their heads have been cut off. If it was to be done over again, would he not do it? Yes; and still this weight pressed upon his heart and numbed his sense of happiness.

Wherefore was this? Did he love Dorothy Crosby? Did he feel a regret that he had barred himself forever from the chance of making her his wife? Bah! He had taken this step with deliberation. One cannot have everything in the world, and he had made his choice. No, he did not love her; he did not

wish to marry her. Why, in Heaven's name, should he marry her? What was this tyrant that was oppressing his spirit with these sentimental doubts? He surely had a right to consult his own happiness in this respect? There was no tangible reason why he should wed a penniless girl merely because she was sweet and lovely. That might have been the philosophy of his ancestors, but he could not subscribe to it. But did he not subscribe to it in spite of himself?

He cast his eyes up toward the sky. Above the waving foliage of the trees, which the night air was now stirring, the stars were burning calm and clear. Their orbs, eloquent with chaste but impenetrable mystery, embittered, even while they softened, the young man's spirit. He had gazed so often at the stars before; and what had they ever brought him but thoughts which were not to be fathomed and aspirations that could not be fulfilled? They had been the bugbear of his days—these vague, intangible yearnings. They had fettered the play and scope of his natural impulses and desires. Ideals? Aspirations? What were they but the reflex of a craving for self-approbation based on the approval of his fellow-men? That which was called right and that which was called wrong were right and wrong merely by a reference to a human judgment founded upon the laws of nature and the laws of society. The latter varied with every clime and race. Why was it that this shadow of a curse should be hovering about him, like some pale specter? There were times when men had faith in ghosts; there were times when they believed in hell. But those days were past; at least they were past for him. The conception of an avenging Deity was no longer tenable by thinking beings. He had no more fear of future punishment than of a grave-yard at night; and what was there terrible in the vicinity of the tombs of the dead, but the damp and cold? What difference would it make whether or not he listened to the voice of this whispering tyrant? Time reconciles us to all things. Time had laid its moss over his wounds before, and would do so again. He had no fear of remorse. Remorse? And wherefore remorse? His act was but the selection of his own happiness, a mere choice between two agreeable methods of living. He liked the girl. He could get on with her perfectly,—and her money would be everything to him, for the last six months had treated him badly. He had lost fifteen thousand dollars in speculation.

His thoughts ran on in a swift and analytic vein. And yet, save for ideality, for the hope of something beyond the ken of man, the animal pleasures and passions were the sweet-

est. Was not all higher enjoyment based necessarily on an assumed or, at least, a longed-for sympathy between the unseen and the human? What was it that deterred him from vice and lower pursuits, that spurred him to intellectual endeavor, save a sense of kinship with something nobler? If he followed out the train of his materialistic logic to the end, where would it lead him? What would become of the race and civilization? The race! Civilization! What was it to-day? A surging mass of beings, each trying to outstrip the other. And whither were they tending? Who could tell? And here he sat—a man, a human creature, one of them. Above his head the stars were twinkling with silent poetry. Before his mental vision rose a picture of the throbbing interests and ambitions of real life. The unreal and the real, the material and the ideal! He was conscious of a sense of shame that he would fain have silenced, of a bitter pang that would not depart. Cursed fate, that he must be a victim of the momentum of bygone ages, of the superstition of the past! And yet, even while he murmured, was he not aware in his heart that in struggle and resistance lay the secret of the shining stars?

He sat and pondered. Presently he took from his pocket a letter-case, out of which he extracted a tiny note. It had the thumbed look which proceeds from frequent examination, and was in a feminine hand. Stoughton opened it and stared at the white page. Perhaps by holding it toward the adjacent gaslight he might have been able to decipher the writing. But this was quite unnecessary, for the young man knew the contents by heart. The note was from Dorothy Crosby, merely a few lines thanking him for a book he had lent her. He let it remain for a moment on his knee; then, slowly folding it into a narrow strip, he struck a match and watched the flame eat its gradual way up the paper. When it was well ablaze he lit his cigar with this precious *allumette*. As he tossed the remains, which threatened to burn his fingers, over the piazza rail, the hotel coach came bowling up to the entrance. It was the hour of arrival for those who had left New York that afternoon by the boat. There was but one passenger, a thick-set young man, well wrapped in an ulster. As he descended from the vehicle the light fell on his face and disclosed Finchley. Stoughton was standing close by the steps, and the young men recognized each other simultaneously. One who was alert might have noticed a slight scowl of annoyance flit across the new-comer's countenance, but he held out his hand cordially.

"Well, well, Finchley, you're about the last

man I expected to see in this place. How did you leave them all in New York? How are stocks?"

"Dull, dull as death. There was so little doing I thought I'd run down here for Sunday. It looks as if you had it pretty much all to yourself here," he said, glancing up at the wide-stretching wooden building, and along the broad piazza, which now lay silent and deserted.

"Yes, I'm rather a night-owl. You'll find it lively enough to-morrow, though. But you must be done up with the heat. Come in and have something to drink."

Stoughton led the way into the bar. While the attendant prepared their orders, the young men chatted on indifferent topics. "Here's luck. Ah," said Finchley, as he drained his glass, "that goes to the right spot. Tell me," he asked presently, turning toward the other, "are the Idlewilder still at Newport?"

"Oh, yes; they have a cottage for the summer—Colonel Patterson's old place on Leroy Avenue. I've seen a good deal of them."

"How long have you been down here?" inquired Finchley, after a little.

"About four weeks. You see there's some compensation for being a briefless lawyer; we get more time to play the butterfly." Stoughton spoke jocularly, but his companion might have noticed the confusion of his manner.

"I see," said Finchley, dryly. He changed the subject to stocks, and for some minutes discoursed glibly on the state of the market.

Stoughton felt puzzled what to do. Here it was past midnight. The engagement would be announced in the morning, and everybody would know it. There was no reason why he should not tell Finchley. It was much more natural he should. Finchley had been attentive to Miss Idlewild, he knew, but he had no ground for suspecting anything serious. Besides, if there was, he must hear of the news sooner or later.

"Look here, old fellow, let's have another drink." He had never used such familiarity with the broker before, but somehow his spirits seemed to be effervescing under the prospect of narrating his good fortune. There was no question people would think him immensely to be envied. "There's something I want to tell you. I've had a big slice of happiness put to my account to-day. The same again," he interjected to the bar-keeper.

"Is that so? Struck a bonanza?" said the other, with a grim effort at humor, but with his eyes fastened on the speaker's face.

"I'm engaged to be married. To Miss Idlewild," he added, by way of explanation.

"To Miss Idlewild? Well, you are a lucky

fellow," replied Finchley, quietly, but without flinching. He cast about his eyes as if in search of some vent for his feelings. His glance fell on the drinks, which were now prepared. He reached forward and seized his glass. "Here's my regards, Stoughton; you're a lucky fellow, an infernal lucky fellow," he cried with a fierce fervor, and he drained the glass to the bottom. "How much is it?" he asked of the bar-tender with a frown, and he tossed a silver dollar on the counter so that it rang.

"Stop, stop! it's my treat, Finchley. I asked you to drink with me," exclaimed Stoughton.

"No, it's all right; it's my affair; I drank with you before." But Finchley colored with annoyance. His mechanical action must have betrayed his feelings. "How long have you been engaged?" he inquired abruptly.

Stoughton was a little nettled by the impertinence of the question. He could afford, however, to be good-natured. "Only a short time. It is to be announced to-morrow," he replied quietly.

"Is that so?"

"I shall have to bid you good-night, Finchley; it's rather late for an engaged man," said Stoughton festively, looking at his watch.

The other had lighted a cigar, at which he was puffing vigorously. "All right. I guess I sha'n't turn in just yet. I want a smoke." Finchley seated himself on the edge of a side-table fronting the counter, which the bartender was polishing with a cloth. The latter was a sallow, drawn-out young man, without a shirt-collar, and arrayed in a soiled linen duster. He seemed to be in no hurry to bring matters to a close; for after having finished his occupation, he proceeded to pick his teeth reflectively.

"Hot in New York, sir, I dare say," he observed, by way of conversation.

"Right you are," was the laconic reply.

"Come by boat to-night, sir?"

"Cor-r-rect!"

There was something trenchant in the tone of his customer which doubtless warned this seeker after information that a continuation of his talkative vein might prove dangerous. At any rate he relapsed into silence, save for a consolatory low whistle, to the melody of which he proceeded to put things to rights, preparatory to closing up. He turned out all the lights except one small gas-jet. Revenge was here simple and perhaps justifiable. "Time to close the bar, sir."

"All right." Finchley was sitting on the table, his legs hanging over, and his pursed-up lips were sending forth now and again wreaths of smoke. One foot swung nervously to and fro. "I suppose there's no way of getting back to New York to-night?"

"Nothing till to-morrow." The tables were turned. The stranger was the interrogator now. But the victor, either generously content with a short triumph, or unable to resist—for the sake of a mere sentimental consideration, like pride—a chance of satisfying his propensity, asked, after a pause, "Expecting to make a lengthy stop, sir?"

Finchley made no reply. He passed out through the corridors on to the piazza again, where he walked up and down with a quick tread. He did not know exactly what to make of his sensations. A feeling of utter misery, as if—in the language of his own calling—the bottom had dropped out of everything, oppressed him. Little accustomed to analyze his impressions, he simply gritted his teeth in the ecstasy of a suffering he could not quite understand, and paced the platform much after the method of a wounded animal that is ignorant of all save the pain. Life seemed a void, a complete blank. There was nothing worth having. The handsome profit placed to his account the past six months, on a lot of Western bonds which his firm had floated with success, no longer caused him a thrill at its remembrance.

He stepped off the piazza and wandered along Bellevue Avenue, which was now wrapped in silence. No footfall but his own was stirring. On either side of the way, through a vanguard of dusky trees, handsome cottages slumbered on a sea of glittering lawn; for the moon had risen. He walked rapidly, with eyes cast on the ground. He was scarcely aware of a destination, and perhaps, if he had fully realized whither his steps were tending, would have rebelled. He had been to Newport once or twice already this summer, and this walk was familiar to him. Upon reaching a corner where one of the side streets crosses the main avenue, he turned down the same, but with a slackened pace. Close at hand rose, clear and white in the moonshine, a stately villa, built somewhat in the style of an ancient castle. A grove of chestnuts shut in the front; but there was a skirting of box-hedge upon the side of the grounds that bordered the cross-road, over which could be seen fantastic beds of flowers, and farther away a tennis-court. A neatly graveled avenue twisted its course through the lawn, like a shining snake.

Finchley stood still. The well-known sight had brought him to his senses, or rather opened his eyes more significantly to the sources of his sorrow. He sighed heavily, and, glancing up at the windows for an instant, turned on his heel. As he reached the corner of the avenue again, he almost ran upon a man who was reeling along the path, close to the fence, in a half-inebriated condition.

"G'd ev'ning. Say, boss, aint you got something for a poor feller?"

Finchley was going to pass on; but the man ran out in front of him with a beseeching, cringing air. He was a meager-faced, disheveled-looking wretch, with no suggestion of the highwayman about him. "Just a thrifle, boss."

"What do you want with money this time of night?"

"Well, boss," said the man, with a gaunt leer and a huskiness of tone which he intended to be wheedling, "I need a drink awful bad."

There was something of pathos in the appeal that harmonized with Finchley's mood. Here was another fellow-being, as miserable as himself perhaps, whose sorrows could be drowned for an hour by a glass of poor whisky. He reached down into his pocket and drew forth a handful of small coins. In their midst glistened a five-dollar gold bit, fresh from the mint. It was a habit with Finchley to carry a few gold pieces about with him. Perhaps their daintiness pleased him, or he thought they gave him an air of splendor. He tossed the coin in question to the beggar. It fell on the ground with a clink and described an arc into the gutter, from which the unsteady fingers of the searcher presently rescued it.

"Heaven bless yer, boss."

"That's all right. Go and get drunk now, —roaring, boiling drunk, mind. Have an A-number-one time for once in your life." He felt at odds with destiny and ripe to play the social iconoclast.

He strode on. His dream was dissipated. Not that it had been a soaring conception, this love of his; but the fervor had been genuine of its kind. A beautiful girl at the head of his table, in a snug little house bedizened with all that is pretty and cozy,—a soft, plump cheek, and radiant eyes to be proud of at the theater, or the supper parties he would give at Delmonico's,—such was its objective end. He had money enough, and she would have millions some day. But her wealth was by way of an after-thought. What had been ever present to him was the subtle tremor of excitement which her presence evoked, a consciousness that was strange to him, and delightful from its very vagueness. He had lived, so to speak, from hand to mouth through the years of his youth, with but one idea as a beacon—the necessity of becoming rich. He had taken existence as he found it. He had practiced the commonplace virtues with the best intention; but, in his haste and absorption, what others did had been good enough for him. His world had been the streets of New

York, and his laws the laws of trade. His knowledge of what was outside and beyond was but superficial, and his latter-day efforts to arrive thereat had, as we already know, been stamped with an ostentatious vulgarity.

The advent of his passion scarcely altered his habits, but a new train of perceptions had been awakened thereby. A certain tenderness of nature, hitherto unknown to him,—a coarse-grained, clumsy article, to be sure, but still a reality,—had manifested itself. A growing conviction of the grossness of his own mode of life had stirred under the breath of love, and been slowly fanned to a flame, which, though not prodigious, might have sufficed in time to keep the *penates* warm. Thoughts of public usefulness, such as a career in politics, that had been before merely hazy conceptions, assumed the form of distinct ambitions. This new master of his spirit demanded fealty, and he had been prepared to ratify his claims.

But now it was all over. The vision had vanished, and he was remanded to the society of his old companions. As the truth dawned upon him, he experienced the repulsion of one who comes out of the sunshine into an apartment stale with smoke and lighted by gas. He had never realized until this moment the extent to which his interest in Isabel had separated him from the past, and a sense of angry grief, mingled with despair, kept him tossing on his couch until the gray of morning.

x.

ONE evening, late in the following winter, Remington sat sipping his coffee after dinner at the club, which had become a favorite resort of his. He met there principally men who, like himself, had enjoyed the advantages of a university education. It was there that he had become more alive to the feverish energy of his own generation, and had grown to admire the ability and information of men who were but a few years older than himself. Many, of course, were to be found there who were simply votaries of pleasure—mere loungers, who read the newspapers and played cards as an existence; but the larger portion were intelligent, earnest-minded men, who came thither for relaxation. That they were an ambitious, hard-working set it was easy to see from the expression of their faces, and from the supineness with which they took their ease, as if they could not feel sure of ever being at leisure again. Shrewd and intelligent in matters of business, they were charmingly versatile in moments of recreation. Many of them had traveled abroad, and the conversation to be heard often bore the stamp

of sense and cleverness. Their speech was, however, tinged with that peculiar ironical humor common to all classes in this country, against which nothing is completely sacred. To touch serious topics with a light hand was there a custom; and yet they loved dearly to philosophize after dinner. For the rest, their dress was in excellent taste; they breakfasted very late on Sunday mornings; it was uncommon to find one who did not turn to the stock quotations before anything else in the newspaper; and, almost unanimously, they inveighed against the political debasement of the country. There were many who, though young, had already acquired reputation in their callings, and yet who delighted in company to scoff at ambition and harp upon the omnipotence of wealth.

Upon quitting Bar Harbor eight months before, life had seemed a terrible blank to Remington, and the wound caused by Miss Crosby's refusal had smarted far into the autumn. His love had been thoroughly genuine, and the sudden extinction of the beacon upon which his eyes had rested unwaveringly for the past two years left him in utter darkness. His catastrophe with Miss Maud Bolles sank into insignificance beside the desperation of this really heart-felt grief. After the edge of his suffering became so far blunted as to permit of rational thought, he had tried to analyze the situation, but without much comfort. He was all adrift as to Miss Crosby's feelings. Speculation as to his chances of success, in case he were to persevere, left him at the close precisely where he started from.

There had been a gradual sequel to this frame of mind. Her refusal had been decided—oh, yes, perfectly decided; still she had said there was no one else. Perhaps time would make a difference. If he went to work and showed himself worthy of her, she might come to like him some day. His best plan undoubtedly would be to neglect her for a while. He had heard that girls miss attentions to which they have become accustomed, and that a lover has much more chance if he fights shy of one who has given him the mitten. Little by little he began to take more interest in his down-town work. He felt that he ought not to allow his scheme of life to be interfered with by a disappointment of this kind. Marriage was only an incident in a man's career; and, however deplorable it might be to meet with disaster where hopes had been garnered up, despair ought not to be permitted to encroach too far. It may be, too, there was a dash of vengeance in his industry. He would like to distinguish himself, and prove to Miss Crosby how much she had

lost by throwing him overboard. Girls do not like to see their suitors recover from the effects of a somersault too easily. If she could hear that he was able to be so diligent, would not the sweetness of her triumph be sensibly diminished?

But the concomitant of these resolutions had been much thoughtfulness and some cynicism. It pleased him to represent to himself that a material view of existence was the most satisfactory, and that love was only a delusion. It was more difficult to remain faithful to the idealism which he used to woo in his younger days. Modern life, with its whirl of prosaic business cares and worldly pleasures, reminded him of a country road in midsummer, upon which a pitiless sun pours down, where the foliage on either side is shabby with choking dust, and no breeze stirs. He lived on from day to day; he enjoyed himself in a certain measure, but it was so difficult to extract from existence aught that was exhilarating or refreshing to that inner sense of aspiration. The spiritual oxygen of creation seemed to have become exhausted, and the world to lie, like the landscape of his vision, veiled in depressing dust.

It was best to take life quietly and sensibly. He enjoyed his profession, and he had the means to indulge in all rational amusements. His bachelor days were lapped in comfort, if he would but look at the matter philosophically. Ah, that was just what he did do—look at the matter philosophically! There was the whole difficulty. It was the philosophy of life which lay at the root of his trouble. It was that great enigma of the whence and the wherefore and the whither, rising up forever in his thoughts, that doomed him to unrest. Not purely selfish was his struggle for the means of living and the meed of fame; but with his daily work was mingled a desire to do the best he could, to contribute his mite toward the solution of that mystery which he could never expect to unravel. Others were working around him in the same spirit. They toiled until the flesh was weary, and then they drowned fatigue in full-fledged pleasure. But still it was a hard and hueless labor, like that of the mine, unilluminated by the rays of a warm and definite inspiration. It was, as it were, a standing face to face with fate, the heart whispering the while, "We will be faithful, but we have no hope." Whither was this strife of humanity tending? Has the world advanced in the drift and intensity of its aspirations from what it was a hundred years ago? Mankind were more comfortable now, doubtless; they understood better how to take care of themselves, to ward off disease, and to abbreviate suffering; but did the spirit that

animated men's breasts to-day soar above the cold and leaden realities of material things?

And yet, with changing mood, he would perhaps oftener dwell upon the sincerity of modern labor, on the enthusiastic, critical, and patient temper of research in all fields, the stern desire for truth at every cost. This, at least, was the attitude of a vast contingent of intelligent, sober-minded men, who neither flaunted in society nor figured in the newspapers. The new and marvelous inventions of science, the countless schemes and appliances for the bettering of the condition of the poor and ignorant, the vast foundations for the spread of knowledge, alike testified to the danger of judging the world's core by the pulsation of its extremities. The fashionable whirl and socialistic outcries were but as the chaff upon the threshing-floor, or the sparks from the grindstone.

On New Year's day he called upon Dorothy. She was not at home, and so it chanced that he scarcely saw her all winter. They had exchanged a few words at parties; that was all. But Remington rarely went to parties now. Indeed, it was a matter of comment that he was completely changed. Miss Lawton declared, as he shook hands with her at the last of the "Late and Plentiful" Germans, that she had hardly laid eyes on him for six months. "I hear you are *blasé*, Mr. Remington."

"Not so bad as that, I hope; call it busy."

The only person of the other sex with whom Remington had cultivated an intimacy of late was Mrs. Tom Fielding. He had got into the way of dropping in at her house in the evening. After coming up town he would dress himself, dine at the club, read the papers for half an hour, and then, if he did not play whist or go to the theater, would turn his steps toward her door, which was only a block distant. He had found her an extremely agreeable companion. She was very sympathetic, and evinced a keen interest in literary and artistic matters.

The early part of the winter, Remington had flattered himself that male society sufficed for all his needs in the way of companionship. He had been quite content to establish himself with his cigar in an easy-chair, and chat the evening away with some friend at the club—often with Lattimer, who was a suggestive spirit, and occasionally with Ramsay Whiting. During such hours time took unto itself wings. The conversation, beginning with the surroundings and the current gossip, would branch off to the stock market, travel by short stages from politics to sociology, and finally arrive at immortality. At length would come a pause,—a reflective

draining of the last drops of the beverage, as if there were an expectation of catching a glimpse of the infinite at the bottom of the glass,—and that glance at the watch which accompanies a return to consciousness.

"Another drink?"

"Thank you, I believe not."

Then followed the struggle back into his ulster, and the stroll in the cool night air along the deserted pavements. He would glance at the chaste stars, and feel their influence probe, as it were, his unhealed wound. He was perfectly happy in communion with his own sex. A fig for the society of the other!

That had been two months ago; but to-night he sat stirring his coffee in the pleasant consciousness that he was to spend the evening with an attractive woman—one who was intelligent enough to understand him, and clever on her own account withal. He glanced at the clock; it was later than usual, for he had been detained at the office. It would be time to go in a few minutes. He took up the evening paper, and came upon Woodbury Stoughton's name as a newly appointed director of several important concerns in which his father-in-law held a controlling interest. He had not seen so much of Woodbury since his marriage; their pursuits and ideas, too, seemed less in common than formerly; though he now and then dropped in to dinner at his friend's beautiful house. Stoughton was much absorbed in his career at Albany, but he and Remington had by tacit consent avoided conversing about politics. Isabel appeared happy. She was looking very handsome since her marriage, and had been a good deal in society.

Remington had the Stoughtons in his mind as he donned his overcoat and walked up the street. There was a tinge of envy to his thought concerning them. After all, Woodbury had shown himself a level-headed fellow. His friend seemed somehow always to fall on his feet. He had married a beautiful girl, and acquired with her a pot of money. That might just as well have happened to *him*. Why hadn't it? He was sacrificing his welfare to a mere sentiment. There were plenty of girls in New York just as attractive as Miss Crosby, if he would only choose to look at the matter without prejudice.

And yet this wavering on his own part annoyed him. He felt ashamed of himself for harboring the possibility of a doubt regarding the wisdom of his choice. He had always believed his attachment for Miss Crosby to be of the deepest kind, and yet of late he had constantly caught himself putting his hand on his heart, as it were, to see if it were beating with sufficient intensity; which reminded

him of children digging up seeds that they have planted, to find out whether they are growing.

Mrs. Fielding greeted him with cordiality. She was very grateful to him for coming, she said, as she was all alone and rather low-spirited. Her husband had gone to the meeting of some philanthropic society. He was wrapped up in model tenement houses and other schemes to better the condition of the poor. She was just reading the proofs of a report regarding coöperative housekeeping that Mr. Fielding had written. Would he like to look at them?

Remington took the sheets from her hand and ran his eye over them. "I often wonder," he said, "if the poor are really more unhappy than the well-to-do. Except in the case of actual suffering from cold or hunger, their very necessity to work without stopping to think must be in a certain sense a relief. The responsibility of choice is removed from them; or rather their only choice is between unceasing labor and starvation."

"I should prefer to starve."

"Perhaps, with your experience of something different. But the sweetness of toil has ever been proverbial. I, for one, can testify to the gratification of feeling at night the emotionless fatigue of the clown. Are you altogether certain that the liberty to split hairs with one's consciousness is to be esteemed a boon?"

"That is," she asked in soft tones, without looking up from her embroidery, "you regard the problem of existence as too complex for the highly evolved brain? It is preferable, you think, to be body-tired than mind-tired?"

"My remark was in the form of a question simply. Is it preferable to beat iron and brass or to beat the air? The artisan works for bread and meat, but what are you and I working for,—what are we seeking?"

"Yes; I have often thought of that."

"Look back a thousand, two thousand years, and what more do we know to-day concerning the purpose of existence? Centuries ago, men loved and laughed, and toiled and slept, and ate and mourned, and finally they died. That is what mankind is doing now. The world is a pleasanter place to live in, perhaps. We have discovered how to exist more comfortably. We have learned, from experience, that wars and dirt and polygamy and unwholesome food diminish the happiness of the individual. We no longer burn our brethren at the stake because they do not chance to agree with us, and we are able to communicate by word of mouth with those who are hundreds of miles distant. But what more have we grasped concerning the mystery of life? What has the nineteenth century to say to you and me, who have food to eat and clothes to wear?"

"Better food and more clothes," she answered, with a laugh. She was silent a minute, and, taking from the table a fan, moved mechanically to and fro its mother-of-pearl sticks, which were edged with white fluff. "You think, then, religion is an excellent thing for the masses, but that it is out of date for you and me?"

"Heaven forbid! With the advent of greater intelligence we have, to be sure, become exempt from the delusion and superstition which victimizes many others. We know that prayer will not save the life of a man wounded in a particular spot, and that human beings inherit their dispositions. But however much we may grope and wonder, every man is forced at last back upon himself, it seems to me. We cannot escape our own characters; and, despite logical demonstration to the contrary, we cling to a belief that we are responsible for our actions."

He paused a moment. "Go on," she said, glancing up at him. "I want to hear you through."

"There is not much to say," he answered; but he added that one tired of trying to unravel the mysteries of living, and sought refuge in action. There, at least, however difficult the path might be, it was tolerably plain. It was possible to distinguish between evil and good, between what is hurtful to society and the reverse. Unintelligible and bewildering as creation seemed as a whole, one was never at a loss as to the value of proximate conduct. "There are two things in life that seem to me certain," he said; "one is, that no man can be completely happy; the other, that the greatest chance of happiness lies in obedience to the promptings of one's own conscience. The world found that secret out ages ago, and it has outlived all philosophies."

Mrs. Fielding was silent a moment.

"And you mean," she said, "that it is more difficult for people who enjoy the so-called advantages of life to appreciate this?"

"Yes; for, being free from the superstitions that influence the ignorant, they are more susceptible to the arguments of materialism, from their very ability to make discriminations and reason from cause to effect."

"We have to give up more, too, if we obey our consciences," she said. Remington noticed that she held her lace handkerchief by the tips, and was twisting it round and round.

"Indeed we do. The thing we have to renounce is often so essential to happiness as to make the bar which separates us from it seem very shadowy."

"Do you ever feel like that?" She glanced

up quickly as she spoke. "I mean—that is," she continued, with some confusion, "do things affect you so strongly?"

Remington smiled. "You think me, then, incapable of intensity?"

"No, not that. I didn't mean that, of course." She looked into distance a moment, then turned her eyes toward the floor. "I suppose I was surprised to think any one could be as unhappy as I have been."

Remington was aware that she was conscious he knew her story, and remained silent. He knew, also, that they were friends, and felt that this confidence on her part was somehow as the act of one who is groping in the dark and seeks a helping hand.

"At least you have conquered—lived down your sorrow," he said presently, with the lack of appositeness of one at loss for a reply.

"Have I?" she replied, with a tremor of the voice. She passed her hand hastily across her eyes. "Oh, yes, I am happy, quite happy. You must not think I am not, Mr. Remington. Only, you see," and there were tears in her tone despite her effort to control herself, "when you spoke of it all in such a calm, analyzing way, as if faith were something to be accepted or not, just as one preferred, I couldn't help wondering if you had ever known what it is to care intensely for something that was forbidden you. A woman needs more than a code of morals, more than the husk of a belief to cling to. It must be real and burning, and a part of her life; for there are moments when, if it were otherwise——" She paused and covered her face with her hands. "And yet you all say religion is but a convention—a superstition."

Remington leaned forward and touched her shoulder. "No, no, my friend, you misunderstood me. I did not say that; I——"

The sound of footsteps in the entry interrupted his words, and the young woman scarcely had time to rouse herself from her position before the portière was drawn aside, and the servant announced Mr. Woodbury Stoughton. For an instant the latter stood as if surprised at the encounter. Perhaps, too, through Remington's mind passed the thought that the key to the confession he had just heard was at hand; for were not those words "convention" and "superstition" cornerstones in the oft-listened-to philosophy of his quondam friend? But Mrs. Fielding, veiling her countenance behind the mask that is part of the wardrobe of every clever woman, advanced with her head poised on one side, and a cordial greeting.

"Good-evening, Mr. Stoughton."

(To be continued.)

UNCLE TOM WITHOUT A CABIN.

IN the last year of his life General "Light Horse Harry" Lee made a visit to Dungeness,* the residence of General Nathaniel Greene, on Cumberland Island, Georgia. While there he was attacked with a sickness which in the end proved fatal. His nurse was an old negro woman, the "momma" of the household. One day, in a paroxysm of nervous pain, he became enraged at her officious benevolence and threw a slipper at the old woman's head. There was a skillful dodge of the red bandanna, and then she deliberately picked up the slipper and hurled it back at him, with the words, "Dah, now! I aint gwine to let no white chile sass me; / aint."

This incident, which is historic, illustrates the position of the "momma" or "mammy" in a Southern family in the olden time. She had rocked the cradle of her young master and crooned him to sleep with those weird melodies which are unsurpassed in the Mother Goose lore of any land. As he grew to manhood he was still her "chile," and she became, in turn, a grandmother in affection to the children of his household. In family affairs, in determining the components of a cake, the pattern of a garment, or some nice question of a neighbor's social status, she wielded that potent wand, "the wisdom of ancestors," and quoted "ole marster" and "ole missus" with oracular confidence, inspired by the impossibility of contradiction. Jealous was she for the honor of "our family." The authority thus assumed was always good-naturedly acquiesced in; and, when ignored, was overruled indirectly, so as not to shake the old soul's self-confidence in her infallibility or the children's veneration for her wisdom. The latter was a conservative influence too valuable to be sacrificed.

Very similar was the position of the "old uncle." Even the harsh overseer, dressed in a little brief authority, took counsel of his weather wisdom and his "sperence" in planting to suit the moon. Over the dwellers in the quarters he was wont to take a patriarchal jurisdiction. The children, white and black, revered him not only for the stories of Brer Fox and Brer Rabbit, which a later Uncle Remus has told to all the world, but for the unexhausted stores of similar lore which

remained locked in his venerable bosom. He always impressed the pickaninnies with the fact that he only told the half he knew. No grandsire ever had a more eager audience for his garrulity.

What element in Cicero's charming picture "de Senectute" was lacking to make such an old age happy? Against all care and want these old attachés of the family were insured in the love of their owners, and, if that was not sufficient, in a legal obligation for their support. Who have had, more than they,

"That which should accompany old age,
As, honor, love, obedience, troops of friends?"

What a change in all this was wrought by that otherwise beneficent stroke of Abraham Lincoln's pen, January 1st, 1863. Its results to the aged and aging negroes are more perceptible to-day than just after the close of the war. There is a sort of conservatism which modifies the first shock of a great revolution in the condition of a people. Because of this, no immediate and general breaking up of the plantation system occurred in the South in 1865. Many of the planters attempted to farm their lands as before, substituting paid labor for slave labor. In such cases, it made little difference to the kindly owner that the old negroes on the place should be pensioners on the supplies furnished by him for the plantation. But this system is decaying. The owner of broad acres finds it profitable to divide them into "settlements" and rent them to the "hands." Small farms are the order of the day. Many of the thrifty negroes are acquiring the ownership of the "patches" they cultivate. There is no place in these new economies for those who cannot take care of themselves. "Every sun sets upon a change which strips them of some refuge." Many of their old masters have died, unable to survive the wreck of their hopes and their fortunes; most of those who survive are too poor to requite the faithful service of their aged servants with the bounty they would gladly bestow.

It might be supposed that this class of dependent negroes have their natural protectors in their children. But the separation of families which occurred during slavery, and which was one of its admitted evils, in most cases left parents and descendants ignorant even of each other's location. Many tenta-

* General Greene and General Lee are both buried at Dungeness. The place has recently passed into the hands of Mr. Andrew Carnegie, author of "An American Four-in-Hand in Britain."

tive letters addressed to places where a son or daughter was last heard from are confidently intrusted to the detective agency of the mails, and if they come back to the sender from that mute cemetery at Washington, a faith that is stronger than the death of the Dead Letter Office (for it has been reënforced by a dream) will unfailingly appeal to the amanuensis to write another letter to the same address, year after year. There is something pathetic in the launching of these annual missives into the realm of the No-Whither; nor is the pathos destroyed by the clause, which I have never known omitted, "Please send me a little money." In the instances where the separation of families has not occurred, it must be owned that an argument may be found for the development theory of the moral instincts. During the period of slavery, the old were never dependent upon their children, and the sentiment which responds to such a dependence was never awakened. The heart of the negro is kindly, and this sentiment will grow with time and occasion for its exercise; but meanwhile the old people are generally left to shift for themselves.

It was not long after "freedom come" before the freed people saw that they must find some substitute for the loss of the provision which slavery made for them in time of sickness and death. The majority of them were not capable of practicing the present self-denial required for "laying up something for a rainy day." But what was hard to do singly could be easily done by societies. These organizations for mutual help are very numerous throughout the entire South. Their names are startling, such as "The Independent Order of Immaculates," "The Military Sisters," "The White Ring Doves," "The Grand Champions of Distress," "The Rising Stars," etc. There are men's societies and women's societies, while some are composed of both sexes, as the "Sons and Daughters of Jacob." The members contribute monthly dues, usually twenty-five cents, for the following purposes: (1.) When any member is sick, a monthly benefit is paid, and all medicines prescribed by a physician are bought at the expense of the society. (2.) Upon the death of a member, the society pays the funeral expenses, which are on a somewhat extravagant scale, and a small benefit fund, supposed to be sufficient for pressing necessities at that time. The negroes pay a practical tribute to the usefulness of these organizations by sustaining them in spite of frequent defalcations on the part of their officers. The members are almost as loyal to them as to their churches. In all contracts for "service," the colored "help" invariably stipulates for the

day of the monthly meeting and "all de funerals." It will be seen from this description that these societies are mutual, and that, valuable as they are for their members, they do not admit to their benefits the aged who are too poor to pay the dues, or who would be likely in a short time to become charges on the treasury. To sum up the case: The results of emancipation have brought only distressing conditions to the negroes who were aged at the close of the war (many of whom are still living, such is their remarkable longevity) and to those who were at that time too far advanced in years to acquire a competence for themselves before the feebleness of age has come upon them. Deprived of the assured peace and plenty of the old régime, unable to reap any of the benefits of the new, they afford an instance in human life of the truth so often observed in geological history, that types existing at the close of one era and the beginning of another bear the brunt of the change and struggle for existence in an unfriendly environment. The present relation of master and servant is governed purely by business principles. It is not expected that the employer will keep an employé longer than the latter can give value received in work. The relation does not now continue long enough between the same parties to create the sentiments which have been described. The old uncle and the old momma are impossibilities to this generation. Time has broken the die which molded them, and we shall not look upon their like again.

The old plantation parceled out to strange tenants, the old master dead, the children scattered,—Uncle Tom is left without a cabin!

What, then, is the lot of the old negroes? The story of *my* Uncle Tom will partly tell. In it may be seen some of the lights and shadows of slavery. By the will of his master, who lived in one of the border States, he was entitled to manumission upon his arrival at the age of twenty-one. Shortly before that date he was "captured" by a slave-dealer, who paid a part of the profits of his sale to the young spendthrift who had become his master, and who had resolved to "set aside the old man's will." Tom's story of this outrage, delivered from the auction block, was regarded as the best joke of the sale day. No one would put himself to the inconvenience of believing it. But, after all, the lines fell to Tom in pleasant places. That such was his opinion of his lot, he had a unique opportunity of testifying. He became the body-servant of the gallant General B—, who had left one leg in Mexico during the war. Tom accompanied him in his summer

visits to Saratoga, and on one occasion was induced to attend an abolition meeting which was held at that time with no great publicity. A real Southern slave, a victim of the atrocities which were rehearsed, was an interesting figure. A kind-hearted disciple of Garrison, a believer in the "higher law," was so moved upon that he offered Tom money with which to make his escape. To the disgust and indignation of the gathering, Tom declined it. "I'm powerful 'bleeged," he said, "but I doan' know nuthin' 'bout all dis! I gits my keepin' at de hotel and dese clo'es, and 'fore God I doan' have nuthin' to do all de summer but shine one boot a day!"

Tom's master threw himself with Southern ardor into the wild war passion of 1860. He declared that he could stand on his one leg and rout a Yankee regiment with his derringer. He offered to drink all the blood that was spilt. The death of his gallant son was one of the first forms in which his prophecies came home to him. He could not long survive the cause which seemed to him to represent all for which life was worth living. Among the mourners who followed his bier, no one was more sincere than Tom, for Tom was orphaned by his death. Since then, Tom, in his age and feebleness, has maintained a precarious struggle for existence, earning a quarter occasionally by working in a garden or sawing wood about town when the "rheumatics let up" on him. On other days he may be seen on the streets, toiling painfully along with that indescribable motion made by two inward-curved legs, each alternately coming from behind, alongside and in front of the other. His appeal for eleemosynary nickels is made with a removal of the hat—which serves at once to emphasize his bow and collect the coin. His dwelling is an old freight box-car, lifted from its wheels and shoved aside from the busy railroad track. There is a subtle sympathy between the shattered tenement and its worn-out occupant, both left superfluous on the edge of the rushing life which has cast them aside.

But there are two days on which Uncle Tom is in his glory—a sovereign factor in their events. One is election day. In the Southern States poll-taxes are required of all voters under the age of sixty. There is no way of enforcing the payment of these taxes except where the voters have property out of which it may be raised by levy. Since the general ascendancy acquired by the white element in the South, in the years between 1872 and 1876, fully one-half of the negroes have quit voting. Having no stimulus to pay their annual poll-taxes, they are in default for periods ranging from five to ten

years. To bring up these arrears costs more than most of the negroes value the privilege of the ballot. (Thus, indirectly, it is coming to pass that suffrage rests, in the main, upon a property qualification.) Voters over the age of sixty are exempt from poll-taxes. Hence, precious in the eye of the candidate is the aged negro. He is worth more than a score of able-bodied men. In the elections frequently occurring in the South on local option, the liquor men, who receive aid from the West, pay the taxes of their colored allies in order that their votes may be counted; but in other campaigns the election funds are not adequate to such outlays. In the ordinary State and county elections, in which the rival candidates bid for the colored vote, the venerable sovereigns are always in demand. They are treated to free rides to the polls in the "phaetons" which, after they have been worn out by the gentry, are used as hacks. Under shrewd management they are voted, with perfect innocence on their part, early and often. In the elections on the liquor question Uncle Tom is always solid for license. "Whisky was here when I come," says he, "and I want it to stay till I go." "But, Uncle Tom, slavery was here when you came, and you didn't want that to stay." The argument had no force. Uncle Tom had evidently extracted some good out of both evils, and was as unsound on abolition as on prohibition.

The reference to elections brings up the negro problem. In a memorable interview with Mason and Vallandigham, John Brown said in 1859: "This question is still to be settled; this negro question, I mean. The end of that is not yet." This is as true to-day as when it was uttered. Immediately after the war, the bummers who followed the rear of the Federal armies, firing only with the torch, capturing only the jewelry of women, domiciled themselves in the land whose plunder had been their fatness. They became the controlling politicians of the era. They organized the negroes into leagues, and on election days marshaled these solid masses of ignorance with military discipline. Upon their votes these adventurers hoisted themselves and the worst types of their dusky confederates into power, and played such fantastic tricks as the world has never seen since the days of Masaniello. It was the period of negro supremacy—the reign of terror. The "mud-sills" of the social fabric were the pillars of state. "The bottom rail was on top." In the nature of things, this could not last. During the years already mentioned, the white race in the various Southern States, by a desperate struggle, threw

off the intolerable yoke. Their former "governors" returned to the North, one or two of them to figure in records of crime and thus furnished some testimony of the grievousness of the infiction which the South had borne. The means by which this revolution was accomplished are not to be apologized for: they can only be explained.

The instincts are regarded as outside of the region of ethics. The methods which overturned the carpet-bag and negro dynasties find their justification, if anywhere, in the instinct of self-preservation, which is a primary law of social as well as individual life. Of course, the high-souled men, whose simple faith in principle would prefer eternal martyrdom to expediency, protested against this phase of higher law. One of the greatest men in the South said in an address, frankly recognizing the state of public opinion:

"I will add, at the risk of meeting with some dissent possibly in my audience, certainly beyond it, that there is the same reason for rigid honesty in politics and public life, in elections and with electors and elected, as in ordinary private business or personal conduct. The political devil is no more to be fought with fire, without terrible consequences to the best interest of the community, than is the devil of avarice, or of envy, or of ambition, or any other of the numerous devils which infest society."

But the masses of the whites could see no consequences in any mode of riddance so terrible as the political devil of negro domination. When public opinion is practically a unit, there is no dearth of hands ready to execute its decrees.

Since this result has been accomplished, the rights of the colored population have been generally respected by the dominant element. A ruling race may in one day nominally accept its former slaves as its equals before the law; but the real adjustments in habits of thought and conduct must inevitably be gradual. Making allowance for this, it may be affirmed that, as a rule, justice is impartially administered. The purpose is to do that; failures come from the unconscious operation of past influences. The whites tax their property to maintain schools for the colored youth. The negro votes without molestation, and his vote is counted. General Toombs, the "old man terrible" of the South, declares, whenever an interviewer is within range, that every election in the South for ten years has been carried by fraud, intimidation, and violence. But the exaggeration of this statement is obvious from the fact that since the political "redemption" of 1872-6, these methods have been wholly unnecessary. The power of the negro organization has been effectually broken; no attempt to rally its forces on the

color line has had any approach to success. Many of the colored people see that the whites of the South have done as well for them as the rulers they themselves set up. They never got from the latter the promised forty acres and a mule. They realize that they are to stay among the Southern white people, and must earn a living chiefly through their employment and patronage. Political gratitude is a lively sense of future favors, and it is not a special wonder when a "sovereign" who owes his ballot to one political party casts it in favor of the other.

The strongest sentiment among the Southern whites is the determination to maintain their present supremacy. This is the meaning of the *Solid South*—solidarity in favor of home rule, and the domination of her intelligence in public affairs. She is not to be ruled by the blacks, nor by white men at home or from abroad who owe their election exclusively to the blacks. On other questions there are divergences of opinion, but on the color line the unity of public feeling is complete. In such a platform there is nothing of hostility to the African *per se*; no unwillingness to accept him as a citizen with rights which the white man is bound to respect. Indeed, it may be safely said that the temporary reign of the negro was submitted to with more forbearance, and its overthrow accomplished with less of passion and violence, than if the Caucasian and the Chinese had been the parties to the issue. The purpose to retain the political mastery does not rest upon dread of "social equality." Amalgamation of races is too abhorrent to the Southern mind to seem a threatening probability. It has a natural barrier in the instinct of race, and is prohibited by enactments which have been upheld as constitutional in the United States courts. It has been plausibly suggested that the intermingling will begin along the line of the highest development of the black and the lowest of the white; but this is opposed by two facts. (1.) The sporadic cases of miscegenation have occurred among the lowest types of both races. (2.) The highest developments of the negro type scorn such intermarriage with whites as is possible to them. In this fact lies a centrifugal force acting upon the negroes themselves. Of course, so long as there are gradations in society, we shall see exhibitions of that spirit which a French writer has defined "a desire to be equal to one's superiors and superior to one's equals." But among the negroes of intelligence and character, who believe they are as good as the white people because they are what God made them, there is growing up a self-respect and pride of race which forbids a pretentious

intrusion upon the social privileges of the whites. If the public carrier provides equal but separate accommodations for whites and blacks, it would be felt as a confession of personal inferiority, and an affront to their color, to insist upon mixing with the other race. When this view becomes general, as it must with increasing intelligence, the colored flunkey will be outlawed by the contempt of both races. The united feeling which keeps the South together is not founded upon opposition to the social or civil rights of the negro. It rests wholly upon the well-remembered horrors of a former experience, and the profound conviction that neither life, liberty, nor property is safe when it is in the power of the ignorant negro masses. The white element is solid politically simply through fear of a solid black element. No wedge can split the former until one has first penetrated the latter.

Where, then, lies the hope for the political education which the negro can acquire only by the use of the ballot? Obviously, it is to be found only in a state of political parties which will permit the white voters to divide, and, by their division, enable them to divide the four millions of enfranchised blacks.

In the minds of a majority, as I believe, of the Southern people, such a consummation is devoutly wished. The desire for it is based on many grounds. (1.) The danger is recognized of having a party in power without an opposition whose criticism and rivalry are sufficient to inspire a wholesome fear. The recent careers of several State treasurers in the South would have been impossible with an alert and vigilant opposition to scrutinize the administration of the public business. But the national office-holders and their small following have not the number or influence to make the dominant party watchful of its own rascals. (2.) The interest felt by the Southern people in politics is far more general than at the North. This results from the general cast and tendency of the Southern mind. "Its activity ran after affairs. It loved questions at issue. Contest was its delight. This mental predilection found its field of exploit in the twin sciences, politics and jurisprudence. Politics was the science of sciences, the art of arts, the absorbing popular study. Every hotel corridor was an open lyceum, every fireside an embryonic school of statecraft, every dinner-party a meeting of political scientists." These words explain why the South filled so large a place in politics before the war, but no place in literature. The tendency to political activity is as strong as it ever was, but it is cramped by the existing condition of affairs. There is but one side in pol-

itics, and many are beginning to chafe at its procrustean bed. The State offices within the gift of party are too few to "go around." Office-getting is coming more and more into the control of rings. In the "good old times" the party put forward its candidate, fought his battles, gave his barbecues, and paid the campaign expenses. Now all the candidates must enter into a "scramble" for the nomination (which is equivalent to election), and to secure it must ply their own resources. This has brought about a stagnation of political energy which is wholly unnatural to the people. Much of the seeming quietude is only the eager waiting for the stirring of the waters. (3.) Many persons are acting with the dominant party both in the North and South simply because they desire to ally themselves with the virtue and intelligence of their respective sections. This principle of political affinity allows no opportunity for the expression of individual opinion on the tariff, civil-service reform, or any of the questions of the time; yet such differences exist among the Southern people, and are increasing every day. Some of these may be here pointed out.

While the South is solid in its purpose to prevent a recurrence of negro control, yet there is a wide difference of opinion as to the method by which this is to be done. One view of this question has already been indicated — that it would be fortunate if the whites and blacks could be divided on issues which would divide both classes, and thus eliminate the race issue. But there is a strong sentiment which would crystallize into perpetuity the present condition of absolute white rule and negro subjection in political affairs. Its advocates see a menace to their policy in the education of the negro, and they are outspoken in their opposition to it. They claim that the experiment has been tried and failed; that education has had no effect but to make those who have been educated too conceited to work; that in most cases the educated negroes have simply used their advantages to prey on the ignorance of their fellow-men; and that no real progress has been made by the race since the war. It is frequently uncharitable to charge those who hold a doctrine with its logical consequences; yet, while admitting that those who entertain the views just stated would disclaim such an inference, it must be said that the inevitable sequence of their opinions is the reëstablishment of slavery. They are, in the main, the old men, whose opinions are too stiff with the fixity of age to bend to any pressure of truth. But it must also be owned that, even in the rising generation, there are young leaders who have

received no light from the past but the torch of its hatreds, and who flourish that as the only beacon of the future. Opposed to these errors is the spirit of the New South, a phrase which this magazine first made current. Its creed is found in Macaulay's words: "There is only one cure for the evils which a newly acquired freedom produces, and that is *freedom*." The negro must be educated in the responsibilities of citizenship, and this training must be made practical by the use of the ballot. Irrespective of the interests of the black race, the general welfare does not permit a mass of ignorant, easily duped voters in the nation's midst. The work of removing illiteracy which the Southern States have undertaken, but which they are without resources to accomplish, should be generously aided by the large hand of the Nation. The vanity and want of principle exhibited by a few educated negroes are not arguments for keeping millions in ignorance, but rather for removing the ground of conceit and the opportunity for knavery by making education common. Nothing is more beautiful than the zeal of these darkened people for enlightenment for themselves and their children. They have made, since the war, a general improvement, intellectually and morally. It was not to be expected that, in two decades, a nation could rise from a bondage preceded by barbarism to a high plane of development; but the steps of Providence are measured not by years, but centuries. In holding to a faith like this, the New South sees no treason to the Old. Slavery, it holds, was founded on clear constitutional right. "Every man who helped to make the Constitution was responsible for it." The sincerity of its defenders can never be questioned, since they sealed it with their blood. In its tutelage of a barbarous race, the New South sees Providence as clearly as in the freedom for which that made them ready; but she rejoices that slavery has been destroyed and the Union preserved.

The tariff also causes a division of public opinion; and the line of intersection on this subject is naturally coincident with that already drawn. The Old South, exclusively agricultural, was a unit for free trade; while the New, turning its attention to cotton-spinning and mining, favors a policy which will foster these interests. She sees in the tariff a temporary but necessary expedient for the upbuilding of new industries, and is naturally unwilling, after her section has paid tribute for a century to that policy, to abandon it at the very moment when it is beginning to aid in the development of her resources.

Another issue which is deeply agitating the Southern States is the liquor question. It has leaped from Maine to Georgia and from Iowa to Texas. It would seem that the next step which organized society is preparing to take toward the improvement of its conditions is in some way to abate the liquor nuisance as it now exists. This is a social question; yet the fact that it must be settled by election gives it a quasi-political character. Its introduction into party politics is to be deprecated; but if it should force its way there, the party which favored the suppression of the traffic as it is now carried on, or such taxation as would secure from it an indemnity against the cost of its evils, would carry more than half of the Southern States and heavy votes in all of them.

These are a few of the questions which, if the danger of negro ascendancy could be removed, would cleave asunder the "Solid South." If sectionalism could only be allayed in the North, if the handful of federal officeholders in the Southern States would cease their futile efforts to rally the negroes against the whites in general elections, there are thousands of white men ready to vote with those at the North in whom they recognize their natural allies in patriotism and principle. Until this is done, the ghost of negro supremacy will not down, and the friends of the negro at the South will be powerless to aid his sympathizers at the North. The sooner these facts are recognized, the better for those whose welfare they affect.

But there is another day besides that of an election when Uncle Tom will be a great hero. It is the day (may it not hasten!) of his funeral. In the negro mind, Death is a wonder-worker. The proverb that a living dog is better than a dead lion is, with them, exactly reversed. When one of them dies, has not his spirit passed at once to the "hallelujah land," and is not his body to be treated with a reverence befitting so grand a transition? At any rate, on that morning when the news is whispered on ashen lips that Uncle Tom is dead, all his neighbors who are none too kindly now, and all who ever knew him, and all who know that "they're gwine to have a funeralizin'," will vie with each other in the mournful solemnities of the occasion. The brass band will play the Portuguese hymn as the procession moves on to the church; the preacher will "hold his ear to the harp of heaven," and with ecstatic eloquence portray the bliss of "our bereaved brother." And we may be sure that the simple, faithful soul deserves it all.

Walter B. Hill.

THE NEW YORK CITY HALL.

GENERAL VIEW OF THE NEW YORK CITY HALL.

AT this time, when architecture is being revived in America as an art, rather than practiced as a trade, attention is being drawn to the excellence of some of our public buildings erected in the last century or about the beginning of this,—when, fortunately, the purity of style in architecture maintained in England, especially by Sir William Chambers and certain of his pupils, and others, was gaining a footing in this country, and was taking shape in the New York City Hall and some other buildings of the time. If what is said here helps to fix attention upon these old buildings, and to stimulate efforts for their preservation, the object of the writer will have been attained.

When the City Hall was first occupied, in 1811, it had for its nearest neighbors the bridewell close by on the west, the almshouse behind it, and the jail, which was made over into the present Hall of Records. From the portico of the City Hall there was an unbroken view down Broadway, including St. Paul's, the odd little shops that occupied the site of the "Herald" building, the wooden spire of Trinity, and the cupola of Grace Church. Now the post-office shows its ugly back to its classic neighbor, and, on the

northern side, the new court house has been built on the site of the almshouse.

To tell the story of the building of the City Hall in all its details would be impossible here. From corner-stone to parapet it was more than ten years under way. Many a modern settlement has grown to cityhood in less time. The labors and dangers, constructive and financial, connected with it, rivaled those of carrying the gods to Latium. May 26, 1803, the corner-stone was laid in the southeast corner by Edward Livingston, then Mayor of the city.

The preceding three years had been spent by the corporation in the endeavor to settle upon a plan that would be acceptable to all. On March 24, 1800, they had appointed a committee to consider the expediency of erecting a new Hall, and to report their opinion as to the proper place, with a plan of the building, an estimate of the expense, and suggestions for the disposal of the old City Hall. In accordance with this resolution, the committee offered a premium of three hundred and fifty dollars for a plan and elevations of the four facades. From among the plans so obtained one was selected and adopted by the Aldermen, October 4, 1802. On the 11th

of the same month the Common Council appropriated twenty-five thousand dollars toward carrying it out, and appointed a building committee. Opposition to the undertaking now developed itself through a

by the late committee were discharged, and the moneys remaining in their hands were paid over to the city treasurer. The new committee immediately reappointed Mr. McComb architect, and fixed his pay at six dollars a

THE NEW YORK CITY HALL, FROM DRAWING BY W. G. WALL, PUBLISHED DECEMBER 20, 1826.

dilatory resolution offered in the Common Council, December 27. It was ingenuously worded and called for much detailed information. The hope of its promoter was to create dissatisfaction with the adopted plan as being too ornate, too expensive, and larger than the city required. Under the pressure thus brought to bear, the committee, although fully intent upon the use of marble, on February 21, 1803, reported estimates of the cost of using marble and of using stone for the front of the building.

They advised the Common Council that the plan might be somewhat curtailed, especially in the projecting wings, but were unanimously of the opinion that it was advisable that the Hall should be built in accordance with the adopted plans, with the exception mentioned; that the front should be of Stockbridge marble, the sides of Morrisania or Verplanck marble, and the rear of brown stone.

This report was rejected, and at the meeting of the Common Council a week later it was ordered that the committee should be discharged and a new one named, to consist of a member from each ward of the city. Aldermen Oothout, Van Zandt, Brasher, Barker, Minthorne, Le Roy, and Bogardus were accordingly appointed. All persons employed

day for each and every day he should be engaged upon the building.

I have had access to Mr. McComb's papers, which still remain in his family, and which include the original designs, a great part of the working drawings, the diary that he kept pertaining to the building, his accounts of marble, correspondence, etc. Many of the books of his library also remain, and through them one may trace the sources from which he had collected much of the information that enabled him to execute a work which, so long as it stands, will continue to be admired for the purity of the design and the elegance of its execution. It was probably in anticipation of the change which was to take place in the committee that the architect had been instructed on March 10 to make out a plan on a reduced scale, by taking away three windows from the extreme depth of the building, two of them to come away from the depth of the end projections of the main front; and by shortening the length of the building by taking out two windows, and to make estimates accordingly. The reduced plan and estimates were at once furnished, with the information that, should brown stone be used, the cost, exclusive of statuary and bas-relief, would not exceed \$200,000. On the 18th of the same month the new Building Committee

met at the almshouse, and determined "that the reduced plan for building the new City Hall presented by Mr. John McComb should be adopted; that the front, rear, and ends be built of brown freestone; that the said building be erected on the vacant ground between the jail and bridewell; that the wings, in front, range with Murray street, on a parallel line with the fence in front of the almshouse."

On the 21st the committee reported their action to the Common Council, and the plan and estimates above referred to, with the assurance that they had "endeavored to combine durability, convenience, and elegance with as much economy as the importance of the object will possibly admit of." This report was at once

STATUE FROM THE ARCHITECT'S ORIGINAL DESIGN.

confirmed, and \$25,000 placed at the disposal of the committee, with instructions to proceed with the construction of the Hall with all expedition. During this time Mr. McComb had been indefatigable in his efforts to induce the committee to return to the original plan with the use of marble as the building material; and on April 4 they so far relented as to express to the Common Council their doubts as to the propriety of diminishing the length by leaving out two windows of the front. Fortunately, the Common Council seems to have been similarly impressed, and ordered the original dimensions of the front to be restored. Discussion as to the dimensions of the plan then ceased, for under date of the following day Mr. McComb's diary contains this entry:

"April 5.—I marked out the ground for the building, and the cart-men began to dig for the foundation. Previous to this, the Corporation resolved to have the length of the building agreeable to the original design of 215

BIT OF DETAIL OF THE MAIN STAIR-WAY. (FROM THE ORIGINAL DRAWING.)

feet and 9 inches, but insisted on its being reduced in depth as they had directed in March. Reducing the projections in front, I readily agreed to; but cutting off the depth of the building, I contended, was a very bad plan, as it spoils the proportion of the large court-rooms and cramps the whole of the work,—but no

THE CUPOLA, PRIOR TO 1830. (FROM THE ORIGINAL DRAWING.)

arguments could prevail. Several wished to cut off the projection in the rear, and two of the committee insisted that the north front had better be built of blue stone."

Steps were taken to procure the brown stone determined on as the material to be used from New Jersey. A quarry at Newark was leased, and arrangements were made to procure more from Second River. Notwithstanding the unhealthfulness of the city, the construction does not seem to have been retarded, for in the fall of the same year the foundation had been carried to the top of the basement window arches, at a cost of some \$46,000. Meanwhile the views of the committee seem to have been again enlarged, for on September 3 Mr. McComb records that he found some of the members of the Common Council in favor of white stone for the principal fronts, and that he was then requested

JOHN MCCOMB, ARCHITECT OF NEW YORK CITY HALL. (FROM A PAINTING BY WALDO, IN POSSESSION OF THE FAMILY.)

to estimate the additional cost of the use of marble for the three fronts. The estimate was furnished and reported to the Common Council. The report was made in October, and included the following argument in favor of a more liberal expenditure :

"It appears from this [the architect's] estimate, that the difference of expense between marble and brown stone will not exceed the sum of forty-three thousand seven hundred and fifty dollars, including every contingent charge. When it is considered that the city of New York, from its inviting situation and increasing opulence, stands unrivaled; when we reflect that as a commercial city we claim a superior standing, our imports and exports exceeding any other in the United States, we certainly ought, in this pleasing state of things, to possess at least one public edifice which shall vie with the many now erected in Philadelphia and elsewhere. It should be remembered that this building is intended to endure for ages; that it is to be narrowly inspected, not only by the scrutinizing eyes of our own citizens, but of every scientific stranger, and in an architectural point of view it, in fact, is to give a character to our city. The additional expense of marble will be fully counterbalanced when we recollect that, from the elegance and situation of this

building, the public property on the Broadway and Collect will much increase in value, and that the same influence will be extended to property far beyond these limits, and that in the course of a very few years it is destined to be in the center of the wealth and population of this city. A building so constructed will do honor to its founders, and be commensurate with our flourishing situation. Under these impressions, the Building Committee strongly recommend that the front and two end views of the new Hall be built with marble."

The report is in Mr. McComb's handwriting, but is signed by Wynant Van Zandt, Jr.

In accordance with this report, the Corporation authorized the use of marble in the "three fronts," and on November 14 concluded a contract for marble from West Stockbridge, Mass.; the price was \$1.06 per cubic foot, delivered in New York. Under this contract 33,274 feet and 10 inches of marble were delivered. In 1808 the same contractors furnished 2000 feet more, at \$3 a foot. The aggregate of these two bills gives us the amount used in the edifice.

VIEW OF PORTICO.

Nearly all the building material was furnished by contract. The labor was by day's work. By December 1, 1807, the amount expended had reached \$207,000, and the walls were built up to the under side of the second story window-sills. The expenditures were always in excess of the appropriations, and the slowness with which the work was carried on is attributable probably to the reluctance of the Corporation to increase the burdens of taxation. The stirring political contests of the day induced both parties to act with great caution. At the same time, apart from the question of expediency, the ability of the city to raise money for extraordinary purposes was circumscribed.

In 1808 the wages of the stone-cutters was reduced from \$1.25 to \$1 a day, and many were given employment who would otherwise have become a charge upon the city. The building was then retarded on account of

hard times, for the appropriation was small. In the spring of 1810 it was impossible to obtain workmen enough, and delay was caused by the return of prosperity. In the fall of this year, however, the interior walls had been carried up to their full height, and the interior roof of the wings in part slated. The copper for the upper roof, which was imported at a cost of £2425 13s. 9d. sterling, was daily expected. It did not arrive, however, in time to be used before the following spring. Considerable progress had been made toward finishing rooms for the accommodation of the Common Council, Mayor, Clerk, and Comptroller; and in 1811 the city fathers celebrated the Fourth of July in the new Hall.

On the second Monday in August the Aldermen bade adieu to their old quarters, and met for the first time in the room intended for the Mayor. The Comptroller and Street

IONIC ORDER—FIRST STORY.

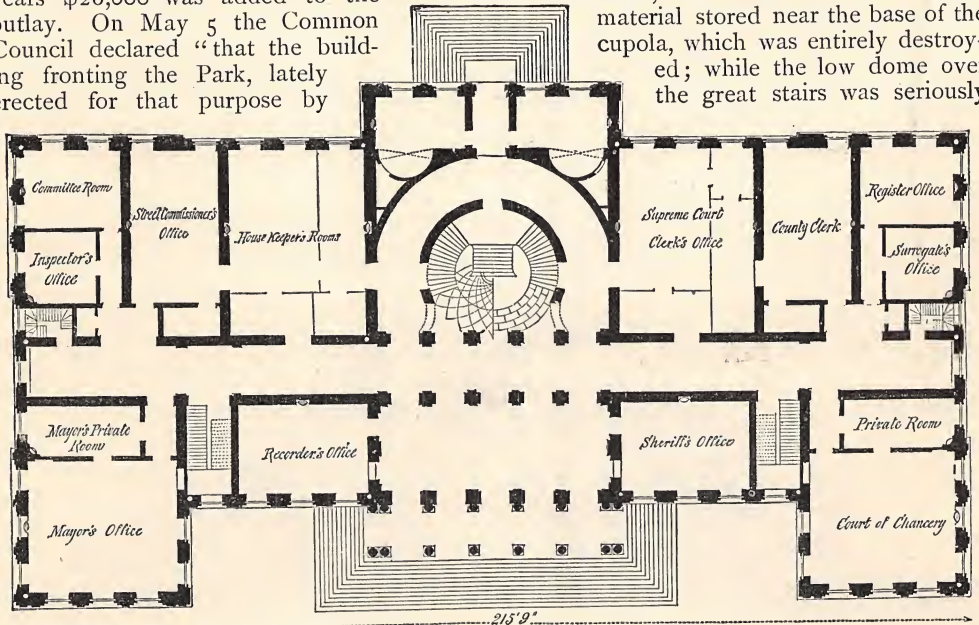

Commissioner moved in at the same time. In October the roof was complete, the window-sashes were about to be put in, and they were waiting for the capitals and statue to complete the cupola. The interior of the west wing, with the housekeeper's apartments, were finished that fall, and the east wing put under scratch-coat. The largest annual outlay was made in 1812, running well up to \$100,000, expended mostly upon the inside finish and embellishment. The center columns over the main stairs were put up, and the front steps were cut and set. During the next two years \$26,000 was added to the outlay. On May 5 the Common Council declared "that the building fronting the Park, lately erected for that purpose by

the corporation, shall be the *City Hall of the City of New York*."

On the corner-stone the building is called the "Hall of the City of New York"; but in 1831 by legislative enactment the designation of 1812 was adhered to. Early in May the old City Hall and grounds were ordered to be sold at auction, and the proceeds devoted to the new building. The old Hall stood nearly upon the present site of the Sub-Treasury at the corner of Wall and Nassau streets, opposite Broad street.

The only notable change that has been made in the exterior of the building was not accomplished without opposition. In the original design, a clock was to have been placed in the middle window of the attic-story front; and when in 1828 the Common Council ordered one to be made, it was at first proposed to place it there. But the Committees on Repairs and Arts and Sciences, to whom the matter had been referred, recommended "that it is altogether practicable to alter the present cupola, by cutting it off near the bottom of the round part and raising it up to receive an octagonal section to show four dials. The proposed alterations, in the opinion of your committee, will not cost more than five or six hundred dollars, and will add materially to the usefulness and beauty of the building."

In the spring of 1830 this change was made, and a clock was placed in the cupola. In August, 1858, a spark from the fireworks displayed from the roof, at the celebration of the successful laying of the first Atlantic telegraph cable, set fire to some inflammable material stored near the base of the cupola, which was entirely destroyed; while the low dome over the great stairs was seriously

PLAN OF PRINCIPAL FLOOR AS FINALLY ADOPTED, APRIL 4, 1803. (FROM THE ORIGINAL DRAWING.)

damaged. Wall's drawing exhibits the cupola as it stood prior to the insertion of the clock, and the cut showing it detached is from the architect's original design. It appears that some slight changes were made during construction. In rebuilding the cupola and the dome over the stairs, but little effort was made to restore more than the general appearance of the originals, which accounts for the present deformity of both.

Notwithstanding this change, and the damage done less by time than by stupidity, the Hall stands to-day unsurpassed by any structure of the kind in the country. The design is pure. No pains or research was spared. The capitals of the first and second orders are marvels of execution. When some fault seems to have been found during the progress of the work by a competitor of the sculptor, in a communication upon that subject to the Building Committee Mr. McComb remarked: "I have visited the carvers' shop almost daily, and have been always pleased with Mr. Lemair's attention, mode of working, and finishing the capitals,—work which is not surpassed by any in the United States, and but seldom seen better executed in Europe, and which for proportion and neatness of workmanship will serve as models for carvers in future." The name of Mr. John Lemair, to whom this compliment was so deservedly paid, will be found cut in the top of the blocking course over the front attic story, together with the names of the Building Committee, architect, and master mechanics. The Ionic columns and pilasters, with their capitals, are remarkably like those in the portico of St. Paul's Church, New York. The latter, however, are fluted and cabled, and in turn resemble those by Ripley in the Admiralty Office, London. The second order is designed after Sir William Chambers, whose work on civil architecture had made its appearance a few years prior to the beginning of the century. The entablature of this order, however, after the Greek, is composed without the dentil, which gives prominence to the modillion and lightens up the cornice, the dentil being introduced in the Ionic order of the first story, where the soffit of the corona is worked into a plain drip with strong effect. The classic detail throughout is admirably wrought. There is a touch of the Adam Brothers in the leaves of the capitals to the pilasters of the attic-story front that is not displeasing. This part of the building has, in fact, never been finished. The undefined want was supplied in the design by a pedimental foil to the base of the cupola, composed of statuary representing the city arms as shown in the illustration, which was

CORINTHIAN ORDER—SECOND STORY. (FROM ORIGINAL DRAWING.)

simply intended to convey the architect's idea. This was to have covered the middle block, while the blocks at either end were to have held respectively the arms of the United States and those of the State of New York. In 1817 Mr. McComb, then Street Commissioner, endeavored to have this carried out, and stated, in a communication to the Common Council, that it had not been done before for the want of a sufficiently skilled resident artist; that a highly recommended sculptor having recently settled here, the difficulty no longer existed. He therefore recommended the subject to the consideration of the Board. The Committee on Arts reported adversely, the estimated cost being \$8,556. The outlay was considered too great. It was the same committee that in 1830 expended about \$6,500 in providing a bell and placing a clock in the cupola. The clock was destroyed in the fire of 1858, and the bell has been removed. In removing the bell, the cornice of the rear was damaged, and the decorative parts that were set aside have never been replaced, but still lie upon the roof. The scales have fallen from the hand of the statue of Justice, and the birds have built a nest in a break in her side. Heaven benignly wards the lightning from the broken rod on the cupola, but seems powerless to prevent the heavy telegraph cables from tugging at the chimneys. One of these wires stretches, other-

wise unsupported, to the roof of the Tract House. Holes for rain-water leaders have been hacked through the cornice, and on the west side the iron rust from a neglected chimney-top has discolored the marble, well down the building.

A glance at the plan of the main floor will serve to show the uses to which the different rooms were at first put. The Mayor's office is the only apartment that has been continuously occupied for the same purpose, and the room over it, which was the original Common Council Chamber, is the only one that retains much of its former appearance. The mantels of this room have been torn out, and the magnificent glass chandelier that hung from its ceiling has disappeared. But despite foreign paint, and dirty and dingy as it is, enough remains and can be retained to give some idea of its former beauty. The original Ionic pillars also remain in the present Aldermen's room, bedizened with color and gilt, but the doors and doorways throughout the building are fairly intact. The Governor's room has been lengthened by including the rooms formerly occupied by the Comptroller and grand jury. The portrait of Lafayette, together with some others, remain in this room, but several good portraits have been removed to glorify other walls. Of the present City Library, located in the south-east wing on the main floor, it were charity to say nothing. A comparison of the Hall of to-day with the Hall of 1814 is unsatisfactory. Yet it would not be difficult to restore much of the original appearance, and the building is as solid as ever.

Of the original plan, as reference has been made to the existing evidences of its origin, a word should be said. Cross-sectioned north and south, it bears a strong resemblance to the Register Office erected, in 1774, in Edinburgh by the Adam Brothers; the main stair-way is very like that in the new Assembly Rooms at Glasgow, built about that time by the same architects, but is superior in grace and proportion. Much of the interior detail shows a careful study of these architects; but the

whole was most influenced by the genius of Sir William Chambers, whose works and productions Mr. McComb admired and followed above all others.

The principal elevations were undoubtedly suggested by Inigo Jones's design for the Palace at Whitehall, of which only the Banqueting House was built.

In fact, it may be said that, in the detail of the exterior and of the marble of the inside, Sir William Chambers was closely imitated; while in the plan and wood-work the Adams, Richardson, and Soane, and the examples in the "Vitruvius Britannicus" of both Campbell and Richardson, were followed to a certain degree. The execution of the wood-carving is inferior to the work done by Mr. Lemair, for great difficulty was experienced in obtaining competent workmen in this department. The aggregate cost of the building, exclusive of furniture, did not exceed half a million of dollars, a generous sum for those days, while some twelve millions are said to have been expended upon the New Courthouse.

John McComb, the architect of the City Hall, was born in this city October 17, 1763. His grandfather was a Malcolm of Scotland, and first settled in Maryland. At the beginning of the Revolutionary war the family removed to Princeton, but at its close returned to New York, where he pursued his studies, and was very successful in his profession. He furnished the designs for the front of the Government House in New York, which was executed in 1790, and for St. John's Church, the Murray and Bleecker Street churches, Washington Hall, and many other public and private buildings in New York, Philadelphia, and throughout the Eastern States. He was a governor of the hospital, "a strong supporter of Fulton, and shared with Clinton the obloquy of the day for his determined advocacy of the Erie Canal." He filled many positions of honor and trust, and died in New York May 25th, 1853.

XXVI.

OUT OF THE FRYING-PAN.

ROUND goes the wheel forever. Another sun rose up, not a moment hurried or belated by the myriads of life-and-death issues that cover the earth and wait in ecstasies of hope or dread the passage of time. Punctually at ten Justice-in-the-rough takes its seat in the Recorder's Court, and a moment of silent preparation at the desks follows the loud announcement that its session has begun. The perky clerks and smirking pettifoggers move apart on tiptoe, those to their respective stations, these to their privileged seats facing the high dais. The lounging police slip down from their reclining attitudes on the heel-scraped and whittled window-sills. The hum of voices among the forlorn humanity that half fills the gradually rising, greasy benches behind, allotted to witnesses and prisoners' friends, is hushed. In a little square, railed space, here at the left, the reporters tip their chairs against the hair-greased wall, and sharpen their pencils. A few tardy visitors familiar with the place, tiptoe in through the grimy doors, ducking and winking, and softly lifting and placing their chairs, with a mock-timorous upward glance toward the long, ungainly personage who, under a faded and tattered crimson canopy, fills the august bench of magistracy with its high oaken back. On the right, behind a rude wooden paling that rises from the floor to the smoke-stained ceiling, are the peering, bloated faces of the night's prisoners.

The recorder utters a name. The clerk down in front of him calls it aloud. A door in the palings opens, and one of the captives comes forth and stands before the rail. The arresting officer mounts to the witness-stand and confronts him. The oath is rattled and turned out like dice from a box, and the accusing testimony is heard. It may be that counsel rises and cross-examines, if there are witnesses for the defense. Strange and far-fetched questions, from beginners at the law or from old blunderers, provoke now laughter and now the peremptory protestations of the court against the waste of time. Yet, in

general, a few minutes suffices for the whole trial of a case.

"You are sure she picked the handsaw up by the handle, are you?" says the questioner, frowning with the importance of the point.

"Yes."

"And that she coughed as she did so?"

"Well, you see, she kind o'—"

"Yes, or no!"

"No."

"That's all." He waives the prisoner down with an air of mighty triumph, turns to the recorder, "trusts it is not necessary to," etc., and the accused passes this way or that, according to the fate decreed,—discharged, sentenced to fine and imprisonment, or committed for trial before the courts of the State.

"Order in court!" There is too much talking. Another comes and stands before the rail, and goes his way. Another, and another; now a ragged boy, now a half-sobered crone, now a battered ruffian, and now a painted girl of the street, and at length one who starts when his name is called, as though something had exploded.

"John Richling!"

He came.

"Stand there!"

Some one is in the witness-stand, speaking. The prisoner partly hears, but does not see. He stands and holds the rail, with his eyes fixed vacantly on the clerk, who bends over his desk under the seat of justice, writing. The lawyers notice him. His dress has been laboriously genteel, but is torn and soiled. A detective with small eyes set close together, and a nose like a yacht's rudder, whisperingly calls the notice of one of these spectators who can see the prisoner's face to the fact that, for all its thinness and bruises, it is not a bad one. All can see that the man's hair is fine and waving where it is not matted with blood.

The testifying officer had moved as if to leave the witness-stand, when the recorder restrained him by a gesture, and, leaning forward and looking down upon the prisoner, asked:

"Have you anything to say to this?"

The prisoner lifted his eyes, bowed affirm-

* Copyright, 1883, by George W. Cable. All rights reserved.

atively, and spoke in a low, timid tone. "May I say a few words to you privately?"

"No."

He dropped his eyes, fumbled with the rail, and, looking up suddenly, said in a stronger voice, "I want somebody to go to my wife—in Prieur street. She's starving. This is the third day"—

"We're not talking about that," said the Recorder. "Have you anything to say against this witness's statement?"

The prisoner looked upon the floor and slowly shook his head. "I never meant to break the law. I never expected to stand here. It's like an awful dream. Yesterday, at this time, I had no more idea of this—I didn't think I was so near it. It's like getting caught in machinery." He looked up at the recorder again. "I'm so confused"—he frowned and drew his hand slowly across his brow—"I can hardly—put my words together. I was hunting for work. There is no man in this city who wants to earn an honest living more than I do."

"What's your trade?"

"I have none."

"I supposed not. But you profess to have some occupation, I dare say. What's your occupation?"

"Accountant."

"Hum; you're all accountants. How long have you been out of employment?"

"Six months."

"Why did you go to sleep under those steps?"

"I didn't intend to go to sleep. I was waiting for a friend to come in who boards at the St. Charles."

A sudden laugh ran through the room. "Silence in court!" cried a deputy.

"Who is your friend?" asked the Recorder.

The prisoner was silent.

"What is your friend's name?"

Still the prisoner did not reply. One of the group of pettifoggers sitting behind him leaned forward, touched him on the shoulder, and murmured: "You'd better tell his name. It won't hurt him, and it may help you." The prisoner looked back at the man and shook his head.

"Did you strike this officer?" asked the Recorder, touching the witness, who was resting on both elbows in the light arm-chair on the right.

The prisoner made a low response.

"I don't hear you," said the Recorder.

"I struck him," replied the prisoner; "I knocked him down." The court officers below the dais smiled. "I woke and found him spurning me with his foot, and I resented it. I never had expected to be a law-breaker.

I—" He pressed his temples between his hands and was silent. The men of the law at his back exchanged glances of approval. The case was, to some extent, interesting.

"May it please the court," said the man who had before addressed the prisoner over his shoulder, stepping out on the right and speaking very softly and graciously, "I ask that this man be discharged. His fault seems so much more to be accident than intention, and his suffering so much more than his fault—"

The Recorder interrupted by a wave of the hand and a preconvinced smile. "Why, according to the evidence, the prisoner was noisy and troublesome in his cell all night."

"Oh, sir," exclaimed the prisoner, "I was thrown in with thieves and drunkards! It was unbearable in that hole. We were right on the damp and slimy bricks. The smell was dreadful. A woman in the cell opposite screamed the whole night. One of the men in the cell tried to take my coat from me, and I beat him!"

"It seems to me, your honor," said the volunteer advocate, "the prisoner is still more sinned against than sinning. This is evidently his first offense, and—"

"Do you know even that?" asked the Recorder.

"I do not believe his name can be found on any criminal record. I—"

The Recorder interrupted once more. He leaned toward the prisoner.

"Did you ever go by any other name?"

The prisoner was dumb.

"Isn't John Richling the only name you have ever gone by?" said his new friend; but the prisoner silently blushed to the roots of his hair and remained motionless.

"I think I shall have to send you to prison," said the Recorder, preparing to write. A low groan was the prisoner's only response.

"May it please your honor," began the lawyer, taking a step forward; but, the recorder waved his pen impatiently.

"Why, the more is said the worse his case gets; he's guilty of the offense charged, by his own confession."

"I am guilty and not guilty," said the prisoner, slowly. "I never intended to be a criminal. I intended to be a good and useful member of society; but I've somehow got under its wheels. I've missed the whole secret of living." He dropped his face into his hands. "O Mary, Mary, why are you my wife?" He beckoned to his counsel. "Come here; come here." His manner was wild and nervous. "I want you—I want you to go to Prieur street, to my wife. You know—you

know the place, don't you? Prieur street. Ask for Mrs. Riley——"

"Richling," said the lawyer.

"No, no! you ask for Mrs. Riley! Ask her—ask her—oh! where are my senses gone? Ask——"

"May it please the court," said the lawyer, turning once more to the magistrate and drawing a limp handkerchief from the skirt of his dingy alpaca, with a reviving confidence, "I ask that the accused be discharged; he is evidently insane."

The prisoner looked rapidly from counsel to magistrate, and back again, saying in a low voice, "Oh, no! not that! Oh, no! not that! not that!"

The Recorder dropped his eyes upon a paper on the desk before him, and, beginning to write, said, without looking up:

"Parish Prison—to be examined for insanity."

A cry of remonstrance broke so sharply from the prisoner that even the reporters in their corner checked their energetic streams of lead-pencil rhetoric and looked up.

"You cannot do that!" he exclaimed. "I am not insane! I'm not even confused now! It was only for a minute! I'm not even confused!"

An officer of the court laid his hand quickly and sternly upon his arm; but the recorder leaned forward and motioned him off. The prisoner darted a single flash of anger at the officer, and then met the eye of the justice.

"If I am a vagrant, commit me for vagrancy! I expect no mercy here! I expect no justice! You punish me first and try me afterward, and now you can punish me again; but you can't do that!"

"Order in court! Sit down in those benches!" cried the deputies. The lawyers nodded darkly or blandly, each to each. The one who had volunteered his counsel wiped his bald Gothic brow. On the recorder's lips an austere satire played as he said to the panting prisoner:

"You are showing not only your sanity, but your contempt of court also."

The prisoner's eyes shot back a fierce light as he retorted:

"I have no object in concealing either!"

The Recorder answered with a quick, angry look; but instantly restraining himself, dropped his glance upon his desk as before, began again to write, and said with his eyes following his pen:

"Parish Prison, for thirty days."

The officer grasped the prisoner again and pointed him to the door in the palings whence he had come, and whither he now returned,

moaning as he went, "O my wife! my wife! O Mary, my wife! my wife!"

Half an hour later the dark omnibus without windows, that went by the facetious name of the "Black Maria," received the convicted ones from the same street door by which they had been brought in out of the world the night before. The waifs and vagabonds of the town gleefully formed a line across the sidewalk from the station-house to the van, and counted with zest the abundant number of passengers that were ushered into it one by one. Heigh ho! In they went. All ages and sorts; both sexes; tried and untried, drunk and sober, new faces and old acquaintances; a man who had been counterfeiting, his wife who had been helping him, and their little girl of twelve who had done nothing. Ho, ho! Bridget Fury! Ha, ha! Howling Lou! In they go; the passive, the violent, all kinds; filling the two benches against the sides, and then the standing room; crowding and packing, until the officer can shut the door only by throwing his weight against it.

"Officer," said one, whose volunteer counsel had persuaded the reporters not to mention him by name in their thrilling account,—"Officer," said this one, trying to pause an instant before the door of the vehicle, "is there no other possible way to——"

"Get in, get in!"

Two hands spread against his back did the rest; the door clapped to like the lid of a bursting trunk, the padlock rattled, away they went!

XXVII.

"OH, WHERE IS MY LOVE?"

At the prison the scene is repeated in reverse, and the Black Maria presently rumbles away, empty. In that building, whose exterior Narcisse found so picturesque, the vagrant at length finds food. In that question of food, by the way, another question arose, not as to any degree of criminality past or present, nor as to age, or sex, or race, or station; but as to the having or lacking fifty cents. "Four bits" a day was the open sesame to a department where one could have bedstead and ragged bedding and dirty mosquito-bar, a cell whose window looked down into the front street, food in variety, and a seat at table with the officers of the prison. But those who could not pay were conducted past all these delights, along one of several dark galleries, the turnkeys of which were themselves convicts who, by a process of reasoning best understood among the harvesters of perquisites, were assumed to be undergoing sentence.

The vagrant stood at length before a grated iron gate while its bolts were thrown back and it growled on its hinges. What he saw within needs no minute description; it may be seen there still, any day: a large, flagged court, surrounded on three sides by two stories of cells with heavy, black, square doors all arow and mostly open; about a hundred men sitting, lying, or lounging about in scanty rags,—some gaunt and feeble, some burly and alert, some scarred and maimed, some sallow, some red, some grizzled, some mere lads, some old and bowed,—the sentenced, the untried, men there for the first time, men who were oftener in than out,—burglars, smugglers, house-burners, highwaymen, wife-beaters, wharf-rats, common “drunks,” pickpockets, shop-lifters, stealers of bread, garroters, murderers,—in common equality and fraternity. In this resting and refreshing place for vice, this caucus for the projection of future crime, this ghastly burlesque of justice and the protection of society, there was a man who had been convicted of a dreadful murder a year or two before, and sentenced to twenty-one years’ labor in the State penitentiary. He had got his sentence commuted to confinement in this prison for twenty-one years of idleness. The captain of the prison had made him “captain of the yard.” Strength, ferocity, and a terrific record were the qualifications for this honorary office.

The gate opened. A howl of welcome came from those within, and the new batch, the vagrant among them, entered the yard. He passed, in his turn, to a tank of muddy water in this yard, washed away the soil and blood of the night, and so to the cell assigned him. He was lying face downward on its pavement, when a man with a cudgel ordered him to rise. The vagrant sprang to his feet and confronted the captain of the yard, a giant in breadth and stature, with no clothing but a ragged undershirt and pantaloons.

“Get a bucket and rag and scrub out this cell!”

He flourished his cudgel. The vagrant cast a quick glance at him, and answered quietly, but with burning face:

“I’ll die first.”

A blow with the cudgel, a cry of rage, a clash together, a push, a sledge-hammer fist in the side, another on the head, a fall out into the yard, and the vagrant lay senseless on the flags.

When he opened his eyes again and struggled to his feet, a gentle grasp was on his arm. Somebody was steadying him. He turned his eyes. Ah! who is this? A short, heavy, close-shaven man, with a woolen jacket thrown over one shoulder and its sleeves tied

together in a knot under the other. He speaks in a low, kind tone:

“Steady, Mr. Richling.”

Richling supported himself by a hand on the man’s arm, gazed in bewilderment at the gentle eyes that met his, and with a slow gesture of astonishment murmured, “Ristofalo!” and dropped his head.

The Italian had just entered the prison from another station-house. With his hand still on Richling’s shoulder, and Richling’s on his, he caught the eye of the captain of the yard, who was striding quietly up and down near by, and gave him a nod to indicate that he would soon adjust everything to that autocrat’s satisfaction. Richling, dazed and trembling, kept his eyes still on the ground, while Ristofalo moved with him slowly away from the squalid group that gazed after them. They went toward the Italian’s cell.

“How are you in prison?” asked the vagrant, feebly.

“Oh, nothin’ much—witness in shootin’ scrape—talk ’bout aft’ while.”

“Oh, Ristofalo,” groaned Richling, as they entered, “my wife! my wife! Send some bread to my wife!”

“Lay down,” said the Italian, pressing softly on his shoulders; but Richling as quietly resisted.

“She is near here, Ristofalo. You can send with the greatest ease! You can do anything, Ristofalo,—if you only choose!”

“Lay down,” said the Italian, again, and pressed more heavily. The vagrant sank limply to the pavement, his companion quickly untying the jacket-sleeves from under his own arms and wadding the garment under Richling’s head.

“Do you know what I’m in here for, Ristofalo?” moaned Richling.

“Don’t know, don’t care. Yo’ wife know you here?”

Richling shook his head on the jacket. The Italian asked her address, and Richling gave it.

“Goin’ tell her come and see you,” said the Italian. “Now, you lay still little while; I be back t’reckly.” He went out into the yard again, pushing the heavy door after him till it stood only slightly ajar, sauntered easily around till he caught sight of the captain of the yard, and was presently standing before him in the same immovable way in which he had stood before Richling in Tchoupitoulas street, on the day he had borrowed the dollar. Those who idly drew around could not hear his words, but the “captain’s” answers were intentionally audible. He shook his head in rejection of a proposal. “No, nobody but the prisoner himself should scrub out the

cell. No, the Italian should not do it for him. The prisoner's refusal and resistance had settled that question. No, the knocking down had not balanced accounts at all. There was more scrubbing to be done. It was scrubbing day. Others might scrub the yard and the galleries, but he should scrub out the tank. And there were other things, and worse—menial services of the lowest kind. He should do them when the time came, and the Italian would have to help him too. Never mind about the law or the terms of his sentence. Those counted for nothing there." Such was the sense of the decrees; the words were such as may be guessed or left unguessed. The scrubbing of the cell must commence at once. The vagrant must make up his mind to suffer. "He had served on jury!" said the man in the undershirt, with a final flourish of his stick. "He's got to pay dear for it!"

When Ristofalo returned to his cell, its inmate, after many upstartings from terrible dreams, that seemed to guard the threshold of slumber, had fallen asleep. The Italian touched him gently, but he roused with a wild start and stare.

"Ristofalo," he said, and fell a-staring again.

"You had some sleep," said the Italian.

"It's worse than being awake," said Richling. He passed his hands across his face. "Has my wife been here?"

"No. Haven't sent yet. Must watch good chance. Git captain yard in good humor first, or else do on sly." The cunning Italian saw that anything looking like early extrication would bring new fury upon Richling. He knew *all* the values of time. "Come," he added, "must scrub out cell, now." He ignored the heat that kindled in Richling's eyes, and added, smiling, "You don't do it, I got to do it."

With a little more of the like kindly guile, and some wise and simple reasoning, the Italian prevailed. Together, without objection from the captain of the yard, with many unavailing protests from Richling, who would now do it alone, and with Ristofalo smiling like a Chinaman at the obscene ribaldry of the spectators in the yard, they scrubbed the cell. Then came the tank. They had to stand in it with the water up to their knees, and rub its sides with brickbats. Richling fell down twice in the water, to the uproarious delight of the yard; but his companion helped him up, and they both agreed it was the sliminess of the tank's bottom that was to blame.

"Soon we get through we goin' to buy drink o' whisky from jailer," said Ristofalo; "he keep it for sale. Then, after that, kin

hire somebody to go to your house; captain yard think we gittin' mo' whisky."

"Hire?" said Richling. "I haven't a cent in the world."

"I got a little—few dimes," rejoined the other.

"Then why are you here? Why are you in this part of the prison?"

"Oh, 'fraid to spend it. On'y got few dimes. Broke ag'in."

Richling stopped still with astonishment, brickbat in hand. The Italian met his gaze with an illuminated smile. "Yes," he said, "took all I had with me to bayou La Fourche. Coming back, slept with some men, in boat. One git up in night time and steal everything. Then was a big fight. Think that what fight was about—about dividing the money. Don't know sure. One man git killed. Rest run into the swamp and prairie. Officer arrested me for witness. Couldn't trust me to stay in the city."

"Do you think the one who was killed was the thief?"

"Don't know sure," said the Italian, with the same sweet face, and falling to again with his brick bat,—“hope so.”

"Strange place to confine a witness!" said Richling, holding his hand to his bruised side and slowly straightening his back.

"Oh, yes, good place," replied the other, scrubbing away; "git him, in short time, so he swear to anything."

It was far on in the afternoon before the wary Ristofalo ventured to offer all he had in his pocket to a hanger-on of the prison office, to go first to Richling's house, and then to an acquaintance of his own, with messages looking to the procuring of their release. The messenger chose to go first to Ristofalo's friend, and afterward to Mrs. Riley's. It was growing dark when he reached the latter place. Mary was out in the city somewhere, wandering about, aimless and distracted, in search of Richling. The messenger left word with Mrs. Riley. Richling had all along hoped that that good friend, doubtless acquainted with the most approved methods of finding a missing man, would direct Mary to the police stations at the earliest practicable hour. But time had shown that she had not done so. No, indeed! Mrs. Riley counted herself too benevolently shrewd for that. While she had made Mary's suspense of the night less frightful than it might have been, by surmises that Mr. Richling had found some form of night-work,—watching some pile of freight or some unfinished building,—she had come, secretly, to a different conviction predicated on her own married experiences; and if Mr. Richling

had, in a moment of gloom, tipped the bowl a little too high, as her dear lost husband, the best man that ever walked, had often done, and had been locked up at night to be let out in the morning, why, give him a chance! Let him invent his own little fault-hiding romance and come home with it. Mary was frantic. She could not be kept in; but Mrs. Riley, by prolonged effort, convinced her it was best not to call upon Dr. Sevier until she could be sure some disaster had actually occurred, and sent her among the fruiterers and oystermen in vain search for Raphael Ristofalo. Thus it was that the Doctor's morning messenger to the Richlings, bearing word that if any one were sick he would call without delay, was met by Mrs. Riley only, and by the reassuring statement that both of them were out. The later messenger, from the two men in prison, brought back word of Mary's absence from the house, of her physical welfare, and Mrs. Riley's promise that Mary should visit the prison at the earliest hour possible. This would not be till the next morning.

While Mrs. Riley was sending this message, Mary, a great distance away, was emerging from the darkening and silent streets of the river front and moving with timid haste across the broad levee toward the edge of the water at the steam-boat landing. In this season of depleted streams and idle waiting, only an occasional boat lifted its lofty, black, double funnels against the sky here and there, leaving wide stretches of unoccupied wharf-front between. Mary hurried on, clear out to the great wharf's edge and looked forth upon the broad, softly moving harbor. The low waters spread out and away, to and around the opposite point, in wide surfaces of glassy purples and wrinkled bronze. Beauty, that joy forever, is sometimes a terror. Was the end of her search somewhere underneath that fearful glory? She clasped her hands, bent down with dry, staring eyes, then turned again and fled homeward. She swerved once toward Dr. Sevier's quarters, but soon decided to see first if there were any tidings with Mrs. Riley, and so resumed her course. Night overtook her in streets where every footstep before or behind her made her tremble; but at length she crossed the threshold of Mrs. Riley's little parlor. Mrs. Riley was standing in the door, and retreated a step or two backward as Mary entered with a look of wild inquiry.

"Not come?" cried the wife.

"Mrs. Richlin'," said the widow, hurriedly, "yer husband's alive and found."

Mary seized her frantically by the shoulders, crying with high-pitched voice:

"Where is he? — where is he?"

"Ye can't see um till marning, Mrs. Richlin'."

"Where is he?" cried Mary, louder than before.

"Me dear," said Mrs. Riley, "ye kin easy git him out in the marning."

"Mrs. Riley," said Mary, holding her with her eye, "is my husband in prison? — O Lord God! O God, my God!"

Mrs. Riley wept. She clasped the moaning, sobbing wife to her bosom, and with streaming eyes said:

"Mrs. Richlin', me dear, Mrs. Richlin', me dear, what wad I give to have my husband this night where your husband is!"

XXVIII.

RELEASE.—NARCISSE.

AS SOME children were playing in the street before the Parish Prison next morning, they suddenly started and scampered toward the prison's black entrance. A physician's carriage had driven briskly up to it, ground its wheels against the curbstone, and halted. If any fresh crumbs of horror were about to be dropped, the children must be there to feast on them. Dr. Sevier stepped out, gave Mary his hand and then his arm, and went in with her. A question or two in the prison office, a reference to the rolls, and a turnkey led the way through a dark gallery lighted with dimly burning gas. The stench was suffocating. They stopped at the inner gate.

"Why didn't you bring him to us?" asked the doctor, scowling resentfully at the facetious drawings and legends on the walls, where the dampness glistened in the sickly light.

The keeper made a low reply as he shot the bolts.

"What?" quickly asked Mary.

"He's not well," said Dr. Sevier.

The gate swung open. They stepped into the yard and across it. The prisoners paused in a game of ball. Others, who were playing cards, merely glanced up and went on. The jailer pointed with his bunch of keys to a cell before him. Mary glided away from the doctor and darted in. There was a cry and a wail.

The doctor followed quickly. Ristofalo passed out as he entered. Richling lay on a rough gray blanket spread on the pavement with the Italian's jacket under his head. Mary had thrown herself down beside him upon her knees, and their arms were around each other's neck.

"Let me see, Mrs. Richling," said the

physician, touching her on the shoulder. She drew back. Richling lifted a hand in welcome. The doctor pressed it.

"Mrs. Richling," he said, as they faced each other, he on one knee, she on both.—He gave her a few laconic directions for the sick man's better comfort.—"You must stay here, madam," he said at length; "this man Ristofalo will be ample protection for you; and I will go at once and get your husband's discharge." He went out.

In the office he asked for a seat at a desk. As he finished using it he turned to the keeper and asked, with severe face:

"What do you do with sick prisoners here, anyway?"

The keeper smiled.

"Why, if they gits right sick, the hospital wagon comes and takes 'em to the Charity Hospital."

"Umhum!" replied the doctor, unpleasantly,— "in the same wagon they use for a case of scarlet fever or small-pox, eh?"

The keeper, with a little resentment in his laugh, stated that he would be eternally lost if he knew.

"I know," remarked the doctor. "But when a man is only a little sick,—according to your judgment,—like that one in there now, he is treated here, eh?"

The keeper swelled with a little official pride. His tone was boastful.

"We has a complete dispensary in the prison," he said.

"Yes? Who's your druggist?" Dr. Sevier was in his worst inquisitorial mood.

"One of the prisoners," said the keeper.

The doctor looked at him steadily. The man, in the blackness of his ignorance, was visibly proud of this bit of economy and convenience.

"How long has he held this position?" asked the physician.

"Oh, a right smart while. He was sentenced for murder, but he's waiting for a new trial."

"And he has full charge of all the drugs?" asked the doctor, with a cheerful smile.

"Yes, sir." The keeper was flattered.

"Poisons and all, I suppose, eh?" pursued the doctor.

"Everything."

The doctor looked steadily and silently upon the officer, and tore and folded and tore again into small bits the prescription he had written. A moment later the door of his carriage shut with a smart clap and its wheels rattled away. There was a general laugh in the office, heavily spiced with maledictions.

"I say, Cap', what d'you reckon he'd 'a' said if he'd aseen the women's department?"

In those days recorders had the power to release prisoners sentenced by them, when in their judgment new information justified such action. Yet Dr. Sevier had a hard day's work to procure Richling's liberty. The sun was declining once more when a hack drove up to Mrs. Riley's door with John and Mary in it, and Mrs. Riley was restrained from laughing and crying only by the presence of the great Dr. Sevier and a romantic Italian stranger by the captivating name of Ristofalo. Richling, with repeated avowals of his ability to walk alone, was helped into the house between these two illustrious visitors, Mary hurrying in ahead, and Mrs. Riley shutting the street door with some resentment of manner toward the staring children who gathered without. Was there anything surprising in the fact that eminent persons should call at her house?

When there was time for greetings she gave her hand to Dr. Sevier and asked him how he found himself. To Ristofalo she bowed majestically. She noticed that he was handsome and muscular.

At different hours the next day the same two visitors called. Also the second day after. And the third. And frequently afterward.

RISTOFALO regained his financial feet almost, as one might say, at a single hand-spring. He amused Mary and John and Mrs. Riley almost beyond limit with his simple story of how he did it.

"Ye'd better hurry and be getting up out o' that sick bed, Mr. Ritchlin'," said the widow in Ristofalo's absence, "or that I-talian rascal 'll be making himself entirely too agree-ble to yer lady here, ha, ha! It's *she* that he's a-comin' here to see."

Mrs. Riley laughed again, and pointed at Mary and tossed her head, not knowing that Mary went through it all over again as soon as Mrs. Riley was out of the room, to the immense delight of John.

"And now, madam," said Dr. Sevier to Mary, by and by, "let it be understood once more that even independence may be carried to a vicious extreme, and that"—he turned to Richling, by whose bed he stood—"you and your wife will not do it again. You've had a narrow escape. Is it understood?"

"We'll try to be moderate," replied the invalid, playfully.

"I don't believe you," said the Doctor.

And his skepticism was wise. He continued to watch them, and at length enjoyed the sight of John up and out again with color in his cheeks and the old courage—nay, a new and a better courage—in his eyes.

Said the doctor on his last visit, "Take good care of your husband, my child." He held the little wife's hand a moment, and gazed out of Mrs. Riley's front door, upon the western sky. Then he transferred his gaze to John, who stood, with his knee in a chair, just behind her. He looked at the convalescent with solemn steadfastness. The husband smiled broadly.

"I know what you mean. I'll try to deserve her."

The doctor looked again into the west.

"Good-bye."

Mary tried playfully to retort, but John restrained her, and when she contrived to utter something absurdly complimentary of her husband, he was her only hearer.

They went back into the house, talking of other matters. Something turned the conversation upon Mrs. Riley, and from that subject it seemed to pass naturally to Ristofalo. Mary, laughing and talking softly as they entered their room, called to John's recollection the Italian's account of how he had once bought a tarpaulin hat and a cottonade shirt of the pattern called a "jumper," and had worked as a deck-hand in loading and unloading steam-boats. It was so amusingly sensible to put on the proper badge for the kind of work sought. Richling mused. Many a dollar he might have earned the past summer, had he been as ingeniously wise, he thought.

"Ristofalo is coming here this evening," said he, taking a seat in the alley window.

Mary looked at him with sidelong merriment. The Italian was coming to see Mrs. Riley.

"Why, John," whispered Mary, standing beside him, "she's nearly ten years older than he is!"

But John quoted the old saying about a man's age being what he feels, and a woman's what she looks.

"Why—but—dear, it is scarcely a fortnight since she declared nothing could ever induce —"

"Let her alone," said John, indulgently. "Hasn't she said half a dozen times that it isn't good for woman to be alone? A widow's a woman—and you never disputed it."

"Oh, John," laughed Mary, "for shame! You know I didn't mean that. You know I never could mean that."

And when John would have maintained his ground, she besought him not to jest in that direction, with eyes so ready for tears that he desisted.

"I only meant to be generous to Mrs. Riley," he said.

"I know it," said Mary, caressingly; "you're always on the generous side of everything."

She rested her hand fondly on his arm, and he took it into his own.

One evening the pair were out for that sunset walk which their young blood so relished, and which often led them, as it did this time, across the wide, open commons behind the town, where the unsettled streets were turf-grown, and toppling wooden lamp-posts threatened to fall into the wide, cattle-trodden ditches.

"Fall is coming," said Mary.

"Let it come!" exclaimed John; "it's hung back long enough."

He looked about with pleasure. On every hand the advancing season was giving promise of heightened activity. The dark, plummy foliage of the china trees was getting a golden edge. The burnished green of the great magnolias was spotted brilliantly with hundreds of bursting cones, red with their pendent seeds. Here and there as the sauntering pair came again into the region of brick sidewalks, a falling cone would now and then scatter its polished coral over the pavement, to be gathered by little girls for necklaces, or bruised under foot, staining the walk with its fragrant oil. The ligustrums bent low under the dragging weight of their small, clustered berries. The oranges were turning. In the wet, choked ditches along the interruptions of pavement, where John followed Mary on narrow plank footways, bloomed thousands of little unrenowned asteroid flowers, blue and yellow, and the small, pink spikes of the water-pepper. It wasn't the fashionable habit in those days, but Mary had John gather big bunches of this pretty floral mob, and filled her room with them—not Mrs. Riley's parlor—whoop, no! Weeds? Not if Mrs. Riley knew herself.

So ran time apace. The morning skies were gray monotones, and the evening gorgeous reds. The birds had finished their summer singing. Sometimes the alert chirp of the cardinal suddenly smote the ear from some neighboring tree; but he would pass, a flash of crimson, from one garden to the next, and with another chirp or two be gone for days. The nervy, unmusical waking cry of the mocking-bird was often the first daybreak sound. At times a myriad downy seeds floated everywhere, now softly upward, now gently downward, and the mellow rays of sunset turned it into a warm, golden snow-fall. By night a soft glow from distant burning prairies showed the hunters were afield. The call of unseen wild fowl was heard overhead, and—finer to the waiting poor man's ear than all

other sounds—came at regular intervals, now from this quarter and now from that, the heavy, rushing blast of the cotton compress, telling that the flood tide of commerce was setting in.

Narcisse surprised the Richlings one evening with a call. They tried very hard to be reserved, but they were too young for that task to be easy. The Creole had evidently come with his mind made up to take unresentfully and override all the unfriendliness they might choose to show. His conversation never ceased, but flitted from subject to subject with the swift waywardness of a humming-bird. It was remarked by Mary, leaning back in one end of Mrs. Riley's little sofa, that "summer dresses were disappearing, but that the girls looked just as sweet in their darker colors as they had appeared in mid-summer white. Had Narcisse noticed? Probably he didn't care for —"

"Ho! I notiz them an' they notiz me! An' thass one thing I 'ave notiz about young ladies; they ah juz like those bird'; in sum-meh lookin' cool, in winteh waum. I 'ave notiz that. An' I've notiz anotheh thing which make them juz like those bird'. They halways know if a man is lookin', an' they halways make like they don't see 'im! I would like to 'ite an i'ony about that—a lill i'ony—in the he'oic measuh. You like that he'oic measuh, Mizzez Witchlin'?"

As he rose to go he rolled a cigarette, and folded the end in with the long nail of his little finger.

"Mizzez Witchlin', if you will allow me to light my ciga'ette fum yo' lamp —? I can't use my sun-glass at night, because the sun is nod theh. But, the sun shining, I use it. I 'ave adop' that method since lately."

"You borrow the sun's rays," said Mary, with wicked sweetness.

"Yes; 'tis cheapeh than matches in the longue 'un."

"You have discovered that, I suppose," remarked John.

"Me? The sun-glass? No. I believe Ahchimides invend that, in fact. An' yet, out of ten thousan' who use the sun-glass only a few can account 'ow 'tis done. 'Ow did you think that that's my invention, Mistoo 'Itchlin'? Did you know that I am something of a chimist? I can tu'n litmus papeh 'ed by juz dipping it in SO₃HO. Yesseh."

"Yes," said Richling, "that's one thing that I have noticed, that you're very fertile in devices."

"Yes," echoed Mary, "I noticed that, the first time you ever came to see us. I only wish Mr. Richling was half as much so."

She beamed upon her husband. Narcisse laughed with pure pleasure.

"Well, I am compel' to say you ah co'ect. I am continually makin' some discove'ies. 'Necessity's the motheh of inventions.' Now thass anotheh thing I 'ave notiz — about that month of Octobeh: it always come befo' you think it's comin'. I 'ave notiz that about eve'y month. Now, to-day weah the twennieth Octobeh! Is it not so?" He lighted his cigarette. "You ah compel' to co'obo'ate me."

XXIX.

LIGHTING SHIP.

YES, the tide was coming in. The Richlings' bark was still on the sands, but every now and then a wave of promise glided under her. She might float, now, any day. Meantime, as has no doubt been guessed, she was held on an even keel by loans from the doctor.

"Why you don't advertise in papers?" asked Ristofalo.

"Advertise? Oh, I didn't think it would be of any use. I advertised a whole week, last summer."

"You put advertisement in wrong time and keep it out wrong time," said the Italian.

"I have a place in prospect, now, without advertising," said Richling with an elated look.

It was just here that a new mistake of Richling's emerged. He had come into contact with two or three men of that wretched sort that indulge the strange vanity of keeping others waiting upon them by promises of employment. He believed them, liked them heartily because they said nothing about references, and gratefully distended himself with their husks, until Ristofalo opened his eyes by saying, when one of these men had disappointed Richling the third time:

"Business man don't promise but once."

"You lookin' for book-keeper's place?" asked the Italian at another time. "Why don't dress like a book-keeper?"

"On borrowed money?" asked Richling, evidently looking upon that question as a poser.

"Yes."

"Oh, no," said Richling, with a smile of superiority; but the other one smiled too, and shook his head.

"Borrow mo', if you don't."

Richling's heart flinched at the word. He had thought he was giving his true reason, but he was not. A foolish notion had floated, like a grain of dust, into the over-delicate wheels of his thought,—that men would employ him the more readily if he looked needy. His hat was unbrushed, his shoes unpolished; he had let his beard come out, thin and untrimmed; his necktie was faded. He looked battered. When the Italian's gentle warning

showed him this additional mistake on top of all his others, he was dismayed at himself; and when he sat down in his room and counted the cost of an accountant's uniform, so to speak, the remains of Dr. Sevier's last loan to him was too small for it. Thereupon he committed one error more,—but it was the last. He sunk his standard and began again to look for service among industries that could offer employment only to manual labor. He crossed the river and stirred about among the dry-docks and shipcarpenters' yards of the suburb Algiers. But he could neither hew spars, nor paint, nor splice ropes. He watched a man half a day calking a boat; then he offered himself for the same work, did it fairly, and earned half a day's wages. But then the boat was done, and there was no other calking at the moment along the whole harbor front, except some that was being done on a ship by her own sailors.

"John," said Mary, dropping into her lap the sewing that hardly paid for her candle, "isn't it hard to realize that it isn't twelve months since your hardships commenced? They *can't* last much longer, darling."

"I know that," said John. "And I know I'll find a place presently, and then we'll wake up to the fact that this was actually less than a year of trouble in a lifetime of love."

"Yes," rejoined Mary, "I know your patience will be rewarded."

"But what I want is work now, Mary. The bread of idleness is getting *too* bitter. But never mind; I'm going to work to-morrow;—never mind where. It's all right. You'll see."

She smiled, and looked into his eyes again with an unreserved confession of trust. The next day he reached the—what shall we say?—big end of his last mistake. What it was came out a few mornings after, when he called at Number 5 Carondelet street.

"The Doctah is not in pwesently," said Narcisse. "He ve'y hawdly comes in so soon as that. He's living home again, once mo', now. He's ve'y un'estless. I tole 'im yes-tiddy, 'Doctah, I know juz 'ow you feel, seh; 'tis the same way with mieseff. You ought to git ma'ied!"

"Did he say he would?" asked Richling.

"Well, you know, Mistoo 'Itchlin', so the povub says, 'Silent give consense.' He juz look at me—neveh said a word—ha! he couldn't! You not lookin' ve'y well, Mistoo 'Itchlin'. I suppose 'tis that waum weatheh."

"I suppose it is; at least, partly," said Richling, and added nothing more, but looked along and across the ceiling, and down at a skeleton, in a corner, that was offering to shake hands with him. He was at a loss how to talk to Narcisse. Both Mary and he had

grown a little ashamed of their covert sarcasms, and yet to leave them out was bread without yeast, meat without salt, as far as their own powers of speech were concerned.

"I thought the other day," he began again, with an effort, "when it blew up cool, that the warm weather was over."

"It seem to be finishin' ad the end, I think," responded the Creole. "I think, like you, that we 'ave 'ad too waum weatheh. Me, I like that weatheh to be cole, me. I halways weigh the mose in cole weatheh. I gain flesh, in fact. But so soon 'tis summeh something become of it. I dunno if 'tis the fault of my close, but I always reduct in summeh. Speakin' of close, Mistoo 'Itchlin',—egscuse me if 'tis a fair question,—w'at was yo' objec' in buyin' that tawpaulin hat an' jacket lass week ad that sto' on the levee? You din know I saw you, but I juz 'appen to see you, in fact." (The color rose in Richling's face, and Narcisse pressed on without allowing an answer.) "Well, thass none o' my bizness, of co'se, but I think you lookin' ve'y bad, Mistoo 'Itchlin' ——" He stopped very short and stepped with dignified alacrity to his desk, for Dr. Sevier's step was on the stair.

The doctor shook hands with Richling and sank into the chair at his desk. "Anything turned up yet, Richling?"

"Doctor," began Richling, drawing his chair near and speaking low —

"Good mawnin', Doctah," said Narcisse, showing himself with a graceful flourish.

The doctor nodded, "Narcisse," then turned again to Richling. "You were saying—"

"I 'ope you well, seh," insisted the Creole, and as the doctor glanced toward him impatiently, repeated the sentiment, "'Ope you well, seh."

The doctor said he was, and turned once more to Richling. Narcisse bowed away backward and went to his desk, filled to the eyes with fierce satisfaction. He had made himself felt. Richling drew his chair nearer and spoke low.

"If I don't get work within a day or two, I shall have to come to you for money."

"That's all right, Richling." The doctor spoke aloud; Richling answered low.

"Oh, no, Doctor, it's all wrong! Indeed, I can't do it any more unless you will let me earn the money."

"My dear sir, I would most gladly do it; but I have nothing that you can do."

"Yes, you have, Doctor."

"What is it?"

"Why, it's this: you have a slave boy driving your carriage."

"Well?"

"Give him some other work and let me do that."

Dr. Sevier started in his seat. "Richling, I can't do that. I should ruin you. If you drive my carriage——"

"Just for a time, Doctor, till I find something else."

"No, no! If you drive my carriage in New Orleans, you'll never do anything else."

"Why, Doctor, there are men standing in the front ranks to-day, who ——"

"Yes, yes," replied the doctor, impatiently, "I know,—who began with menial labor; but—I can't explain it to you, Richling, but you're not of the same sort; that's all. I say it without praise or blame; you must have work adapted to your abilities."

"My abilities!" softly echoed Richling. Tears sprang to his eyes. He held out his open palms,—“Doctor, look there.” They were lacerated. He started to rise, but the doctor prevented him.

"Let me go," said Richling, pleadingly, and with averted face. "Let me go. I'm sorry I showed them. It was mean and foolish and weak. Let me go."

But Dr. Sevier kept a hand on him, and he did not resist. The doctor took one of the hands and examined it. "Why, Richling, you've been handling freight."

"There was nothing else."

"Oh, bah!"

"Let me go," whispered Richling. But the doctor held him.

"You didn't do this on the steam-boat landing, did you, Richling?"

The young man nodded. The doctor dropped the hand and looked upon its owner with set lips and steady severity. When he spoke, he said:

"Among the negro and green Irish deck-hands, and under the oaths and blows of steam-boat mates!—Why, Richling!"—He turned half away in his rotary chair with an air of patience worn out.

"You thought I had more sense," said Richling.

The doctor put his elbows upon his desk and slowly drew his face upward through his hands. "Mr. Richling, what is the matter with you?" They gazed at each other a long moment, and then Dr. Sevier continued: "Your trouble isn't want of sense. I know that very well, Richling." His voice was low and became kind. "But you don't get the use of the sense you have. It isn't available." He bent forward: "Some men, Richling, carry their folly on the surface and their good sense at the bottom,"—he jerked his thumb backward toward the distant Narcisse and added, with a stealthy frown,—“like that

little fool in yonder. He's got plenty of sense, but he doesn't load any of it on deck. Some men carry their sense on top and their folly down below ——"

Richling smiled broadly through his dejection, and touched his own chest. "Like this big fool here," he said.

"Exactly," said Dr. Sevier. "Now you've developed a defect of the memory. Your few merchantable qualities have been so long out of the market, and you've suffered such humiliation under the pressure of adversity, that you've—you've done a very bad thing."

"Say a dozen," responded Richling, with bitter humor. But the doctor swung his head in resentment of the levity:

"One's enough. You've allowed yourself to forget your true value."

"I'm worth whatever I'll bring."

The doctor tossed his head in impatient disdain.

"Pshaw! You'll never bring what you're worth, any more than some men are worth what they bring. You don't know how. You never will know."

"Well, Doctor, I do know that I'm worth more than I ever was before. I've learned a thousand things in the last twelvemonth. If I can only get a chance to prove it!" Richling turned red and struck his knee with his fist.

"Oh, yes," said Dr. Sevier; "that's your sense, on top. And then you go—in a fit of the merest impatience, as I do suspect—and offer yourself as a deck-hand and as a carriage-driver. That's your folly, at the bottom. What ought to be done to such a man?" He gave a low, harsh laugh. Richling dropped his eyes. A silence followed.

"You say all you want is a chance," resumed the doctor.

"Yes," quickly answered Richling, looking up.

"I'm going to give it to you." They looked into each other's eyes. The doctor nodded. "Yes, sir." He nodded again.

"Where did you come from, Richling—when you came to New Orleans—you and your wife? Milwaukee?"

"Yes."

"Do your relatives know of your present condition?"

"No."

"Is your wife's mother comfortably situated?"

"Yes."

"Then I'll tell you what you must do."

"The only thing I can't do," said Richling.

"Yes, you can. You must. You must send Mrs. Richling back to her mother."

Richling shook his head.

"Well," said the doctor, warmly, "I say

you must. I will lend you the passage money."

Richling's eye kindled an instant at the doctor's compulsory tone, but he said, gently:

"Why, Doctor, Mary will never consent to leave me."

"Of course she will not. But you must make her do it! That's what you must do. And when that's done, then you must start out and go systematically from door to door—of business houses, I mean,—offering yourself for work befitting your station—ahem!—station, I say—and qualifications. I will lend you money to live on until you find permanent employment. Now, now, don't get alarmed! I'm not going to help you any more than I absolutely must!"

"But, Doctor, how can you expect——" But the doctor interrupted.

"Come, now, none of that! You and your wife are brave; I must say that for you. She has the courage of a gladiator. You can do this if you will."

"Doctor," said Richling, "you are the best of friends; but, you know, the fact is, Mary and I—well, we're still lovers."

"Oh!" The doctor turned away his head with fresh impatience. Richling bit his lip, but went on:

"We can bear anything on earth together; but we have sworn to stay together through better and worse——"

"Oh, pf-f-f-f!" said the doctor, closing his eyes and swinging his head away again.

"—And we're going to do it," concluded Richling.

"But you can't do it!" cried the doctor, so loudly that Narcisse stood up on the rungs of his stool and peered.

"We can't separate."

Dr. Sevier smote the desk and sprang to his feet:

"Sir, you've got to do it! If you continue in this way, you'll die! You'll die, Mr. Richling—both of you! You'll die! Are you going to let Mary die just because she's brave enough to do it?" He sat down again and busied himself nervously placing pens on the pen-rack, the stopper in the inkstand, and the like.

Many thoughts ran through Richling's mind in the ensuing silence. His eyes were on the floor. Visions of parting,—of the great emptiness that would be left behind,—the pangs and yearnings that must follow,—crowded one upon another. One torturing realization kept ever in the front—that the doctor had a well-earned right to advise, and that, if his advice was to be rejected, one must show good and sufficient cause for rejecting it, both in present resources and in

expectations. The truth leaped upon him and bore him down as it never had done before—the truth which he had heard this very Dr. Sevier proclaim—that debt is bondage. For a moment he rebelled against it; but shame soon displaced mutiny, and he accepted this part, also, of his lot. At length he rose.

"Well?" said Dr. Sevier.

"May I ask Mary?"

"You will do what you please, Mr. Richling." And then, in a kinder voice, the doctor added, "Yes; ask her."

They moved together to the office door. The doctor opened it, and they said goodbye, Richling trying to drop a word of gratitude, and the doctor hurriedly ignoring it.

The next half hour or more was spent by the physician in receiving, hearing, and dismissing patients and their messengers. By and by no others came. The only audible sound was that of the doctor's paper-knife as it parted the leaves of a pamphlet. He was thinking over the late interview with Richling, and knew that, if this silence were not soon interrupted from without, he would have to encounter his book-keeper, who had not spoken since Richling had left. Presently the issue came.

"Dr. Seveeah,"—Narcisse came forward, hat in hand,—"I dunno 'ow 'tis, but Mistoo 'Itchlin' always wemine me of that povvub, 'Ully to bed, ully to 'ise, make a pusson to be 'ealthy an' wealthy an' wise.'"

"I don't know how it is, either," grumbled the doctor.

"I believe thass not the povvub I was thinking. I am acquainting myseff with those povvubs; but I'm somewhat gween in that light, in fact. Well, Doctah, I'm goin' ad the —shoemakeh. I burs' my shoe yistiddy. I was juz——"

"Very well, go."

"Yesseh; and from the shoemakeh I'll go——"

The doctor glanced darkly over the top of the pamphlet.

"—Ad the bank; yesseh," said Narcisse, and went.

XXX.

AT LAST.

MARY, cooking supper, uttered a soft exclamation of pleasure and relief as she heard John's step under the alley window and then at the door. She turned, with an iron spoon in one hand and a candlestick in the other, from the little old stove with two pot-holes, where she had been stirring some mess in a tin pan.

"Why you're"—she reached for a kiss—"real late!"

"I could not come any sooner." He dropped into a chair at the table.

"Busy?"

"No; no work to-day."

Mary lifted the pan from the stove, whisked it to the table, and blew her fingers.

"Same subject continued," she said laughingly, pointing with her spoon to the warmed-over food.

Richling smiled and nodded, and then flattened his elbows out on the table and hid his face in them.

This was the first time he had ever lingered away from his wife when he need not have done so. It was the doctor's proposition that had kept him back. All day long it had filled his thoughts. He felt its wisdom. Its sheer practical value had pierced remorselessly into the deepest convictions of his mind. But his heart could not receive it.

"Well," said Mary, brightly, as she sat down at the table, "may be you'll have better luck to-morrow. Don't you think you may?"

"I don't know," said John, straightening up and tossing back his hair. He pushed a plate up to the pan, supplied and passed it. Then he helped himself and fell to eating.

"Have you seen Dr. Sevier to-day?" asked Mary, cautiously, seeing her husband pause and fall into distraction.

He pushed his plate away and rose. She met him in the middle of the room. He extended both hands, took hers, and gazed upon her. How could he tell? Would she cry and lament, and spurn the proposition, and fall upon him with a hundred kisses? Ah, if she would! But he saw that Dr. Sevier, at least, was confident she would not; that she would have, instead, what the wife so often has in such cases, the strongest love, it may be, but also the strongest wisdom for that particular sort of issue. Which would she do? Would she go or would she not?

He tried to withdraw his hands, but she looked beseechingly into his eyes and knit her fingers into his. The question stuck upon his lips and would not be uttered. And why should it be? Was it not cowardice to leave the decision to her? Should not he decide? Oh! if she would only rebel! But would she? Would not her utmost be to give good reasons in her gentle, inquiring way why he should not require her to leave him? And were there any such? No, no. He had racked his brain to find so much as one, all day long.

"John," said Mary, "Dr. Sevier's been talking to you."

"Yes."

"And he wants you to send me back home for a while."

"How do you know?" asked John, with a start.

"I can read it in your face." She loosed one hand and laid it upon his brow.

"What—what do you think about it, Mary?"

Mary looking into his eyes with the face of one who pleads for mercy, whispered, "He's right," then buried her face in his bosom and wept like a babe.

"I felt it six months ago," she said later, sitting on her husband's knee and holding his folded hands tightly in hers.

"Why didn't you say so?" asked John.

"I was too selfish," was her reply.

When on the second day afterward they entered the doctor's office, Richling was bright with that new hope which always rises up beside a new expedient, and Mary looked well and happy. The doctor wrote them a letter of introduction to the steam-boat agent.

"You're taking a very sensible course," he said, smoothing the blotting-paper heavily over the letter. "Of course, you think it's hard. It is hard. But distance needn't separate you."

"It can't," said Richling.

"Time," continued the doctor—"may be a few months—will bring you together again, prepared for a long life of secure union; and then, when you look back upon this, you'll be proud of your courage and good sense. And you'll be——" He inclosed the note, directed the envelope, and, pausing with it still in his hand, turned toward the pair. They rose up. His rare, sick-room smile hovered about his mouth, and he said:

"You'll be all the happier—all three of you."

The husband smiled. Mary colored down to the throat and looked up on the wall, where Harvey was explaining to his king the circulation of the blood. There was quite a pause, neither side caring to utter the first adieu.

"If a physician could call any hour his own," presently said the doctor, "I should say I would come down to the boat and see you off. But I might fail in that.—Good-bye."

"Good-bye, Doctor."—A little tremor in the voice.—"Take care of John."

The tall man looked down into the upturned blue eyes.

"Good-bye!" He stooped toward her forehead, but she lifted her lips and he kissed them. So they parted.

The farewell with Mrs. Riley was mainly characterized by a generous and sincere ex-

change of compliments and promises of remembrance. Some tears rose up; a few ran over.

At the steam-boat wharf there were only the pair themselves to cling one moment to each other and then wave that mute farewell that looks through watery eyes and sticks in the choking throat. Who ever knows what good-bye means?

"DOCTOR," said Richling when he came to accept those terms in the doctor's proposition which applied more exclusively to himself, — "no, Doctor, not that way, please." He put aside the money proffered him. "This is what I want to do: I will come to your house every morning and get enough to eat to sustain me through the day, and will continue to do so till I find work."

"Very well," said the doctor.

The arrangement went into effect. They never met at dinner; but almost every morn-

ing the doctor, going into the breakfast room, met Richling just risen from his earlier and hastier meal.

"Well? Anything yet?"

"Nothing yet."

And unless there was some word from Mary, nothing more would be said. So went the month of November.

But at length, one day toward the close of the doctor's office hours, he noticed the sound of an agile foot springing up his stairs three steps at a stride, and Richling entered, panting and radiant.

"Doctor, at last! At last!"

"At last, what?"

"I've found employment! I have, indeed. One line from you, and the place is mine! A good place, Doctor, and one that I can fill. The very thing for me! Adapted to my abilities!" He laughed so that he coughed, was still, and laughed again. "Just a line, if you please, Doctor."

(To be continued.)

" *THY KINGDOM COME!* "

BATTLE's red banner frights the shrinking sky,
His fierce foot tramples earth's prone, rended heart;
But some time will be hushed his orphan's cry,
And Peace rejoice in meadow and in mart.

Wrong throttles Right, Injustice reigns in guile,
Self, the base robber, riots mid his gains;
But some time Right will come with golden smile,
Victorious virtue spread its heavenly reign.

Genius, unnoticed, shrinks at jest and sneer;
Wealth, Rank combine to blight his glorious life;
But some time up his bay-wreathed brow will rear,
And his keen sword hew way amid the strife.

Money reigns king: its slaves cheat, lie, and steal,
Mean flatterers bow the knee and bare the head;
But some time Worth his presence will reveal
And spurn the spaniels with his stately tread.

Hail the blest time! 'twill not be alway night!
Earth's sounding song will not be ever dumb!
Hasten, O Thou, Thy grand Millennial light!
Sovereign and Father! "Let Thy Kingdom Come!"

Alfred B. Street.

AMONG THE MAGDALEN ISLANDS.

THE CRUISE OF THE "ALICE MAY." III.

HAVING arrived at the Magdalen Islands, we anchored at Havre Aubert, the chief town. There is a small, snug port here, but difficult to enter, and the channel is narrow and only good for small vessels. The roads are formed by the bight inside of the group, which are so situated as to resemble a boot. This anchorage is reasonably secure in good weather, but is open to northerly and easterly winds. Vessels caught there in a gale of wind dodge around the islands, unless the wind shifts too rapidly for this manœuvre to be accomplished.

In the memorable cyclone of 1873 a large fleet of American mackerel schooners were making a lee at Amherst, when the storm suddenly shifted from south-west to north-east. Thirty-one schooners were driven on shore at their anchors in an hour, and proved a total loss.

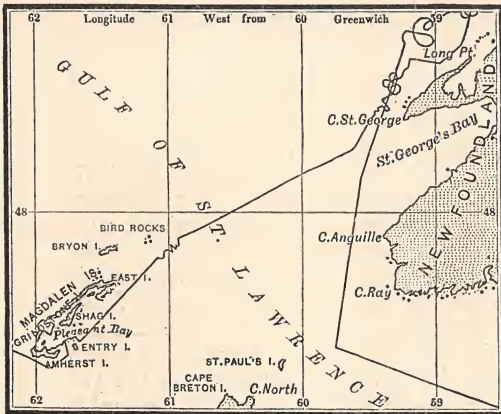

There is nothing very inspiring about the insular metropolis called Havre Aubert. It receives character from the lofty eminence called *Demoiselle Hill*, which springs vertically from the sea. But there is an extraordinary air of solitude and woe-begoneness over the place, which grows on one, because there are no trees or shrubs, and the wrecks bleaching in the slime or on the beach seem to suggest that this is the grand central spot to which decayed vessels come, a sort of hospital for disabled and superannuated ships. And indeed, no place in the world is responsible for more shipwrecks than this savage, solitary cluster of sand dunes in the Gulf of St. Lawrence.

The Magdalen Islands extend about sixty miles north and south. The main group is practically one island; that is, it consists of several islands composed of real soil and rocks more or less covered with trees, connected by long stretches of sand which are broken at intervals by inlets. Between are shallow lagoons, generally not deep enough for a boat. Thus Amherst is connected with Grindstone Island, and Grindstone and Alright are connected with Coffin Island. Were it not for the inlets, one might go continuously dry-shod from Amherst to Coffin Island. But the water in the inlets is so shoal that in places they can be forded — not, however, without some danger, as quicksands abound. Several detached islands lie outside of the main group. These are Deadman Island, Entry, Bird Rock,

and Bryon islands. The last is a great resort of sea-birds, and offers manifold attractions to naturalists and sportsmen.

These islands were a royal grant to Admiral Coffin in the last century. They are peopled, with the exception of Entry Island, by Acadian French, who retain all the characteristics of their race. The present population is 4,316. It is curious that, although the French were but a short time in Acadie, yet the impression of the life there and their subsequent expulsion is yet so vivid that the good people of these islands visit Canada as an American returns to England, as though it were the old home. They are a quiet, well-behaved folk, somewhat inclined to indolence. But they can hardly be blamed for lack of enterprise and spirit when the circumstances in which their lives have been cast are so forbidding. For six months in the year they are shut out from the rest of the world by the ice which incloses the islands. They might as well be at the south pole. Two years ago a cable was laid to Prince Edward Island, but it does not extend to the detached islands, and does not appear to be of much use to any of them. When we were there, the operator at Havre Aubert was absent; he had actually left for the main-land, to be gone several weeks. During the summer a steamer runs from Pictou to Amherst. She is old as the "remainder biscuit after a voyage," and plies twice monthly on this course when really unfit for service, probably because the good people of these islands are charitably supposed to be more ready to go to heaven by sea than most travelers. Almost the sole means of livelihood is found in the fisheries, and when these fail, which is not rarely, life becomes a burden. Last year a famine occurred which came within an ace of decimating the population. The fisheries had been a failure; then the ship which was expected to bring the winter's supply of flour before the ice formed foundered in a storm. By the time spring came, starvation stared the people in the face. Many would have died if it had not been that a large ship with produce was wrecked on the ice off Coffin Island. The news spread like wild-fire. The whole population turned out, and from the cargo of a shipwrecked vessel drew a new lease of life. But these repeated calamities are at last having their effect. The people are attached to

these naked isles, for here is their home. But fate is against them, and, scraping together a few dollars, they are gradually emigrating to Labrador or Canada. During the long winters they sometimes catch seals on the ice, occasionally upwards of 30,000 in one season. The hunt after seals is one of the most exciting incidents of winter-life at these desolate isles. The ice forms for several miles entirely around the group, besides welding them fast together with its iron-like grip.

MAP OF THE CRUISE FROM THE MAGDALEN ISLANDS TO CAPE ST. GEORGE.

The seals have no regular haunt, but are liable to appear at any spot. A keen look-out is kept for them, and from the hills their dark forms can be discerned for a long distance away on the ice. When they are discovered the news spreads rapidly. From every quarter the people hasten toward the prey in feverish excitement, armed with knives, clubs, and spears. In their eagerness these sportsmen often forget all caution, and venture out a long distance from the shore. But this is attended with great hazard, as a sudden wind is liable to break up the ice, which is, in any case, brittle along its outside barrier. Every winter one or two men are lost in the seal hunt. A year or two ago three poor fellows were carried off on a cake of floating ice before the eyes of their neighbors, who were helpless to aid.

Another winter occupation here is to go to the forests of dwarf spruce at Amherst and Grindstone Islands and build fishing boats and small schooners. When the vessel is completed, the owner invites his neighbors to help him haul her to the beach; she is drawn thither on rollers and launched on the ice. After that follows a dance, for which he provides simple refreshments. Liquors, it may be added, are little drunk here, chiefly because of a prohibitory law. Seven lobster canneries have been established quite recently

which give employment to a number; 434,758 lobsters were exported in 1881. But the continuance of even this business is precarious, as it depends upon the lobsters, which are liable to take a sudden whim, like the mackerel, and leave for other parts. The cannery of our courteous consular agent, Mr. Ogilby, at Amherst, is a very well regulated establishment, and due regard seems to be given to the condition and cleanliness of the lobster before it is canned, which is a matter very little considered at some lobster factories which we might name. Capitalists have repeatedly offered to purchase the Magdalen Islands of Colonel Coffin, their present owner. There is considerable coloring matter in the soil, which it is thought might be turned to account for pigments. But the proprietor justly reasons that, if any one is willing to give \$30,000, the sum offered, the islands must undoubtedly be worth more. The revenue from the islands is trifling; but to a man of large fortune like him, it is interesting to be called Lord of the Magdalen Islands, and to hold them, as it were, in fief to the Crown. He charges a mere nominal annual rent of one shilling the acre, and does not press his tenants for immediate payment. It would, therefore, be difficult to foment rebellion here.

The Magdalen Islands were a few years ago one of the most frequented resorts of the Gloucester fishermen. Sometimes one hundred and fifty sail might be seen fishing there at one time. At night or in foul weather they would run in and make a lee in the bight of the islands. At such times there have been upward of ten hundred fishermen on shore. Often they were noisy and "flown" with liquor, and great merriment and rioting, as one might easily imagine, was the result, frequently to the annoyance of the inhabitants, among whom there were not all told that number of male adults. But these fishermen were, on the other hand, an appreciable source of revenue, the loss of which is greatly felt since our schooners ceased to frequent the Gulf. The great storm previously alluded to appears to have had a depressing influence on the mackerel.

Havre aux Maisons, or House Harbor, is next in size to Havre Aubert, and the only other inclosed port in the group. But the entrance is tortuous and difficult; and in order to avoid getting the *Alice May* again aground, we decided to leave her at Amherst, with directions to run her into the inner harbor in case it came on to blow from the north-east, while we proceeded to Grindstone Island in one of the large schooner-rigged fishing-boats of Amherst. It was thirty feet long and shaped

THE DASH TO AMHERST.

somewhat like a whale-boat. She was manned by a highly respectable old French fisherman, whose hair was grizzled, and whose features were seamed and bronzed by a life of hardship and danger. His son accompanied us. We were privately informed that they belonged to upper society at Amherst, for the sister of the old man lived in one of the best houses there, and kept a boarding-house, although boarders must be rather scarce. There was much quiet dignity in the bearing of this venerable habitant, albeit he wore a sou'wester and smoked a spliced clay pipe. The crow's feet in the corners of his dimmed eyes, the hard look as he gazed over the sea, and the pursed-up mouth indicated the struggles of a long life of sea toil and suffering. We started with a strong breeze at early morning. It was blowing half a gale, and our sails were reefed down. But the wind moderated as the sun rose higher, and the distance of nine miles across the bay was made in good season.

Things were apparently more quiet at Havre aux Maisons than at Amherst. The liveliest object there was the sail-boat which ferried across the inlet from Grindstone to Alright. But in reality there is more commercial activity here than at any other port in the Magdalen. This is due, in part, to the energy

of M. Nelson Arseneaux, who owns several schooners and a trading establishment, besides vats for trying out seal oil. He is a man of frank and hearty disposition and of hospitable bent. He is ever ready to extend a welcome to travelers; and those who have experienced his courtesy will always remember him and his amiable family with lively interest.

We found a comfortable lodging and capital board at the house of Madame Baudreau, a native of Nova Scotia, whose Highland origin is unmistakably evident in her matronly features, her galliard manner, ready wit, and keen intelligence. If a beneficent Providence had placed her in a more active society, she would have been a woman of affairs. Her husband superintended a lobster cannery at Grand Entry Island, while she remained at home and gave a lodging to such stray wanderers as might come there during the summer. She had the history of the island and its every inhabitant at her fingers' ends. Excellent, also, were the meals she served. It is a fact worth remembering that women of masculine strength of character are generally good cooks. The islands are so poor that any attempt at an elaborate *menu* must prove a failure there. There is much, however, in cooking well what is at hand,

THE OLD SKIPPER.

and in this quality our hostess excelled. The chops were admirable; the wild strawberries and cream were delicious; the tea was steeped just enough, and the potatoes were mealy and toothsome.

To cap the climax, Madame gave us at breakfast trout that Lucullus might have envied. Noble three- and four-pound trout they were, and cooked as if Izaak Walton himself had been there to give directions. There was no difficulty in swallowing these beautiful fish; but when it came to swallowing the account of the manner in which they were caught, there was some demur. I tell the story, but do not vouch for it; although, as I heard it elsewhere also, without any collusion between the narrators, it would seem to have some basis in fact. These fish were caught by hand; not with a net or a gaff, but actually by grasping them with the bare hand, and taking them out of the water! No fly-makers or rod-fashioners need expect custom for their wares in places where trout are caught by hand. The explanation given is that the streams are very small, which is perfectly true; and that, when the fish get up near the head of the brook, it becomes so narrow and shallow that a three-pound trout finds it hard work to turn around. While the fish are in this predicament, an active lad can get a fast hold of them and land them on the grass.

After returning from mass, Madame Baudreau placed her carriage at our disposal. It was after the latest style of phaeton in use at the islands; to be sure, it looked like a very primitive sort of a cart, but it was the only sort of vehicle to be had; and although its jolting made our teeth chatter, we had a very jolly ride to the fishing village of Étang du Nord. The distance was five miles over a very broken country. This village is by far the most bustling of any settlement in the group. It appears even more populous than it is, because the shore of the semicircular harbor is lined with fish-houses built on piles, which look very much like the huts of the lake-dwellers of Switzerland. A large fleet of fishing-boats belong to this place, and when they are at anchor on a holiday, or during a westerly gale, the little port has a most animated appearance.

At a cost which it would seem must be altogether beyond the means of the poverty-stricken people, a breakwater is in course of construction across the mouth of the harbor, which lies exposed to north and west winds. The great drawback to Étang du Nord is the unspeakable filth around the fish-houses. The stench of decaying fish exceeds belief. A board of health would seem a prime requisite at this place.

It was pleasant to turn from these fish-

houses to a characteristic scene, to which we were attracted by the sweet strains of a violin floating on the calm summer air. On proceeding in the direction from which it came, we discovered the village musician seated bare-headed on the door-step of a small house, absorbed in the harmonies of the fiddle-bow.

scouring the neighborhood, we succeeded in obtaining two carts and a guide, who would also bring back the vehicles. Passing again through Étang du Nord, we entered on the dunes, and for some ten miles the course lay along a beach of sand, through which the wheels were dragged with difficulty. The strong north-

ÉTANG DU NORD.

He was a character whose fine cranial development and sapient eye might have enabled him easily to pass himself off for a philosopher. We set him down as the village pedagogue, if there be one—a question we did not ask. Around him a group of eager listeners had collected. Some were seated on chairs or stools; others had planted themselves on the ground; while the younger members of this rustic audience lay on their stomachs, supporting their faces on their elbows and flourishing their feet in the air. It was a delicious bit of nature, unaffected by the restraints of city life. A far greater musician might envy the uncritical delight with which the audience testified their appreciation of the pleasure afforded them.

The following day opened with a gale of wind, which sang wildly over the lonely wolds of Grindstone Island. As it was blowing too hard for the boat, and we had no time to lose, we decided to return to Havre Aubert by land along the sand dunes. The fords had been shifted by recent storms, and we were told that the passage was more hazardous than it had been for years. But a man had been over the road the previous week without accident, and we decided to take the risk. After

west wind drove the great breakers shoreward on our right with deafening thunder. At times the surf encroached on our path and splashed over the wheels. Wrecks, or the skeletons of ill-fated vessels, were seen frequently, either entirely exposed or deeply embedded in the sand. Many a poor ship has been picked up by these dunes at night, or driven on them by the fury of irresistible tempests. Water was on either hand—the open sea on the right and a great lagoon on the left. The gusts swept furiously over that scene of solitude and desolation. The air was misty with spray, and the screaming fish-hawks and cormorants wheeled past us like lightning borne down on the wind. Like a gray cloud, Deadman Island loomed faintly in the southern horizon. Not a soul was in sight on that desolate shore. Alone, we labored slowly over the sand toward Amherst, which looked far enough away directly ahead. At last we arrived at a place where a long break occurred in the beach on which we were traveling. Before us rolled the sea. We could reach the opposite shore only by venturing to try a shoal which lay across the inlet, curving inward, and somewhat removed from direct exposure to the surf, or it would have been impassable.

THE FIDDLER.

The ford was marked by twigs fixed in the bottom at rare intervals, and also by land bearings known to the guide. But it was narrow, and great care was necessary to avoid getting into deep water. The water came up repeatedly over the hubs into the bottom of the carts. The poor horses panted with the exertion. The passage was successfully accomplished after we had proceeded a distance of a mile through the water. From that point there were no further difficulties to encounter, and we stopped to rest the horses and partake of the lunch we had brought. What we had most apprehended was the quicksands, exceedingly subtle foes, which take one unawares, and out of which there is no escape. Having passed this danger, we were able to enjoy our sandwiches and pipes with unusual zest, as we sat under the lee of a great white sand-hill, over which the wind whistled with a shrill wail.

The shores of Amherst Island, to which we had crossed, were quite different from those of Grindstone Island. There we traversed a bare beach of fine sand; but here we found a line of high and very picturesque sand-hills, covered with long salt grass, running along the coast like a breastwork erected to protect the land from the ravages of the sea. Many highly pictorial effects, replete with sentiment, presented themselves as we slowly rode to-

ward the hills of Amherst. When we reached there we found a soil sufficiently rich to support forests of dwarf spruce and pine, and farther on, to yield potatoes and cabbages. From these spruce trees the islanders brew spruce beer, which is the chief beverage in the Magdalen Islands.

At Anse aux Cabanes the cliffs became abrupt, and we found a small cove where a group of fishing-boats were drawn up on the beach. A little beyond this we came to a lake forming the foreground of a very agreeable landscape, whose features were so combined as to suggest some fair prospect in southern seas instead of an actual scene in the bleak Magdalen Isles. In the extreme distance the noble outline of Entry Island loomed up beyond the blue sea, suffused with a deep, warm lilac hue; the water was of a superb azure, like amethyst and turquoise. Demoiselle Hill gave emphasis to the middle distance, and a lawn-like slope, clothed in verdure, encircled the small lake which formed the foreground of an exquisite natural composition.

We reached Havre Aubert without further incident, and went on board our schooner hungry as wolves. We found calkers in possession of the deck. The heat at Gaspé had melted the tar out of the seams, and our cabin had for several days leaked badly.

Captain Welsh had succeeded in engaging calkers when at mass on the previous Sabbath. It was difficult to get them at this season, as it was the time for making hay at the Magdalen Islands—that is, for catching fish, which is the chief harvest of the people.

On the following day the sky was reasonably clear, but looked smoky in the south-

tinted red and brown, are to be seen in its entire circuit, which, at the eastern end, are over four hundred feet high. A most beautiful undulating plateau, covered with long waving grass, breast high, on the western half of the island, rises, first gradually, then rapidly, into a central range, terminating in twin peaks, the loftiest of which is called St. Law-

CROSSING THE FORD TO AMHERST.

west, and the glass was falling; but we concluded to run over to Entry Island at least, where we could make a lee if it should blow hard. Before starting, we laid in a supply of eggs and salt herrings, and were lucky enough to meet a woman with a bucket full of wild strawberries. They were so ridiculously cheap, that for two days all on board luxuriated on the berry of which Walton said, "Doubtless God might have made a better berry, but doubtless He never did."

A boat having come over from Entry Island to trade, we secured one of her crew to pilot us to a good anchorage there, and made sail. A very fresh breeze of wind drove us rapidly across the bay. We came to anchor under the lee of a sandy point and bar. The appearance of Entry Island is very impressive, differing altogether from that of the islands already described. It stands entirely isolated, ten miles from Havre Aubert. It is about three miles long, and in proportion to its size as mountainous as Madeira. Abrupt and magnificently shaped cliffs, beautifully

rency Hill, and is about six hundred feet high. The adjoining height is absurdly called Pig Hill. The slopes are partly covered by a miniature forest of dwarf cedars and spruces, which look like forest trees of larger growth. The soil is arable, and affords fine grazing. The summit of St. Lawrence Hill was whitened by a flock of nibbling sheep.

We landed on a sand beach near two lofty columnar red rocks, grotesquely shaped and called the Old Man and Old Woman. These names frequently occur in the nomenclature of those waters. From the frequent repetition of geographical epithets in the Gulf of St. Lawrence, one has a right to infer paucity of invention or verbal weakness among the early navigators who opened those regions. It was a good two miles' walk to the settlement, which is near the center of the island. The general aspect of things at Entry seemed like Pitcairn's Island, and I was constantly haunted by the idea that I was there. Entry Island is shaped something like a tadpole, a long point running out toward the west.

We first went to the light-house. It is kept by Mr. James Cassidy, a very civil and intelligent man, who has been there since the light was first erected. He invited us into his house, which adjoins the tower. Mrs. Cassidy also received us with refined affability. Books and magazines were abundant on the tables, and there was a true home-like aspect to everything about the house, which seemed very attractive, and was almost unexpected in that solitary spot. Mrs. Cassidy lamented the lack of educational advantages at Entry Island, and said she had been obliged to send her children to Nova Scotia for a schooling. She seemed to occupy an unusually lonely position, because the house is a mile from any other and the Cassidy's are entirely unrelated to the other residents at Entry.

After buying a sheep from Mr. Cassidy, we rambled over to Mrs. Dixon's house. This is the oldest of the ten dwellings on the islet, and she is both the oldest inhabitant and the first settler. Mrs. Dixon is now eighty-eight years of age, and came to Entry Island with her husband in 1822, sixty years ago. Still hale and hearty, she is full of animation and keen observation, and is virtually the queen of Entry Island, for she has twelve children and forty-seven grandchildren, besides a number of great-grandchildren, all of whom, with one or two exceptions, live there. There are ten families at Entry, all but one of whom are related to her; she is looked up to by all with reverence; her advice is asked and her counsels are followed, and she rules by a sort of mild patriarchal sway.

On reaching Mrs. Dixon's, we were cordially invited to enter, and bowls of fresh milk were brought to us. A flock of rosy, barefooted grandchildren clustered by the door and gazed at the strangers, until gradually they gathered courage to come in and talk with us. Mrs. Dixon welcomed us to her old home with a hearty cordiality, in which one could discern a certain air of authority natural to one who was at once an uncrowned sovereign and the progenitor of the subjects who peopled her insular realm. Had she ever wearied of such a lonely existence? we asked. Oh, no, she replied. She had been once off the island in sixty years; but there was always plenty to do, and with her children about her she was content. During the long winters they threshed grain, or made butter, or spun yarn, and wove the cloth they wore. Sometimes they had a fiddle and a dance, and at any rate there was always something to be done. She regretted that only during the summer could they have

religious services, when a clergyman would come over two or three times and baptize the babies or confirm the young. From December to February Entry Island is cut off from all communication with the other isles of the group. In February or March the broken ice generally becomes solid, and people can then cross over to Grindstone Island until May, when the ice disappears.

The old lady sat in the ample smoke-blackened chimney corner of her kitchen, while entertaining us, knitting a stocking. There was no dimness in her eyes, no quavering in her utterance. Her voice was clear and strong, and her speech was spiced with shrewd and witty remarks. She was evidently a woman of remarkable strength of character. It was with great interest that I heard her talk, for it is not often in this age that a woman is found occupying such a position, the virtual sovereign of an island which for six months in the year is shut out from the world. It was interesting to see the deference shown to the old lady by her sons when they entered the room where she was seated. A large family Bible was a prominent object in the best room; and from all we could gather, these people are honest and piously inclined.

From Mrs. Dixon's we made our way through the long grass to the grand precipices at the eastern end of the island. These cliffs are upward of four hundred feet above the sea, and are remarkable for their color and form. At the extreme easterly point there is a small inaccessible peninsula connected with the main island by a narrow curtain of rock, which comes up into a very sharp edge, four hundred feet high. A few foxes hide on this point, and at night creep over on this sharp edge, and make a raid on the hen-roosts. There seems to be no way of reaching these stealthy rogues, without great risk of destruction to the hunter.

The highest of the Entry Island cliffs is four hundred and forty feet high, and comes to a point like a turret erected to watch the coast. It is, in fact, called the Watch Tower. As we gazed over the edge of the precipices on the sea side of these cliffs, I was vividly reminded of the celebrated rocks of the Channel Islands.

There is great beauty and variety in the formation of Entry Island. Its surface is so broken into miniature valleys, gorges, and plateaus, that it seems very much larger than it is. There are several deep pits near the east end, to which one must give a wide berth, for they contain water to an unknown depth, while the mouths are almost concealed by a growth of rank grass. Everything about

A FEW OF THE NATIVES.

the interior of Entry Island suggested pastoral ease and happiness. The flocks and herds grazed on the hills. Healthy children, fowls, calves, geese, and pigs jostled together before the farm-houses in good-natured rivalry of friendship. If there were no evidences of wealth among the good people, there were also no signs of squalor or discontent. As the day declined, and the shadows grew long, the cattle from all parts of the island gathered to a common stock-yard or byre. It was pleasing to hear the bells tinkling as the cattle wended home. When they had all come, the milk-maids entered the inclosure with their pails.

After purchasing a supply of eggs, we turned our faces toward our floating home riding in the bay. The ramble of the afternoon and the keen sea-wind had whetted our appetites. But the state of the weather also warned us to hasten on board without further delay. All the afternoon the wind had been rising, until now it blew a gale from the south-west, with every prospect of increasing in violence. It swept over the hills in shrill blasts, and the reefs were

white with the foam of the beating surges. Vessels could also be discerned putting back to make a lee behind the island. A great bank of cloud had gathered in the west like a smoke, and fully an hour before sun-down the sun had buried itself in this cloud, and an early and ominous twilight came on apace. Hastening our steps, we at last reached the boat. Mr. Cassidy was waiting there with the sheep. He advised us to remain on shore, and offered us a lodging at his house. Although protected from the direct force of the waves, the cove where the *Alice May* was anchored showed the influence of the under-tow escaping around the bar. She was rolling heavily, surrounded by a fleet of schooners which had collected there during our absence, seeking a shelter.

We found our boat's crew in bad humor, because they had been detained so long after eight bells, or supper-time. Punctuality at meals is one of the important points in a sailor's life; his fare may be poor, but it is the best he has, and he looks forward to it. Nothing irritates Jack more than to be late to meals. We desired to go aboard without delay. The fury of the wind soon drove the boat out to the vessel, but it required great caution to round to and get aboard without swamping the boat. As we had but one boat, and it was now dark, it would be all up with us if the yawl capsized. To make matters worse, the men were scared as well as cross, and I found it no small matter to bring her to with the steering oar.

"Keep cool; one at a time, boys," was the word as we lay alongside and grasped the line which was thrown to us. As the schooner rolled her side down toward us, there was a general scramble, and we all grasped the rail at once and leaped safely on board.

"Well, Henry, is supper ready yet?"

"Yes, sir, all ready; it's waiting for you below, sir."

The faithful fellow had kept the supper warm, and, as soon as he saw us coming off, knowing our eagerness for something warm, he lighted the lamp and laid the dishes on the table. Out from the wind, we stepped below into our homely but cozy cabin, and were greeted with the grateful fragrance of a savory meal. Among other dishes was a mess that was new to us. A ragout of lamb, highly sea-

soned, was surrounded by a wall of potatoes, mashed and richly browned.

Many were the expressions of ecstasy and impatience with which we hailed the supper, and especially this dish. It was frequently encored until it was exhausted. Whenever a new dish appeared, we gave it an appropriate name. Bean soup we called "Potage à la Pompadour"; then, too, we had a *fricassée au cheval de maître d'hôtel*, which was composed of salt

The glass was still falling, and if the wind should shift to the north-east or north-west we were in a nice box. But we preferred to regard this as a summer blow that would die out before morning, and accordingly enjoyed the grandeur of the night without apprehension. About midnight the wind began to cant, with that whiffing uneasiness of direction which always demands a sharp lookout. It was preparing to shift. All hands were

OLD FIRE-PLACE AT ENTRY ISLAND.

beef. Our favorite dish was *œufs au dindon du Cap Cod*, which, freely translated, means fish-balls garnished with poached eggs. This dish was, perhaps, Henry's *chef d'œuvre*.

But while we were enjoying our supper with such zest, the little schooner was rolling more heavily, and the hum of the wind in the rigging showed that the force of the gale was increasing.

When the moon rose it added to the wildness and splendor of the night. The sky was clear from clouds, but a thin haze slightly obscured the stars. A tremendous surf was breaking on the low spit which protected us from the brunt of the gale. As the spray shot high up in vast sheets of foam, it caught the light of the moon, and was turned into molten silver. Before us loomed the dark mass of Entry Island, vague and mysterious. From time to time the dark outline of a schooner could be seen coming around the island under short sail to make a lee. Then would be heard the rattle of the cable, and soon the schooner would add the gleam of her anchor light to those already twinkling and bobbing in the roads.

called, close reefs were put in the fore and main sails, and the crew manned the windlass. This preparation had come none too quickly, for, with a flurry of rain and several vivid flashes of lightning, the wind suddenly came out of the west-north-west. Quickly hoisting the reefed main sail and jib, we hastened away from an anchorage which, from being a safe lee, had become a lee shore. As we passed from the shelter of the island, we encountered a wild, tumultuous sea, which decided us to head on our original course, instead of running to the leeward of Entry Island. If it should come on to blow hard, we considered that it would beat down the old sea, and we could then run for the southern side of Entry; while, if the wind moderated, we were gaining in every mile we sailed. Cruising among the Magdalen Islands is not a trifling sport; it requires judgment and caution, for there are no harbors accessible in bad weather, and the lee under the land made with one wind may become a deadly foe the next hour, while the seas which the winds raise in the Gulf are exceedingly dangerous, not because they are unusually high, but be-

THE GALE AT ENTRY ISLAND.

cause they are short and steep—just the sort of waves which trip vessels rolling in a calm, or cause them to founder when hove to.

But the wind soon began to moderate, and we headed north-east for the Bay of Islands, two hundred and fifty miles away. It was with enthusiasm that we saw the *Alice May* at last shaping a course for what promised to be one of the most interesting points in our cruise. The reports we had heard regarding the grandeur of the scenery on the west coast of Newfoundland, together with the savage reputation of the cliffs and people, had fired our imagination. Bryon Island and Bird Rock bore about west at noon; the latter was only two miles distant. It is indeed a lonely spot, entirely bare, and occupied only by the three light-keepers. Access can be had to it only by a crane overhanging the water from the precipice. A chair is lowered, and visitors are hoisted from the boat. The Rock has been the scene of two disasters within the last fifteen months. When the keepers were firing the fog-gun, it exploded and killed two of them on the spot. It was several days before the poor survivor could contrive to induce a passing sail to touch there and carry the news to the mainland. Previous to this sad event, Bird Rock was at one time destitute of provisions after a prevalence of long bad weather, and the light-keepers were forced to consider seriously the possibility that one of the Magdalen Islands might become a cannibal island. But their signals were finally seen when the weather moderated, and a passing ship came to their aid at the last moment. It is dreadful that such a condition of things should be

possible so near to civilized life. There is not the slightest excuse for a light-house to be allowed to run out of provisions. In this day of canned and preserved meats and hard bread, a supply sufficient for a year would not spoil, and would prevent peril from starvation. No light-house, difficult of access in bad weather, should be at any time left with less than a double supply of light-keepers, and stores for fully six months. The smaller Bird Rock lies about half a mile distant from the one on which the light-house stands. It is a low, jagged, dangerous ledge. There is a passage between the two islands, or rocks, but no vessel should try it, unless pressed by the wind too near the rocks without the ability to tack or claw off from such perilous proximity. Although the wind was light, there was still such a high swell that we did not think it expedient to attempt to try landing on Bird Rock. Bryon Island resembles Entry Island, being well fitted for pasturage; it is occupied by several English farmers. But it is more flat than Entry Island, and every way less interesting, except for its large variety of sea-fowl. Owing to its distance from the other islands of the group, and the entire absence of harbors, Bryon Island is rarely visited by boats or ships. A party of naturalists and sportsmen from Boston were there during our visit to the Magdalen Islands.

The sunset was superb, the colors being brilliant, but tender, and finally merging in a deep orange hue, lasting for hours, until imperceptibly absorbed in the purple veil of night. It was emphatically a fair-weather sky, which was exactly what we hoped for when cruising along the tremendous coast of

the west of Newfoundland. A light wind fanned the schooner on her course all night, and at sunrise land was made out on the lee bow. Never does the first sight of a new coast, or in fact of any coast, become a commonplace event, even to the most experienced old salt. All the senses seem at once on the alert to ascertain what point it can be. The various bearings are considered, the chart is studied afresh, and each one has his own opinion to express. Of course there are times when the characteristics of the land are so salient, or so well known, that there can be no question as to its identity. But, as a rule, when land is first descried at sea, its whereabouts continues for a while a matter of speculation. Then, too, the imagination is stimulated, and actively surmises the nature of the country, its people, and special peculiarities. Particularly is this the case when one approaches an island he has not seen before. When one travels by rail, the social or topographical changes come by gradation, and there is rarely a striking contrast apparent at any one point. But when one arrives in sight of a new country by sea, the transition from the one to the other is rapid, and often violent. When he lands on the new shore, it seems to be like coming to another planet, and he is constantly saying to himself, "How strange it appears to see these people. Here they have been existing for ages; they are real human beings, marrying and giving in marriage, and engaged in human pursuits, and going through the endless round of destiny like my own people, and yet I never saw them or heard of them before. They seem quite able to do without the rest of the world!"

We made out the land in sight to be Cape St. George. It was yet very distant, and loomed like a gray cloud in the offing. A long and lofty and forbidding coast-line gradually came into view, trending north and south for a great distance. The larger part of the day a calm prevailed. Numerous whales were to be seen sporting in schools, their smoke-like spouting suggesting the firing of muskets. One of these unwieldy leviathans passed under our stern near enough to strike the schooner with a stroke of the tail, if he had so chosen. The high westerly swell drifted the vessel shoreward quite near to the inaccessible precipices of Cape St. George. This is a terrible coast in stormy weather. For sixty miles there is not a place where a ship attacked by westerly gales could make a lee or get an anchorage. The coast is many hundreds of feet high, without any beach at the foot except at rare intervals. When south of Cape St. George, a ship can make a lee of it in a nor'wester or run into

Georgetown. A lee can also be made in the bight of the cape, which is shaped not unlike a fish-hook. But this bight, or bay, is dangerous in a north-east wind, and the entrance is at best hazardous, as it is beset with reefs which are not buoyed. A very precarious lee resembling a forlorn hope may be made behind Red Island, a rock near the outer angle of Cape St. George. Red Island, by the way, is a summer station of the large French cod-fishing firm of Camolet Frères et les Fils de l'ainé, whose head-quarters are at St. Pierre.

What adds to the perils of this coast is the scarcity of the population and the desperate character of those who live there, occupying rough shanties among the rocks. It is a matter of fact and not of rumor that, when a shipwrecked vessel happens to be so situated that the crew can not escape, they are in great danger from these ruffians of the sea, whose object is to plunder the ship. It is most disgraceful that such miscreants should be permitted to live on any part of the British or French dominions. The perils of the sea are already sufficient without adding to them, by allowing the coast to be infested with sea-pirates. Probably each government would shirk the responsibility on the other, because the western and southern shores of Newfoundland are debatable ground, where each claims, but fails to obtain, unrestricted jurisdiction.

It is also very discreditable to somebody that there is no light-house between Cape Ray and the straits of Belle Isle, a distance of four hundred miles, on a coast passed by many vessels during six months of the year. Some would reply to this that the coast is high, and is easily discernible in all weathers, and that the entrances to the bays are free from shoals. This is true enough; but this very boldness of the coast makes it difficult to distinguish the ports until a ship is very close in, while it is quite impossible at night. The few ports are likewise so very far apart that it is highly dangerous for a ship to make a mistake in a gale of wind, for she is sure to be driven on shore before she can make the next port; whereas, with four or five prominent light-houses, this danger might be mitigated to a considerable degree. Two years ago a fleet of six schooners came out of the Bay of Islands in the afternoon. As it was late in the season, there were many passengers on board who were leaving the bay before the inclemency of the season should close navigation. It came on to blow hard from the westward during the night. The schooners could not carry sail against the savage wind and sea; under their lee was a pitiless coast without

anchorage or harbor, and haunted by demons in human shape. Before morning every one of this fleet had struck on the rocks and all hands perished; whether any of them came to land and were murdered remains a matter of conjecture.

Three winters ago a square-rigged vessel struck on the coast north of the Bay of Islands and lodged high up in a hollow of the cliff. All the crew but two were lost in trying to get to land. The survivors lingered on board, looking for a chance to get off safely or to be rescued by the inhabitants. After some weeks the fuel gave out, or at least the means for kindling a fire. Then one of the men died. For two months the single survivor lived in this appalling situation, with

only a frozen corpse for companionship and without fire, while the deafening din of the breakers constantly reminded him of his own impending doom. In the spring, when navigation opened, the wreck was discovered by some fishermen. They boarded her, and found a man alive lying by the side of a corpse, and in the last stages of despair and glimmering vitality. After receiving sustenance he revived, and was able to narrate the details of an experience never surpassed by the most harrowing tales of suffering at sea.

It was a fact attracting attention that, although the weather was fine, we saw no sea-birds in this region excepting Mother Carey's chickens. Even the noisy and ubiquitous gull failed to put in an appearance.

S. G. W. Benjamin.

OFF DEADMAN ISLAND.

THE MASTER.

AN IMITATION.

- Q. TELL me, O Sage! What is the true ideal?
 A. A man I knew,—a living soul and real.
 Q. Tell me, my friend! Who was this mighty master?
 A. The child of wrong, the pupil of disaster.
 Q. Under what training grew his lofty mind?
 A. In cold neglect and poverty combined.
 Q. What honors crowned his works with wealth and praise?
 A. Patience and faith and love filled all his days.
 Q. And when he died what victories had he won?
 A. Humbly to live and hope—his work was done.
 Q. What mourning nations grieved above his bier?
 A. A loving eye dropped there a sorrowing tear.
 Q. But History, then, will consecrate his sleep?
 A. His name is lost; angels his record keep.

William Preston Johnston.

PROGRESS IN FISH-CULTURE.

ATKINS'S METHOD OF PENNING SALMON.

Few persons not specially interested in fish-culture are aware of the rapid advance made in the last ten years. It seems but a short time ago when fish-culture was regarded merely as a curious discovery, or, at best, a plaything for people of means to amuse themselves with; and from the time of its discovery by the German, Jacoby in 1741, and the publication of the fact in France in 1770, and in England eight years later, down to the middle of the present century, little or nothing had been done in a practical way, although John Shaw, of England, began hatching a few salmon in 1837. Even the successful rearing of brook-trout in America by Dr. Theodatus Garlick and his partner, Professor Ackley, in 1853, was not at that time regarded as having any bearing on the question of the food supply of the people. And the publication of a treatise on the subject by the former, in the proceedings of the Cleveland Academy of Natural Science, in the following year, failed to awaken interest in it in this country outside of scientific circles. Two years after Drs. Ackley and Garlick began their work they published an account of it, and thereupon the Rev. Dr. Bachman made the claim that he had hatched trout in Charleston in 1804. The governments of Belgium, Holland, and Russia began, in a small

way, to cultivate fish about the year 1853. Public attention in America was first called to the subject, as one which promised to be of future benefit, by an act of the Massachusetts Legislature in 1856, appointing three commissioners to report such facts concerning the artificial propagation of fish as might tend to show the practicability and expediency of introducing the same into the Commonwealth, under the protection of law. Three years later, Stephen H. Ainsworth began trout-breeding in the State of New York, at West Bloomfield, Monroe County, and achieved a limited success with a scant supply of water.

With the creation by Congress of a Commission of Fisheries for the United States, in 1871, and the appointment of Professor Spencer F. Baird as Commissioner, fish-culture began to extend its usefulness; and from a means of growing a few brook-trout for the angler, or of increasing in a small way the food fishes of a few rivers, it has become a system of propagating both sea and freshwater fishes, of introducing the best native and foreign species, and also of investigating the food and habits of those fishes which are inhabitants of our coasts during a part of the year only, and whose migrations and life history can be worked out by trained scientific observers alone. From the beginning of the

work on this extended scale dates the great improvement in apparatus, which has made

GREEN'S SHAD-BOX.

the past ten years a period of constant progress in methods and in knowledge, and which has stimulated the work, not only in America but throughout the civilized world, by the very complete manner in which the results have been accomplished and published. Previously, the introduction of salmon into Tasmania, from England, by Mr. Francis Francis, was the only attempt at sending the eggs of fishes long distances, while now each season sees millions of eggs of different species crossing the ocean.

The very important discovery was made by the Russian Vrasski that the best mode of fertilizing the eggs of the salmon family was by the dry method, or without the use of water at first; this was translated by Mr. G. S. Page some years after, and was found to have been also an original discovery of Mr. Atkins, of Maine, who had written of it previous to Mr. Page's translation. These, and the invention of Mr. Seth Green's floating shad-hatching box, were really all the important improvements or experiments made previous to the formation of the United States Fish Commission. Since that time the numerous labor-saving devices, the extensive operations undertaken, as well as the important discoveries made, have placed the United States far in advance in both the science and practice of fish-culture. There are but few States in the Union which have not their fishery commissioners, and the present methods enable one man to do the work that formerly required several persons. In the mode of obtaining salmon eggs, a great step in advance was made by Mr. Atkins, on the Penobscot, when, instead of depending on the accidental capture of salmon with ripe eggs, he found that he could keep the fish in pens, in fresh water, until their spawn ripened, and thus could obtain a hundred-fold more than had been got before. At Bucksport, Maine, after the eggs are taken from the salmon, a metal tag with a number on it is attached to the posterior part of the first dorsal fin. A record is kept of the sex, length, and weight of each fish, and the date of its liberation, thereby showing what growth is made up to the time of its second capture. A reward is offered for the return of these tags accompanied by statements of the time

and place of capture, the weight of the fish, and other information. A female salmon, liberated at Bucksport, November 10, 1875, which weighed sixteen pounds after spawning, was captured two years later, and was found to have grown a foot in length, and to have increased eight and a half pounds in weight. Mr. Buckland also marked salmon by punching holes in the second dorsal fin with a conductor's punch, but we have no records of their subsequent capture and rate of growth. Mr. Stone, also, corralled the salmon on the McCloud River, California, and thereby obtained enormous quantities of the eggs of the salmon of the Sacramento. Thus at Bucksport, Maine, and at Baird, Shasta County, California, the supply of salmon eggs on our eastern and western coasts was surprisingly increased. This increase naturally resulted in taxing the working force of these hatcheries beyond their capacity, which led to the discarding of the old system of hatching on gravel as too laborious, and as requiring too much work to keep the dead eggs from destroying the living ones. Then the Brackett trays came into use. Similar trays had been used before, but they were of glass grilles, easily broken, and expensive.

TAGGING SALMON.

The new trays were of iron wire coated with asphaltum; and the ease with which they were handled, and the facility with which they and their contents were removed while a trough was cleaned, commended them above all other apparatus. For bringing forward eggs to the point where the eyes were visible, and the eggs ready for shipment, they were placed in the troughs, five or six trays on top of each other, and thus the capacity of the hatching-troughs was increased many times, and the labor much simplified. This has been the great object of American fish-culturists—to get the maximum of results with the minimum of labor, a most important thing in our country, and one which the fish-culturists of Europe, on account of the cheapness of labor there, do not strive for as we do.

Germany is far in advance of any other European country in the propagation of fishes, and is second only to the United States and Canada; but their apparatus is bulky, even when made after American models, and the fish-breeders of that country seem to care little about economizing either space or labor. France has done something, and so has England. The latter has been far behind without knowing it, and is now awakening to the fact. At a recent meeting to organize a national fish-cultural association, Lord Exeter plainly told the English fish-culturists that they were not up to the times; and this statement has been seconded by such able men as Mr. R. B. Marston and Mr. W. O. Chambers, who have been foremost in promoting the above-mentioned society. The late Mr. Frank Buckland was regarded as the fountain-head of all piscicultural knowledge in England, but he really made little progress in a matter affecting the people at large, and which had no public recognition. With the forming of the new association, and the clamor for governmental aid, it may safely be prophesied

that England will soon take rank beside other nations in the art of cultivating the waters and of producing food from them. Hungary has an influential society for fish-culture. Sweden sustains a school wherein pupils are taught, and salmon culture is fostered by sending men to the different fisheries to instruct the fishermen how to take and hatch the eggs of their fish.

The first hatching of fish in all countries, excepting China, was begun by propagating the brook trout, and in all cases the work was done on gravel until the invention of Coste's glass grilles and the improved system of wire trays, which rendered it possible to remove the eggs and clean the trough. China was said by missionaries and travelers, who knew nothing of fish-culture, to be far advanced in the art and to have practiced it for an indefinite number of years. Inquiry has shown that there is nothing done in that

country in the way of multiplying fish except to place twigs in the water, and, when the spawn of the carp is found to be deposited upon them, to remove them to other waters and allow them to hatch. How long the Chinese have done this is not known, but they have never made any improvement upon it.

The difficulties that beset the fish-culturist in dealing with a fish whose breeding habits are unknown are many. His former experience is often of little value, because the eggs of different fishes usually require different treatment. The eggs of the salmon family, except those of the smelt, are comparatively large and considerably heavier than water; the eggs of the shad have little specific gravity and will sink in perfectly still water and die. The salmon eggs may lie in a trough and a strong current be passed over them, while under the same conditions the shad eggs would be washed down stream. The ova of the shad require a buoying current which forms an eddy, while the eggs of the smelt, herring, carp, and some other fishes are covered by a glutinous coating which adheres to twigs, stones, etc. Again, the eggs of the

McDONALD JARS.

common yellow perch are in a ribbon-like mass which is hung over twigs but does not adhere to them, and the small egg of the cod-fish follows a slight current. These varying conditions have tasked the ingenuity of fish-culturists to devise means to develop the different eggs; and, with the exception of those of the cod, they have been successful with all. A perfect arrangement for the eggs of the cod has not yet been found, unless the new McDonald jar should prove to be the proper one. This apparatus, the latest fish-hatching device, will be referred to again. One of the first improvements on the old methods with which the public are familiar was the use of glass jars by Major T. B. Ferguson, then of the Maryland Commission, but now of the United States Fishery Commission; his jar allowed the different layers of eggs to be inspected without removal. The same gentleman also devised a system of plunging buckets, to be worked by machinery on an old scow, whereby shad eggs might be developed in waters where neither tide nor currents were available.

Another invention, in 1875, by the writer and his assistant, C. F. Bell, known as the Bell and Mather hatching cones, superseded the hatching of shad in floating boxes. The eggs were placed in a conical vessel, with the water entering from below and sustaining them in mass with a gentle motion. The Chase jar, for whitefish eggs, and its modification by Mr. Clark, in both of which the water is delivered at the bottom by a glass tube, followed, and in the hatching of whitefish eggs seemed perfection until McDonald improved upon it by sealing the jar and drawing out the dead eggs through a sliding tube let down through the stopper. This

latest improvement is adapted to hatching the eggs of shad, whitefish, and perhaps cod; and these glass jars have, in most large hatcheries, superseded the earlier troughs and boxes of Williamson, Holton, Clark, Green, and others. Their simplicity, the perfect inspection of the eggs through the glass, and the great saving of labor, commend them to all. All these improvements are of American invention. To them we should add the McDonald fish-way, a device for permitting the ascent of fishes to upper waters, which permits of a steeper incline and more perfect checking of the down-flow than any other form of fish-ladder. These fish-ways are now in operation on the Rappahannock, Savannah, and Oswego rivers, and another will be built at the Great Falls of the Potomac. Thus we have a record showing that our specialists have been busy with their brains as well as with their hands.

From a meeting of a few trout-breeders in Albany, nearly twelve years ago, to arrange a tariff to regulate the sale of their products, has sprung the American Fish-cultural Association—a society which holds annual meetings and listens to papers from experts and scientists from all parts, and which numbers among its members the Crown Prince of Germany and many gentlemen from other lands. This association is only second in importance and influence to the powerful Deutsche Fischereiverein of Germany, which, under its President, the Hon. Herr von Behr, has organized societies for fish-culture in all parts of Germany, and has exchanged valuable species of food fishes with the United States. Within the past six years many kinds of adult fish and eggs have passed between this German society and the United States Commission of Fish and Fisheries. The Germans have thus received six species of American Salmonidæ, viz.: the eastern brook trout, the rainbow trout of California, the quinnat or California salmon,

HOLTON'S BOX.

BIRD'S-EYE VIEW OF CARP-PONDS AT WASHINGTON.

the lake trout, the land-locked salmon of Maine, and the whitefish of the great lakes. They have also received our black bass. In return, Professor Baird has received the salbling, *Salmo salvelinus*, a large lake char which grows to a weight of fifteen to twenty pounds, and is as bright and beautiful as our brook trout; the common trout of Europe, *Salmo fario*; the gold-orfe or golden-ide, a fish bred for both ornament and the table; and the more useful carp, which has been bred in such numbers in the national carp ponds as to allow thousands of the young to be sent to the different States, and which will prove of incalculable value to those parts of the country which have no running streams, and consequently no good table fish. This exchange of the best things in each country has not been confined to Germany and America, although they have led in the matter of important exchanges of the greatest number of species and of specimens. Two years ago some South American gentlemen residing in Ecuador wished to introduce the German carp from America to the vicinity of Quito, and Professor Baird left the details of shipment to Mr. E. G. Blackford, of Fulton Market, who is also a member of the New York Fishery Commission. Cans were made to fit the backs of peons, or burden-bearers, who were to carry the fish over the mountains—a journey occupying a week or more under a

tropical sun. The cans were protected from the heat by a covering of felt, and arranged with the necessary straps to enable the toiling peon to grope his way with his alpenstock up the wearisome mountain-paths and down the other side. The fish arrived safely, pauses having been frequently made to aërate the water by means of dippers; and they are reported as doing well in their new home. Last January, a lot of trout eggs and young carp, the former from the United States Fish Commission station at Northville, Michigan, in charge of Mr. Frank N. Clark, and the latter from Mr. Blackford's stock, were taken by Mr. Decerro to Bogotá, Colombia, also a mountainous journey, on the backs of men and mules; and, while the carp may thrive, it is doubtful if the trout will find there the necessary cool and congenial waters. In sending eggs to foreign countries, the writer has been intrusted with their repacking for the warm ocean voyage. A package has been devised wherein the eggs are surrounded by ice, which retards the development of the embryo and prevents premature hatching. Most of the eggs are received in living moss, which retains moisture and gives off oxygen. From this they are transferred to wooden frames with a bottom of canton flannel, and the frames are packed in a box of ice. The success of this mode has been such that the average loss in transportation has not been greater than if the eggs had remained in the hatching-troughs.

In the distribution of fishes within our own borders, the most notable events are: the introduction of shad into California, at different times, by Messrs. Green and Stone; the taking of eels, lobsters, and oysters to the same State by Mr. Stone; and the accidental stocking of the Elkhorn River, a tributary of the Missouri, with black bass and other fish, through the breaking of a bridge and the upsetting of a car in which Mr. Stone had an assortment of fishes destined for

Egg transportation crate.

Employed in shipping shad eggs from the fishing shores to central station.

California. Eels have been planted by the Michigan Fish Commission in the great lakes above Niagara, with what result is not yet known; black bass have been introduced into eastern New York and the New England States, to which they are not native; and the rainbow trout has been brought east from California by both Mr. Clark and Mr. Green. The quick growth of this fish indicates a voracious appetite, which may result in depriving our native species of food. Like the English sparrow, they may be more easily introduced than banished. The land-locked salmon, called in its Maine habitat, from the lakes to which it is indigenous, the "Schoodic salmon" and the "Sebago salmon," is a fish that, to the eye of the angler, is readily dis-

tinguishable from the sea-going salmon, *Salmo salar*, but it has no structural difference that warrants the ichthyologist in classing it as a different species. It appears to be a salmon whose ancestors have been cut off from access to the sea and obliged to live and breed in fresh water. Their descendants have lost the migratory instinct, and, although the obstruction to their descent to salt water has been removed by some convulsion of nature, they are content to remain in the lakes throughout the year. This fish has been in great demand, and Mr. Atkins, of the United States Fish Commission, has paid great attention to it; he has gathered the eggs for several years in increasing numbers, and the fish has been introduced into many new waters. They love deep, cool lakes, and General R. U. Sherman, of the New York Fish Commission, has planted them in Woodhull Lake, Oneida County, New York, and other Adirondack lakes, and last year

took specimens of five pounds weight. He regards this valuable fish as peculiarly fitted for those waters, and intends to stock many other lakes of that elevated region with it. The New York Fish Commission has been a most useful one, and, with the commissions of the New England States, the most prominent among State commissions in the work

THE McDONALD FISH-WAY AT RAPPAHANNOCK, VA.

of restocking the waters with both the food fishes and the species which the angler most values. This is a natural consequence of their having been foremost in the work, and in having legislative aid to carry it on. At the same time there are various local organizations, to which belong a great deal of credit. Among these are the salmon-canners on the Clackamas River, a tributary of the Columbia, in Oregon, who, seeing that their work would in time deplete the waters and ruin the industry that they had established, concluded to build a hatchery there and keep up the supply; and to this end they sent for Mr. Stone, who established such a hatchery for them, which is now in running order, turning out as many fish as possible in the hope of keeping the stream up to its full salmon-bearing capacity,—a prevision so rare among fishermen as to be worthy of special note.

The United States Commission of Fish and Fisheries was created for the purpose of investigating the cause of the decrease of our marine food fishes, and afterward devoted much attention to fish-culture as a means of increasing the food resources of the country. It keeps up the annual scientific investigations on the coast, and has added much to our knowledge of the life history of fishes. Stations have been established for the season at Noank, Conn.; Eastport, Me.; Wood's

of restocking the waters with both the food fishes and the species which the angler most values. This is a natural consequence of their having been foremost in the work, and in having legislative aid to carry it on. At the same time there are various local organizations, to which belong a great deal of credit. Among these are the salmon-canners on the Clackamas River, a tributary of the Columbia, in Oregon, who, seeing that their work would in time deplete the waters and ruin the industry that they had established, concluded to build a hatchery there and keep up the supply; and to this end they sent for Mr. Stone, who established such a hatchery for them, which is now in running order, turning out as many fish as possible in the hope of keeping the stream up to its full salmon-bearing capacity,—a prevision so rare among fishermen as to be worthy of special note.

Holl, Gloucester, and Provincetown, Mass., and at Newport, R. I., where valuable collections of marine fauna have been made, the food, habits, and migrations of fishes studied, and testimony taken from the best informed fishermen. Besides these stations for scientific observation, hatcheries for different fishes have been built at Bucksport and Grand Lake Stream, Maine; at Baird, Shasta County, California; at Northville and Alpena, Michigan; at Wythe-

upper deck, and a cam on a shaft works the Ferguson plunging buckets on her sides. The other steamer, the *Albatross*, is fitted with machinery for deep-sea soundings, taking temperatures, dredging, etc., and a

naturalist's room with microscopes, ice-chests, and alcohol tanks for preserving specimens. The

Commission has also two transportation cars fitted with ice-chests and fans, to convey cold air over the cans, worked

HATCHING ROOM AT COLD SPRING HARBOR.

ville, Virginia, in conjunction with the Fish Commission of that State; and at Raleigh, North Carolina, and much support has been given the station of the New York Commission at Cold Spring Harbor, Long Island. At first, a small tug-boat, the *Bluelight*, was borrowed from the Navy Department, and most efficient aid has been rendered by Captains Beardslee and Tanner, of the navy, who volunteered for this service. Following the *Bluelight*, the yacht *Lookout* was fitted up for river work. Two new steamers have since been built by the Government especially for the work of the Commission. The *Fish-Hawk* is a flat-bottomed vessel with twin screws, designed to go up the rivers, and fitted with the most approved apparatus for hatching shad wherever caught. Her pumps supply a copious flow of water to the Bell and Mather hatching cones on her

by the axles when the car is in motion, bunks and kitchen for the men, and all that is necessary to transport live shad, carp, or other fish anywhere by rail, with only the labor of taking on water where the engines are supplied. These cars have taken fish from Washington to Texas and California, in the most perfect manner.

Within the past two years the propagation of oysters has received attention, and, while not yet a complete success, approaches have been made toward it that give promise of future benefit. Professors Brooks, Rice, and Ryder, and Lieutenant Winslow, U. S. N., have all made valuable experiments in this line, and we at least know more of the life

history of the toothsome mollusk than formerly. Abroad, oyster-culture is practiced to the extent of placing twigs, shells, and other objects, in the water, to arrest the free-swimming "spat" until it fastens itself and settles down to steady habits and the accumulation of a sufficient amount of succulent protoplasm to entitle it to the honor of being laid on the "half shell." In the Poquonnock River, near New London, Connecticut, the tops of trees are placed in the water at the proper season, and when loaded with oyster spat are hauled out by oxen, when the twigs with the juvenile "East Rivers" are scattered on the beds. It is the desire of the Commission to be able to express the eggs and milt from oysters, and fertilize the eggs and grow them, as is done with the fishes. Professor Ryder has also experimented with clams.

It is only within a few years that the propagation of the cod has been attempted. While the Commission was at Gloucester, Massachusetts, some three years ago, the eggs of the cod were taken and hatched. The young fish were turned out in the harbor, and now they are taken by boys from the docks. When it is remembered that the inshore cod are small and red in color, and the same fish from the different "banks" are gray and more slender, with shorter fins and clear-cut forms, it will readily be seen that it does not require an ichthyologist to determine whether a cod-fish comes from the banks or is a "rock cod," and no gray fish were ever taken in Gloucester harbor before. This fact has been

McDONALD JARS ON THE "LOOK-OUT."

so encouraging, that efforts toward a perfect hatching apparatus for the delicate eggs of the cod-fish have been made by several persons. Captain H. C. Chester, formerly of the *Polaris* expedition, but now with the United States Fish Commission, made a semi-rotary vessel which promised fairly; but last year Colonel McDonald devised the closed hatching-jar, already referred to, which has its inlet and outlet below the surface of the water, and this promises to do the work without danger that the almost floating eggs will escape with the outflow. The suggestion of Mr. E. G. Blackford, that millions of cod eggs could be obtained from the fish brought alive in the well-smacks to Fulton Market, has been acted upon, and eggs were gathered there last year and sent to the old Armory at Washington, which has been turned into a hatchery. It had been decided to turn the eggs loose in the waters about

PART OF THE INTERIOR OF THE "FISH-HAWK."

New York; but in December, 1882, just at the spawning season, the severe weather prevented the arrival of many ripe fish.

The introduction of the improved German carp, which has been of great value to warm inland waters where no good food fish was before found, has been a boon to those living far from the sea-coast. These fish have made most wonderful growth in many states, especially in the South, and their progeny have even been asked for by the Germans who sent the original stock.

One of the amusing phases of fish-culture is the numerous specimens of small, indigenous species which are sent to the National Museum on the supposition that they are the newly planted shad, trout, carp, or salmon. They are generally some small cyprinoids which never grow to large size, and consequently have hitherto escaped the observation of the sender. This, and the confusion of the names of fishes in different localities, tend to mislead those whose desire for knowledge

SECTION OF "FISH HAWK," SHOWING FERGUSON'S PLUNGING BUCKETS.

UNITED STATES FISH COMMISSION STEAMER "FISH-HAWK."

and new fishes is but just awakened. The fish which is most commonly known as a black bass in the North and West becomes a "chub" in Virginia, a "welshman" in North Carolina, and a "trout" farther south. The name of "trout" is also applied in the South to a salt-water fish called "squeteague" and other names in the New England States, and "weak-fish" in New York; while the pike-perch becomes a "salmon" in the Susquehanna, Ohio, and Mississippi rivers. Old names were applied by the early settlers to new fishes, and, as a consequence, each state has certain misnomers for its fishes and birds, which errors are persistent, and often lead to

misunderstandings. Among the new fishes lately brought to yield their eggs to the fish-culturist, in addition to those mentioned, are the Spanish mackerel (which were discovered at the spawning season in Chesapeake Bay by Mr. R. E. Earll), the haddock, and moon-fish,—the last being a valuable food fish, but little known, and sometimes appearing on the bill of fare in New York as "angel-fish." A few turbot and soles have been brought over from England and released on our coasts, but not in numbers sufficient to hope for important results; but from the introduction into New Hampshire lakes of the German salbling, *Salmo salvelinus*, a large

Canning of shad fry for transportation

CENTRAL STATION UNITED STATES FISH COMMISSION.

lake char, or trout of high color and fine flesh, much may be expected.

The general awakening of the people of the United States to the benefits of fish-culture has been a source of gratification to the pioneers

have their waters stocked and for protection of the fish during the spawning seasons. The different townships on Cape Cod protect the alewife, or "river herring," and only allow each inhabitant to take two or three barrels of them

HATCHERIES AND REARING PONDS AT COLD SPRING HARBOR, N. Y.

in the art, whose early enthusiasm was occasionally ridiculed, but many of whose prophecies have been fulfilled. The fishermen have been the last ones to see its benefits, for they seem to have a firm faith in the inexhaustibility of the waters, even though they acknowledge that the supply of fish has rapidly decreased in the past twenty years. A few of them have begun to look favorably upon pisciculture, and the first indication of it is a desire to

from the artificial run-ways, constructed of three planks, which sometimes extend for five or six miles. Each one pays a certain sum for his fish, and the money is applied to the school fund. The remainder of the alewives are allowed to spawn, in order to keep up the stock. The number of private and public fish-cultural establishments in America is astonishing to one who has but recently looked into the subject. The number of them sixteen

NEW YORK STATE HATCHERIES AT CALEDONIA.

years ago, when the writer first engaged in fish-culture as a private enterprise, could be almost numbered on the fingers of one's hand; while to-day it would take many pages of this magazine to record them. Of the different States and Territories, thirty-seven have appointed fishery commissioners, and the private hatcheries and ponds are almost innumerable. Among the latter may be mentioned the South Side Sportsmen's Club, of Long Island, which has over five miles of trout streams and more than a hundred acres in ponds. This club keeps a fish-culturist, who takes the eggs from the fish and hatches them; and while its members have all the fishing which they allow themselves, they sent a surplus of a ton of trout, alive and dead, to Fulton Market in 1882. The Blooming Grove Park Association, of Pennsylvania, is now building a hatchery to replenish their

streams and lakes, which once abounded with trout. Among the notable private fish-cultural establishments are the trout ponds of Mr. James Annin, at Caledonia, New York; Mr. Livingston Stone, Charlestown, New Hampshire; Messrs. Eddy and Mosher, Randolph, New York; Mr. Geo. F. Parlow, New Bedford, Massachusetts; Mr. W. H. Furman, Smithtown, New York; and Mr. A. R. Fuller, of Malone, Franklin County, New York. Mr. Fuller is deserving of especial mention from the fact that his work has been directed toward stocking the waters of the Adirondack region in the vicinity of Meacham Lake, which are open to public fishing. He has stocked Clear Pond, where trout were before unknown, and are now found of five pounds weight, the largest brook trout found wild in the State of New York; and this has been done without public assistance, or even

SHAD-HATCHING STATION AT HAYVE DE GRACE.

STRIPPING SHAD.

recognition. The New York Fish Commission, in addition to its well-known hatchery at Caledonia, has, since the appointment of Mr. Blackford as a member of its board, established a supplemental hatchery on Long Island, at Cold Spring Harbor, where salt water is pumped into an elevated reservoir and brought into the hatchery, and fresh and salt water fishes may be hatched side by side, and where it is easy to make preserves for either native or foreign marine fishes. To this station Professor Baird has sent many thousand eggs of both the Atlantic and land-locked salmon, for distribution in the Adirondack waters, he having previously used the private hatchery of Mr. Thomas Clapham, at Roslyn, Long Island, for the same purpose. The land-locked salmon of Maine is especially valuable for deep, cool lakes, and therefore the Adirondack waters are suited to them, as has been proved by the few specimens which were planted in the Bisby Lakes a few years ago. The new hatching station at Cold Spring Harbor has distributed many of these fish, and its proximity to salt water will give it great facilities for storing foreign marine fishes or hatching native ones. The work of taking, hatching, and distributing the eggs of the lake whitefish has been most successfully done in Michigan, both by the Fishery Commission of that State at its Detroit hatchery, and by the United States Commission at its stations at Northville and Alpena, under Mr. F. N. Clark, a fish-culturist of much experience and good judgment. This fish and the shad are the most important of the commercial fishes which are propagated; the former spawning in

the fall, and the latter in early summer. Attempts have been made to introduce the shad into Europe, but have not been successful. Mather and Anderson took 100,000 fry as far

FIRST PRIZE AT BERLIN, AWARDED TO PROFESSOR SPENCER F. BAIRD.

as Southampton in 1874, and the next year Mr. M. A. Green and Mr. H. W. Welsher started with eggs, which died outside Sandy Hook. Both Rice and McDonald have since made experiments on the retardation of the development of the embryo which promise good results. The Germans, becoming impatient at the delay in sending them this fish, point to the fact that Meyer, of Kiel, retarded the eggs of the herring for nearly a month by means of ice; overlooking the fact that fishes like the winter spawners will bear to have their eggs retarded by cold, because they develop them on a falling temperature, while the eggs of fishes which spawn in spring, on a rising

A great breeding ground was discovered in Chesapeake Bay, and at Havre de Grace a station was established which yielded great numbers of eggs. The process of stripping the shad is similar to that of other fishes, but the impregnation requires less time to become apparent than with species which spawn in colder waters.

Progress in fish-culture may be noted not alone in the multiplication of hatcheries, the creation of fish commissions, and the publication of journals like "Forest and Stream" and the reports of the fish commissioners. Public interest in it is shown by the recent exhibitions of fisheries and their products in

CARP POND AT WASHINGTON.

thermometer, are killed by a lowering of the temperature. The fact is, that fishes of some kind are spawning during every month in the year, and their eggs require to be hatched, or kept, under natural conditions. This makes it possible to ship the eggs of the fall and winter spawning fishes any distance, if kept cold and not allowed to freeze; while the quick-hatching eggs of summer spawners will not bear to be retarded in their development by ice to any great extent, although the experiments of Rice and McDonald seem to point to a different conclusion. In the propagation of shad, the main difficulty in producing great numbers lay in the fact that the ripe fish could not be obtained in sufficient quantities.

Germany, England, and Scotland. One of the first and largest of these was the great International Fisheries Exhibition at Berlin, in 1880. At this exhibition, all the countries except France made more or less of a display of their fishery resources and products. The exhibition was a complete success, both from a utilitarian point of view and financially. It became the fashion; ladies flocked there to see not only the displays of pearls and amber, but the fountains and the decorations. On some days as many as twenty thousand persons visited it. The American exhibit was prepared, under direction of Professor Baird, by Professor G. Brown Goode, who accompanied it to Berlin and

remained in charge, with a staff of assistants. It included everything, from the knives used by fishermen to their clothing, boats, apparatus of all kinds, and even their food; models of fish-curing houses, the hooks of bone, wood, or iron of the inhabitants of Greenland and Alaska, as well as the appliances of the modern angler. Fish-culture in all its branches was illustrated, and a majority of the awards in this class came to America. At the distribution of awards by the Crown Prince of Germany, no surprise was shown when the grand prize of honor offered by the Emperor for the best collective exhibit was given to Professor Baird. A National Fisheries Exhibition was held the next year in England, at Norfolk, and another the year following at Edinburgh, Scotland. The great interest manifested in these displays led to a grand International Exhibition in London, which opened in May of last year, and which eclipsed all others in the size and character of the exhibits. The American exhibit by Professor Baird was again in charge of Professor Goode, and was more extensive than at Berlin, owing to greater facilities and the longer time allowed for preparation.

The day when fish-culture was regarded as an experiment passed several years ago, and it is now one of the recognized industries in Europe and America. ("Most *all* countries" are in great part outside of these.) Its results in restoring food fishes to depleted waters, and the introduction of new fishes, have popularized it, until the supply of young fish and eggs cannot keep pace with the demand. It has not cheapened fish food to any extent, owing to the growth of population, but it has increased the supply in American waters, which were becoming exhausted in both the older and some of the newer States, and promised to become entirely barren. It restored the salmon to the Connecticut River, where they were taken and sent to market for three years, until the rapacity of the fishermen exhausted the supply by cutting off the fish from their spawning grounds. It has placed shad in San Francisco markets, where they were before unknown, and has materially added to the supply of our lake and river fishes, and now promises to increase those of the sea-coast.

Fred Mather.

WRITTEN IN EMERSON'S POEMS.

FOR A CHILD.

MIDNIGHT or morning, eve or noon,
Torn March or clover-scented June,—
Whene'er you stand before this gate,
'T will open—if but not too soon
You knock, if only not too late.

Ere you have banished Mystery,
Or throned Distrust, or less shall be
Stirred by the deep and fervent line
Which is the poet's sign and fee:
Be this your joy that now is mine.

Well shall it be if, boyhood gone,
A boy's delight you still may own
To play the dawn-new game of life,—
If what is dreamed and what is known
In your still startled heart have strife.

When comes the hour, be full and bright
Your lamp, as the wiser virgins' light!
Choose some familiar shrine-like nook,
And offer up in prayer the night
Upon the altar of this book.

Always new earth, new heavens lie
The apocalyptic spirit nigh:
If such be yours, oh, while you can,
Bid unregretted Youth good-bye,
For morning shall proclaim you Man.

Robert Underwood Johnson.

THE DESTINY OF THE UNIVERSE.

EVERY night there glides along above us in the sky the corpse of a dead world. Sometimes shrouded in the glare of sunshine, she dimly appears in the sky of day; sometimes full and round, she is bright with a cold splendor; sometimes wan and shorn of her beams, she rises late and chill, forerunning the sun; sometimes following his departing light, she delights us with the graceful crescent and its nightly growing radiance; sometimes coming between earth and sun, she casts that baleful shade which made the heart of the elder world to quake, and still smites uncultured nations with fear. To the eye of the poet the very type and emblem of inconstancy, she is to the thought of the astronomer only the dead-world satellite, the airless, waterless, lifeless mass of rock that swings slowly along the orbit of the earth, swaying mundane tides, and, by the aid of science, helping the sailor to find his way upon the trackless ocean.

But we know she was not always such as she now is. Rugged with mountains like earth's loftiest, and with volcanic craters of vast diameter and depth, her surface shows that the elemental war of fire and earth raged here most fiercely; that she was once hot and flaming; and that from this state of ignition and self-shining she has become dark and cold; whatever of atmosphere and water she may have had has retired deep into her substance; and in the long presences and absences of the sun's heat she is alternately parched and frozen. Life, either vegetable or animal, is impossible; for to life, as we know it, there are necessary water and air, and such temperance of temperature as finds no place in the moon.

But the earth, too, is cooling. The geologists tell us of the time when it was a molten mass. Professor Newcomb, in his "Popular Astronomy," says that water may have existed upon the earth in a fluid state ten millions of years, but no longer; it is probable that this period is much too long. Our mountains have become so cold, though some were thrown up hot from the flaming bowels of the earth, that everlasting snow lies on their summits, and glaciers creep down to their feet. The cooling of the earth has reached the point at which the influence of the sun not only antagonizes it, but furnishes the surplus of heat which makes life on the earth a possibility.

But modern science tells us that the sun

himself must fade; that his brightness must pale and his heat exhaust itself; that his brilliance and beauty, measured by ages and æons, is at last transitory, and must end in darkness and frost; and that causes are perpetually at work to produce this result. And what then shall become of the sun, and of all the myriads of suns that bedeck the firmament and are to us the purest, grandest emblems of ineffable beauty? What shall be the End of the World, the Destiny of the Cosmos?

Science teaches us to trace causes forward to their results and backward to their antecedents. Before we come to the final end of the cosmos, let us follow the chain of mighty links and vast induction back through thousands and millions of years, and see how the world was made, so far as this same science can show us by reasoning from the facts she has to those she infers. We find ourselves in a stream of causes and effects of which we know not the extremes, but may infer them; there are stairs above and below like those on which we tread.

Emerson says:

"The astronomers said, 'Give us matter and a little motion, and we will construct the universe. It is not enough that we have matter: we must also have a single impulse: one shove to launch the mass and generate the harmony of the centrifugal and centripetal forces. Once heave the ball from the hand, and we can show how all this mighty order grew.' 'A very unreasonable postulate,' said the metaphysicians, 'and a plain begging of the question. Could you not prevail to know the genesis of projection, as well as the continuation of it?' Nature meanwhile had not waited for the discussion, but, right or wrong, bestowed the impulse; and the balls rolled."

This is Emerson's pregnant comment on world-making as practiced by the astronomers. The seer has put his finger on the heart of the question. We must have matter and motion to begin with, and for the present ask no further questions.

The current theory of world-making is the famous Nebular Hypothesis, to which have contributed one of the greatest philosophers of modern times, Immanuel Kant; the greatest astronomical observer, Sir William Herschel; and the greatest mathematician and physicist, Laplace. Kant, getting a hint from an obscure English writer named Wright (Thomas Wright, of Durham, whose astronomical works were published about the middle of the last century), developed the notion of the shape of the universe which Herschel adopted—

namely, that it is a host of stellar bodies occupying a portion of space in the shape of two dinner plates placed with their faces toward each other; so that as we look in one direction, into the Milky Way, we look into the vast mass of heavenly bodies; but as we look another way, we see fewer, because we look out of the mass. Kant, whose earlier works were on physics, mathematics, and astronomy, set himself to world-making, and calculated what would be the result of motion in a mass of tenuous matter, nebulous matter, filling the space of the physical universe. Herschel's adoption and development of the theory arose from his observations, and especially from his study of the nebulae, of which there are over four thousand in our sky. Laplace took up the matter as Kant had done; and assuming a condition of the solar system in which the matter of the sun and planets should be diffused through the whole space of the solar system, forming an orb surpassing the limits of the present orbit of Neptune, he calculated the results of a gradual condensation and cooling of this vast mass of star-mist, and in theory produced the existing system.

Since this development of the scheme, it has received constant accessory support from later discoveries in physics. Indeed, it seems to be certain now that some of the nebulae in our sky are masses of glowing gas, shreds of the original material of the universe that have survived in this shape, and that are now in the very process of world-making. The physicists say that a nebulous body, in order to shine by its own light, as these do, must have heat, and must be losing heat through the very radiation by which it becomes visible. As it loses heat, it must undergo successive changes, among which will be contraction; and this contraction cannot cease until it becomes either a solid body or a system of such bodies revolving around each other or around a central body. The nebular hypothesis was popularly set forth in the "Vestiges of Creation" about forty years ago; and it is given in all astronomies. It was elaborated in the "Westminster Review" in 1858, by Herbert Spencer, whose statement may be condensed thus:

Assuming, for the sake of the argument, a rare homogeneous nebulous matter widely diffused through space, certain changes will, on physical principles, take place in it: (1) mutual gravitation of its atoms; (2) atomic repulsion; (3) evolution of heat by overcoming this repulsion. [Right at this point it is easy to see that this theorist has by this time assumed the whole matter and introduced that push of which Emerson speaks, for there is no proof of any necessity for overcoming atomic repulsion except this, that the world must be made by a theory, and this is necessary for the theory, and thus vortices can be started in this star-mist.] There will be after this push is given: (4)

molecular combination, followed by (5) sudden disengagement of heat; (6) lowering of temperature by radiation; (7) consequent precipitation of binary atoms aggregating into irregular flocculi, floating in a rarer medium, as water precipitated from clouds floats in air; (8) motion of the flocculi toward a common center of gravity; but as these are irregular masses in a resisting medium, it follows (9) that the motion will not be rectilinear, but spiral; (10) the rarer medium will be involved in this motion, and thus at last comes (11) the grand rotation of the whole mass of the universe, the balanced whirl of the cosmos.

But this form of the nebular hypothesis has not been accepted by physicists. It is at fault in several points; but most of all, and most fatally, in the very part of it which is original with Spencer, in the attempt to develop a rotary motion of the system from the mutual action of the parts upon each other, gravitation and the qualities of matter only being assumed. This is as contrary to the accepted laws of physics as would be a theory that motion in a wheel may arise by the attraction of the rim for the hub. The spiral movement which is needed cannot be generated by simple gravitation, as Laplace showed in proving that any system left to itself will always have the same amount of rotary motion. Physicists now claim as necessary fundamental assumptions for a nebular hypothesis, first, dissemination of matter; and second, rotary motion of the mass. From these two conditions will flow everything else that is needed for the development of systems. No discovery since Laplace's time has done away with the need of the original impulse, as stated by Emerson.

The nebular hypothesis has sundry great advantages in elucidating very many of the existing arrangements of the stellar universe, but it fails to accord with all of them. To account for the existing order, it must be assumed that there were many independent centers of movement and system-making; for if there were but one, there would be a similar motion of all the stars, or, as said above, a balanced whirl of the cosmos, a grand rotation of the whole mass of the universe. In this case, Mädler's speculation that the universe revolves around the star Alcyone, one of the Pleiades,—this, or something like it, would be true. But this has met with no favor from astronomers, and is deemed a baseless imagination. Proctor has given the name "star-drift" to the special and proper movement of groups of stars in certain regions, as of groups in Taurus and in Ursa Major which have motions not shared by other stars. Says Professor Newcomb: "So far as our observation can inform us, there is no reason to suppose that the stars are severally moving in definite orbits of any kind. . . . If the stars were moving in any regular circular

orbits whatever, having a common center, we could trace some regularity among their proper motions. But no such regularity can be seen." If the Kantian galaxy-theory were true, the motions of the stars should be in lines nearly parallel to the Milky Way; but they do not so move. There is one star, known as "Groombridge 1830" in the catalogues, whose motions are inconsistent with any theory that can be devised to make it a part of any system. Its velocity is certainly over two hundred miles a second, and is probably much more; and this speed is such as to counter-vail the attractive force of all the stars in the known universe, since it is greater than such attractive force can produce. Its erratic course must carry it out of the stellar universe, according to all known laws.

The nebular hypothesis, then, while admirably fitting our solar system and several systems of similar motion, does not fit the total cosmos. It may be true that some systems are so formed, but not the universe as a whole: applied to this, it becomes, not the nebular, but the nebulous hypothesis.

Approaching now again the question of the duration of the universe, we find ourselves deprived of the centrifugal force which might be asserted if the whole cosmos were in a well-balanced rotation. To keep up a stable system, it is almost imperatively necessary that there should be a central body vastly greater in mass than all the outlying bodies, just as our sun vastly outweighs all the planets. Hence the stars do not form a stable system in the same sense of the term as when we say that the solar system is stable, with recurring and nearly compensating revolutions. Such a central body could be dispensed with only if the separate stars should have a regularity of motion and arrangement which does not exist in the present stellar system. And a most conclusive proof that the stars do not revolve around definite attracting centers is found in the variety and irregularity of their observed movements.

Assuming that the law of gravitation is universal throughout the cosmos and extends to all bodies, we can foretell "the wrecks of matter and the crush of worlds" remote from us, says Professor Newcomb, by millions of years, but inevitable. To quote his language:

"All modern science seems to point to the finite duration of our system in its present form, and to carry us back to the time when neither sun nor planet existed, save as a mass of glowing gas. How far back that was it cannot tell us with certainty; it can only say that the period is counted by millions of years, but probably not by hundreds of millions. It also points forward to the time when the sun and stars shall fade away, and Nature shall be enshrouded in darkness and death, unless some power unseen shall uphold or restore her."

Some of the causes tending to produce this latter result are to be considered. The revolution of the earth around the sun is what now prevents its falling straightway and directly into the sun. It is a yet unsettled question whether the planets and the sun move in a resisting medium; the nebular hypothesis of Mr. Spencer evidently assumes such a medium for a part of the world-formation; certain phenomena of Encke's comet during this century gave considerable reason to suspect that the ether which the physicists postulate is dense enough to have a perceptible effect upon at least the light bodies of the solar system. But at present a resisting medium is not asserted as verified by observation. Yet, if light and heat are ether-waves, as is now universally held, there is something to be thrown into waves; this something is a resisting medium,—for only something capable of resistance can be moved,—and to some extent, the movements of the stars must be affected by it.

Another fact to be noted is that space is full of meteoric bodies which retard the planets as they fall upon them. They increase the weight of the earth thousands of tons every year, and all increase of weight diminishes speed of motion in the orbit. The same cause is increasing the weight and attractive power of the sun. These are but small matters, it is true; but small matters acting constantly in the eternities, or in the vast tracts of space and periods of time, produce great effects. Even the works of man may affect the rotation of the planet. From the substance of the earth men make bricks, dig rocks, bring up heavy metals; and these are spread on its surface or put up in buildings, so that the crust of the earth is made relatively heavier; that is, the average distance of the crust of the earth from the axis of revolution is made greater. In effect, this diminishes rotation. But, on the other hand, some of man's works have an opposite tendency. He cuts down the forests and hastens the wash from the mountains; he levels and cuts through hills, and makes embankments for his railroads. Ericsson has shown that a diminution of speed is resulting from the deposits made by the great rivers, varying in influence according to the latitude of their mouths, as well as the amount of their débris. He calculates that the effect of these upon the earth will be enough to alter the length of the day. But Ericsson may be wrong, for all this débris is brought from the mountains, producing another counteracting influence. Observations do not yet show the influence of these causes, because only in recent times have instruments and calculations been able to cope with such a problem.

A thousand years hence, the variations, if any, may be distinctly stated.

But another running down of the stellar system must be noted. According to modern science, radiant heat and light are forms of energy; they are a real expenditure of work; they can be changed into other forms of motion, and *vice versâ*. Now all the stars and our sun are bodies radiating heat; they are putting forth energy and producing effects by it. But what is the source of their heat? and can they continue to give it out without exhausting themselves? There is a perpetual radiation of heat from all visible objects, which is to some extent an interchange; and this has been going on from the beginning. There has been forever a transformation of motion into heat, and a radiation of heat into space. This heat and heat-energy is wasted, because it is never returned; radiated in every direction, only a small part of it is caught by any body and thrown back. For example, the sun gives out two thousand one hundred and seventy million times as much heat as the earth receives; and very little of that is ever returned to him. As Sir William Thompson expresses it, "There is a constant dissipation of energy going on in nature." The stars, on the average, give each more light than the sun; hence, they lose more heat. This cannot go on forever. The sun cannot have been radiating at his present rate for more than eighteen millions of years; and as he continues to give out heat, he must contract, grow smaller and denser and less luminous. In twelve million years more he will, changing at the present rate, become as dense as the earth, and his fires will have paled or will have been quenched.

Science is here confronted with a great difficulty. Is this heat annihilated? Science may not say "Yes" to this question without a denial of one of her fundamental doctrines. She cannot admit that heat, which is one of the forms in which energy is manifested, is annihilated, for she holds that neither motion nor matter is either created or destroyed. But this doctrine itself is one which can neither be proved nor disproved experimentally; it is one which, however verified by its leading on to discoveries, and however uncontradicted by experience, runs nevertheless upon the verge of metaphysics; it rests mainly upon the impossibility of our conceiving of either creation or annihilation, and upon the metaphysical necessity which scientists feel that the substances or realities with which science deals, namely, matter and motion, shall remain constant. But scientists generally, while ready to make sport of the metaphysics of other people, in which they have

no interest, vigorously defend their own metaphysics, and contend for their own notions of atoms and molecules with their interspaces, vortices, attractions, and repulsions, which are mere products of the scientific imagination, and not of scientific knowledge.

Or does heat go on traveling forever into space, beyond all ponderable matter? As heat is a mode of motion of ponderable matter, or of the ether which is conceived of as the medium of transmitting it, we must say that the radiated heat is lost to ponderable matter, but produces endless agitation in the illimitable ether. To space we can set no limit; the human power of conception finds equal difficulty in limited or unlimited space; one is inconceivable because absurd, the other because it eludes our grasp. Is the ether limited or unlimited? As this question cannot be answered, all the result we reach is this, that the vibrations of heat go out into ether of which we know no limit; and as there is no boundary of ponderable matter to reflect it back, it is practically lost; it does work only as it encounters ponderable matter. There is but one alternative, and that is suicidal. If science could only affirm that a straight line is in fact a curve, and that the outgoing heat radiating in straight lines really moves on a curve of infinite radius and comes back again, she might save the vital warmth and the universe. But this would upset the whole Euclidian geometry, as well as belie the fundamental conceptions of mankind, and set all science itself afloat; for that is founded upon the common experience, necessary processes of thought, and fundamental conceptions of men. Science must therefore admit a never-ending dissipation of energy; all forms of energy tend to fritter away into heat, and to disappear in an objectless radiation.

We may, therefore, as taught by modern science, picture the long agony and dissolution of the cosmos. The planets lose their heat and life; all animals and then all plants die; the globes slacken their speed; they approach the sun in a gradually narrowing spiral, drawn out through millions of years; but, as fast as one after another touches the sun and becomes a part of its mass, the predominating centripetal attraction of the central globe increases; and, the perturbations which arise from planetary attractions ceasing, the rest more easily yield to his overpowering sway. These collisions for a time light up his fires; but when, Kronos-like, he has devoured all his children, like Kronos he too shall begin to fail. The same process is meanwhile going on in other systems, and now the overgrown suns become planets to each other; vortices of suns take the place of solar systems; and

suns fall into suns, till all are united into one vast glowing mass containing all the matter of the universe, from which much of the energy that once animated and vivified it has departed by the infinite and eternal radiation. Else we might say that the crash of worlds had generated heat to rehabilitate the star-mist and inaugurate a new nebular globe or disk, to repeat the long formation of the worlds and the procession of the ages; but Science herself has shown this cannot be.

And now the central mass is cooling for thousands of centuries; from the bright white heat and light which no nerve feels and no eye sees, it fades away to a bright red, a dull red, and finally the last ray of light, the last life-producing quiver of the ether, has gone out into the void of boundless space, pursued by the swift-flying darkness. But the heat-waves continue in the everlasting night; these too spread vainly out into space, growing fainter and fainter, until the absolute zero of cold is reached; there is the faint shudder of an eternal chill; heat too has perished; the last throb of the ether has passed, and the universe is dead.

This is the funeral to which modern Science invites us; for I have but followed out legitimately her teachings to their acknowledged ultimate results. We have been told that the universal star-mist, in whose nebulous bosom arose the first vortices and chance movements that built a cosmos of order and beauty, contained the promise and potency of all things—

“Of Cæsar’s hand and Plato’s brain,
Of Lord Christ’s heart and Shakspeare’s strain.”

But I submit that, if this is the result of science, the physicists need not wonder that

men turn rather to theology and to poetry. If the system of nature, running with matter and motion or force for an eternity of time in an infinity of space, results in everlasting death and nothingness, we must believe that the motion was created by some greater power extraneous to matter, and superior to the sum of cosmic motion. The powers and potencies of matter are evidently not inherent in it; if they were, they could not be wasted and lost; they must have been communicated to it. Whatever be said of matter, whether matter was created or not, motion must have come from some unseen Power behind the cosmos. Whatever difficulties there may be in theories of creation and in doctrines of teleology or final causes, they are no greater than those which belong inevitably to the assumptions of modern science; and the doctrines of creation and of purpose in creation accord better with human reason, with the impulses of the heart, and with the imperative demands of the conscience. With Fichte and Schopenhauer, two very different men, agreeing in one fundamental doctrine, we may recognize an Infinite Will as the substratum and substance of the universe, behind and under and over all phenomena, into which it can flow with renewing life and energy; with Kant and Fichte we may assert the “Emphasis of the Moral Ego,” the supremacy of moral laws, which afford a final end to account for the existence of the universe; and with the author of the Epistle to the Hebrews we must say, “The worlds were framed by the word of God, so that the things which are seen were not made of things which do appear.”

Samuel Willard.

THE SOUL'S REFLECTION.

ONCE in the night-time I was looking up,
And saw the stars slow circling 'round the pole,—
Orbs that through endless epicycles roll
And worlds on worlds. Lo, in a daisy's cup
A tiny dew-drop did reflect the whole,
And all the azure sky and countless spheres
That gleam in Heaven, through the varied years,
Lay in this tiny globule. Oh! my soul,
Thou mote in Nature, is not this to thee
An image of thyself? Ere thou hast passed
Beyond Time's threshold, and God's purpose vast
Breaks on thy sight, yet canst thou clearly see
The one great goal man must attain at last,
And mirror in thyself Eternity.

R. T. W. Duke, Jr.

NEW ZEALAND IN BLOOMING DECEMBER.

It was midsummer—in other words, the last week of December—when we reached the shores of New Zealand, whither we had fled from Fiji and the steaming heat of stifling summer days.

We were more fortunate than we at first realized in the time of our arrival; for, being Christmas week, there was unwonted stir in the quiet city of Auckland, and crowds of Maoris, laughing girls and stalwart men, thronged the streets, this being the only season when they assemble in any number in the white man's town, drawn thither by the annual gifts which have hitherto been so freely dispensed by the English Government, in carrying out what is commonly called the sugar-and-blanket policy.

Never in our previous wanderings had we met with a colored race who could assume the broadcloth of civilization without being thereby hopelessly vulgarized; but here we found splendid fellows, who in their European clothes could scarcely be distinguished from well-bronzed whites, while some occasional touch of color, such as a brilliant scarf around the hat or thrown over the shoulders, lent something of Spanish grace to the wearer. Only on a few of the older men did the deep lines of blue tattooing over nose and cheeks appear in curious contrast with the adopted dress. On the girls, however, the arts of millinery were less successful, and hats trimmed with artificial flowers scarcely looked in keeping with the wild shock of unkempt hair, overhanging the great dark eyes and long earrings of greenstone, and the lips and chin disfigured by curves of blue tattooing. It also struck us strangely to observe a casual meeting of friends, when the ceremony of pressing noses together (not sniffing each other, as in Fiji) was substituted for the kiss, which to our notion seems the natural form of greeting.

Many of the girls wore bright tartan shawls, for all the race are extremely sensitive to cold, and even on these hot summer days both men and women apparently delight in warm clothing, and like to exclude every breath of air from their wretched, stuffy little cottages. The inferiority, dirt, and discomfort of these, and their total lack of drainage, struck us all the more from contrast with the cleanliness, comfort, and well-raised foundation of the Fijian houses with which we had become familiar. As a general rule, a traveler would find the prospect of claiming a night's

shelter in a Maori *wharre* quite as uninviting as being driven to accept the hospitality of a very poor Highland bothie. A certain number of the chiefs, however, now own good houses (in most instances built for them by Government as rewards, or bribes for good behavior), and pride themselves on their excellent carriages and furniture, even adopting such effeminacies as white muslin covers for dressing-tables, with dandy pink trimmings.

Much as we admired the Maori race, we were even more struck by the half-castes, all our previous experience in other lands having led us in a great measure to sympathize with the aversion commonly felt toward mixed races, which generally seem to unite the worst characteristics of both. Here, however, this rule is reversed, and the most casual observer can scarcely fail to note the physical and intellectual superiority of the Anglo-Maori. I am told, however, that the physique is not in reality so good as at first sight appears, and that the tendency to consumption is even greater than in the pure Maori, whose ranks have been so terribly thinned by this insidious foe.

Next in interest to the old lords of the land are the geological surroundings of the city of Auckland, which is situated in the midst of a cluster of extinct volcanoes. The largest and most perfect specimen of these retains its true native name, Rangi-Toto, but the principal crater in the immediate neighborhood of the town has had to submit to the common custom of colonies, where old places must perforce receive new names; so it is now known as Mount Eden, and its grassy slopes are dotted with pleasant homes. Only its summit retains traces of the old Maori fortifications, in artificially leveled terraces surrounding the deep crater, wherein, in case of dire attack, a whole tribe might have taken refuge. Every green hillock, far and near, partakes of the same character.

I cannot say we were much struck by the beauty of Auckland, though there are some fine views, such as that from the cemetery, looking across the blue waters of the harbor to the great triple cone of Rangi-Toto, which rises from a base of black, broken volcanic refuse,—a suggestive contrast to the foreground of beautiful tree ferns, which have been suffered still to survive in the valley just before us. But the noble primeval forest which formerly clothed this district has almost entirely been swept ruthlessly away, and wholesale burning has destroyed

what the woodman's axe had spared, so that there now remains literally no shelter from the summer sun, save such English oak and other trees as have been planted by the settlers.

It was not till we found ourselves on Kawau, Sir George Grey's fascinating island home, that we had an opportunity of seeing something of a carefully preserved New Zealand bush. Here every headland is crowned with magnificent pohutukawa trees (*Metrosideros tomentosus*), literally rendered, "the brine-sprinkled,"—so called by the Maoris, because they are said only to flourish close to the sea; but known to the settlers as the Christmas tree, since it invariably blossoms in Christmas week, when boughs of its glossy green and scarlet are used in church decoration as a substitute for the holly berries of Old England. Like many of the flowering trees of the Pacific, its blossom when gathered possesses small attraction, its brilliant color being derived solely from the clusters of bright scarlet stamens, which, however, when seen in masses, produce such an effect of intense color that the whole tree appears aflame, and the overhanging boughs seem to be dripping fire into the clear blue water, while the ground on every side appears as if tinged with blood, the grass being fairly hidden by the showers of constantly falling stamens.

To us, so long wanderers in tropical isles, where a grassy meadow is a thing unknown, and the most inviting green hill-side invariably proves to be a matted sea of tall reeds, it was a positive delight to find ourselves once more rambling over grassy downs, where sheep and cattle pasture peacefully and mushrooms grow abundantly, and where a multitude of English sky-larks make their homes and fill the air with their thrilling warblings. The larks, the bees, and the thistles are alike imported, and all equally thriving. As to the thistles, the size and beauty of their purple blossoms must gladden the heart of every true Scot, especially as the farmers praise them and vow that they actually improve the new soil.

Even the grass itself is not indigenous, all these hills having till recently been densely clothed with a thicket of tea-tree, which is a shrub somewhat resembling juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris manakau, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called ti by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle. Curi-

ously enough, the Maoris give this same name, ti-tree, to the *Cordyline indivisa*, a kind of dragon-tree, which here flourishes on all moist soils. The settlers with strange perversity have dubbed this the cabbage-tree, though its cluster of handsome long leaves, crowning a tall stem, is nowise suggestive of that familiar vegetable.

New Zealand seems to be the very paradise of acclimatization, so readily does she accept the office of foster-mother to the products of other lands. Though the combinations did not appear to me so startling as some in Queensland and New South Wales,—where I first saw holly-trees (with wealth of crimson berries) overshadowed by tall palms, and luxuriant camellias loaded with blossoms growing side by side with broad-leaved plantains and tree ferns, beneath the shelter of great pines from Norfolk Island, with a carpet of mignonette and violets,—I believe the kindly soil and climate of New Zealand can nurture almost any plant that finds its way thither.

Here and there the banks are clothed with a handsome green flag, the precious New Zealand flax (*Phormium tenax*), whose tall, red, honey-laden blossoms, growing on a stem fully ten feet high, offer special attractions to the bees; and great are the treasures of wild honey to be found in these parts, where the busy creatures apparently do not learn the idle habits attributed by some to their brethren when imported to tropical isles, where the supply of flowers never fails through all the circling year. For the first season the newcomers work diligently; but, after having made the pleasant discovery that they have no need to gather a winter store, they are said to abstain from useless toil and thenceforth live a life as careless and idle as any butterfly. I am, however, inclined to look upon this story as savoring of bee calumny.

The long leaves of the flax are nature's ready-made cords and straps, so strong is the fiber and so readily do the leaves split into the narrowest strips, while at the base of each lies a thick coating of strong gum. This, I believe, is the chief difficulty in employing machinery in the manufacture of this flax so as to render it a profitable article of commerce.

With all this natural vegetation the foliage of other lands mingles so freely that in a very few years it will be hard to guess what is indigenous and what imported. For here we find pines and cypresses from every corner of the globe, oaks and willows, Australian gums, and all manner of fruit-trees, more especially apples and pears, peaches, apricots, and figs, which grow in luxuriant thickets wherever they are once planted, and bear fruit abundantly. And after feasting on these,

we may pass through some romantic glen, where the sunlight flickers through the delicate tracery of tall tree ferns, and thence emerge where some quiet brook, fringed with water-cresses, flows sparkling through the meadow.

As with the vegetable world, so with the animal. Though New Zealand, in common with other isles of the South Pacific, could originally boast of literally no four-footed creature save a small rat, she gives such cordial welcome to all new-comers, that all living things imported seem certain to increase and multiply to any extent. Already, in this island home, large herds of fallow deer and Indian elk roam at large; pheasants are abundant, and a good day's sport may be had in pursuit of wild cattle; while kangaroos, or wallabies, as they are commonly called, are so numerous and such easy prey as to be almost beneath the dignity of a true sportsman, so very deliberate is their strange leaping retreat, and so frequently do they pause to gaze wistfully at the intruder. A rare and beautiful variety of kangaroo, called the tree wallaby, because of its squirrel-like habits, has been imported from New Guinea, and is already so abundant on this island of Kawau that a very large number annually have to be shot. It is a small animal, with the richest brown fur, and when feeding in the grassy glades might at first sight be mistaken for a hare, till at the faintest sound of danger it sits upright; then, standing on its long hind legs, it bounds away with a succession of leaps, and reappears springing from branch to branch, and peering cautiously from among the dark foliage of the pohutukawa.

But if tree wallabies sounds strange to Australian ears, what would a Londoner think of gathering oysters from the lower branches of the same "brine-sprinkled" trees? Here, however, he will find them abundantly and of excellent flavor; for these branches literally dip in to the water, and overshadow rocks, all of which are oyster-beds extending entirely round the island, a coast-line of perhaps thirty miles. Indeed the oysters seem equally abundant in all the neighborhood of Auckland, and here, as at Sydney, we found a simple and enticing form of afternoon picnic greatly in favor, where bread and butter and a hammer were the only accessories carried to the feast. True gourmets brought lemons and spoons. I confess to having frequently dispensed with all these superfluities, and to have greatly enjoyed the simple process of knocking my oysters on the hinge with a stone, thereby removing the upper shell, and leaving the dainty morsel unprotected. This did at first sight appear a very savage feast, and for awhile I stood aloof in some disgust; but *ce n'est que le premier pas*

qui coûte, and, having once overcome this natural repugnance so far as to *try* (as the colonials say) just one, I plead guilty to having thenceforth been foremost at every oyster festival.

The island being now simply the private estate of an English gentleman, its inhabitants are all his comfortable and well-cared-for dependents, if such a word can possibly be applied to a race so thoroughly independent, and who require to be humored to an extent that would greatly astonish land-owners and housekeepers in the old country.

Only once a year do the Maoris return to this coast to fish for sharks; not the dreaded white sharks, though these also are frequent visitors, but a hideous creature resembling a dog-fish, and from four to six feet in length, which the Maoris split and dry for winter fare. One day a large party of natives arrived in half a dozen good English boats. We rowed out to join them, and they invited us on board the largest boat, in the hold of which were already stowed about fifty of these small sharks. They caught ten more while we were watching,—fishing with line and bait. Each shark, as it was drawn up, received a severe blow on the nose, which was then cut off, and the sufferer apparently died at once. When the fishing was over the boats departed to a small island, where the sharks are hung up to dry, and horrible must be the effluvia. A gentleman who accompanied us told me that in one season they had caught fifteen thousand off this island, and that he had himself seen a pile of dried fish three hundred feet long by six deep, ready for winter use. One of the fishers was introduced to me as the Queen's godson, a fine, stalwart fellow. His father, having visited England, and having been honored by presentation to her Majesty, was granted this further privilege on behalf of his son, together with the accustomed christening cup.

While looking down from my window to the lovely little bay—a beautiful scene, framed by large trees and tall, flowering aloes—I saw on two different occasions a wonderful effect of phosphorescence. The 11th of February had been marked by violent thunder-storms, vivid lightning, and downpours of rain, leaden skies, and a bright green sea. I chanced to look out about eleven P. M., and saw the whole bay glowing with pale white light, and fiery waves rolling right up beneath the trees and around the rocks, which stood out sharp and black. The effect was as of a sea of living light. For about ten minutes I watched it, entranced; then it slowly faded away, and the scene was changed to dense obscurity. Next night I looked out at the same hour, and be-

held only darkness; but about midnight I was awakened by a deafening crash of thunder, followed by heavy rain. I guessed this would stir up whatever creatures caused the strange, weird light; perhaps they are disturbed by the electricity-laden rain-drops, and seek safety in flight, or it may be that they receive a small electric shock which starts them all dancing. Whatever be the cause, the result proved as I expected. Ere I could reach the window, the bay was illuminated by tiny ripples of fire, which gradually increased in size and number till all was a blaze of glowing, dazzling light. This lasted for about five minutes, and then died completely away.

Returning to Auckland, our next expedition was a five-hours' trip by steamer to Grahamstown—in other words, the Thames Gold Fields. We sailed at sunset, with a good three-quarter moon. This was obscured for a few minutes by a slight shower, which was followed by a very beautiful lunar rainbow—a phenomenon which must surely be more common in the southern hemisphere than with us, for the ship's officers spoke of it as by no means rare, whereas this was my first sight of the ghostly, pallid rainbow of the night.

Ere midnight we were luxuriously housed near the great baby town, where, till about ten years ago, not a sound disturbed the deep stillness, save the ripple of the sea around the steep, richly wooded shores. But swift change followed the discovery of gold. Too quickly the hills were denuded of all their timber, and left bare, and red, and ugly. Adventurers poured in and burrowed for the precious ore, till the hills now resemble one vast rabbit-warren. So great is the amount of refuse thus cast out that it has served to reclaim a tract of land from the sea, thus considerably enlarging the site for building purposes, which, even thus, is but a narrow strip between the sea and the steep hills. Here a large, straggling town has sprung up, and mighty batteries, whose tall chimneys darken the air with black smoke, work with deafening noise, crushing the auriferous quartz; for you must not confuse the gold fields with "diggings" where the precious nuggets lie embedded in alluvial deposit, and entail only digging and washing. Here the gold is traced to its original home, where it forms part of the quartz veins which traverse the hard rock, and has to be sought by tunneling and by the pickaxe with patient toil. Truth to say, a few days' acquaintance with Grahamstown greatly disturbed my preconceived ideas of life at the diggings. Here I found a large, scattered town, peopled wholly by miners, but nowhere have I seen a more orderly and respectable community. Every miner

has his tidy house and garden; most have a wife and children. On Sunday all work save that of the great pump ceases, and the large churches of every denomination are crowded by congregations who certainly retain no trace of having been working in mines all the week. Various volunteer corps, including a fine force of Naval Reserve, a large regiment of Scotch volunteers, and one of cadets, turn out in excellent order, and march to one or other of the places of worship. The law of order prevails here as thoroughly as in any quiet English village. All matters relating to the mines are regulated by a printed code of rules, and inspectors are appointed, whose duty it is continually to visit every corner of the mines, and who, in their turn, are responsible to the Warden of the Gold Fields. The great pump is one of the marvels of the place. Its shaft is six hundred and ninety feet deep, and it drains the whole neighborhood. The water pumped up deposits silica in such quantities that the great tubes through which it passes are coated every few days with an incrustation about an inch thick, which has to be removed with a chisel. Small objects, such as wicker baskets, are occasionally left to soak for a short period, and re-appear apparently carved in white stone.

We were fortunate in the time of our arrival, as large quantities of gold had just been discovered in the Moanitairi mine, hitherto considered almost worthless. Of course the shares flew up, and the excitement was tremendous. We saw fortunate holders of old shares who, a few days previously, had been poor men, suddenly transformed into men of large capital. Indeed, we ourselves were sorely exasperated by the persistency with which our friends in Auckland and elsewhere would congratulate us on the successful speculation which they assumed we must have made. Unfortunately our sole acquaintance with the gold was as sight-seers; and first of all we were taken along the great main tunnel whence the side-drives diverge in all directions, following the lead of the quartz veins.

The great tunnel extends three-quarters of a mile, and is lighted by gas, to say nothing of the tiny green lamps of multitudinous glow-worms, which, together with a fluffy white fungus, cover the sides and roof. On reaching the far end, we came to the shaft leading down to the lucky Moanitairi, and were urged to descend and have a look at the gold; but the journey appeared so uninviting that we contented ourselves with exploring some of the side-drives, where we found the men, generally in couples, working hard with pickaxe and shovel, each in his own bur-

row, like so many rabbits. On our appearing they worked with renewed energy, that they might "show us the color"; and though the particles thus revealed were infinitesimal, we had the satisfaction of having ourselves seen them brought to light.

Next we were taken to see the huge batteries, where the quartz is pounded into white mud, through which quicksilver is run to amalgamate the gold. The mixture is then distilled, when the quicksilver evaporates, and is again condensed, ready for use, leaving the gold comparatively pure. The refuse from the batteries, known as tailings, is heaped up to be eventually subjected to closer scrutiny.

Our last visit was to the bank, to see the process of making golden bricks. Twelve thousand ounces of Moanitairi gold was brought in, already roughly run into lumps the size of a man's head. These had to be broken up with wedge and sledge-hammer into pieces sufficiently small to find room in the melting pots which stood ready on the furnace. I confess the use of such tools in working gold was to me quite a new impression! The molds were then well oiled, and into them was poured the liquid ore, which, being cooled with water, soon formed a heap of solid golden bricks, bearing the bank stamp—very pale gold, however, the proportion of silver therein contained being about thirty per cent.

Leaving Grahamstown one lovely afternoon in the comfortable little steamer *Te Aroha*, we proceeded up the river Thames to Paeroa, where we arrived at sunset. It is a most beautiful river, flowing sometimes through rich pasture land, alternating with large forests of white pine, called by the Maoris kakikatea, while here and there the banks are fringed with graceful weeping-willows, which were imported not many years ago from Britain, and have already attained a larger growth than is often to be seen there, showing that, like the sweet-brier and peach-trees, they take kindly to their adopted land. The latter have already overspread the country, forming thickets where the traveler may halt and feast to his heart's content, while his horse munches the red berries of the sweet-brier which covers large tracts of land, filling the air with fragrance.

As we neared our destination, we had the opportunity of seeing a Maori pah in full fighting condition, two of the neighboring tribes being at variance. It did not appear very imposing, its fortifications consisting of the usual red fences. Nevertheless, its defenders were all on the alert to prevent the passage of any foe, for which purpose the river was barred, only leaving space enough for the steamer to pass.

At Paeroa we found horses awaiting us, and a lovely moonlight ride brought us to

Mackaytown, where we were gladdened by a bright fire and a cordial welcome. Sorely did we regret that we had not so planned our days as to allow time to see something more of this beautiful district of Ohinimuri and its gold-fields, where life in the heart of wild forests and mountains must necessarily be of a far more primitive stamp than in the orderly city of Grahamstown—perhaps more like our ideal, derived from Bret Harte and kindred writers. But ruthless fate urged us on, and at the first peep of day we started, having before us a twenty-five miles' ride, which was considerably prolonged by the necessity of making wide circuits to head treacherous swamps.

Our first mile lay through the most exquisite tract of bush it has ever been my good fortune to behold in any land; groups of tall red or black pine (native names, rimu and matai) mingled with fine trees of various sorts, matted by luxuriant creepers, through which the sunlight stole tenderly, to reveal the treasures of beauty below. For the glory of this fairy dell lay in its tree ferns, no new delight to me, for I have seen such wealth of these in the various isles of the Pacific as I thought could never be excelled. But in this one tract of New Zealand bush it seemed to me that Nature had surpassed herself, that she might revel in her own loveliness, so artistic was the grouping of each several cluster of these dainty trees, some of them towering above their fellows, with foliage crowning stems from twenty to thirty feet high, and so rich was the undergrowth of all manner of humbler ferns. Imagine my feelings of disgust when, on alluding to this dream of beauty to a practical settler, he at once recognized the spot, saying: "Oh, yes! that block has been reserved for fire-wood!"

Above us lay a magnificent forest of the giant kauri pine, which is found only in this northern part of the North Island. It is a noble tree, and the tall, upright stems were ranged like the pillars of some mighty cathedral; and so highly is it prized as timber that it is largely exported both to the South Island and to Australia. So extensive a demand has already well-nigh denuded many vast tracts, which but a few years ago were clothed with primeval forest. Hence the necessity which has caused Government to take what remains under its special protection. It is from the scrub-land which was formerly occupied by kauri forests that are dug the large, amber-like lumps of gum which are so valuable in commerce. They are found within two feet of the surface, and are by some supposed to have been formed by the melting of the resin when the forests were burned. The industry affords a livelihood to a large

class of men, both Maori and European, known as gum-diggers.

Beyond the dark forest we could see the tiny tents of the gold-miners gleaming like white specks, high on the mountain side,—a most romantic site for a camp, and one which we would fain have visited, had time allowed. We found no cool shade inviting us to halt, till we reached a Maori village on the shore. Thence our route lay for some miles along the hard, yellow sands, with the wavelets rippling right up to the horses' feet,—a beautiful ride, had there been leisure to enjoy it; but before us lay a wide tidal creek which it behooved us to cross before the waters should rise, so we had to get over the ground at a swinging pace, which, however pleasant under ordinary circumstances, is scarcely so enjoyable when you are holding on to a large umbrella, with opera-glasses flying and bumping on one side, and a large traveling-bag, containing night-gear and sketching materials, somewhat insecurely strapped to the pommel, and all beneath a burning sun. I was a novice at bush travel, and had not yet learned how little can be carried in lands where no patient and much-enduring coolies await the white man's pleasure.

After all, we reached the ford too late, and had to wait a couple of hours at a lonely little telegraph station till a boat was ready to take us across; a circumstance which, in my secret heart, I did not much regret; for, under any circumstances, the creek is very wide and muddy, and the ford difficult and insecure. So we left the horses to enjoy their supper, while we found friendly shelter at Kati Kati, a district inhabited solely by settlers from Belfast. The next afternoon we rowed down the lake to Tauranga in a small boat, a distance of about twenty-five miles. It was midnight before we arrived, and bitterly cold, but all weariness was soon forgotten in the cordial kindness of our reception by total strangers, previously known to us only by name, as friend's friends,—a title, however, which we found in every case to be a sure passport in this genial land.

The interest of Tauranga centers around the Gate Pah, in the capture of which so many brave English soldiers and officers were slain during the Maori war in 1864. They were buried (together with many others, including sailors and marines, who perished in the same useless strife) on a green headland beside the sea,—a lovely spot, and lovingly cared for, where bright blossoms bloom beneath the shelter of weeping-willows, and scented geraniums grow in wild profusion among the rocks. On the many head-stones and crosses are inscribed names still precious to many a home

in Britain. The Gate Pah itself, despite its historic interest, has been leveled with the ground and nothing now remains to mark its site.

Of the unsatisfactory results obtained at the cost of so much bloodshed there can, I suppose, be no doubt. It seems as if it had but taught the Maoris their own strength, and left them in a position which, to the settlers, must be galling indeed, they being often compelled to submit patiently to overbearing insolence on the part of the natives, who know full well that their white neighbors are practically without redress in a land where the Queen's writ does not run. Imagine that, within twenty miles of Auckland itself, a murderer is safe from British law, no officer of justice daring to pursue him into "the King Country," where no white man may travel, save by special permission of the chiefs—a permission often withheld, even when the traveler carries letters of introduction from their oldest and long-tried friends, as one of our party proved, much to his annoyance.

Even the white man's religion has fallen into contempt with a vast multitude, who previous to the war were apparently most reverent and devout Christians, but who at that time either banished or murdered their teachers, and invented new religions for themselves—strange compounds of many creeds, mingled with the most utter absurdities. One sect has retained the custom of reading daily lessons, but the Scriptures from which they are drawn are the ancient Maori legends collected and published by Sir George Grey, which the natives consider on the whole more edifying than those of Syria and Palestine. Many of the once flourishing mission stations are now deserted, and the churches stand silent and forsaken.

As regards the future, there are many who consider that the attitude of the Maoris is decidedly hostile, and that a fresh war may even now be imminent. Should this prove to be the case, the whites would now fight at a greater disadvantage than ever, both owing to the loss of prestige due to over-familiarity and to the fact that the natives have now accumulated such stores of fire-arms as they formerly could never have hoped for. But, after all, it is only within their own reserved lands that they show so firm a front, and perhaps we have small right to blame their determination to resist further aggression. Undoubtedly, their dealings with white men have, on the whole, been just and honorable; and, possibly, had their positions been reversed, we might be disposed to view matters very differently.

Constance F. Gordon Cumming.

ARNOLD ON EMERSON AND CARLYLE.

MATTHEW ARNOLD'S lecture upon Emerson was also incidentally a lecture upon Carlyle, with glances at Cardinal Newman and at Benjamin Franklin. The gist of the speaker's view of Emerson was briefly as follows: Emerson was not a great poet, was not to be ranked among the legitimate poets, because his poetry had not the Miltonic requirements of simplicity, sensuousness, and passion. He was not even a great man of letters, because he had not a genius and instinct for style; his style had not the requisite wholeness of good tissue. Who were the great men of letters? They were Plato, Cicero, Voltaire, La Bruyère, Milton, Addison, Swift,—men whose prose is by a kind of native necessity true and sound. Emerson was not a great philosopher, because he had no constructive talent,—he could not build a system of philosophy. What then was his merit? He was to be classed with Marcus Aurelius, who was "the friend and aider of those who would live in the spirit." This was Emerson's chief merit and service: he was the friend and aider of those who would live in the spirit. The secret of his influence was not in his thought; it was in his temper, his unfaltering spirit of cheerfulness and hope.

In the opinion of the speaker, even Carlyle was not a great writer, and his work was of much less importance than Emerson's. As Wordsworth's poetry was the most important work done in verse in our language during the nineteenth century, so Emerson's essays were, in the lecturer's view, the most important work done in prose. Carlyle was not a great writer, because he was too impatient, too willful, too vehement; he did not work his material up into good literary form.

It will be seen that this criticism of these eminent men is wholly with reference to what many of us consider of secondary importance, namely, their style, or manner of delivery; a criticism from the technical and academic side of literature, which makes little account of their intrinsic quality of genius and of the real force and stimulus they left embodied in literary forms,—imperfect or inadequate forms if you will, but still *literary* forms. Did the speaker disengage for us and impart to us what of worth and significance there was in these men? Did he convey to us a lively impression of their genius? I think not. And yet he has told us in his essay on Joubert that this is the main matter; he asks "What is

really precious and inspiring, in all that we get from literature, except this sense of an immediate contact with genius itself and the stimulus toward what is true and excellent which we derive from it?" Like all other writers, when Arnold speaks from the traditions of his culture and the influence of his environment he is far less helpful and satisfactory than when he speaks from his native genius and insight, and gives free play to that wonderfully clear, sensitive, flexible, poetic mind of his. And in this verdict upon Emerson and Carlyle, it seems to me, he speaks more from his bias, more from his dislike of nonconformists, than from his genius. I read in it something that we might almost call the provincialism of the academy.

We have had much needed service from Arnold; he has taught his generation the higher criticism, as Sainte-Beuve taught it to his. A singularly logical and constructive mind, yet a singularly fluid and interpretive one, giving to his criticism charm, as well as force and penetration.

All readers of his know how free he is from anything strained or fantastic or paradoxical, and how absolutely single his eye is. His page flows as limpid and tranquil as a meadow brook, loitering under this bank and under that, but yet really *flowing*, really abounding in continuous currents of ideas that lead to large and definite results. His works furnish abundant illustrations of the principle of evolution in literature, which he demands of others. He makes no use of the Emersonian method of surprise; his ideas never suddenly leap out full-grown from his brain, but slowly develop and unfold before you, and there are no missing links. Any given thought is continuous with him, and grows and expands with new ramifications and radiations, from year to year. This gives a wonderful consecutiveness and wholeness to his work, as well as great clearness and simplicity. Yet one sometimes feels as if he were the victim of his own admirable method, as if his keen sense of form and order sometimes stood between him and the highest truths. I believe the notions we get from him of the scope and function of poetry, and of the value and significance of style, are capable of revision.

Less stringency of form is to be insisted upon, less servility to the classic standards. We live in an age of expansion, not of con-

centration, as Arnold long ago said; "like the traveler in the fable, therefore, we begin to wear our cloak a little more loosely." In literature, we are coming more and more to look beyond the form into the substance; yea, into the mood and temper that begat the substance.

"The chief trait of any given poet," says a recent authority, "is always the spirit he brings to the observation of humanity and nature—the mood out of which he contemplates his subject. What kind of temper and what amount of faith reports these things?"

Of like purport is the well-known passage of Sainte-Beuve, wherein, after referring to the demands and standards of the classic age, he says that for us, to-day, "the greatest poet is not he who has done the best"—that is, written the most perfect poem from the classic standpoint; "it is he who suggests the most,—he, not all of whose meaning is at first obvious, and who leaves you much to desire, to explain, to study, much to complete in your turn."

In the decay of old traditions, and in the huge aggrandizement of physical science, the refuge and consolation of serious and truly religious minds is more and more in literature, and in the free escapes and outlooks which it supplies. The best modern poetry, and the best modern prose, takes down the bars for us and admits us to new and large fields of moral and intellectual conquest in a way the antique authors could not and did not aim to do. New wants, and therefore new standards, have arisen. It were far better for us to have Wordsworth without style (Arnold says Wordsworth has no style, but at best plain force of expression) than Milton with his un-failing style, because the intrinsic purity and force of the poetic inspiration, though it come rarely, is of more value to us than any grandeur of extrinsic form and movement Milton ever attained to. Of Milton's style I think one is justified in saying that it is like the finest and most aristocratic china, but that the refection itself few modern readers can face. A dinner of game and wild fruits and herbs, served upon birch chips, as in Wordsworth, is far more in keeping with the modern taste. If we must have partial men, let their partiality be toward the intrinsic, not toward the extrinsic, in literature, as well as in other things.

The type of men of which Emerson and Carlyle are the most pronounced and influential examples in our time, it must be owned, are comparatively a new turn-up in literature,—men whose highest distinction is the depth and fervor of their moral conviction, whose greatness of character is on a par with their

greatness of intellect; a new style of man writing poems, essays, criticisms, histories, and filling these forms with a spirit and a suggestiveness far more needful and helpful to us than the mere spirit of perfection in letters—the classic spirit, which Mr. Arnold himself so assiduously cultivates.

To say that Carlyle is not a great writer, or, more than that, a supreme literary artist, is to me like denying that Angelo and Rembrandt were great painters, or that the sea is a great body of water. His life of Herculean labor was entirely given to letters, and he undoubtedly brought to his tasks the greatest single equipment of pure literary power English prose has ever received. Beside some of the men named by the lecturer, his illuminating power is like the electric light beside a tallow dip. Not a perfect writer certainly, nor always an agreeable one; but he exhibited at all times the traits which the world has consented to call great. He bequeathed to mankind an enormous intellectual force and weight of character, embodied in enduring literary forms.

I know it has become the fashion to disparage Carlyle's histories; it is said he has been superseded by the more scientific historians. When the scientific artist supersedes Michael Angelo, and the scientific poet supersedes Shakspeare, then probably the scientific historian will supersede Carlyle. The scientific spirit, when applied to historical research, is—like chemistry applied to agriculture—valuable, but good crops have been and can be grown without it. Scientific method can exhume the past, but cannot breathe the breath of life into it, as Carlyle did. Your scientific critic is usually a wearisome creature. We do not so much want history explained after the manner of science as we want it portrayed and interpreted after the manner of literature. And the explanations of these experts is usually only clever thimble-rigging. If they ferret the mystery out of one hole, they run it to cover in another. How clever, for instance, is Taine's explanation of those brilliant epochs in the history of nations when groups of great men are produced, and literatures and arts get founded. Why, it is only the result of a "hidden concord of creative forces"; and the opposite periods, the periods of sterility, are the result of "inward contrarieties." Truly, a rose by any other name would smell as sweet. What causes the hidden concord, etc., so that we can lay our hand upon the lever and bring about the splendid epochs at a given time, the astute Frenchman does not tell us. I like better the explanation of the old Roman, Paterculus, namely, emulation among men;

yes, and emulation in Nature herself. One great orator, or poet, will make others. Or Emerson's suggestion, which is just as near the truth, and much more taking to the imagination :

"Heats or genial periods arrive in history, or, shall we say, plenitudes of Divine Presence, by which high tides are caused in the human spirit, and great virtues and talents appear, as in the eleventh, twelfth, thirteenth, and again in the sixteenth and seventeenth centuries, when the nation (England) was full of genius and piety."

Carlyle's bias does not, in my opinion, mar his histories at all, and we can always allow for it when he writes upon any subject,—upon America, for instance, or "Shooting Niagara." It does not mar his "Cromwell," but lends zest to it. He was himself the fiery partisan he was portraying. It does not mar "Frederic," though the author's partialities and prepossessions crop out on every page. What vivid portraiture, what rapid grouping, what *reality*, what exhaustless wit and humor, what entertainment for both heart and head this book holds !

It was unworthy of Arnold to try to twist Carlyle up on the subject of happiness, as if his casual utterance on this subject formed the measure of his merit as a writer. Carlyle simply taught that there was a higher happiness, namely, blessedness—the spiritual fruition that comes through renunciation of self, the happiness of heroes that comes from putting thoughts of happiness out of sight ; and that the direct and persistent wooing of fortune for her good gifts was selfish and unmanly,—a timely lesson at all seasons.

Emerson, too, is a great figure in modern literary history, and to his worth and significance, in this connection, the speaker did very inadequate justice. We know there is much in Emerson's works that will not stand rigid literary tests ; much that is too fanciful and ethereal, too curious and paradoxical,—not real or *true*, but only seemingly so, or so by a kind of violence and disruption. The weak place in him as a literary artist is probably his want of continuity and the tie of association—a want which, as he grew old, became a disease, and led to a break in his mind like that of a bridge with one of the piers gone, and his power of communication was nearly or quite lost. The greatness of his work consists in the measure of pure genius and of inspiration to noble and heroic conduct which it holds. As a writer he had but one aim, namely, to inspire, to wake up his reader or hearer to the noblest and the highest there was in him ; and it was no part of his plan to enter into competition with the Addisonian writers for the production of perfect literary

work—perfect from the standpoint of extrinsic form, argument, logic, evolution. His purpose did not require it, his genius did not demand it. He was to scatter the seed-germs of nobler thinking and living, not to rear a temple to the Muses ; and from our point of view the former is by far the more important service. To get at the full worth of Emerson, I say, we must appraise him for his new and fundamental quality of genius, not for his mere literary accomplishments, great as these were.

If it is replied that this is just what the lecturer did, I say the word of highest praise, all through the discourse, was given to the master of mere literary form. There was a tone of disparagement toward Emerson as a man of letters, when there should have been generous approval of the quickening and liberating spirit he brought to letters. But in saying he was not a true man of letters, the emphasis of the criticism, if there be criticism, really falls upon the men of letters, not upon Emerson.

Of a writer of the order of Emerson or Carlyle, we shall only demand that he have something of the first importance to say, and that he say it with force and felicity. Emerson's message is of the highest importance, and he renders it with rare effectiveness and charm. His page is an enticement to the æsthetic sense of the intellect, and a stimulus and tonic to the ethical sense of the moral nature.

But let us see the extent of Emerson's offending against this divinity called style, a divinity of whom Mr. Arnold is the prophet, and the best she has had for this long time, it must be admitted,—perhaps the best she ever had among the English-speaking people.

The masters of literary art, like the masters of sculpture, of painting, of music, of architecture, exhibit style in two ways : in design or conception, and in finish or treatment. Now the larger style of design, it is to be admitted, Emerson did not possess. There is no artistic conception that runs the length and breadth of any of his works ; no unity of scheme or plan like that of an architect, or of a composer, that makes an inevitable whole of any of his books or essays ; seldom a central and leading idea of which the rest are but radiations and unfoldings. His essays are fragmentary, successions of brilliant and startling affirmations, or vaticinations, with little or no logical sequence. In other words, there are seldom any *currents* of ideas in Emerson's essays, but sallies and excursions of the mind, as if to get beyond the region of rational thinking into the region of surmise and prophecy,—jets and projectiles of thought under great pressure, the pressure of the moral genius. He says,

speaking more for himself than for others: "We learn to prefer imperfect theories and sentences, which contain glimpses of the truth, to digested systems, which have no one valuable suggestion." It would be almost impossible to condense any of his essays; they are the last results of condensation; we can only cut them up and abridge them. So far as this criticism tells against Emerson as a literary artist, it must be allowed.

But of style in treatment, in finish, the perfection of paragraph, felicity of utterance, he is the consummate master. How vital and flexible his sentences are; how instinct with life and music; how genial, lucid, and flowing are many whole chapters, filling the spirit with a fine excitement, elation, and joy.

The logical texture of the sentences in "English Traits," and in "Representative Men," and in all his historical and biographical sketches, and political tracts and speeches, lately published, seems to me to have unquestionably "the requisite wholeness of good tissue"; it is true and sound prose, and, as a specimen of the free play of the mind upon ideas and traits of character, is far enough above the tame pages of Addison.

The essay, I say, makes no unit of impression, though undoubtedly the personality of the writer does; and this, I think, largely makes up, in such a writer as Emerson, for the want of inclosing design to which I have referred. The design that gives unity and relevancy to these isolated paragraphs is the personality of Emerson, his peculiar type and idiosyncrasy. This is the plan, the theme which these musical periods illustrate. The artist, says Goethe, "make what contortions he will, can only bring to light his own individuality." Of men of the Emersonian and Wordsworthian stamp, this is preëminently true; and it is this which finally interests us and gives the totality of impression in their works. The flavor of character is over all; the features of the man are stamped upon every word. From this point of view, much faultless and forcible writing—the writer always under the sway of Arnold's law of pure and flawless workmanship—is destitute of intrinsic style, because it is destitute of individuality. I should say that such a writer as Gladstone, for instance, had no style; such a man as Edward Everett, very little, though he had logic and plenty of verbal grace and finish. In the case of Emerson, the only new thing in the book is the man; this is the surprising discovery; but this makes all things new; we see the world through a new personal medium.

Everything Emerson wrote belongs to literature, and to literature in its highest and

most serious mood. If not a great man of letters, then a great man speaking through letters, and delivering himself with a charm and a dignity few have equaled. We cannot deny him literary honors, though we honor him for much more than his literary accomplishments. No more could a bird fly without wings, than could Emerson's thought have reached and moved Arnold in his early Oxford days, as the latter said it did, without rare qualities of literary style.

All Emerson's aspirations were toward greatness of character, greatness of wisdom, nobility of soul. Hence, in all his writings and speakings the great man shines through and eclipses the great writer. The flavor of character is stronger than the flavor of letters, and dominates the pages.

If he is "the friend and aider of those who would live in the spirit," he is equally the friend and aider of those who would found a great state, a great literature, a great art. The spirit he brought to his task, and which he displayed through his life, is a stimulus and a support to all noble endeavor, of whatever kind or in whatever field.

Yet it is to be said that neither Emerson nor Carlyle was a typical literary man. They both had too great moral vehemence, or bent, to be the doctors and professors of mere literature for and of itself. And this brings us to one of Arnold's test words, *disinterestedness*. The great writer is disinterested; his interest is to be in truth alone, severed from all practical considerations. True, certainly, and true when applied to the writers named. In the American phrase, neither of them had "an axe to grind," and yet they were *interested* in certain phases or kinds of truth over certain other kinds—moral truth above all others. In this sense they were not disinterested writers; and may not this kind of bias or preference be consistent with the work of a true literary artist, though a hinderance to the discharge of the functions of a scientific critic? Are there not cases in which we may go behind the disinterestedness of the poet or artists, and condemn, not the work, but the spirit of the work? I have heard it said that the "mood of the poet is always to be accepted." But if the mood of the poet is like the breath of the upas, it is to be condemned; if it is subversive of life and of the perpetuity of the race, there is no second question to be asked. If the air of the place is rotten and pestilential, no beauty of scenery can save it. If this is not in accordance with "art for art's sake," it is in accordance with life for life's sake. The artist holds the mirror up to nature, but it is the Claude Lorraine mirror. He takes liberties with the facts; he is not a

mere reporter; he idealizes the fact and gives it his own coloring. The critic does not in the same measure do this. He is the appraiser, the distributor of the honors, and his scale must be nicely poised. That all poetry and all good literature is, in a measure, a criticism of life—some more, some less—is a valuable suggestion, almost discovery, of Arnold's own; but it is equally true that there is a class of imaginative writers who are more properly feeders and reinforcers of life itself; who gather in from wide-lying realms, not always with nice judgment or wise selection, but always with bold, strong hands, much that nourishes and fertilizes the very roots of the tree Igdrasil. Such writers were Emerson and Carlyle. Such a writer is *not* Mr. Arnold, though his function as pruner and cultivator of the tree is scarcely less in importance.

Disinterestedness, then, is to be demanded of the critic, but the creative imagination may have free play within the limits of a strong intellectual bias. The charm and value of Darwin is his disinterestedness, but Darwin is a critic of the scheme of creation: he is interested only in finding and stating the largest truth, in outlining the theory that will cover the greatest multitude and the widest diversity of facts. But the charm and value of such a writer as Abram Cowley, or Mr. Ruskin, or our Thoreau, is largely given by a peculiar moral and mental bias. It is Thoreau's stoicism and vehement partiality to nature that gives his page such a fillip and genial provocation. And what would Mr. Ruskin be without his delightful one-sidedness and bright unreasonableness?

Few men eminent in literature have been free from some sort of bias. Arnold himself has the academic bias. There is in him a slight collegiate contemptuousness and aloofness which stands a little in the way of his doing full justice, say, to the nonconformist, and to the bereaved mortal who wants to marry his deceased wife's sister, and in the way of his full acceptance by his countrymen, to which he is justly entitled. Was he not also just a little *interested* in giving our pride in Emerson a fall, at least a shaking up? Milton is biased by his Puritanism; his "Paradise Lost" is the pageant or drama of the Puritan theology; but he is undoubtedly best as a poet when he forgets his Puritanism. Wordsworth has the didactic bias; his steed of the empyrean is yoked with another of much commoner clay. Carlyle's bias is an overweening partiality for heroes; he cuts all his cloth to this one pattern. Among our own writers, Bryant, Longfellow, Irving has little or no bias; they are disinterested witnesses,

but they are not men of the first order. Our younger corps of writers are free from bias, which is less a merit than their want of earnestness is a defect.

Arnold's view of Emerson as a poet is not entirely new, though perhaps it has never before been set forth in quite so telling and authoritative a form. The British literary journals have been in the habit of saying for years, whenever the subject was up, that Emerson was not a poet. An able London critic likened him to a Druid who wanders among the bards, and smites the harp with even more than bardic stress. And a poet on the usual terms we must admit Emerson was not. He truly had a druidical cast. His song is an incantation. Not a minstrel at the feast of life is he, but a chanter of runes at life's shrine. Arnold gave us the worst that could be said of Emerson as a poet, namely, that he lacked concreteness, sensuousness, and passion. Perhaps the best that can be said of him as a poet is that, notwithstanding these deficiencies, there is usually a poetic stress in his verse, a burden and an intensity of poetic appeal, that would be hard to match in any other poet. He had the eye and ear of the poet preternaturally sharpened, but lacked the full poetic utterance. It would seem as if he besieged the Muses with all the more seriousness and eloquence, because of the gifts that had been denied him. His verse is full of disembodied poetic values, of "melody born of melody." Compared with the other poets, he is like an essence compared to fruits or flowers. He pierced the symbol, he discarded the corporeal; his science savors of magic, his power of some mysterious occult force. Yet to say he is not a true poet implies too much; he does not stop short of the achievements of other poets, but goes beyond them. He would get rid of the bulk, the mass, and save the poetry; get rid of the concrete and catch the ideal; in other words, turn your mountain of carbon into diamonds.

As a rule, the qualities we miss from his verse, he did not aim to put there; he did not himself value them in poetry. He knew the classic models were not for him. He valued only the memorable passages, the lightning strokes of genius, the line that

"overleapt the horizon's edge,"
and
"Searched with Apollo's privilege."

He hung his verses in the wind:

"All were winnowed through and through,
Five lines lasted sound and true;
Five men smelted in a pot
Than the South more fierce and hot;

These the siroc could not melt,
 Fire their fiercer flaming felt,
 And the meaning was more white
 Than July's meridian light.
 Sunshine cannot bleach the snow,
 Nor time unmake what poets know.
 Have you eyes to find the five
 Which five hundred did survive? "

This was Emerson's method,—not to write a perfect poem, a poem that should be an inevitable whole, as Arnold would have him, but to write the perfect line, to set the imagination ablaze with a single verse, leaving the effects of form, of proportion, to be achieved by those who were equipped for it. His poetry is undoubtedly best when it is most concrete, as in the "Humblebee," "Rhodora," "Seashore," "The Snow Storm," "The Problem," "The Titmouse," and like poems, and poorest in "Wood Notes," "Celestial Love," etc. "Unless the heart is shook," says Lander, "the gods thunder and stride in vain"; and the heart is seldom shook by Emerson's poetry. It has heat, but it is not that of English poetical literature, the heat of the blood, of the affections, the emotions; but arises from the ecstasy of contemplation of the universality of the moral law.

It is hard to reconcile Arnold's criticism of Emerson's poetry with what many of us feel to be its beauty and value. It is irritating to Emersonians to be compelled to admit that his strain lacks any essential quality. It is irritating to me. I confess that I would rather have his poetry than all Milton, Cowper, Gray, Byron, and many others ever wrote. I see the grounds upon which Milton's poetry is considered greater, but I do not care for it, all the same. Emerson's poetry does not dilate me, as Wordsworth's does, because the human emotional element in it is weaker. It has not the same touch of nature that makes the whole world kin, the touch of commonalty heightened and vivified.

Whether we know it or not, we doubtless love Emerson all the more because he is not a legitimate poet or the usual man of letters, but an exceptional one. We do not love Shakspeare in the same way, because he is of no special and peculiar service to us as men and moral beings; he is not dear to any man, but generously beloved by all men. He is in the midst of the great currents of life and nature. 'Tis the universal air, the universal water we get here. But Emerson stands apart.

We go to him as we go to a fountain to drink, and to a fountain of peculiar virtues, a fountain that contains iron, or sulphur, or some other medicinal property. Hence, while to criticism Emerson is less than Gray or Milton, to us who need his moral and spiritual tonics he is more, vastly more. We

live in a sick age, and he has saved the lives of many of us. So precious has his service been, so far beyond the reach of mere literature, that we are irritated, I say, when we hear the regular literary men placed above him. When I think of Emerson, I think of him as a man, not as an author; it was his rare and charming personality that healed us and kindled our love. When he died, it was not as a sweet singer, like Longfellow, who had gone silent; but something precious and paternal had departed out of nature; a voice of hope and courage, and inspiration to all noble endeavor, had ceased to speak.

As a prose writer there is one note in Emerson which we get with the same emphasis and clearness in no other writer. I mean the heroic note, the note of manhood rising above the accidents of fortune and the tyranny of circumstances, the inspiration of courage and self-reliance. It is in Carlyle, but is often touched by his ill-humor. When Teufelsdröckh fulminates his "Everlasting No" in "Sartor," it rings out like a thunder-peal; this is the wrath and invincibility of the hero at bay. If, in Emerson's earlier essays, this note seems to us now a little too pronounced, savoring just a little of "tall talk," it did not seem so when we first read them, but was as clear, and frank, and sweet as the note of a bugle. Carlyle once defined poetry as the "heroic of speech," a definition that probably would not suit Mr. Arnold, but which describes much of Emerson's verse, and many of those brave sentences in his essays.

If in Addison the note is that of genial urbanity, in Franklin that of worldly prudence ("There is a flower of religion, a flower of honor, a flower of chivalry," says Sainte-Beuve, "which must not be required from Franklin"), in Bacon of large wisdom, in Pope of polished common sense, in Arnold himself the classical note or note of perfection, in Emerson we come at once upon the chivalrous, heroic attitude and temper. No scorn, no contempt, no defiance, but a bright and cheerful confronting of immense odds. In other writers there are words of prudence, words of enlightenment, words of grave counsel, words that divide one thing from another like a blade, words of sympathy and love; but in Emerson more than in any other there are words that are like banners leading to victory, symbolical, inspiring, rallying, seconding, and pointing the way to your best endeavor. "Self-trust," he says, "is the essence of heroism," and this martial note pulses through all his utterances. It is found in others, too, but it is the leading note in him. In others it is oftener the inspiration of conduct; in him it is the inspiration of morals.

The quality I refer to is in this passage from Marcus Aurelius:

"Suppose that men kill thee — cut thee in pieces — curse thee. What, then, can these things do to prevent thy mind from remaining pure, wise, sober, just?"

It is in these lines from Beaumont and Fletcher's "Sea Voyage," quoted by Emerson himself:

"*Julietta*. Why, slaves, 'tis in our power to hang ye.

Master. Very likely. 'Tis in our power, then, to be hanged, and scorn ye."

It is the salt of this passage of another poet:

"How beggarly appear arguments before a defiant deed!

How the floridness of the materials of cities shrivels before a man's or woman's look!"

It is in the reply of the Spartan soldier who, when the threatening Persian told him their arrows would darken the sun, answered: "Very well, then; we will fight in the shade." Emerson sounds the same note throughout his essays, takes the same attitude toward circumstances, toward conventions, toward tradition, toward theological dogma, toward everything that would hamper and limit him. It shines in his famous boast:

"Give me health and a day, and I will make the pomp of emperors ridiculous."

There is a glint of it in this passage, which might have been written to comfort John Brown, or re-assure a certain much-abused poet, had it not been before the fact, a prophecy and not a counsel:

"Adhere to your own act, and congratulate yourself if you have done something strange and extravagant, and broken the monotony of a decorous age."

Here it takes another key:

"If we dilate on beholding the Greek energy, the Roman pride, it is that we are already domesticating the same sentiment. Let us find room for this great guest in our small houses. The first step of worthiness will be to disabuse us of our superstitious associations with places and times, with number and size. Why should these words Athenian, Roman, Asia, and England so tingle in the ear? Where the heart is, there the muses — there the gods sojourn, and not in any geography of fame. Massachusetts, Connecticut River, and Boston Bay, you think paltry places, and the ear loves names of foreign and classical topography. But here we are, and if we will tarry a little, we may come to learn that here is best. See to it only that thyself is here — and art and nature, hope and fate, friends and angels, and the Supreme Being, shall not be absent from the chamber where thou sittest."

Half the essays are to this tune. "Books," he said, "are for nothing but to inspire"; and

in writing his own he had but one purpose in view, to be, as Arnold so well says, "the friend and aider of those who would live in the spirit" — in the spirit of truth, in the spirit of virtue, in the spirit of heroism.

The lecturer was unfortunate in what he said of Emerson's "Titmouse." We do not learn, he said, what his titmouse did for him; we are reduced to guessing; he was not poet enough to tell us. But the bird sounded the heroic note to the poet, and inspired him with courage and hope when he was about to succumb to the cold.

"Here was this atom in full breath,
Hurling defiance at vast death."

"Henceforth I wear no stripe but thine;
Ashes and jet all hues outshine."

"I think old Cæsar must have heard
In northern Gaul my dauntless bird,
And, echoed in some frosty wold,
Borrowed thy battle-numbers bold."

"*Pæan! Veni, vidi, vici.*"

It is one of Emerson's most characteristic poems. Burns, the speaker said, would have handled the subject differently, thinking probably of Burns's "Mouse." Certainly he would. He was pitched in a different key. The misfortunes of his mouse touched his sympathy and love, appealed to his human tenderness, and called up the vision of his own hard lot. Each poet gives us the sentiment proper to him: the heroic from Emerson, the human from Burns. The lecturer was right in saying that the secret of Emerson's influence is his temper, but it is not merely his good temper, his cheerfulness, hopefulness, benevolence, etc. These he shared with the mass of his countrymen. The American temperament is sanguine and turns confidently to the future. But it is again his heroic temper, his faith in "the ideal tendencies," in the value of personal force and character, in the grandeur of the present moment, the present opportunity; a temper he shares with but few, but shares, say, with his friend and master, Carlyle:

"One equal temper of heroic hearts,"

and more especially in Carlyle's case,

"Made weak by time and fate, but strong in will
To strive, to seek, to find, and not to yield."

It has long been clear to me that Carlyle and Emerson were in many important respects closely akin, notwithstanding the wrath and melancholy of the one, and the serenity and hopefulness of the other. Their main ground of kinship is the heroic sentiment which they share in common. Their effects upon the mind

are essentially the same: both have the "tart cathartic virtue" of courage and self-reliance; both nourish character and spur genius. Carlyle does not communicate the gloom he feels; 'tis the most tonic despair to be found in literature. There is a kind of felicity in it. For one thing, it sprang from no personal disappointment or selfishness. It always has the heroic tinge. In a letter to Emerson he refers to it as a "kind of imperial sorrow that is almost like felicity,—so completely and composedly wretched, one is equal to the very gods." His wretchedness was a kind of *sorrow*; that is always its saving feature. One's unhappiness may be selfish and ignoble, or it may be noble and inspiring; all depends upon the sentiment from which it springs. Men selfishly wretched never laugh, except in derision. Carlyle was a man of sorrow, and sorrow springs from sympathy and love. A sorrowing man is a loving man. His is the Old World sorrow, the inheritance of ages, the grief of justice and retribution over the accumulated wrongs and sufferings of centuries. In him it became a kind of poetic sentiment, a fertile leaf-mold that issued at last in positive verdure and bloom. Not happiness, but a kind of blessedness, he aspired to, the satisfaction of suffering in well-doing. How he loves all the battling, struggling, heroic souls! Whenever he comes upon one such in his histories, no matter how obscure, he turns aside to lay a wreath upon his tomb. It was his own glory that he never flinched; that his despair only nerved him to work the harder; the thicker the gloom, the more his light shone. Hope and heart never left him; they were of the unquenchable, the inextinguishable kind, like those ragged jets of flame the traveler used to see above the oil wells or gas wells in Pennsylvania, which the wildest tempest could not blow out, so tenaciously and desperately did the flame cling.

Carlyle's lamentations are loud; a little of his own doctrine of silence would have come in well here. What he said of Voltaire, the world is bound to say of himself: "Truly M. de Voltaire had a talent for speech, but lamentably wanted that of silence." But he worked like a Hercules. He does not charm the demons away like Emerson, but he defies them. Emerson wins them over, but Carlyle explodes them with their own sulphur. Both men rendered their age and country a signal service, and to rule them out of the company of the great authors is to rob that company of the two names of this century it can least afford to lose.

In his essay on Joubert, Arnold says, following a remark of Sainte-Beuve, that as to the estimate of its own authors every nation is the best judge (the positive estimate, not the comparative as regards the authors of other countries), and that, therefore, a foreigner's judgments about the intrinsic merits of a nation's authors will generally, when at complete variance with that nation's own, be wrong. Arnold's verdict upon Emerson's intrinsic merits was certainly at variance with that of the best judges among Emerson's countrymen, and is likely, therefore, according to the above dictum, to be wrong. But whether it was or not, it is no doubt true that every people possesses a key to its own great men, or to those who share its tendencies and hopes, that a foreigner cannot possess, whatsoever keys of another sort he may bring with him.

From Arnold's point of view, his criticism of Emerson was just and consistent; but he said he spoke not of himself, but assumed to anticipate the verdict of time and fate upon this man. But time and fate have ways of their own in dealing with reputations, and the point of view of the future with reference to this subject is, I imagine, as likely to be different from Mr. Arnold's as it is to be one with it.

John Burroughs.

MARSE CHAN.

A TALE OF OLD VIRGINIA.

ONE afternoon, in the autumn of 1872, I was riding leisurely down the sandy road that winds along the top of the water-shed between two of the smaller rivers of eastern Virginia. The road I was traveling, following "the ridge" for miles, had just struck me as most significant of the character of the race whose only avenue of communication with the outside world it had formerly been. Their once splendid mansions, now fast fall-

ing to decay, appeared to view from time to time, set back far from the road, in proud seclusion among groves of oak and hickory now scarlet and gold with the early frost. Distance was nothing to this people; time was of no consequence to them. They desired but a level path in life, and that they had, though the way was longer and the outer world strode by them as they dreamed.

I was aroused from my reflections by hear-

ing some one ahead of me calling, "Heah!—heah,—whoo-oop, heah!"

Turning the curve in the road, I saw just before me a negro standing, with a hoe and a watering-pot in his hand. He had evidently just gotten over the "worm-fence" into the road, out of the path which led zigzag across the "old field" and was lost to sight in the dense growth of sassafras. When I rode up, he was looking anxiously back down this path for his dog. So engrossed was he that he did not even hear my horse, and I reined in to wait until he should turn around and satisfy my curiosity as to the handsome old place half a mile off from the road.

The numerous out-buildings and the large barns and stables told that it had once been the seat of wealth, and the wild waste of sassafras that covered the broad fields gave it an air of desolation that greatly excited my interest. Entirely oblivious of my proximity, the negro went on calling, 'Whoo-oop, heah!' until along the path, walking very slowly and with great dignity, appeared a noble-looking old orange and white setter, gray with age, and corpulent with excessive feeding. As soon as he came in sight, his master began:

"Yes, dat you! You gittin' deaf a'll well as bline, I s'pose! Kyarnt heah me callin', I reckon? Whyn't yo' come on, dawg?"

The setter sauntered slowly up to the fence and stopped without even deigning a look at the speaker, who immediately proceeded to take the rails down, talking meanwhile:

"Now, I got to pull down de gap, I s'pose! Yo' so sp'ilt yo' kyahn' hardly walk. Jes' ez able to git over it as I is! Jes' like white folks—think 'cuz you's white and I's black, I got to wait on yo' all de time. Ne'm mine, I ain' gwi' do it!"

The fence having been pulled down sufficiently low to suit his dogship, he marched sedately through, and, with a hardly perceptible lateral movement of his tail, walked on down the road. Putting up the rails carefully, the negro turned and saw me.

"Sarvent, marster," he said, taking his hat off. Then, as if apologetically for having permitted a stranger to witness what was merely a family affair, he added: "He know I don't mean nothin' by what I sez. He's Marse Chan's dawg, an' he's so ole he kyahn git' long no pearter. He know I'se jes' prodjickin' wid 'im."

"Who is Marse Chan?" I asked; "and whose place is that over there,—and the one a mile or two back,—the place with the big gate and the carved stone pillars?"

"Marse Chan," said the darkey, "he's Marse Channin'—my young marster; an' dem places,—dis one's Weall's, an' de one back dyar wid de rock gate-pos's is ole Cun'l

Chahmb'lin's. Dey don' nobody live dyar now, 'cep' niggers. Arfter de war some one or nudder bought our place, but his name done kind o' slipped me. I nuvver hearn on 'im befo'; I think dey's half-strainers. I don' ax none on 'em no odds. I lives down de road heah, a little piece, an' I jes' steps down of a evenin' and looks arfter de graves."

"Well, where is Marse Chan?" I asked.

"Hi! don' you know? Marse Chan, he went in de army. I wuz wid 'im. Yo' know he warn' gwine an' lef' Sam."

"Will you tell me all about it?" I said, dismounting.

Instantly, and as if by instinct, the darky stepped forward and took my bridle. I demurred a little; but with a bow that would have honored old Sir Roger, he shortened the reins, and taking my horse from me, led him along.

"Now tell me about Marse Chan," I said.

"Lawd, marster, hit's so long ago, I'd a'mos' forgit all about it, ef I hedn' been wid him ever sence he wuz born. Ez 'tis, I remembers it jes' like' twuz yistiddy. Yo' know Marse Chan an' me—we wuz boys togedder. I wuz older'n he wuz, jes' de same ez he wuz whiter'n me. I wuz born plantin' corn time, de spring arfter big Jim an' de six steers got washed away at de upper ford right down dyar b'low de quarters ez he wuz a bringin' de Chris'mas things home; an' Marse Chan, he warn' born tell mos' to der harves' arfter my sister Nancy married Cun'l Chahmb'lin's Torm, 'bout eight years arfterwoods."

"Well, when Marse Chan wuz born dey wuz de grettes' doin's at home you ever did see. De folks all hed holiday, jes' like in de Chris'mas. Ole marster (we didn' call 'im *ole* marster tell arfter Marse Chan wuz born,—befo' dat he wuz jes' de marster, so)—well, ole marster, his face fyar shine wid pleasure, an' all de folks wuz mighty glad, too, 'cause dey all loved ole marster, and aldo' dey did step aroun' right peart when ole marster wuz lookin' at 'em, dyar warn' nyar han' on de place but what, ef he wanted anythin', would walk' up to de back poach, an' say he warn' to see de marster. An' ev'ybody wuz talkin' 'bout de young marster, an' de maids an' de wimmens 'bout de kitchen wuz sayin' how 'twuz de purties' chile dey ever see; an' at dinner-time de mens (all on 'em hed holiday) come roun' de poach an' ax how de missis an' de young marster wuz, an' ole marster come out on de poach an' smile wuz 'n a 'possum, an' sez, 'Thankee! Bofe doin' fust rate, boys'; an' den he stepped back in de house, sort o' laughin' to hisse'f, an' in a minute he come out agin wid de baby in he arms, all wropped up in flannens an' things, an' sez, 'Heah he is, boys.' All de folks

den, dey went up on de poach to look at him, drappin' dey hats on de steps, an' scrapin' dey feets ez dey went up. An' pres'n'y ole marster, lookin' down at we all chil'en all packed togedder down deah like a parecel o' sheep-burrs, cotch sight o' *me* (he knowed my name, 'cause I use' to hole he hoss fur 'im sometimes; but he didn' know all de chil'en by name, dey wuz so many on 'em), an' he sez, 'Come up heah.' So up I goes tippin', skeered like, an' ole marster sez, 'Ain' you Mymie's son?' 'Yass, seh,' sez I. 'Well,' sez he, 'I'm gwine to give you to yo' young Marse Channin' to be his body-servant,' an' he put de baby right in my arms (it's de truth I'm tellin' you!), an' yo' jes' ought to a-heard de folks sayin', 'Lawd! marster, dat boy'll drap dat chile!' 'Naw, he wont,' sez marster; 'I kin trust 'im.' And den he sez: 'Now, Sam, from dis time you belong to yo' young Marse Channin'; I wan' you to tek keer on him ez long ez he lives. You are to be his boy from dis time. An' now,' he sez, 'carry him in de house.' An' he walks arfter me an' opens de do's fur me, an' I kyars him in my arms, an' lays 'im down on de bed. An' from dat time I wuz taken in de house to be Marse Channin's body-servant.

"Well, you nuvver see a chile grow so. Pres'n'y he growed up right big, an' ole marster sez he must have some edication. So he sont him to school to ole Miss Lawry down dyar, dis side o' Cun'l Chahmb'lin's, an' I use' to go 'long wid him an' tote he books an' we all's snacks; an' when he larnt to read an' spell right good, an' got 'bout so-o big, ole Miss Lawry she died, an' ole marster said he mus' have a man to teach him an' trounce him. So we all went to Mr. Hall, whar kep' de school-house beyant de creek, an' dyar we went ev'y day, 'cep' Sat'd'ys of co'se, an' sich days ez Marse Chan din' warn' go, an' ole missis begged him off.

"Hit wuz down dyar Marse Chan fust took notice o' Miss Anne. Mr. Hall, he taught gals ez well ez boys, an' Cun'l Chahmb'lin he sont his daughter (dat's Miss Anne I'm talkin' about). She wuz a leetle bit o' gal when she fust come. Yo' see, her ma wuz dead, an' ole Miss Lucy Chahmb'lin, she lived wid her brudder an' kep' house for him; an' he wuz so busy wid politics, he didn' have much time to spyar, so he sont Miss Anne to Mr. Hall's by a 'ooman wid a note. When she come dat day in de school-house, an' all de chil'en looked at her so hard, she tu'n right red, an' tried to pull her long curls over her eyes, an' den put bofe de backs of her little han's in her two eyes, an' begin to cry to herself. Marse Chan he was settin' on de een o' de bench nigh de do', an' he jes' reached out

an' put he arm roun' her an' drewed her up to him. An' he kep' whisperin' to her, an' callin' her name, an' coddlin' her; an' pres'n'y she took her han's down an' begin to laugh.

"Well, dey 'peared to tek' a gret fancy to each udder from dat time. Miss Anne she warn' nothin' but a baby hardly, an' Marse Chan he wuz a good big boy 'bout mos' thirteen years ole, I reckon. Hows'ever, dey sut'n'y wuz sot on each other, an' (yo' heah me!) ole marster an' Cun'l Chahmb'lin dey 'peared to like it 'bout well ez de chil'en. Yo' see Cun'l Chahmb'lin's place jined oun, an' it looked jes' ez natural fur dem two chil'en to marry an' meck it one plantation, ez it did fur de creek to run down de bottom from our place into Cun'l Chahmb'lin's. I don' rightly think de chil'en thought 'bout gitten married, not den, no mo'n I thought 'bout marryin' Judy when she was a little gal at Cun'l Chahmb'lin's, runnin' 'bout de house, huntin' fur Miss Lucy's spectacles; but dey wuz good frien's from de start. Marse Chan he use' to kyar Miss Anne's books fur her ev'y day, an' ef de road wuz muddy or she wuz tired, he use' to tote her; an' 'twarn' hardly a day passed dat he didn' kyar her some'n' to school—apples or hick'y nuts, or some'n'. He wouldn't let none o' de chil'en tease her, nudder. Heh! One day, one o' de boys poked he finger at Miss Anne, an' arfter school Marse Chan he axed him 'roun' hine de school-house out o' sight, an' ef he didn' whop 'im!

"Marse Chan, he wuz de peartes' scholar ole Mr. Hall hed, an' Mr. Hall he wuz mighty proud o' him. I don' think he use' to beat 'im ez much ez he did de udders, aldo' he wuz de head in all debilment dat went on, jes' ez he wuz in sayin' he lessons.

"Heh! one day in summer, jes' 'fo' de school broke up, dyah come up a storm right sudden, an' riz de creek (dat one yo' cross' back yonder), an' Marse Chan he toted Miss Anne home on he back. He ve'y off'n did dat when de parf wuz muddy. But dis day when dey come to de creek, it had done washed all de logs 'way. 'Twuz still mighty high, so Marse Chan he put Miss Anne down, an' he took a pole an' waded right in. Hit took him long up to de shoulders. Den he waded back, an' took Miss Anne up on his head an' kyared her right over. At first she wuz skeered; but he tol' her he could swim an' wouldn't let her git hu't, an' den she let him kyar her 'cross, she hol'in' his han's. I warn' 'long dat day, but he sut'n'y did dat thing.

"Ole marster he wuz so pleased 'bout it, he giv' Marse Chan a pony; an' Marse Chan rode him to school de day arfter he come, so proud, an' sayin' how he wuz gwine to let Anne ride behine him; an' when he come

home dat evenin' he wuz walkin'. 'Hi! where's yo' pony?' said ole marster. 'I give him to Anne,' says Marse Chan. 'She liked him, an'—I kin walk.' 'Yes,' sez ole marster, laughin', 'I s'pose you's already done giv' her yo'se'f, an' nex' thing I know you'll be givin' her this plantation and all my niggers.'

"Well, about a fortnight or sich a matter arfter that, Cun'l Chahmb'lin sont over an' invited all o' we all over to dinner, an' Marse Chan wuz 'spressly named in de note whar Ned brought; an' arfter dinner he made ole Phil, whar wuz his ker'ige-driver, bring roun' Marse Chan's pony wid a little side-saddle on 'im, an' a beautiful little hoss wid a bran' new saddle an' bridle on him; an' he gits up an' mecks Marse Chan a gret speech, an' presents him de little hoss; an' den he calls Miss Anne, an' she comes out on de poach in a little ridin' frock, an' dey puts her on her pony, an' Marse Chan mounts his hoss, an' dey goes to ride, while de grown folks is a laughin' an' chattin' an' smokin' dey cigars.

"Dem wuz good ole times, marster,—de bes' Sam ever see! Dey wuz, in fac'! Niggers didn' hed nothin' 't all to do,—jes' hed to 'ten' to de feedin', an' cleanin' de hosses, an' doin' what de marster tell 'em to do; an' when dey wuz sick, dey had things sont 'em out de house, an' de same doctor come to see 'em whar 'ten' to de white folks when dey wuz po'ly. Dyar warn' no trouble nor nothin'.

"Well, things tuk a change arfter dat. Marse Chan he went to de bo'din' school, whar he use' to write to me constant. Ole missis use' to read me de letters, an' den I'd git Miss Anne to read 'em agin to me when I'd see her. He use' to write to her too, an' she use' to write to him too. Den Miss Anne she wuz sont off to school too. An' in de summer time dey'd bofe come home, an' yo' hardly knowed whether Marse Chan lived at home or over at Cun'l Chahmb'lin's. He wuz over dyah constant. 'Twuz always ridin' or fishin' down dyah in de river; or sometimes he'd go over dyah, an' him an' she'd go out an' set in de yard onder de trees; she settin' up meckin' out she wuz knittin' some sort o' bright-cullored some'n, wid de grasss growin' all up 'g'inst her, an' her hat th'owed back on her neck, an' he readin' to her out books; an' sometimes dey'd bofe read out de same book, fust one an' den toddler. I use' to see 'em! Dat wuz when dey wuz growin' up like.

"Den ole marster he run for Congress, an' ole Cun'l Chahmb'lin he wuz put up to run 'ginst ole marster by de Dimicrats; but old marster he beat 'im. Yo' know he wuz gwine do dat! Co'se he wuz! Dat made ole Cun'l Chahmb'lin mighty mad, and dey stopt

visitin' each udder reg'lar, like dey had been doin' all 'long. Den Cun'l Chahmb'lin he sort o' got in debt, an' sell some o' he niggers, an' dat's de way de fuss begun. Dat's whar de lawsuit cum from. Ole marster he didn' like nobody to sell niggers, an' knowin' dat Cun'l Chahmb'lin wuz sellin' o' his, he writ an' offered to buy his M'ria an' all her childen, 'cause she hed married our Zeek'yel. An' don' yo' t'ink, Cun'l Chahmb'lin axed ole marster mo' 'n three niggers wuz wuth fur M'ria. Befo' ole marster bought her, dough, de sheriff cum an' leveled on M'ria an' a whole parcel o' udder niggers. Ole marster he went to de sale, an' bid for 'em; but Cun'l Chahmb'lin he got some one to bid 'ginst ole marster. Dey wuz knocked out to ole marster dough, and den dey hed a big lawsuit, an' ole marster wuz agwine to co't, off an' on, fur some years, till at lars' de co't decided dat M'ria belonged to ole marster. Ole Cun'l Chahmb'lin den wuz so mad he sued ole marster for a little strip o' lan' down dyah on de line fence, whar he said belonged to him. Ev'ybody know'd hit belonged to ole marster. Ef yo' go down dyah now, I kin show it to yo', inside de line fence, whar it hed done bin ever since long befo' ole marster wuz born. But Cun'l Chahmb'lin wuz a mons'us perseverin' man, an' ole marster he wouldn't let nobody run over him. No, dat he wouldn't! So dey wuz agwine down to co't about dat, fur I don' know how long, till ole marster beat him.

"All dis time, yo' know, Marse Chan wuz agoin' backa'ds an' fora'ds to college, an' wuz growed up a ve'y fine young man. He wuz a ve'y likely gent'man! Miss Anne she hed done mos' growed up, too,—wuz puttin' her hyar up like ole missis use' to put hers up, an' 't wuz jes' ez bright ez de sorrel's mane when de sun cotch on it, an' her eyes wuz gre't big dark eyes, like her pa's, on'y bigger an' not so fierce, an' 'twarn none o' de young ladies ez purty ez she wuz. She an' Marse Chan still set a heap o' sto' by one 'nudder, but I don' t'ink dey wuz easy wid each udder ez when he used to tote her home from school on his back. Marse Chan he use' to love de ve'y groun' she walked on, dough, in my 'pinion. Heh! His face 'twould light up whenever she come into chu'ch, or anywhere, jes' like de sun hed come th'oo a chink on it suddenly.

"Den ole marster lost he eyes. D' yo' ever hyah 'bout dat? Heish! Didn' yo'? Well, one night de big barn cotch fire. De stables, yo' know, wuz under de big barn, an' all de hosses wuz in dyah. Hit 'peared to me like 'twarn' no time befo' all de folks an' de neighbors dey come, an' dey wuz a-totin'

water, an' a-tryin' to save de po' critters, an dey got a heap on 'em out; but de ke'idge-hosses dey wouldn' come out, an' dey wuz a-runnin' back'ads an' for'ads inside de stalls, a-nickerin' an' a-screamin', like dey know'd dey time hed come. Yo' could heah 'em so pitiful, an' pres'n'y ole marster said to Ham Fisher (he wuz de ke'idge-driver), 'Go in dyah an' try to save 'em; don' let 'em bu'n to death.' An' Ham he went right in. An' jes' arfter he got in, de shed whar it hed fus' cotch fell in, an' de sparks shot 'way up in de air; an' Ham didn' come back, an' de fire begun to lick out under de eaves over whar de ke'idge hosses' stalls wuz, an' all of a sudden ole marster tunned and kissed ole missis, who wuz stan'in' nigh him, wid her face jest ez white ez a spert's, an', befo' anybody know'd what he wuz gwine do, jumped right in de do', an' de smoke come po'in' out behine 'im. Well, seh, I nuvver 'specks to hyah tell Judgment sich a soun' ez de folks set up. Ole missis she jes' drapt down on her knees in de mud an' prayed out loud. Hit 'peared like her pra'r wuz heard; for in a minit, right out de same do', kyarin' Ham Fisher in his arms, come ole marster, wid his clo'es all blazin'. Dey flung water on him, an' put him out; an', ef you b'lieve me, yo' wouldn' a-knowned 'twuz ole marster. Yo' see, he hed find Ham Fisher done fall down in de smoke right by de ke'idge-hoss' stalls, whar he sont him, an' he hed to tote him back in his arms th'oo de fire what hed done cotch de front part o' de stable, an' to keep de flame from gittin' down Ham Fisher's th'ote he hed tuk off his own hat and mashed it all over Ham Fisher's face, an' he hed kep' Ham Fisher from bein' so much bu'nt; but *he* wuz bu'nt dreadful! His beard an' hyar wuz all nyawed off, an' his face an' han's an' neck wuz scorified terrible. Well, he jes' laid Ham Fisher down, an' then he kind o' staggered for'ad, an' ole missis ketch' him in her arms. Ham Fisher, he warnt bu'nt so bad, an' he got out in a month or two; an' arfter a long time, ole marster he got well, too; but he wuz always stone blind arfter dat. He nuvver could see none from dat night.

"Marse Chan he comed home from college toreckly, an' he cert'n'y did nuss ole marster faithful,—jes' like a 'ooman. Den he took charge o' de plantation arfter dat; an' I use' to wait on him jes' like when we wuz boys togedder; an' sometimes we'd slip off an' have a fox hunt, an' he'd be jes' like he wuz in ole times, befo' ole marster got bline, an' Miss Anne Chahmb'lin stopt comin' over to our house, an' settin' onder de trees, readin' out de same book.

"He sut'n'y wuz good to me. Nothin' never

made no diffunce 'bout dat. He never hit me a lick in his life — an' never let nobody else do it, nudder.

"I 'members one day, when he wuz a leetle bit o' boy, ole marster hed done tole we all chil'en not to slide on de straw-stacks; an' one day me an' Marse Chan thought ole marster hed done gone 'way from home. We watched him git on he hoss an' ride up de road out o' sight, an' we wuz out in de field a-slidin' an' a-slidin', when up comes ole marster. We started to run; but he hed done see us, an' he called us to come back; an' sich a whoppin' ez he did gi' us!

"Fust he took Marse Chan, an' den he teched me up. He never hu't me, but in co'se I wuz a-hollerin' ez hard ez I could stave it, 'cause I knowed dat wuz gwi' mek him stop. Marse Chan he hed'n open he mouf long ez ole marster wuz tunin' him; but soon ez he commence warmin' me an' I begin to holler, Marse Chan he bust out cryin', an' stept right in befo' ole marster, an' ketchin' de whop, sed:

"'Stop, seh! Yo' sha'n't whop him; he b'longs to me, an' ef you hit him another lick I'll set him free!'

"I wish yo' hed see ole marster. Marse Chan he warn' mo'n eight years ole, an' dyah dey wuz — ole marster stan'in' wid he whop raised up, an' Marse Chan red an' cryin', hol'in' on to it, an' sayin' I b'longst to him.

"Ole marster, he raise' de whop, an' den he drapt it, an' broke out in a smile over he face, an' he chuck' Marse Chan onder der chin, an' tu'n right roun' an' went away, laughin' to hissef, an' I heah 'im tellin' ole missis dat evenin', an' laughin' 'bout it.

"'Twan' so mighty long arfter dat when dey fust got to talkin' 'bout de war. Dey wuz a-dictatin' backa'ds an' forra'ds 'bout it fur two or three years 'fo' it come sho' nuff, you know. Ole marster, he wuz a Whig, an' of co'se Marse Chan he tuk after he pa. Cun'l Chahmb'lin, he wuz a Dimicrat. He wuz in favor of de war, an' ole marster and Marse Chan dey wuz agin' it. Dey wuz a-talkin' 'bout it all de time, an' purty soon Cun'l Chahmb'lin he went about ev'vywhar speakin' an' noratin' 'bout Ferginia ought to secede; an' Marse Chan he wuz picked up to talk agin' 'im. Dat wuz de way dey come to fight de duil. I sut'n'y wuz skeered fur Marse Chan dat mawnin', an' he wuz jes' ez cool! Yo' see, hit happen so: Marse Chan he wuz a-speakin' down at de Deep Creek Tavern, an' he kind o' got de bes' of ole Cun'l Chahmb'lin. All de white folks laughed an' hoorawed, an' ole Cun'l Chahmb'lin — my Lawd! I t'ought he'd 'a' bu'st, he wuz so mad. Well, when it come to his time to speak, he

jes' light into Marse Chan. He call 'im a traitor, an' a ab'litionis', an' I don' know what all. Marse Chan, he jes' kep' cool till de ole Cun'l light into he pa. Ez soon ez he name ole marster, I seen Marse Chan sort o' lif' up he head. D' yo' ever see a hoss rar he head up right sudden at night when he see some-thin' comin' to'ds 'im from de side an' he don' know what 'tis? Ole Cun'l Chahmb'lin, he went right on. He said ole marster hed taught Marse Chan; dat ole marster wuz a wuss ab'litionis' dan he son. I looked at Marse Chan, an' sez to myself: 'Fo' Gord! old Cun'l Chahmb'lin better min', an' I hedn't got de wuds out, when ole Cun'l Chahmb'lin 'cuse' ole marster o' cheatin' 'im out o' he niggers, an' stealin' piece o' he lan'—dat's de lan' I tole you 'bout. Well, seh, nex' thing I knowed, I heahed Marse Chan—hit all happen right 'long togedder, like lightnin' an' thunder when dey hit right at you—I heah 'im say:

“ ‘Cun'l Chahmb'lin, what you say is false, an' you know it to be so. You have willfully slandered one of the pures' an' nobles' men God ever made, an' nothin' but yo' gray hyars protects you.’

“Well, ole Cun'l Chahmb'lin, he ra'ed an' he pitch'd. He said he wan' too ole, an' he'd show 'im so.

“ ‘Ve'y well,' says Marse Chan.

“De meetin' broke up den. I wuz hol'in de hosses out dyar in de road by de een' o' de poach, an' I see Marse Chan talkin' an' talkin' to Mr. Gordon and anudder gent'man, an' den he come out an' got on de sorrel an' galloped off. Soon ez he got out out o' sight, he pulled up, an' we walked along tell we come to de road whar leads off to'ds Mr. Barbour's. He wuz de big lawyer o' de country. Dar he tu'ned off. All dis time he hed'n sed a wud, 'cep' to kind o' mumble to hissef now and den. When we got to Mr. Barbour's, he got down an' went in. Dat wuz in de late winter; de folks wuz jes' beginnin' to plow fur corn. He staid dyar 'bout two hours, an' when he come out Mr. Barbour come out to de gate wid 'im an' shake han's arfter he got up in de saddle. Den we all rode off. 'Twuz late den—good dark; an' we rid ez hard ez we could, tell we come to de ole school-house at ole Cun'l Chahmb'lin's gate. When we got dar Marse Chan got down an' walked right slow 'roun' de house. Arfter lookin' 'roun' a little while an' tryin' de do' to see ef it wuz shet, he walked down de road tell he got to de creek. He stop' dyar a little while an' picked up two or three little rocks an' frowned 'em in, an' pres'n'y he got up an' we come on home. Ez he got down, he tu'ned to me an', rubbin' de sorrel's nose, said: ‘Have 'em

well fed, Sam; I'll want 'em early in de mawnin'.

“Dat night at supper he laugh an' talk, an' he set at de table a long time. Arfter ole marster went to bed, he went in de charmb'er an' set on de bed by 'im talkin' to 'im an' tellin' 'im 'bout de meetin' an' ev'ything; but he never mention ole Cun'l Chahmb'lin's name. When he got up to come out to de office in de yard, whar he slept, he stooped down an' kissed 'im jes' like he wuz a baby layin' dyar in de bed, an' he'd hardly let ole missis go at all. I knowed some'n wuz up, an' nex' mornin' I called 'im early befo' light, like he tole me, an' he dressed an' come out pres'n'y jes' like he wuz going to chu'ch. I had de hosses ready, an' we went out de back way to'ds de river. Ez we rode along, he said:

“ ‘Sam, you an' I wuz boys togedder, wa'n't we?’

“ ‘Yes,' sez I, ‘Marse Chan, dat we wuz.’

“ ‘You have been ve'y faithful to me,' sez he, ‘an' I have seen to it that you are well provided for. You wan' to marry Judy, I know, an' you'll be able to buy her ef you want to.’

“Den he tole me he wuz goin' to fight a duil, an' in case he should git shot, he had set me free an' giv' me nuff to tek keer o' me an' my wife ez long ez we lived. He said he'd like me to stay an tek keer o' ole marster an' ole missis ez long ez dey lived, an' he said it wouldn' be very long, he reckoned. Dat wuz de on'y time he voice broke—when he said dat; an' I couldn' speak a wud, my th'roat choked me so.

“When we come to de river, we tu'ned right up de bank, an' arfter ridin' 'bout a mile or sich a matter, we stopped whar dey wuz a little clearin' wid elder bushes on one side an' two big gum trees on de udder, an' de sky wuz all red, an' de water down todes whar de sun wuz comin' wuz jes' like de sky.

“Pres'n'y Mr. Gordon he come wid a 'hog-any box 'bout so big 'fore 'im, an' he got down, an' Marse Chan tole me to tek all de hosses an' go 'roun' behin' de bushes whar I tell you 'bout,—off to one side; an' 'fore I got 'roun' dar, ole Cun'l Chahmb'lin an' Mr. Hennin an' Dr. Call come ridin' from tudder way, to'ds ole Cun'l Chahmb'lin's. When dey hed tied dey hosses, de udder gent'mens went up to whar Mr. Gordon wuz, an' arfter some chattin' Mr. Hennin step' off 'bout fur ez 'cross dis road, or mebbe it mout be a little furder; an' den I seed 'em th'oo de bushes loadin' de pistils, an' talk' a little while; an' den Marse Chan an' ole Cun'l Chahmb'lin walked up wid de pistils in dey han's, an' Marse Chan he stood wid his face right to'ds

de sun. I seen it shine on 'im jes' ez it come up over de low groun's, an' he look' like he did sometimes when he come out of chu'ch. I wuz so skeered I couldn' say nuthin'. Ole Cun'l Chahmb'lin could shoot fust rate, an' Marse Chan he never missed.

"Den I heard Mr. Gordon say, 'Gent'mens, is yo' ready?' and bofe of 'em sez, 'Ready,' jes' so.

"An' he sez, 'Fire, one, two,'—an' ez he said 'one,' ole Cun'l Chahmb'lin raised he pistil an' shot right at Marse Chan. De ball went th'oo his hat. I seen he hat sort o' settle on he head ez de bullit hit it, an' *he* jes' tilted his pistil up in de a'r an' shot—*bang*; an' ez de pistil went *bang*, he sez to Cun'l Chahmb'lin, 'I mek you a present to yo' fam'ly, seh!'

"Well, dey had some talkin' arfter dat. I didn' git rightly what it wuz; but it 'peared like Cun'l Chahmb'lin he warn't satisfied, an' wanted to have anudder shot. De seconds dey wuz talkin', an' pres'n'y dey put de pistils up, an' Marse Chan an' Mr. Gordon shook han's wid Mr. Hennin an' Dr. Call, an' come an' got on dey hosses. An' Cun'l Chahmb'lin he got on his horse an' rode away wid de udder gent'mens, lookin' like he did de day befo' when all de people laughed at 'im.

"I b'lieve ole Cun'l Chahmb'lin wan' to shoot Marse Chan, anyway!

"We come on home to breakfast, I totin' de box wid de pistils befo' me on de roan. Would you b'lieve me, seh, Marse Chan he never said a wud 'bout it to ole marster or nobody. Ole missis didn' fin' out 'bout it for mo' 'n a month, an' den, Lawd! how she did cry and kiss Marse Chan; an' ole marster, aldo' he never say much, he wuz jes' ez please' ez ole missis. He call' me in de room an' made me tole 'im all 'bout it, an' when I got th'oo he gi' me five dollars an' a pyar of breeches.

"But ole Cun'l Chahmb'lin he nebber did furgive Marse Chan, and Miss Anne she got mad too. Wimmens is mons'sus onreasonable nohow. Dey's jes' like a catfish: you can n' tek' hole on 'em like udder folks, an' when you gits 'em yo' can n' always hole 'em.

"What meks me think so? Heaps o' things,—dis: Marse Chan he done gi' Miss Anne her pa jes' ez good ez I gi' Marse Chan's dawg sweet 'taters, an' she git mad wid 'im ez if he hed kill 'im 'stid o' sen'in' 'im back to her dat mawnin' whole an' soun'. B'lieve me! she wouldn' even speak to 'im arter dat!

"Don' I 'member dat mawnin'!

"We wuz gwine fox-huntin', 'bout six weeks or sich a matter arfter de duil, an' we met Miss Anne ridin' 'long wid anudder lady an' two gent'mens whar wuz stayin' at her

house. Dyar wuz always some one or nudder dyar co'ting her. Well, dat mawnin' we meet 'em right in de road. 'Twuz de fust time Marse Chan had see her sence de duil, an' he raises he hat ez he pahss, an' she looks right at 'im wid her head up in de yair like she nuver see 'im befo' in her born days; an' when she comes by me, she sez, 'Good mawnin', Sam!' Gawd! I nuvver see nuthin' like de look dat come on Marse Chan's face when she parss 'im like dat. He gi' de sorrel a pull dat fotch 'im back settin' down in de san' on he hanches. He ve'y lips wuz white. I tried to keep up wid 'im, but 'twarn' no use. He sont me back home pres'n'y, an' he rid on. I sez to myself, 'Cun'l Chahmb'lin, don' you meet Marse Chan dis mawnin'. He ain' bin lookin' 'roun' de ole school-house, whar he an' Miss Anne use' to go to school to ole Mr. Hall together, fur nuffin. He won' stan' no prodgikin' to-day.'

"He nuvver come home dat night tell 'way late, an' ef he'd been fox-huntin' it mus' ha' been de ole red whar lives down in de green-scum mashes he'd been chasin'. De way de sorrel wuz gormed up wid sweat an' mire sut'n'y did hu't me. He walked up to de stable wid he head down all de way, an' I'se seen 'im go eighty miles of a winter day, an' prance into de stable at night ez fresh ez ef he hed jes' cantered over to ole Cun'l Chahmb'lin's to supper. I nuvver seen a hoss beat so sence I knowed de fetlock from de fo'lock, an' bad ez he was he wan' ez bad ez Marse Chan.

"Whew! he didn' git over dat thing, seh,—he nuvver did git over it.

"De war come on jes' den, an' Marse Chan wuz elected cap'n; but he wouldn' tek it. He said Virginia hadn' seceded, an' he wuz gwine stan' by her. Den dey 'lected Mr. Gordon cap'n.

"I sut'n'y did wan' Marse Chan to tek de place, cuz I knowed he wuz gwine tek me wid 'im. He wan' gwine widout Sam. An' beside, he look so po' an' thin, I thought he wuz gwine die.

"Of co'se, ole missis she heard 'bout it, an' she met Miss Anne in de road, an' cut her jes' like Miss Anne cut Marse Chan.

"Ole missis, she wuz proud ez anybody! So we wuz mo' strangers dan ef we hadn' live' in a hunderd miles of each udder. An' Marse Chan he wuz gittin' thinner an' thinner, an' Firginia she come out, an' den Marse Chan he went to Richmond an' listed, an' come back an' sey he wuz a private, an' he didn' know whe'r he could tek me or not. He writ to Mr. Gordon, hows'ever, and 'twuz decided that when he went I wuz to go 'long an' wait on him, an' de cap'n too. I didn' min' dat,

yo' know, long ez I could go wid Marse Chan, an' I like' Mr. Gordon, anyways.

"Well, one night Marse Chan come back from de offis wid a telegram dat say, 'Come at once,' so he wuz to start next mawnin'. He uniform wuz all ready, gray wid yaller trimmin's, an' mine wuz ready too, an' he had ole marster's sword, whar de State gi' 'im in de Mexikin war; an' he trunks wuz all packed wid ev'rything in 'em, an' my chist wuz packed too, an' Jim Rasher he druv 'em over to de depo' in de waggin, an' we wuz to start nex' mawnin' 'bout light. Dis wuz 'bout de las' o' spring, you know. Dat night ole missis made Marse Chan dress up in he uniform, an' he sut'n'y did look splendid wid he long mustache an' he wavin' hyar and he tall figger.

"Arfter supper he come down an' sez: 'Sam, I wan' you to tek dis note an' kyar it over to Cun'l Chahmb'lin's, an' gi' it to Miss Anne wid yo' own han's, an' bring me wud what she sez. Don' let any one know 'bout it, or know why you've gone.' 'Yes, seh,' sez I.

"You see, I knowed Miss Anne's maid over at ole Cun'l Chahmb'lin's,—dat wuz Judy whar is my wife now,—an' I knowed I could wuk it. So I tuk de roan an' rid over, an' tied 'im down de hill in de cedars, an' I wen' 'roun' to de back yard. 'Twuz a right blowy sort o' night; de moon wuz jes' risin', but de clouds wuz so big it didn' shine 'cep' th'oo a crack now an' den. I soon foun' my gal, an' arfter tellin' her two or three lies 'bout herse'f, I got her to go in an' ax Miss Anne to come to de do'. When she come, I gi' her de note, an' arfter a little while she bro't me an-udder, an' I tole her good-bye, an' she gi' me a dollar, an' I come home an' gi' de letter to Marse Chan. He read it, an' tole me to have de hosses ready at twenty minits to twelve at de corner of de garden. An' jes' befo' dat he come out ez ef he wuz gwine to bed, but instid he come, an' we all struck out to'ds Cun'l Chahmb'lin's. When we got mos' to de gate, de hosses got sort o' skeered, an' I see dey wuz some'n or somebody standin' jes' inside; an' Marse Chan he jump't off de sorrel an' flung me de bridle and he walked up.

"She spoke fust ('twuz Miss Anne had done come out dyar to meet Marse Chan), an' she sez, jes' ez cold ez a chill, 'Well, seh, I granted your favor. I wished to relieve myself of de obligations you placed me under a few months ago, when you made me a present of my father, whom you first insulted an' then prevented from gittin' satisfaction.'

"Marse Chan he didn' speak fur a minit, an' den he said: 'Who is with you?' (Dat wuz ev'y wu'd.)

"'No one,' sez she; 'I came alone.'

"'My God!' sez he, 'you didn' come all

through those woods by yourself at this time o' night?'

"'Yes, I'm not afraid,' sez she. (An' heah dis nigger! I don' b'lieve she wuz.)

"De moon come out, an' I cotch sight o' her stan'in' dyar in her white dress, wid de cloak she had wrapped herse'f up in drapped off on de groun', an' she didn' look like she wuz 'feared o' nuthin'. She wuz mons'us purty ez she stood dyar wid de green bushes behine 'er, an' she hed jes' a few flowers in her breas',—right hyah,—and some leaves in her sorrel hyar; an' de moon come out an' shined down on her hyar an' her frock, an' 'peared like de light wuz jes' stan'in' off it ez she stood dyar lookin' at Marse Chan wid her head tho'd back, jes' like dat mawnin' when she pahss Marse Chan in de road widout speakin' to 'im, an' sez to me, 'Good mawnin', Sam.'

"Marse Chan, he den tole her he had come to say good-bye to her, ez he wuz gwine 'way to de war nex' mawnin'. I wuz watchin' on her, an' I tho't when Marse Chan tole her dat, she sort o' started an' looked up at 'im like she wuz mighty sorry, an' 'peared like she didn' stan' quite so straight arfter dat. Den Marse Chan he went on talkin' right fars' to her; an' he tole her how he had loved her ever sense she wuz a little bit o' baby mos', an' how he nebber 'membered de time when he hadn't 'spected to marry her. He tole her it wuz his love for her dat had made 'im stan' fust at school an' collige, an' hed kep' 'im good an' pure; an' now he wuz gwine 'way, wouldn' she let it be like 'twuz in ole times, an' ef he come back from de war wouldn' she try to think on him ez she use' to do when she wuz a little guirl?

"Marse Chan he had done been talkin' so serious, he hed done tuk Miss Anne's han', an' wuz lookin' down in her face like he wuz list'nin' wid his eyes.

"Arfter a minit Miss Anne she said something, an' Marse Chan he cotch her udder han' an' sez:

"'But if you love me, Anne?'

"When he sed dat, she tu'ned her head 'way from 'im, an' wait' a minit, an' den she sed—right clear:

"'But I don' love yo'.' (Jes' dem th'ee wuds!) De wuds fall right slow,—like dirt falls out a spade on a coffin when you's buryin' anybody an' seys, 'Uth to uth.' Marse Chan he jes' let her hand drap, an' he stiddy hisse'f 'ginst de gate-pos', an' he didn' speak torkely. When he did speak, all he sez wuz:

"'I mus' see you home safe.'

"I 'clar, marster, I didn' know 'twuz Marse Chan's voice tell I look at 'im right good. Well, she wouldn' let 'im go wid her.

She jes' wrap' her cloak 'roun' her shoulders, an' wen' 'long back by herse'f, widout doin' more'n jes' look up once at Marse Chan leanin' dyah 'ginst de gate-pos' in he sodger clo'es, wid he eyes on de groun'. She said 'Good-bye' sort o' sorf, an' Marse Chan, widout lookin' up, shake han's wid her, an' she wuz done gone down de road. Soon ez she got 'mos' 'roun' de curve, Marse Chan he followed her, keepin' under de trees so ez not to be seen, an' I led de hosses on down de road behine 'im. He kep' 'long behine her tell she wuz safe in de house, an' den he come an' got on he hoss, an' we all come home.

"Nex' mawnin' we all come off to jine de army. An' dey wuz a-drillin' an' a-drillin' all 'bout for a while an' dey went 'long wid all de res' o' de army, an' I went wid Marse Chan an' clean he boots, an' look arfter de tent, an' tek keer o' him an' de hosses. An' Marse Chan, he wan' a bit like he use' to be. He wuz so solum an' moanful all de time, at leas' 'cep' when dyah wuz gwine to be a fight. Den he'd peartin' up, an' he alwuz rode at de head o' de company 'cause he wuz tall; an' hit wan' on'y in battles whar all his company wuz dat *he* went, but he use' to volunteer whenever de cun'l wanted anybody to fine out anythin', an' 'twuz so dangerous he didn't like to mek one man go no sooner'n anudder, yo' know, an' ax'd who'd volunteer. *He* 'peared to like to go prowlin' aroun' 'mong dem Yankees, an' he use' to tek me wid 'im whenever he could. Yes, seh, he sut'n'y wuz a good sodger! He didn't mine bullets no more'n he did so many draps o' rain. But I used to be pow'ful skeered sometimes. It jes' use' to 'pear like fun to him. In camp he use' to be so sorrerful he'd hardly open he mouf. You'd 'a' tho't he wuz seekin', he use' to look so moanful; but jes' le' 'im git into danger, an' he use' to be like ole times—jolly an' laughin' like when he wuz a boy.

"When Cap'n Gordon got he leg shot off, dey mek Marse Chan cap'n on de spot, 'cause one o' de lieutenants got kilt de same day, an' tor'er one (named Mr. Ronny) wan' no 'count, an' all de company sed Marse Chan wuz de man.

"An' Marse Chan he wuz jes' de same. He didn't never mention Miss Anne's name, but I knowed he wuz thinkin' on her constant. One night he wuz settin' by de fire in camp, an' Mr. Ronny—he wuz de secon' lieutenant—got to talkin' 'bout ladies, an' he say all sorts o' things 'bout 'em, an' I see Marse Chan kinder lookin' mad; an' de lieutenant mention Miss Anne' name. He hed been courtin' Miss Anne 'bout de time Marse Chan fit de duil wid her pa, an' Miss Anne hed kicked 'im, dough he wuz mighty rich,

'cause he warn' nothin' but a half-strainer, an' 'cause she like Marse Chan, I believe, dough she didn't speak to 'im; an' Mr. Ronny he got drunk, an' 'coz' Cun'l Chahmb'lin tole 'im not to come dyah no more, he got mighty mad. An' dat evenin' I'se tellin' yo' 'bout, he wuz talkin', an' he mention' Miss Anne' name. I see Marse Chan tu'n he eye 'roun' on 'im an' keep it on he face, an' pres'n'y Mr. Ronny said he wuz gwine hev some fun dyah yit. He didn't mention her name dat time; but he said dey wuz all on 'em a parcel of stuck-up 'risticrats, an' her pa wan' no gent'man anyway, an' *she*—— I don't know what he wuz gwine say (he nuvver said it), fur ez he got dat far Marse Chan riz up an' hit 'im a crack, an' he fall like he hed been hit wid a fence-rail. He challenged Marse Chan to fight a duil, an' Marse Chan he excepted de challenge, an' dey wuz gwine fight; but some on 'em tole 'im Marse Chan wan' gwine mek a present o' him to his fam'ly, an' he got somebody to brek up de duil; 'twan' nuthin' dough, but he wuz 'fred to fight Marse Chan. An' purty soon he lef de comp'ny.

"Well, I got one o' de gent'mens to write Judy a letter for me, an' I tole her all 'bout de fight, an' how Marse Chan knock Mr. Ronny over fur speakin' contemptuous o' Cun'l Chahmb'lin, an' I tole her how Marse Chan wuz a-dyin' fur love o' Miss Anne. An' Judy she gits Miss Anne to read de letter fur her. Den Miss Anne she tells her pa, an'—you mind, Judy tells me all dis arterwards, an' she say when Cun'l Chahmb'lin hear 'bout it, he wuz settin' on de poach, an' he set still a good while, an' den he sey to hisse'f:

'Well, he carn' he'p bein' a Whig.'

"An' den he gits up an' walks up to Miss Anne an' looks at her right hard; an' Miss Anne she hed done tu'n away her head an' wuz makin' out she wuz fixin' a rose bush 'ginst de poach; an' when her pa kep' lookin' at her, her face got jes' de color o' de roses on de bush, an' pres'n'y her pa sez:

"'Anne!'

"An' she tu'n'd 'roun', an' he sez:

"'Do yo' want 'im?'

"An' she sez, 'Yes,' an' put her head on he shoulder an' begin to cry; an' he sez:

"'Well, I won't stan' between yo' no longer. Write to 'im an' say so.'

"We didn't know nuthin' 'bout dis den. We wuz a-fightin' an' a-fightin' all dat time; an' come one day a letter to Marse Chan, an' I see 'im start to read it in his tent, an' he face hit look so cu'ious, an' he han's trembled so I couldn't mek out what wuz de matter wid 'im. An' he fold' de letter up an' wen' out an' wen' 'way down 'hine de camp, an' staid

dyah 'bout nigh an hour. Well, seh, I wuz on de lookout for 'im when he come back, an', fo' Gord, ef he face didn' shine like a angel's. I say to mysef, 'Um'm! ef de glory o' Gord ain' done shine on 'im!' An' what yo' 'spose 'twuz?

"He tuk me wid 'im dat evenin', an' he tell me he hed done git a letter from Miss Anne, an' Marse Chan he eyes look like great big stars, an' he face wuz jes' like 'twuz dat mawn-in' when de sun riz up over de low groun's, an' I see 'im stan'in' dyah wid de pistil in he han', lookin' at it, an' not knowin' but what it mout be de lars' time, an' he done mek up he mine not to shoot ole Cun'l Chahmb'lin fur Miss Anne's sake, what writ 'im de letter.

"He fold' de letter wha' was in his han' up, an' put it in he inside pocket,—right dyar on de lef' side; an' den he tole me he tho't mebbe we wuz gwine hev some warm wu'k in de nex' two or three days, an' arfter dat ef Gord speared 'im he'd git a leave o' absence fur a few days, an' we'd go home.

"Well, dat night de orders come, an' we all hed to git over to 'ds Romney; an' we rid all night till 'bout light; an' we halted right on a litle creek, an' we staid dyah till mos' breakfas' time, an' I see Marse Chan set down on de groun' 'hine a bush an' read dat letter over an' over. I watch 'im, an' de battle wuz a-goin' on, but we hed orders to stay behine de hill, an' ev'y now an' den de bullets would cut de limbs o' de trees right over us, an' one o' dem big shells what goes '*Awhar—awhar—awhar!*' would fall right 'mong us; but Marse Chan he didn' mine it no mo'n nuthin! Den it 'peared to git closer an' thicker, an' Marse Chan he calls me, an' I crep' up, an' he sez:

"'Sam, we'se goin' to win in dis battle, an' den we'll go home an' git married; an' I'se goin' home wid a star on my collar.' An' den he sez, 'Ef I'm wounded, kyar me home, yo' hear?' An' I sez, 'Yes, Marse Chan.'

"Well, jes' den dey blowed boots an' saddles an' we mounted; an' de orders come to ride 'roun' de slope, an' Marse Chan's company wuz de secon'; an' when we got 'roun' dyah, we wuz right in it. Hit wuz de wust place ever dis nigger got in. An' dey said, 'Charge 'em!' an' my king! ef ever you see bullets fly, dey did dat day. Hit wuz jes' like hail; an' we wen' down de slope (I 'long wid de res') an' up de hill right todes de cannons, an' de fire wuz so strong dyar (dey hed a whole regiment o' infintrys layin' down dyar onder de cannons), our lines sort o' broke an' stop; de cun'l was kilt, an' I b'lieve dey wuz jes' 'bout to brek all to pieces, when Marse Chan rid up an' cotch hol' de flag an' hollers, 'Foller me!' an' rid strainin' up de hill 'mong de cannons. I seen 'im when he went, de

sorrel four good lengths ahead o' ev'y udder hoss, jes' like he use' to be in a fox-hunt, an' de whole regiment right arfter 'im. Yo' ain' niver hear thunder! Fus' thing I knowed, de roan roll' head over heels an' flung me up 'ginst de bank, like yo' chuck a nubbin over 'ginst de foot o' de corn pile. An' dat's what kep' me from bein' kilt, I 'specks. Judy she say she think 'twuz Providence, but I think 'twuz de bank. Of co'se, Providence put de bank dyar, but how come Providence nuvver saved Marse Chan! When I look' 'roun', de roan wuz layin' dyah by me, stone dead, wid a cannon-ball gone 'mos' th'oo him, an' our men hed done swep' dem on t'udder side from de top o' de hill. 'Twan' mo'n a minit, de sorrel come gallupin' back wid his mane flyin', an' de rein hangin' down on one side to his knee. 'Dyar!' says I, 'fo' Gord! I 'specks dey done kill Marse Chan, an' I promised to tek care on him.'

"I jumped up an' run over de bank, an' dyar wid a whole lot o' dead men, an' some not dead yit, onder one o' de guns wid de fleg still in he han', an' a bullet right th'oo he body, lay Marse Chan. I tu'n' 'im over an' call 'im 'Marse Chan!' but 'twan' no use, he wuz done gone home, sho' 'nuff. I pick' 'im up in my arms wid de fleg still in he han's, an' toted him back jes' like I did dat day when he wuz a baby, an' ole marster gin him to me in my arms, an' sez he could trus' me, an' tell me to tek keer on him long ez he lived. I kyar'd him 'way off de battlefiel' out de way o' de balls, an' I laid him down onder a big tree till I could git somebody to ketch de sorrel for me. He wuz cotched arfter a while, an' I hed some money, so I got some pine plank an' made a coffin dat evenin', an' wrapt Marse Chan's body up in de fleg, an' put him in de coffin; but I didn' nail de top on strong, 'cause I knowed ole missis wan' see 'im; an' I got a ambulance an' set out for home dat night. We reached dyar de next evenin', arfter travelin' all dat night an' all next day.

"Hit 'peared like something hed tole ole missis we wuz comin' so; for when we got home she wuz waitin' for us,—done drest up in her best Sunday-clo'es, an' stan'in' at de head o' de big steps, an' ole marster settin' in his big cheer,—ez we druv up de hill to 'ds de house, I drivin' de ambulance an' de sorrel leadin' 'long behine wid de stirrups crost over de saddle.

"She come down to de gate to meet us. We took de coffin out de ambulance an' kyar'd it right into de big parlor wid de pictures in it, whar dey use' to dance in ole times when Marse Chan wuz a school-boy, an' Miss Anne Chahmb'lin use' to come over, an'

go wid ole missis into her charmbler an' tek her things off. In dyar we laid de coffin on two o' de cheers, an' ole missis nuvver said a wud; she jes' looked so ole an' white.

"When I had tell'em all 'bout it, I tu'ned right roun' an' rid over to Cun'l Chahmb'lin's, 'cause I knowed dat wuz what Marse Chan he'd 'a' wanted me to do. I didn' tell nobody whar I wuz gwine, 'cause yo' know none on 'em hadn' nuvver speak to Miss Anne, not sence de duil, an' dey didn' know 'bout de letter.

"When I rid up in de yard, dyar wuz Miss Anne a-stan'in' on de poach watchin' me ez I rid up. I tied my hoss to de fence, an' walked up de parf. She knowed by de way I walked dyar wuz somethin' de motter, an' she wuz mighty pale. I drapt my cap down on de een' o' de steps an' went up. She nuvver opened her mouf; jes' stan' right still an' keep her eyes on my face. Fust, I couldn' speak; den I catch my voice, an' I say, 'Marse Chan, he done got he furlough.'

"Her face wuz mighty ashy, an' she sort o' shook, but she didn' fall. She tu'ned roun' an' said, 'Git me de ke'idge!' Dat wuz all.

"When de ke'idge come 'roun', she hed put on her bonnet, an' wuz ready. Ez she got in, she sey to me, 'Have yo' brought him home?' an' we drove 'long, I ridin' behine.

"When we got home, she got out, an' walked up de big walk—up to de poach by hersef. Ole missis hed done fin' de letter in Marse Chan's pocket, wid de love in it, while I wuz 'way, an' she wuz awaitin' on de poach. Dey sey dat wuz de fust time ole missis cry when she find de letter, an' dat she sut'n'y did cry over it, pintedly.

"Well, seh, Miss Anne she walks right up de steps, mos' up to ole missis stan'in' dyar on de poach, an' jes' falls right down mos' to her, on her knees fust, an' den flat on her face right on de flo', ketchin' at ole missis' dress wid her two han's—so.

"Ole missis stood for 'bout a minit lookin' down at her, an' den she dropt down on de flo' by her, an' took her in bofe her arms.

"I couldn' see, I wuz cryin' so mysef, an' ev'ybody wuz cryin'. But dey went in arfter a while in de parlor, an' shet de do'; an' I hyard 'em say, Miss Anne she tuk de coffin in her arms an' kissed it, an' kissed Marse Chan, an' call 'im by his name, and her dar-

lin', an' ole missis lef' her cryin' in dyar tell some on 'em went in, an' found her done faint on de flo'.

"Judy (she's my wife) she tell me she heah Miss Anne when she axed ole missis mout she wear mo'nin' fur him. I don't know how dat is; but when we buried him next day, she wuz de one whar walked arfter de coffin, holdin' ole marster, an' ole missis she walked next to 'em."

"Well, we buried Marse Chan dyar in de ole grabeyard, wid de fleg wrapped roun' 'im, an' he face lookin' like it did dat mawnin' down in de lowgroun's, wid de new sun shinin' on it so peaceful.

"Miss Anne she nuvver went home arfter dat; she stay wid ole marster an' ole missis ez long ez dey lived. Dat warn' so mighty long, 'cause ole marster he died dat fall, when dey wuz fallerin' fur wheat,—I had jes' married Judy den,—an' ole missis she warn' long behine him. We buried her by him next summer. Miss Anne she went in de hospitals to-reckly arfter ole missis died; an' jes' fo' Richmond fell she come home sick wid de fever. Yo' nuvver would 'a' knowed her fur de same ole Miss Anne. She wuz light ez a piece o' peth, an' so white, 'cep' her eyes an' her sorrel hyar, an' she kep' on gittin' whiter an' weaker. Judy she sut'n'y did nuss her faithful. But she nuvver got no betterment! De fever an' Marse Chan's bein' kilt hed done strain her, an' she died jes' 'fo' de folks wuz sot free.

"So we buried Miss Anne right by Marse Chan, in a place whar ole missis hed tole us to leave, an' dey's bofe on 'em sleep side by side over in de old grabeyard at home.

"An' will you please tell me, marster? Dey tells me dat de Bible say dyar won' be marryin' nor givin' in marriage in heaven, but I don' b'lieve it signifies dat,—does you?"

I gave him the comfort of my earnest belief in some other interpretation, together with several spare "eighteen-pences," as he called them, for which he seemed humbly grateful. And as I rode away I heard him calling across the fence to his wife, who was standing in the door of a small whitewashed cabin, near which we had been standing for some time:

"Judy, have Marse Chan's dawg got home?"

Thomas Nelson Page.

TOPICS OF THE TIME.

The Future of the Metropolitan Museum.

WHILE we do not purpose to discuss the recent protracted libel suit of *Feuardent vs. Cesnola* (proceedings in which are indeed still pending in the courts), nor the collateral issues involved therein, we desire to "improve the occasion" by some general suggestions based upon the experience of the past, and having regard solely to the future well-being of an institution whose objects command the deepest sympathy of every intelligent member of the community.

Suppose the gentlemen composing the Board of Trustees had to establish in this country a branch of manufacture new to us, but which had been carried on successfully elsewhere, would not their first step be to procure the best-trained ability that money could buy in that special branch? Could they afford to take any other course under penalty of certain failure? So here it would seem that the thing of first importance would be to find the men who know best, and in a strictly professional and practical way, what the Museum should be, what the objects to be accomplished are, what classes of exhibits are of the first importance, how they can be procured, what they should cost, and especially what relative importance should be given to the departments of which a museum must be made up. In a word, every man of business is aware that the first essential in any enterprise is a person who actually knows how to do the thing, and that for practical purposes amateur knowledge is worse than no knowledge.

To carry on a Museum of Art is, indeed, a very complicated business. First, as to its uses and objects,—above all, the educational (in the highest sense), which in this country is the first object. It is to teach something, the importance of which is felt, and the knowledge of which does not exist among us except in the vaguest sense. There is no greater or more common fallacy than the idea that this knowledge is of easy attainment. Every one who goes to an art gallery feels the right to pronounce as to the value of the works before him, when, in fact, in nine cases out of ten, his judgment shows nothing at all except his own stage of culture. The man who has a gallery of fashionable pictures never doubts that he sees in his Meissonniers or Milletts or Boughtons all there is in them, just as he knows the qualities of the horses in his stables. In fact, the commonest error among the uneducated in art is that the difference in pictures is in the degree of skill with which nature is photographed; while the real value, the new aspect of the world, or of nature, or of thought which they unfold, is unsuspected and invisible to the untaught eye.

The true value of art consists in this, that it is a language embodying those high ideas of the finest races, which could be expressed and recorded in no other way. Apply this definition, for instance, to the music of the Germans, which is their art. Suppose that we knew about them all that we now know except their

music; and then consider what a new light on German character would be thrown by its revelation, and what a treasury of new thought and feeling for us would be opened. Now Greek sculpture not only reveals the Greek spirit to us as nothing else could, but has been a legacy out of which all subsequent ideas of the human form as a type of ideal beauty are derived; so that now no picture is painted, no statue molded, which does not trace back to it. For, though all original artistic nations—the Egyptians, the Indians, the Chinese, the Japanese—have represented the human form under various aspects, hieratic, characteristic, or grotesque, the Greeks first presented it as pure beauty and ideal humanity.

So of Greek architecture, and so of Italian painting. All these great arts are languages which are speaking to us all the time. They are languages *we* have barely begun to speak, hardly begun to understand; not understanding them, we cannot rightly understand modern art, which has its root in the ancient; nor those numerous subordinate arts growing out of them, and appropriated by the different nations to express their national spirit or ideals of grace. In this country it is only through great museums that these monuments of art can be brought before us. Individuals may be trusted to ornament their houses with (and lend or give to museums) specimens of the smaller and simply decorative arts, with blue china, and Capo-di-Monte and Limoges enamel, all of which have their great but subordinate value; but no American millionaire is going to compete with the museums of Europe for the rare and fragmentary specimens of Greek art that come to light. Even Italian pictures are so far beyond the common appreciation, that if a single specimen of acknowledged first-rate Italian work exists in this, one of the very richest countries in the world, the public does not know of it.

It would seem natural that the first attention of a great American museum should be directed to such things as these; that one of the first acquisitions should be a collection of casts of all the great Greek sculptures. Sculpture has the immense advantage that it can be more adequately represented by copies than any other art. An ample Architectural Museum or Department would be of first-rate importance in a country and city where more bad architecture has been perpetrated in the last thirty years than was perhaps ever accomplished elsewhere. Some masterpieces of Italian painting might still be procured. A full Art Library for students would be of inestimable value; and, above all, a trained corps of genuine experts.

Few know how far from easy it is to acquire a "knowledge of art," as it is called, and to have an authoritative judgment; and, on the other hand, how superficial amateur proficiency mostly is. Mrs. Mitchell (a writer well known to our readers, who has just published her "History of Ancient Sculpture") might tell us something about it. Prob-

ably she would say that to be a good expert one should have seen in their originals most of the extant specimens of pure Greek art, all the good Roman reproductions, all the important collections of Greek vases; should know Greek architecture, mythology, poetry; and that only by degrees would its wonderful lesson be learned, and its perfection revealed; that to know Greek sculpture is an education in itself. What is true of Greek sculpture is true of every great branch of art. This is what it is to be an expert, this along with rare natural aptitude, and this is what "expert" means in the great European museums. This is what we shall have a class of young men growing up to be, to take charge of our museums, when once we have the right man to show us the way. But let us not be misunderstood. There have always been men of special acquirements and scholarly and artistic tastes connected with the Museum, and devoted to its interests. But these very men have been hampered for lack of experience of a practical kind close at hand and always available.

We refer to the Cesnola collection merely by way of illustration. Gathered not only without sufficient means but without sufficient scientific knowledge; bought, as should never be forgotten, in the most generous and commendable spirit, but hurriedly; prepared for exhibition by men without museum experience,—the controversy and annoyance it has occasioned have been largely owing to a lack of expert knowledge in every stage of its history. And yet the very controversy that has been waged over the manner in which it should be exhibited may be taken as an evidence of the unique value of the collection. This value, which is mainly historical, so far from desiring to underrate, we wish rather to insist upon. We wish, in fact, to see the collection so carefully studied and sifted and scientifically guaranteed, that this value will be everywhere acknowledged; while the collection itself will be made to take its proportionate place in the work of public information and instruction. If, in this sifting process, however, a part of the collection should be either set aside as *artistically* so much incumbrance, or sold to, or exchanged with, other museums, we should not be surprised; for it will be admitted that a large part of it is fatally lacking in artistic value, and that owing to its very magnitude and repetition there is danger lest it should be actually misleading in a museum whose main object is to *educate the public in art*, that is, in the best and truest artistic expression.

There is a homely maxim that "hindsight is better than foresight." What has been said is to hint at the future that is open to the Museum rather than to criticise the past. Those who are old enough to remember the greatness of the impulse given to the study of natural science when Agassiz was brought to this country, can appreciate the force of the argument. The Museum needs, and should have, a munificent endowment; then, with the constant presence and advice of experts of the character described,—men of acknowledged authority in the realm of art, commanding the confidence of the entire public,—its present collections would form a valuable nucleus for the systematic building up of a truly educational museum.

The Metropolitan Museum conducted in this spirit would itself be an unrivaled center of artistic influence; but the time, we trust, is coming when its

treasures and resources will be reduplicated in value by an intimate connection with other of our large educational institutions; which institutions will perhaps yet be a part, more or less formal and official, of the great Metropolitan University of the future.

Mob or Magistrate.

DURING the year which has just closed, the telegraph has reported fifteen hundred and seventeen murders in the United States. This record is not supposed to be complete, but it is nearly so. The cases of capital crime are few which the enterprising reporter does not drag to light and publish to the world. The reader of any daily journal connected with the Associated Press is speedily informed of nearly all the desperate deeds that are done in the dark or by daylight upon this continent. The fullness with which crime is reported gives an impression of the increase of crime stronger than the facts will warrant; yet the facts are bad enough. During the year 1882 twelve hundred and sixty-six murders were reported. A comparison of two years is not conclusive, for there is considerable fluctuation in the number of crimes; it is only from comparison of periods of five or ten years that any trustworthy inferences can be drawn. But there is no dispute concerning the rapid increase of capital crime, and the fact is ominous.

Over against the fifteen hundred murders of the last year, we have the report of barely ninety-three legal executions. Many of these must have been cases in which the crime had been committed during 1882, while many of the criminals of 1883 had not yet been brought to trial. It is not, however, far from the truth to say that, while thirteen or fourteen hundred murders are committed in this country every year, fewer than a hundred of the murderers suffer the extreme penalty of the law. When the willful slayer knows that he has thirteen chances out of fourteen of escaping the full penalty of the law, the deterrent influence of punishment cannot be said to be very powerful.

What the law could not do, or has not done, lawlessness has undertaken to accomplish. The failure of judge and jury has let loose the private avenger and the mob. Quite a number of these fifteen hundred murders, as every reader of the newspapers will easily remember, were committed in obedience to the *lex talionis*, to expiate some previous crime. The Oriental avenger and the frontier lyncher join hands in this mad dance of anarchy. The same year that witnessed ninety-three legal executions witnessed one hundred and eighteen lynchings. The lawless executions outnumber the lawful ones by twenty-five per cent.

No very profound philosophy is required to explain the relation of these facts. The inefficiency of the machinery of justice has led to the introduction of these barbarous methods. In some of the States adultery is regarded by the law not even as a misdemeanor. What wonder that private vengeance sometimes rushes in to redress a mortal injury of which the law refuses to take cognizance. But it is not so much defective legislation as inefficient administration that produces lawlessness. The laws against murder are strong enough; but when the people know that not one in a dozen of the willful murderers receives the just recompense of his deeds, and that technicalities and quibbles are constantly allowed to shelter the

worst criminals, they themselves become desperate; and, breaking through the just and salutary restraints of law, they deal vengeance right and left in a bloody and turbulent fashion.

It cannot be too often nor too strongly proclaimed that these lynchings themselves are crimes; that they are utterly without excuse; that they furnish a remedy which is worse than the disease. When a score of men can find no better way of expressing their detestation of murder than by becoming murderers themselves, our civilization seems to have reduced itself to an absurdity. Moreover, lynch law is not much more accurate in its measurement and dispensation of justice than the lax administration against which it protests. The mob is neither judicial nor chivalrous; the weak and defenseless are far more likely to suffer at its hands than the strong and prosperous, as is shown by the fact that the victims of more than half the lynchings reported last year were Southern negroes.

Nevertheless, the failure of criminal justice, which makes room for mobs and lynching, is a greater disgrace than the savagery of the mobs. The fact that thirteen out of fourteen murderers escape the gallows is the one damning fact that blackens the record of our criminal jurisprudence. No American ought to indulge in any boasting about his native land, while the evidence remains that the laws made for the protection of human life are thus shamelessly trampled under foot. No occupant of the bench and no member of the bar ought to rest until those monstrous abuses which result in the utter defeat of justice are thoroughly corrected.

It is often alleged that the failure of juries to convict murderers is due to their unwillingness to inflict capital punishment; and it is argued that if the extreme penalty were imprisonment for life a much smaller number would escape. It is possible that this reasoning may explain some cases of disagreement or acquittal, but the real difficulty is much more serious. It arises, in part, from the exaggeration of the rights of the individual as compared with those of society. The tendency of our jurisprudence is all in this direction. The protection of the individual is the one great achievement of modern criminal practice. It is a noble achievement, and Anglo-Saxon legists are justly proud of it. But a principle as good as this may be over-developed. The rights of the individual must be protected; but society also has rights, and these must not be sacrificed. And the question often arises in the mind of the layman, whether our judges, in their careflessness to guard the criminal, do not often expose and jeopardize the lives of honest and law-abiding citizens. That the rules of the courts should be modified is a suggestion which no well-instructed layman would have the temerity to make; but it is easy for any one to see that the spirit of the laws is of more importance than the letter, and that, if the court is under the influence of a tradition or a spirit which makes rather more of protecting the criminal from the vengeance of society than of protecting society from the violence of criminals, much mischief will result, no matter what the rules may be.

Out of this exaggerated estimate of the criminal's rights have arisen those methods of legal procedure which so disgrace our criminal courts, under which

crafty lawyers are permitted the use of all manner of ridiculous quibbles and technicalities for the sake of defeating the ends of justice. The fact that the American bar is distinguished for its fertility in the invention of these vicious expedients, by which trials are endlessly protracted, and the processes of the law are fatally entangled, and the minds of jurors are hopelessly confused, is a fact not greatly to our credit, but it throws a flood of light on the figures we are studying. The Guiteau trial and the trial of the Star Route conspirators in Washington furnish illustrious instances of the way in which criminal trials in this country are often managed. It is through the use of such methods that the best laws are nullified, and the magistrate, ceasing to be a terror to evil-doers, becomes their laughing-stock.

The small number of murderers hanged by the sheriffs, and the greater number hanged by the mobs, should be evidence enough that the administration of our criminal courts in many quarters is fatally defective, and needs reforming. The only classes of persons interested in maintaining the present state of things are the criminals and the criminal lawyers; and it is not for their exclusive benefit that society is organized. The contrast between the swift, firm, and sure methods of English and Continental courts in dealing with great criminals, and the tardy, feeble, and abortive methods of our own, should sting our national pride to some energetic measures of reform. The people must rouse themselves to demand a more vigorous enforcement of the laws, and they must see to it that judges and prosecuting attorneys are chosen who have the ability and the will to bring evil-doers to justice. The judges on the bench may well inquire whether the protection of the criminal has not assumed disproportionate importance in our criminal procedure. If, in our fear lest an innocent man may suffer, the law itself, which is the only protection of innocent men, becomes utterly paralyzed, then there is a call for a revision of our methods and our maxims, and the infusion of a new spirit into our laws. Every judge who will brush aside the hair-splitting devices of the lawyers, and insist that criminal trials shall be conducted with rigor and directness of purpose, will deserve, and will be likely to win, the approval of his fellow-citizens.

When it shall become evident that the notorious and willful murderer generally receives a speedy and impartial trial and suffers the just penalty of his crime, the day of the lynchers will soon come to an end. This is not conjecture; the experience of many a frontier community illustrates our proposition. Out of a lax administration of criminal law a crop of vigilance committees and regulators has often sprung, spreading terror and anarchy on every hand, until the election of some stern judge or some courageous prosecuting officer has restored to the law its rightful majesty and supremacy, and restrained the lawlessness of both criminals and lynchers. What has so often been done in different localities may well be undertaken with resolute purpose in all parts of the country where these evils now prevail. It is to be hoped that the record of the current year will show that the majority of those who have died for crime have met their fate at the hands of the magistrate, rather than at the hands of the mob.

OPEN LETTERS.

Worshipping by Proxy.

If there be any hope of reaching an agreement in the discussion of such vexed questions as those concerning the musical performances in our modern churches, it is evident there ought to be settled at once some point of departure or some point of approach. What *purpose* is expected to be served by singing as a stated exercise in the service of the house of God? The answer, which is ready on the instant, is that it is part of divine worship. But do we adhere to that in our further argument?

They tell a story hereabouts, for the first part of which I can, as usual with my illustrations on these themes, vouch as a fact; but I am not sure whether I rehearse the conversation that follows with exactness in choice of terms, though accurately enough, I presume, for all needs. A clergyman gave out his morning selection from the hymn-book, as was customary, for the congregation to sing. The organist-leader peremptorily and perversely changed the music, and set the words to a tune of unfamiliar and highly artistic character, through which the will-ing quartette, with due sense of the fun, wound their intricate way on to the end. Then the minister calmly rose, and with proper dignity said: "We will now commence divine worship by singing the same hymn I gave before, and we will use the tune which is very appropriately set to it for our help." And without even a moment's pause he started the strain himself with his clear tenor voice, before the choir had recovered from their positive consternation. As if by instinct, the people rose on their feet, showing that they comprehended the posture of affairs, and unaccompanied joined in the song.

When the services were over, the chorister descended from the gallery, and marched up the aisle to the pulpit platform, where the preacher was waiting. He was angry to the supreme verge of impertinence. "What do you mean, sir?" he asked. "If you will attend to your end of the church, I will attend to mine!" Quietly enough the clergyman replied: "You make me think of an old story my father used to tell when I was a child. A mate was frightened at the ship's nearness to a rocky shore, and went aft to inform the captain that he thought the course should be changed. 'You attend to your end of the ship, and I will attend to mine,' was the answer. The mate went back to his place, but in five minutes more the captain heard the rattle of a chain, and the splash of iron in the water. 'What are you doing?' he thundered; and the mate said: 'Only what you told me, sir. I have anchored my end of the vessel; you may do as you please with yours.' And so," continued the undisturbed pastor, "I have anchored my end of the church, as you call it, *in the worship of Almighty God*, which is what we came here for. What do you propose to do with yours?"

It would astonish many quite belligerent disputants in ordinary congregations to observe how quietly a

vessel of discussion rides, the moment the anchorage of a definition is attained. All this cant about "good music" and "artistic execution" and "soprano solos" would be banished into thin air, if agreement were reached that the worship of God was the purpose to be served by the performances in the gallery. It is not unkind or ungracious to inform many of our musical friends that the usual assemblies of religious people do not have any sympathy with artists in their rivalries for place or emolument. They come to the house of prayer for other reasons than to listen to trills of a voice or tremolos of an organ. They do not converse about the merits of the performers half so much as some suppose. For many years it has been deemed quite witty to fasten upon clergymen the brunt of a well-remembered couplet; but the facts point to another application. Bononcini was a fierce rival of Handel in the city of London. Dean Swift sided with the former, which of course made Handel angry, and he cut Dean Swift in the public street; and then Swift wrote his now-famous epigram:

"Some say that Signor Bononcini,
Compared to Handel, is a ninny;
While others vow that to him Handel
Is hardly fit to hold a candle.
Strange such a difference should be
'Twixt tweedle-dum and tweedle-dee."

Very quickly also would this consideration settle the worrying differences about worshipping by proxy. One of our preachers has lately declared that he would as soon accept four people to write his love-letters for him as to do his singing for him in the house of God. But suppose one should accept the four ready-writers, not being up in penmanship, or in good form, you know, and then discover afterward that his damsel adored was only being mocked by those who were competing for custom, and his affection was not in the epistles at all: what then? A bass singer, who knows the facts if they can be known, himself an artist of the highest character, told me frankly five years ago that the relations of quartette choirs to congregations were, in the majority of cases, purely mercenary. Sweet tones, and finished execution, and wonderful compass, all may be bought for money, no doubt, but can we buy worship from ungodly and mercenary people? And if one proposes to worship by proxy, does he imagine God is ignorant of the difference between æsthetics and devotion? A friend of mine, perfectly trustworthy as to facts, told me that while he was in one of the churches of New York City the book lay in the rack before him, and he took it up mechanically, as he was wont at home. Finding the hymn, and noticing that the music was familiar, he began to sing quietly with the voices he heard, when suddenly the sexton tapped him on the shoulder, and deftly whispered, "It is expected that the singing in this congregation will be performed by the choir."

It might be to edification sometimes to look up the proxies when off duty during the sermon or prayers. A few years ago we had a soprano who used to spend

the spare time in the lecture-room, where her husband kept his tobacco for a smoke. Once a German among the bass went regularly off for lager for months, to our discredit, for he always kept looking at the clock so as to get back before the doxology, and the toppers knew he was doing a job of "worship" over at the church for us. Close by us, in a neighboring congregation, the choir used to have lemons or lemonade behind the curtains, in the intervals of worship. Once the bass, handing a slice to the alto, overset the pitcher upon the floor, and the desecration became known to the rector by an awkward trickling down of wetness on his surplice. Is it harsh for me to go on with these stories? Believe me, I have preferred to keep within the limits of what might be considered playful, rather than tragic; most of us could speak more to the point in sterner facts, if we were not ashamed of our arraignment. For all this goes to show that in many instances, our music committees are to blame as well as the hired creatures under them.

The principle which vitiates all this form of service is found in the acceptance of mere tones of one's voice as church music, and of swift and delicate execution of syllables as intelligent psalmody. This betrays our committees into indiscretion; they listen only to sounds, and care less for characters, for behaviors, and for devotion, than they do for flats, sharps, and *unnaturals*. So some churches are betrayed into most embarrassing complications by the headlong enthusiasm of a few musical men who never professed to have much worship to let out into the hands of the proxies whom they engage prematurely.

There was once a congregation in Albany whose pastor felt himself obliged to clear the gallery of a choir which was turning his Sabbath services into a young people's visiting resort. Just so a church in New York, whose committee hired a choir for twenty thousand dollars a year. Eight singers gave an entertainment in the sanctuary for six months, which was the talk of the town as the wonder of excellence. The chief soprano received four thousand dollars; one of the basses traveled from Boston every week. But the religious authorities were constrained to interfere in the middle of the engagement: they dismissed the whole train during the summer vacation. They paid the remaining ten thousand dollars without a grimace rather than worship by proxy in such a concert-room style clear on to the end of the year.

In this subordination of sense to sound, this grading of musical effects above intelligent worship, is found the reason why choirs claim the liberty of reconstructing hymns for their own convenience. A chorister once told me without any hesitation, as if it had been a matter of perfectly accepted principle between his profession and the public: "We always shorten or lengthen the number of stanzas according to the necessities of the music. How could we do otherwise? If the tune is double, we can sing but four verses." But when I inquired how such frightful cases as three stanzas could be managed, he answered, as if he took me in dead earnest, and deemed me rather sympathetic on the whole: "Oh, repeat the last one; that is easy enough! Indeed, we always give them four verses; that is all they need." I once called the attention of another leader to the fact that the hymn I gave out was not the same in the sheet-music he had been

singing from as it was in the hymn-book which the people had before them in their hands. He was not surprised, but rather pleased, I conjectured, at the chance I gave him to say that the words were always softer in properly prepared music, for "a true artist liked them liquid and flowing"; and he added gently that he wished all the hymns were in Italian or Latin.

That is to say, the purpose of singing in church is simply ignored; we drag our anchor the moment we begin to discuss. But common law speaks of "congregations for *public worship*" in the provisions of the statutes; and presidents' proclamations are addressed to the "assemblies for *the worship of God*." What do we come together for, unless it is for the purpose of worship? And is all this artistic parade of style the worship of God?

Now, I am exceedingly anxious, in bringing these "open letters" to a close, to show the friends to whom I am writing them how amiable I am in the discussion. I cannot deny that I have had serious thoughts all along in my mind. But I desire to leave off in good humor; and I think I see the way out, if I may be allowed to mention one particular more.

It is this, likewise, which introduces so many Germans and Italians into our organ-lofts. These people are declared to be the natural singers of the world, and so are engaged as musical performers. It is not rare that members of the opera troupes and attachés of the minstrel companies are put into our churches to order the worship of God's pious people. It is enough to speak at present about the effect of their poor knowledge of intelligible English pronunciation. Once a choir-leader asked me as a favor if I would criticise the singing at his rehearsal. I willingly consented, and gave my whole patient attention to the two anthems which the choir practiced. I was obliged in candor to tell him that, though I was somewhat well acquainted with ordinary canticles, and might perhaps be permitted to say I could recognize a song of the Psalter if I could get a little started in on it, I had not been able to guess or surmise what these two "opening pieces" were about; I had no clew whatsoever. Not one in a score of our trained singers can be understood through a verse in the hymns which are travestied just to get sounds to suit taste. And, generally speaking, I think it will be found that professional "artists" pride themselves upon the success achieved when their consonants are not suffered to be heard.

Here comes in another incident in my observation; I would rather not name the church in which it occurred. Glorious Easter was at hand and great preparations were made in the rural parish for its celebration; boughs were twined in the arches of the building; flowers swung in wreaths overhead and shone in beautiful baskets among the aisles; children had been rehearsing carols. All the town came in on that notable morning. It was a scene never to be forgotten. The minister was radiant; his eyes beamed with delight. But a thought struck him: this audience, so happy, so generous, so enthusiastic, — would they not hear him a moment for a stroke of business? After the invocation and the first song, he surprised them with a proposition to bring "Easter offerings" now at once to God's altar, and lift the dear old church out of debt: oh, then there would be a

resurrection! The congregation would come up from under its great stone into a new life, if they would roll it away! Then the plates went their course, and hearts were touched, and purses were emptied, and the heaps of money lay before the moistened eyes of the relieved pastor as he tremulously thanked a good God for his people's fidelity in response. "The money is here, I am sure it is," he exclaimed. "If there be a little in arrears, it can be made up in a day, and now we are ready heartily to go on with the worship of our risen Lord." So the fixed programme proceeded. A little German had been procured from the metropolis for an annex to the tenor; his solo came in at this exact crisis of grateful emotion; he rendered it with a fresh aplomb, though the consonants were awkward: "An' *de det* sall be raised — *de det* sall be raised — an' *de det* — an' *de det* — sall be raised — sall be raised — in *de* twinkling of an ay-ee!"

Now it is quite safe to say that after the congregation went home, the theme of the day was dissipated, and the two events uppermost in everybody's mind were the surprise which the eager minister had sprung upon the people, and the ridiculous appropriateness of the declamatory solo which followed it. On general principles, we have no objection to the collection of money to discharge religious obligation, even in divine service; but it does seem a pity that a humorous episode should be the chief reminiscence of such a solemn occasion.

Charles S. Robinson.

"Music in America."

SOME two or three years ago, a much-respected musician, whom I had seen very rarely during an acquaintance which dated from my boyhood, came to me with the proposal that I should write a history of music in America. He urged this upon me, and kindly offered me all the help that he could give. My reply was that, although I should probably write something in regard to the art in which I had been so much interested, and with the professors of which I had been more or less acquainted all my life, I could not undertake a history of music in America; and for these reasons: First, that I was already committed to the assertion that there is no such thing as American music, nor, indeed, such a thing as English music since the days of Henry Purcell*; and second and last, that there were no efforts in musical composition and no public performances here worthy of historical record or critical examination until the beginning of this century; since which time what has been done here publicly is mere repetition of what had been done before in Europe, the performers as well as the music being in both cases European. The subject must necessarily prove somewhat like that of the snakes in Ireland. To write a history of music — of that which is worthy to be called music — in America would be mostly to record the performance here, from time to time, and here or there, giving dates and places, of music written in Europe by artists born and bred in Europe, — a sort of literary work for which I had little liking. To this the rejoinder was that the thing would surely be done, and that I ought to do it, because, in the first

place (as my visitor insisted), I was the only man of letters who was a musician and who had the requisite knowledge of the facts and of the country; and next, because another man who was quite incompetent to the task was about to undertake it, and would do so unless some one "headed him off." This office I was obliged to decline undertaking: partly for the considerations I have already mentioned; and partly because the office was not to my taste. However, I promised my earnest and urgent friend that I would as soon as possible do something of the sort that he desired; and thereupon we parted.

A few weeks after this unexpected interview, I received from the conductors of *THE CENTURY* an equally unexpected proposal to write a History of the Opera in New York. They were entirely ignorant of the suggestion which had already been made to me, and, indeed, knew not of the existence of the maker. The result was the series of articles on this subject which appeared in *THE CENTURY* in March, April, May, and June, 1882. I was able to prepare them so quickly, because I had most of the requisite material at command, either in contemporary records which had in one way or another come into my possession, or in the recollections of friends of an elder generation, or in the memory of my own personal experience. No inaccuracy or omission of moment has been pointed out in these articles; and the conductors of *THE CENTURY* and the writer personally have received from long-retired artists and from competent critics, public and private, in Europe as well as in America, testimony, tinged with surprise, to their remarkable accuracy, — surprise for which there was really little occasion; for the writer simply related what he knew upon the best evidence.

A day or two ago I bought Professor Frédéric Louis Ritter's "Music in England" and "Music in America," recently published, but announced some months ago. Passing quickly over his long discussions, in the latter volume, of New England psalm-singing and of psalm-book makers and country singing-school teachers, which seemed to me about as much in place in the history of musical art as a critical discussion of the whooping of Indians would be, or as a description of the battles of kites and crows in a history of the art of war (not because their labors were simple and unpretentious, but because they were the development of no germ, and themselves produced no fruit, except some chorus material), I reached the pages where true music begins to receive the writer's attention. Dipping into his book, back and forth, I found here and there inaccuracy, erroneous statement, and evidence both of ignorance and of insufficient and perfunctorily acquired information; and some of this it was my purpose to correct, not publicly, but, as I have done before in such cases, by letter to the writer, that he himself might set himself right. Soon, however, I came upon a misstatement of such a character that it changed at once my point of view and my purpose. I read it with mingled wonder and resentment, — wonder and resentment which were enhanced by the fact that, even if it had not been a misstatement, an elaborate and carefully made misstatement, it was entirely superfluous, supererogatory, of not the slightest importance or interest to any intelligent reader of Professor Ritter's book, and having for its only pos-

* See "National Hymns," 1861; Part II.

sible purpose the impeachment of my correctness, and more, of my good faith.

Professor Ritter, in his record of the first appearance of Malibran in New York, presents his readers a long contemporary criticism or report of that performance, and to this he appends the following note:

"The above criticism is copied from Ireland. Mr. R. Grant White, in his article, 'Opera in New York,' in *THE CENTURY MAGAZINE* for March, 1882, gives the same criticism, although somewhat altered and mixed with other matter, saying 'it is from the "Evening Post" of the 30th November, 1825.' Ireland did not say from what paper he copied the article. I have looked carefully through the files of the 'Evening Post,' and have not been able to find it there."

The assertion concerning me in the second sentence of this passage is absolutely untrue; untrue in every particular; without the semblance of foundation in truth. It is not true that I gave the same criticism which Professor Ritter gives; it is not true that I said that that criticism is from the "Evening Post" of the 30th November, 1825, or of any other date; above all, it is not true that I garbled what I did give by altering it and mixing it with other matter. Finally and moreover, all the criticisms in question are from the "Evening Post."

I cannot, of course, produce here the criticisms which I cite and that cited by Professor Ritter; but they may be easily collated by those who desire to do so. The former are on p. 693 of *THE CENTURY* for March, 1882; the latter on p. 187 of Professor Ritter's book. The truth of the case will be difficult of belief to those who do not make the collation; as, indeed, it was somewhat perplexing to me until I had compared the two pages. It is this: After the first six lines and a half of the long article given by Professor Ritter, there is, in the two short paragraphs which I give, not one sentence, not one phrase, which appears in the former; and, although he asserts they are the same (after comparison, for he pronounces mine altered and mixed with other matter), there is not one sentence, not one phrase, in either which has even a likeness to a sentence or a phrase in the other. The two criticisms quoted by me and that quoted by Professor Ritter are wholly different, and are clearly from three different sources. The historian of Music in America (who goes to Ireland for his facts, and therefore not strangely finds blunders) is plainly ignorant of their origin. I will tell it to him.

The first passage quoted by me, beginning, "An assemblage of ladies so fashionable," etc., is from the "Evening Post" of the 30th November, 1825, second page, fifth and sixth columns. The next, beginning, "But how, or in what terms," etc., is from the same journal of the 20th December, 1825, second page, third and fourth columns, and is copied by the editor, as I mention, from another publication, the "New York Review." On the other hand, the criticism which Professor Ritter quotes from Ireland, and which he says I garbled, was taken (that is, the most of it) from the "Evening Post" of the 6th December, 1825, where the historian of Music in America may find it on the second page, last two columns. I was well acquainted with it, but the other articles in the "Post" served my purpose better. The two (after the six and a half lines already excepted) are about as like each other as the

first chapter of Genesis and the first chapter of John. They bring to mind Fluellen's famous river in Macedonia and river in Wye—of which it was true that there was "salmons in both," as it is of these articles that there is a Malibran in both; which, it seems, was enough for the Fluellen of musical history.

One cause of all this confusion and misstatement on the part of Professor Ritter is that, while my quotations are in every sentence and every phrase copied exactly, word for word and letter for letter, from the "Evening Post," the so-called article which he presents is made up from two articles in that paper; the first six lines and a half being from the article of November 30th, 1825, already specified, and the rest, making nearly a full page of his book, from another article in the same journal of December 6th. These are welded together as if they were one article, although they are plainly by different writers. Moreover—must it be said!—the greater part of our censor's quotation is much garbled not only by omission, but by alteration and insertion of words and phrases. Of this, see the following evidence:

*From the "Evening Post,"
November 30th, 1825.*

*From the "article" in Ritter's
"Music in America."*

The daughter, Signorina Garcia, seems to us as being a new creation, etc.

The [] signorina [] seems to us as being a new creation, etc.

*From the "Evening Post,"
December 6th, 1825.*

The best compliment that could be paid to the merit of the acting was the unbroken attention that was yielded during the whole performance.

The best compliment that can be paid to the merit of the company was the unbroken attention that was yielded during the entire performance.

In one respect the exhibition far excelled all that we ever witnessed in any of our theaters—the whole troupe were [] equally excellent.

In one respect the exhibition [] excelled all that we ever witnessed in any of our theaters—the whole troupe were almost equally excellent.

*Signor Garcia indulges in a florid style of singing; but with his fine voice, fine taste, admirable ear, and brilliancy of execution, we could not be otherwise than delighted, nor wished to curtail this exuberance, if it deserves such a term. * * * We will not particularize where all was so admirable, but cannot, if we would, avoid expressing our wonder and delight, etc.*

Signor Garcia indulges in a florid style of singing; but with his fine voice, fine taste, admirable ear, and brilliancy of execution, we could not be otherwise than delighted, []. We [] cannot [] avoid expressing our wonder and delight, etc.

How shall we speak in suitable terms of the enchanting Signorina Garcia? Her voice, which is the first requisite in a singer, is what is denominated in the Italian a fine contralto,—that is, one with a good top and bottom to it, but in which its principal excellence lies in the middle tones; and her science and skill in its management, etc.

[] Signorina Garcia's voice [] is what is denominated in the Italian a fine contra-alto, []; and her science and skill in its management, etc.

The facts of the case, therefore, are that, while the writer of the article in *THE CENTURY* on Opera in New York, going to the original authority, set forth the criticism of the day, as represented in the "Evening Post" (eminent then, as now, in all the departments of higher culture), *verbatim et literatim*, it was the historian of Music in America who, quoting at second hand, gave a hodge-podge made up of an article "somewhat altered" and also "mixed up with

other matter" from another article. His assertion that he "looked carefully through *the files* of the 'Evening Post'" without being "able to find it there" does not raise our estimation of the value of his testimony, whether we take "it" as referring to his article or to my two paragraphs; for all are very prominent in the pages of the journal in question, within a few days of each other, in the places to which I have referred.

My musico-critical censor is, however, not content with this exhibition of sagacity and accuracy. He cannot resist the temptation to turn the light of his dark lantern upon another grievous error of mine—my remark that in 1825 there was but one theater in New York. He finds that Ireland and Wemyss (compilers to whom properly informed persons do not look for instruction, much less for correction) both say that the Chatham Garden Theater was built in 1824 and occupied by theatrical troupes; and as in 1831 a French opera company gave representations there, "consequently there must have been two theaters in New York in 1825." Truly a grievous error! But, indeed, I would rather have made it a dozen times over than have been guilty of such a petty piece of fault-finding. Of what appreciable consequence or interest is it in the history of Music in America, whether New York had two theaters or one in 1825, or what is said on such a point in a magazine article? But, again, our historian is all abroad. I cannot go into full explanation in this brief and hurried communication; but my readers may find that Professor Ritter was in a fog (or something worse), by simply turning the leaf of the article in question and finding on p. 694 this paragraph:

"Nor did New Yorkers at *this time* (1825) fail to offer encouragement to other musical artists, or to enjoy other operatic music and Italian singing. Signora Bartolini, an artist of fair European repute, was engaged at the *Chatham Garden Theater*,—a place in Chatham street, not far from the City Hall, and something like Niblo's Garden of after years,—where she sang operatic airs between the two or three plays which at that time almost always made up an evening's theatrical entertainment."

THE CENTURY, March, 1882, p. 694.

And if the historian will consult the list of public buildings, churches, etc., in the New York Directory for 1825, he will find only one theater mentioned, and simply as the "theatre." It is not until 1827 that it becomes necessary to give it the name Park Theater, to distinguish it from any other like place of amusement. On one momentous point I confess, with becoming humiliation, the historian has detected me in error—that of saying that the English version of "Der Freyschütz" was performed at the Park Theater in 1823 instead of 1825. My error was due to the very easy and very common mistake of a 5 for the 3 of my authority; and I thus grievously gave "Der Freyschütz" eighteen months' instead of six months' precedence of Italian opera in New York. But in the opera articles in THE CENTURY I distinctly announced that I did not profess or even desire particular accuracy in dates, and often I did not give them at all,—“before” or “after” such or such a musical event being sufficient for my purpose, which was not that of a musical annalist. Professor Ritter, however, as becomes the dignity of a historian, is very strong, as

we have seen, on this point, and very captious upon it as to others. But, alas, alas!

"The best laid schemes o' mice an' men
Gang aft agley";

and our historian is wrong upon the very point on which he holds me up for correction. "Der Freyschütz" was produced not on "March 3d, 1825," as he says, but on March 2d: see the New York newspapers of that time.

Nor is other more important evidence lacking that Professor Ritter should be the last person to point out errors that may be the result of misprints or of momentary inadvertence, as even my hasty examination of his book discovered before I found myself called up for discipline. He tells us, for example, that Theodore Eisfeld "was born in 1616 in Wolfenbüttel." That good man and good musician must, therefore, have attained the ripe age of two hundred and sixty-six years before he departed to his place in the heavenly choir. And (on p. 288) we are told of a tenor at Palmo's named "Ambogini." No such tenor was ever heard in this country. Perhaps Professor Ritter confused the name of that admirable tenor Antognini with that of the buffo Ambrogetti, and so "made a mess of it"; or perhaps his copy was not clear and his proof not carefully corrected. He tells us, too (p. 232), of the musical doings of a Mr. "Kirchhoefer," and with clear intention, for the name is thus repeated (p. 274). Now, no such person is known in our musical annals. Mr. Kieckhoefer, a foreign amateur once resident in New York, is the person whom he is groping for. Some of the music used on the occasions to which he refers (p. 232) is in my possession. We find, too, the somewhat astonishing assertion that a concert of the Musical Fund Society (regarded by him as important) was given "at the City Hall, May 10th, 1830." The City Hall has, indeed, been the scene of various performances not quite so harmonious as the one in question, but it was hardly ever put to that use. The concert was given, he may be sure, at the City Hotel, in the lower part of Broadway, which had a large assembly-room, that was frequently at that time used for public musical performances. These are characteristic examples of the accuracy of Prof. Ritter's book. There are more of the same sort. I hope he will be becomingly self-abased and repentant. As for me, I say plainly that under other circumstances I should be ashamed to point out publicly such slips upon unessential points in his work or that of any other man. To do so has always seemed to me the most contemptible business in which a critic can be engaged.

It is not the fault of a foreigner like Professor Ritter that he knows nothing of the society of New York and "America" at the times of which he writes, and that he has, as we shall soon see, a very confused notion even of our public musical performances. But his ignorance leads him into some very queer mistakes. For example, he gives (p. 186) Mr. Lynch as the "manager" of the Garcia company at the Park Theater in 1825. Shade of Brummel, the elegant Dominick Lynch! Professor Ritter's Mr. Lynch was a prominent leader of the gayest set of New York fashionable society at that time; a distinguished

musical connoisseur and amateur, a great promoter and patron of the opera, and doubtless an adviser of Garcia, but hardly his "manager." He lived then in Greenwich street, directly upon the Battery—the most desirable site in the then most fashionable quarter of the town. He was one of the directors of the old Philharmonic Society, whose officers were: Wright Post, president; Augustus Brevoort, Dominick Lynch, Daniel Oakey, Fanning C. Tucker,* Henry Carey, Robert Ray, Ab'm Schermerhorn, Robert Emmett, James I. Jones, H. F. Rogers, B. W. Rogers, I. Delafeld, directors. All these gentlemen were then prominent in society; all were connoisseurs, and some of them amateurs of music. But in this respect, as in others, Mr. Lynch was the most distinguished. Of him, of course, I never saw anything more than his portrait; but his daughter and his niece, one of whom became Mrs. Nicholas Luqueer, of Long Island, and the other, Mrs. Julius Pringle, of South Carolina, were as matrons my gracious friends in my days of hobbledehoydom. The latter distinguished herself in connection with our subject by a strange freak. She appeared in her father's box at the opera (Rivafanoli's, I believe) with the most extraordinary bracelet ever worn by woman, at least in this country—a small living green snake, which she kept as a pet, and which was seen not only winding itself around her beautiful arm, but (fashionable women went to the opera then always in full evening dress) over her shoulders and around her neck. This snake was her constant companion, even in bed. It was venomous, but had been deprived of its poison-glands; and she was told by the person of whom it was bought that if it were allowed to eat milk these glands would be reproduced. One morning, as she was dawdling over breakfast in bed, she looked up from a book that she was reading, and saw her pet with its head plunged into the milk-jug. It was killed immediately. A strange story this; but my authority for it is the lady's sister and my own uncle, a frequenter of the opera and familiar with New York society at that time.†

Let us now consider, as briefly as the subject will admit, a few of the examples which my hasty examination of "Music in America" has thus far discovered of the author's knowledge of his subject. The lack of a taste for good music in America is insisted upon strongly, again and again (see pp. 189–194, 214, 215, etc.), and an especial point is made in this respect in regard to chamber music, which is regarded by the writer (correctly, it need hardly be said) as an eminent form of the highest style of music. Professor Ritter is very particular upon this point; he refers us back and forth to his assertions and opinions in regard to it; and we may justly assume this part of his book as a test of the value of the whole. He tells us (p. 232) that the playing of pianoforte trios in private by two professional musicians and an amateur, in 1838, was the "beginning of the cultivation of chamber music in New York." Then, under the special head "Chamber Music" (p. 274), he indicates the first feeble begin-

nings of a taste for this music in the following passage:

"Thus, about 1848, a Mr. Pirsson, who lived in Leonard street, had regular quartette playing at his house. He was then almost the only amateur in New York who appreciated chamber music. . . . In 1849 Saroni's "Musical Times" arranged four concerts of classical music, to be given by subscription. . . . These concerts appear to have been tolerably well patronized. They, at any rate, proved that there was a small public that began to take delight in that style of music."

There is more of such assertion and remark which need not be specified. Surely, thorough ignorance was never more elaborately set forth. The Mr. Pirsson here set up as an "amateur," whose tastes were indicative of the musical cultivation of the New Yorkers, was a humble English professional musician, a John Bull of the bulliest sort, and a very second-rate double-bass player. His position our historian might have easily discovered by examining any one of the early programmes of the Philharmonic Society, on which, in the list of performers, we find: "Double basses—Jacobi, Loder, Pirsson, Rosier." The idea of old "Jim" Pirsson being set up as a salient type of the most cultivated "American" amateurs of thirty-five years ago will be sufficiently amusing to those who know anything of our musical annals. He was not only a British professional musician, but one of a family of professional musicians. Father and sons played in the orchestra (!) of the Albany Theater; one of his brothers taught the pianoforte; another was a pianoforte maker in a humble way. And this is our historian's acquaintance with the cultivated amateurs of New York society and their tastes.

The performances to which he refers were wholly without significance, the players being all foreigners and professional musicians. I could give their names: Timm, Boucher, and Loder were among them. These Germans, Frenchmen, etc., might just as well have played their trios and quartettes in a private room in one of their own native towns. But it is significant and important in connection with Professor Ritter's subject that eight years before this time—in 1840—there was in New York a chamber music club of "American" amateurs, who met weekly throughout the year (excepting July and August), and who played only Haydn, Mozart, Beethoven, and Mendelssohn. Of this I have written evidence. Their meetings continued regularly for many years.

Of public performances of classical chamber music he shows a like ignorance. He gives an elaborate "notice" of that enthusiastic and enterprising musician, Mr. U. C. Hill, with a "record of his labors";* and yet he can set forth the Saroni quartette concerts as our first public classical chamber music, and say that they were a sign that there was in 1849 a small public that began to take delight in that style of music! Now the fact is, that six years before this date, and five years before that wonderful New York amateur, "a Mr. Pirsson," had quartette playing at his house, the best classical chamber music ever written had been publicly and successfully performed in

* Major Tucker was also president of the St. Cecilia Society, which is referred to on page 952, and leader of the notably fine choir of St. Anne's Church, Brooklyn.

† Mr. Chandler White, of the Narrows, L. I. who was the first vice-president of the Atlantic Telegraph Company.

* Mr. Hill was so constant a factor in the public musical entertainments of New York thirty years ago that a musical amateur (I believe he was the same who gave Bosio her sobriquet of Madame Beaux Yeux), being asked who was the conductor at a certain concert, answered, "Well, if you go into almost any concert-room and look for the conductor, you see Hill."

New York. In 1843, a series of "quartette soirées" was given at the Apollo Rooms. The performers were: U. C. Hill (violin), Apelles (violin and clarinet), Lehmann (violin), Derwort (viola), and Hegelund (violoncello). The soirées were given on the 4th and 15th of March and the 1st and 15th of April of that year. The programmes are before me, and what their character was may be gathered from the first and the last, which I quote. First soirée: Quartette No. 1, op. 18, Beethoven; quintette (clarinet and strings), op. 34, Von Weber; quartette No. 2, op. 59, Spohr; quintette, op. 4, Beethoven. Fourth soirée: Double quartette, op. 65, Spohr; septette, Beethoven. When the fact that these soirées were well attended and successful is considered, and that at least one chamber music club of "American" amateurs had been established in New York three years previously, it will probably be thought somewhat inconsistent with the assertions that "a Mr. Pirsson" was almost the only "amateur" in New York who had a taste for classical chamber music, and that the first concerts of such music were given in 1849, and showed that there was a small public which then began to take delight in that style of music.

Whether there were chamber music concerts before Hill's in 1843, I do not know. No evidence of it is in my hands. But I do know, upon very trustworthy testimony, that the assumption that the playing of pianoforte trios by two professional musicians and an amateur, all foreigners, in 1838, was the beginning of the cultivation of chamber music in New York, is laughably inconsistent with the facts. Long before that time, and then, there were performances of chamber music in private by amateurs. Some of the performers I knew personally in my youth and their old or middle age. I could name more whom I did not know. There are now in the country pianofortes and violins and 'cellos which were used in such private concerts three-quarters of a century ago. I have had them under my hands, and have seen the old music books that were used. I have some of them myself; among them, a set of Boccherini's quintettes, with two violoncellos, which were used here by native amateurs three quarters of a century ago, and which show evidence of their use. One friend of mine has a 'cello which has been in his family more than a hundred years, and during most of that time has been used in the performance of classical chamber music. Our author is lamentably ignorant of the musical taste and experience of the people whose musical history he has assumed to write.

And even as to public performances, and of another sort, what shall we say of a historian of Music in America who asserts, positively and without qualification, that in 1848 "Mr. Timm also brought Rossini's *Stabat Mater* out for the first time in America," when it was performed by eminent vocalists no less than six years before, on the 2d October, 1842, within a few months of its completion and first performance at Paris! The programme is in my possession and is before me. The solo parts were sung by Mrs. Seguin, Madame Spohr-Zahn, Mrs. Morley, Signor Antognini, and Mr. E. Seguin. The conductor of the orchestra was Mr. Pearson. Our author seems to be in like ignorance as to the first performance of Beethoven's Ninth Symphony in this country. In like manner, he is in the dark,

or at least leaves his readers there, as to the old St. Cecilia Society, although it was the first to perform orchestral music in this country (its elegant certificate of membership, showing St. Cecilia surrounded by angels, which was engraved in New York in 1791, is interesting), and also as to the Arion Club of Brooklyn, and the Church Music Society, all of them much more important as signs of the condition of music in America than a great number of the professional companies or associations on which he wastes many words, and the last of which had for its conductors, first that able musician Dr. Pech, and last the gifted Charles Horseley, the hero of "Counterparts," neither of whom is mentioned in Professor Ritter's pages. This association, the performing members of which were amateurs from the more cultivated circles of New York society, among its notable achievements coped creditably with that musical *crux*, Beethoven's Mass in D minor, rarely heard even in Europe. And in his special chapter on "Musical Theory, Musical Grammars, Dictionaries, etc.," "between 1771 and 1815," he seems unaware of the existence of Pilkington's "Musical Dictionary," published at Boston in 1812; a manual so thorough and so sound that (although it has no biographies or histories of inventions) it is all-sufficient for general purposes at the present day. It is not a reprint, nor composed of selections, but is an original work, wrought out of the general mass of musical literature, supplemented by the author's own knowledge. Its author was, or soon afterward became, one of New York's many resident professors of music.

In like manner, writing in this third period, of the time between 1815 and 1825, he says (p. 142): "In order to give my readers an idea of the style of music cultivated by the American amateur at this epoch, I will copy the titles of some of the pieces then advertised by music-sellers"; whereupon we are furnished with the general announcement of a Boston music-seller, who (wonderful tradesman!) calls his stock "fashionable," that he has overtures, battles, songs, glees, catches, little ballads, waltzes, dances, Mozart's songs, etc.; and we are told that "the dance-pieces and the ballads sold best." How does our historian know which sold best? What possible authority can he have for this positive historical assertion? However, he is probably right. It is true that music-sellers in Boston and in New York did at that time sell and advertise glees, catches, dance-pieces, and ballads. But so at the same time did the music-sellers in London. It may be assumed that they sold better (*i. e.* in greater numbers) in New York and Boston than at that time sonatas and Mozart's songs did; for so they did in London; and so they do in Boston, New York, and London to this day. That a historian of music should gravely utter such a platitude as a criticism of social and musical culture! Why, so far is this advertisement and others like it (which might be found by the score nowadays in London and New York) from giving an idea of the style of music cultivated by the American amateur (worthy the name) of the period in question, that it is exactly the sort of announcement in which that typical person took no interest. Many years before the coming of Malibran (in 1825) American amateurs had collections not only of pianoforte sonatas and other chamber music, but of all the celebrated operas in (so-called) pianoforte score. My first boyish ac-

quaintance with Cimarosa's beautiful "Matrimonio Segreto," with "Don Giovanni," and with Rossini's operas was made through a collection of this kind, formed early in the century, and showing, when I first saw the books, evidence of long use. And in the decade in question (1815-1825) Messrs. Dubois and Stodardt, 126 Broadway, then the fashionable music-sellers of New York, advertise that they have received among other music Mozart's and Rossini's operas. One advertisement before me mentions "'Mosè in Egitto,' 'La Donna del Lago,' 'La Cenerentola,' and 'Ricciardo e Zoraide.'" This is done without any fuss, but as a mere matter in the ordinary course of business; and these then-fresh works (as well as the Stabat Mater seventeen years later) came here promptly, it would seem, in those slow-going, slow-sailing times. It would have been well for a historian to know all this before he undertook to give an idea of the style of music cultivated by American amateurs at this epoch, and to do this by copying advertisements of dance-pieces and ballads.

Desultory as these remarks upon "Music in America" have necessarily been, they point in the latter part of my letter to one conspicuous deficiency in that book—an entire lack of knowledge of our society, and of the condition and the influence of cultivated American amateurs. The author, it would seem, has been dependent, in regard to New York at least, almost entirely (and how could it be otherwise?) upon what he could (or could not) find in newspapers, and upon the personal communications of foreign professional musicians, most of them Germans of late importation. Now all this has its place, although subordinate, and its value; but it does not tell of the condition of musical culture among cultivated Americans. This is indicated by a phenomenon which has not escaped Professor Ritter's eye, which he mentions frequently, and which, as he lacks the knowledge that is the key to it, seems to puzzle him. It is that the earliest performances of the several styles of the higher music were invariably of the greatest and, so to speak, the profoundest, compositions in each style. In regard to this our historian says, commenting upon a concert given in 1831:

"In the face of such a programme at so early a period of American musical culture [ignorance here], we are scarcely justified in speaking of our present progress [who are 'we' and 'our'—Professor Ritter's countrymen or mine?] in musical taste."

And again, remarking upon the Eissfeld quartettes, given in 1851, he says:

"Here again a commencement at the top of the ladder. Musical progress in the city of New York for the last thirty years—in fact from 1825 up to our time—witness the first introduction of Italian opera, the first concerts of the Philharmonic Society, the above first regular series of quartette concerts—has been marked by its horizontal and its upward direction."

We have already seen that what our historian calls the first regular series of quartette concerts, which awakens in him so much admiration, was preceded (eight years before) by a regular series of higher—of the highest possible grade.

The cause of this general starting at the top is simply the influence of the amateurs in cultivated circles of society. These are naturally appealed to by professional musicians at such times; they naturally take the lead in the promotion of such enterprises; their tastes naturally are consulted. But they are not, and especially they were not, able to support these undertakings; and the professional musicians who entered upon them were soon obliged to lower their standard and appeal to the general public, or to abandon them altogether. Moreover, the cultivated amateur is not in this country the freest patron of public musical performances. This is true even as to opera; and as to classical chamber music it is notably true. I may venture to say that I have had an unusually large acquaintance among amateur students of classical chamber music; and I know that they are not frequenters of concerts of that music. Indeed, I know those who for many years have met weekly for the enjoyment of that music, who not only will not buy tickets for concerts, but will not use those that are presented to them. They enjoy the musical ideas in the compositions which they perform, and the social pleasure which attends their gatherings. They don't care to go and sit in rows on benches in a big hall (not a fit place for chamber music) and listen to quartette playing, be it ever so good. The apathetic colored gentleman who was slow to respond to demands for his admiration of a reverend sable Boanerges suddenly accounted for his reluctance by the remark, "I'se a preacher myself." Cultivated taste corresponding in degree to that of London or any town in England has not been lacking here; but it is only of late years (if indeed even now) that our town populations have been large enough and rich enough to furnish a public which could and would support musical performances of a high order at the prices which prima donnas, virtuosos, and professional musicians generally have demanded (out of Germany and Italy) within the last half-century.* We have grown bigger and richer, and there are more of us to go to theater and opera, and more dollars to spend; but we can hardly be said to have advanced in taste or in the quality of our amusements very far beyond our fathers and grandfathers, who used to go one night to hear Edmund Kean in "Othello" or "King Lear," the next to hear Malibran in "Il Barbiere," and the next to hear the elder Wallack in old English comedy; which was actually the case in 1825.

A year, however, before the latter date—in 1824—a concert was given in New York, the high quality of which extorts the manifestly puzzled admiration of Professor Ritter; and considering his necessarily slight and scrappy information as to the people about whom he is writing, this is not surprising. For the programme of the concert (which was given at St. George's Church by the New York Choral Society)

*Apropos of this slowness of cultivated amateurs to give pecuniary support to musical entertainments, see the following remarks by a writer of fifty-seven years ago in regard to the old Philharmonic Society:

"By an unanimous vote passed this season, a subscription was to have been raised . . . which would have established it on a solid foundation. However, although all the members were present at those expensive concerts, although the vote was passed, although the list of members comprehends a large number of our richest citizens (and most of the fashionable world), not more than half have paid their subscriptions."—"New York American," Feb. 8, 1827.

was composed entirely of selections from the finest sacred compositions of Handel, Mozart, and Beethoven. Of this programme Professor Ritter says, and rightly, "Many [he might well have said any] of our present societies might be proud of such a one." Now this concert was not only given with amateur performers in the chorus, and even in some of the solo concerted pieces, but it was planned and managed entirely by amateurs, as I happen to know; for my father, although then only twenty-six years old, was a prominent member of St. George's parish, and an amateur of acknowledged taste and a fine voice; and he was one of the chief promoters of this admirable concert, of which I remember hearing him speak often in after years, he saying then that the professional people would find it hard to beat "our great concert." The programme of this concert which so impresses Professor Ritter was only a fair representation of the taste of the cultivated amateurs of sacred music in New York sixty years ago.

The relation of a remarkable musical feat incident to this concert shall bring my letter to an end. During one of the last rehearsals it was suddenly discovered that the music of one of the solo parts of a concerted piece was missing. Search for it was in vain. Whereupon a Mr. Sage, who had an important part himself in other pieces, undertook and successfully performed this feat: While he sang his own part sufficiently for purposes of rehearsal, he wrote out the music of the missing part. I admit that the story is almost beyond belief. The mental process by which it was accomplished is far past my comprehension—to me quite inconceivable. For it must be considered that it was a double process of memory and of execution. Mr. Sage remembered and sang one part while he wrote down the other also from memory (perhaps foreshadowing the process by which a man may sagely chew up one railway while he is swallowing another); but none the less the feat is astounding and incomprehensible, and I should not believe it upon less unimpeachable evidence. My informant was one of those men who not only shun exaggeration and even hyperbole, but who watch their lips that no idle word may pass them; and he told me, as I have heard him tell others, that he stood by Mr. Sage's side and heard him sing one part and saw him at the same time write down the other. Here is a psychological problem worthy of the study of Henry Maudsley; but unless he is a musician he cannot apprehend its perplexity. This first really great classical concert given in America sixty years ago has never yet been surpassed in the quality of the music performed,—a point very significant to a historian of Music in America, and one quite inconsistent with our present historian's estimate of the taste of American amateurs of music at that period, or even in later years.

I could say much more to the same effect even now, but I must stay my hand. A very hasty examination of Professor Ritter's work has revealed to me these striking misstatements and deficiencies. I have not time at present to look at it more carefully; but it would seem necessary that some competent person should do so hereafter. I regret that self-defense against the wrongful public imputation of careless work and, more, of a violation of literary good faith

in the garbling of quotations and the falsification of evidence, the highest literary crime, has made it necessary for me to write thus of an author whose previous writings I have read with interest.

Richard Grant White.

NEW YORK, 29th December, 1883.

P. S.—The necessary delay in the publication of this letter has enabled Professor Ritter to publish a declaration that errors and misstatements "crowd the pages" of my musical writings. Of the value of any assertion of Professor Ritter's as to matter of fact, the reader is now able to judge. This one I pronounce absolutely untrue, like his previous charges. I stop at no labor of research to get at essential truth. When, without a "perhaps" or "probably" or "about" or equivalent phrase, I say that a thing is or was, I do so on contemporary evidence, on the testimony of trustworthy witnesses of the past generation, or of my own personal knowledge, of which I have contemporary record. Consequently, the coming of a gentleman from Alsatia to correct me as to matters of fact, and his calling in the aid of two such book-making compilers as Ireland and Wemyss, is amusing—when it is not intended otherwise.

29th January, 1884.

R. G. W.

Lawrence Barrett and his Plays.

MR. LAWRENCE BARRETT will begin an important engagement in London on April 14th. He will appear at Mr. Irving's Lyceum Theater. Not long ago—it was during the last performance of Mr. Boker's play, "Francesca da Rimini," at the Star Theater, New York,—Mr. Barrett made a brief speech, in which he laid stress upon the fact that he had done something to encourage the American drama. That is perfectly true, and it is also noteworthy. Mr. Barrett has helped forward the drama and the dramatists of our country, just as Mr. Forrest helped them years ago. This is noteworthy, because Mr. Barrett is quite alone in what I may be permitted to call his literary work. Mr. Edwin Booth apparently cares nothing for new plays, nor for the American play-writers. Mr. McCullough uses the American plays that Forrest used, and other plays by Payne, Sheridan Knowles, and Shakspeare; he has, I believe, purchased two or three American dramas, but only to send them back to their authors. Both Mr. Booth and Mr. McCullough lack, apparently, a certain creative instinct,—the desire to bring fresh and salient characters upon the stage. Mr. Barrett, happily, does not lack this instinct. He is even a much more potent force among the American dramatists than Mr. Irving is among the English dramatists. Mr. Irving is not afraid to produce, occasionally, a play by Mr. Wills, or by the Laureate; yet he has given, after all, little encouragement to the English writers of drama. Mr. Barrett, on the other hand, has taken pains to establish his reputation in novel and experimental works, like "The Man o' Airlie," "Dan'l Druce," "Yorick's Love," "Pendragon," and "Francesca da Rimini." Three

of these dramas were written by Americans, and all three are worthy of more respect than one is inclined to offer to many new plays which are now popular. The selection and the production of such dramas show, lucidly, that Mr. Barrett has a fine literary sense, a proper regard for the duty that an actor of distinction owes to contemporary writers, and a moral courage with which actors are not commonly gifted.

It must not be thought, however, that Mr. Barrett's reputation was made altogether in the plays that he has had the taste and the courage to produce. Mr. Barrett is an old and tried actor. For thirty years he has been known in the theaters. He was born in April, 1838, so he is now about forty-five years old. He began to act during 1853 at Detroit, Michigan. His career has been eventful and laborious. At the beginning of his stage life he acted with persons like C. W. Couldock, Edmund Conner, Eliza Logan, and Julia Dean. When he came to New York for the first time, the chief theaters in the city were directed by famous actors — by Blake, Burton, J. W. Wallack, and Laura Keane. Mr. Barrett joined Mr. Burton's company. But it is not my purpose to follow Mr. Barrett through the thirty years of his career. I wish to point out, simply, that he has had unusual opportunities to observe various schools of acting. He has been a good observer from this side of the foot-lights,—his "Life of Edwin Forrest" demonstrates so much,—and he has acted with Forrest, Burton, E. L. Davenport, Edwin Booth, John McCullough, Charlotte Cushman, and with most of the distinguished players of the last quarter-century. In 1869 he began his brilliant management of the California Theater. In 1870 he acted *Cassius*,—one of his most remarkable performances,—with Davenport as *Brutus* and Walter Montgomery as *Antony*. In the same year he went to Booth's Theater. The first production effected independently by Mr. Barrett was a magnificent revival at Booth's Theater of "A Winter's Tale," in which he and Mark Smith and other well-known actors had parts. "The Man o' Airlie" followed "A Winter's Tale." It was in 1871 that Mr. Barrett appeared as *Cassius*, in the splendid revival of "Julius Caesar" at Booth's Theater, with Mr. Booth as *Brutus*, and Mr. Bangs as *Antony*. At the sad period of the Brooklyn Theater fire, Mr. Barrett produced Mr. Gilbert's play, "Dan'l Druce." Thenceforward he branched in a new direction, and sought to win popularity in well-written American dramas.

Mr. Barrett has, it is needless to say, acted in many Shakspearean characters; for example, in *Hamlet*, *Shylock*, *Richard III.*, and *Lear*. His *Cassius*, however, is the most truthful and impressive Shakspearean performance that he has given us. Mr. Barrett, the actor, may be described in a few words. He has quick dramatic instinct, a passionate intensity, which goes high and deep at moments, a noble sincerity, and a bright intelligence. His faults are more conspicuous and irritating than the faults either of Mr. Booth or of Mr. McCullough. He has a stiff, hard manner, a droning voice, and an unfortunate habit of putting noise in the place of strong feeling and inspiration. He is, therefore, a particularly uneven actor. Of late, it is noticeable, he has made a serious effort to overcome his worst faults. His finest performances

are in characters like *Richelieu*, *Cassius*, *Yorick*, *Pendragon*, and *Lanciotto*. He carries some of these characters with singular spirit and intensity, and his bursts of power are occasionally real bursts of power.

"Yorick's Love," in which Mr. Barrett will make his first appearance before the public of London, is a play of uncommon beauty and vigor. It is not, I am sorry to add, an American play from top to toe. It has a Spanish body. The author of the work upon which "Yorick's Love" is based is Señor Estebanez. The American writer who fitted it to our stage, and whose fine and subtle talent added an unexpected beauty to it, is Mr. W. D. Howells, the novelist. Mr. Howells has not altered in any marked degree the purpose and the action of Joaquin Estebanez's drama. A few new scenes have been furnished by him, certain details of the play have been dispensed with, and the characters have been retouched here and there. Mr. Howells has handled this charming work with the taste and the feeling of an artist. His dialogue is fresh, unconventional, and convincing. "Yorick's Love" is a play of direct and simple emotion. It is not one of those ingenious and extravagant theatrical intrigues which have so much popularity upon the stage, chiefly because the public confounds movement in the theater with the pathos and the passion of life. The chief character of this play is *Yorick*, a comedian of the Globe Theater. The scene is laid, therefore, in Shakspeare's time. His wife, *Mistress Alice*, is a young and beautiful actress, who loves *Master Edmund*, a friend and foster-son of *Yorick*. In the beginning of the drama, a new play by *Master Woodford* is about to be produced at the Globe Theater, and the story of this new play deals with an illicit love and with the betrayal of the woman's husband. *Master Woodford's* play is, it is evident, a mimic representation of the real drama at the hearthstone of *Yorick*. The three persons in the real drama are chosen for the corresponding parts in the play. This is an essentially dramatic conception, and it is treated with breadth and strength in the last act, which occurs on the stage of the Globe Theater. It is here, while *Master Woodford's* play is on the stage, that *Yorick* learns the truth: himself, who is acting the character of a wronged husband, has been betrayed by his own wife and by his foster-son. This knowledge once clear to him, he makes ready for a speedy and terrible revenge. The play within a play develops his purpose, and he kills *Edmund* before the audience at the Globe Theater. There is a weakness, however, in "Yorick's Love," for which I can hardly account. Unlike those lovers of the sturdy and frank Elizabethan drama, the lovers in "Yorick's Love" are guiltless; that is to say, they have not done a criminal action, though they have confessed their passion to one another. The play lacks, therefore, a needful element of reality. It is not felt that *Yorick* has justification for his tragic vengeance.

"Pendragon" is the work of a young poet and dramatist, Mr. William Young. "Francesca da Rimini" is the work of an old poet and dramatist, Mr. George H. Boker, and was written more than two decades ago. Both plays have a serious tragic interest, and are seriously treated, though in a somewhat old-fashioned and artificial manner. Both are versions of the sweet and melancholy tale of *Lancelot* and

Guinevere. There is a picturesque simplicity throughout Mr. Young's drama that touches and holds the imagination. The play has good diction, and deserves attention. Mr. Boker's drama is more theatrical and showy, and less poetically written; yet "*Francesca da Rimini*" is conceived in the right tragic spirit.

George Edgar Montgomery.

Dante's Portrait in the Bargello.

IN her paper on the portraits of Dante, in the number of *THE CENTURY* for the current month, Miss Clarke has done me the honor to cite a description of the portrait of Dante in the Bargello at Florence, from a tract of mine printed in 1865. At that time, relying upon the authority of Vasari, as others had done, I ascribed the portrait to Giotto. But there was a difficulty, which seemed to be insoluble, in assigning a date to the picture in accordance with the known facts of the lives of the poet and of the painter. In any case, the picture could not have been painted before 1301, when Dante was thirty-six years old. He is represented, however, much younger than this, and in a sentence, not cited by Miss Clarke, I said: "The date when this picture was painted is uncertain, but Giotto represented his friend in it as a youth, such as he may have been . . . at the season of the beginning of their memorable friendship." Miss Clarke says: "The picture is supposed to have been painted when Dante was about twenty years old." She has inadvertently fallen into error, in stating that this had been supposed; for, if so, the picture must have been painted, if we accept the common chronology, which there seems no sufficient reason to doubt, when Giotto was but nine years old.

At the time when I was preparing my little work as a contribution to the celebration of the six hundredth anniversary of Dante's birth, a commission appointed by the Minister of Public Instruction in Florence was engaged in examining the question as to what was the oldest and most trustworthy portrait of Dante. The members of this commission were the late Count Luigi Passerini, one of the most learned and thorough students of Florentine antiquities, and Signor Gaetano Milanesi, the well-known editor of the best edition of "*Vasari's Lives*," and versed beyond other men in the story of Tuscan art and artists. The report of this committee was published in 1864, in the seventeenth number of the journal entitled *Il Centenario di Dante*, and was followed by a supplementary report later in the year. The first report was reprinted in 1875, by Count Passerini, in his *Curiosità Storico-Artistiche Fiorentine, Seconda Serie*; and the substance of both reports is embodied by Milanesi in an appendix to the "*Life of Giotto*," in the first volume of his new edition of the works of Vasari, Florence, 1878.

The conclusion reached by the commission concerning the picture in the Bargello is that it is not the work of Giotto, but of one of his scholars, and that it was probably painted in 1337. A conclusion so far at variance with the statements of Vasari and other early writers, as well as with popular tradition, has naturally been warmly disputed. It is not established by positive documentary evidence. But the force of the cumulative argument by which it is supported is in-

creased by the difficulties, both chronological and historical, that attend the ascription of the picture to Giotto. The details of the controversy are hardly of interest, except to special students.

That the portrait of Dante, whether painted by Giotto or by one of his pupils, was derived from a sketch by the great master, seems altogether probable. It is the most interesting portrait that has come to us from the middle ages. In the dignity, refinement, sweetness, and strength of its traits it is a worthy likeness of the poet of the New Life, and as such it is a work worthy of the most poetically imaginative of Florentine painters.

C. E. Norton.

CAMBRIDGE, January 23, 1884.

The Proposed Congressional Library—A Reply.

WE notice in the February number of *THE CENTURY* some remarks with regard to the proposed Congressional Library building, in Washington, which seem to us calculated to mislead the public. It is important, of course, that all should be correctly informed of a matter of such great public interest, but we submit that the proper method of doing this is not by allowing an anonymous writer to shoot at random the arrows of crude and uninformed criticism.

The plan which has been offered for the Library is the matured result of upward of twelve years' study of this special branch of architecture, including a personal and exhaustive examination of the arrangements of all the principal libraries in this country and in Europe. No labor has been spared to master thoroughly this very difficult problem of architectural science. The plan does not come from a clique or from favor shown to a "local practitioner," as your correspondent sneeringly insinuates, but is the result of a victory won after the keenest public competition in which twenty-eight competitors participated, and a running competition extending over eight and a half years, one of the competitors being Mr. Clark, who is officially known as the Architect of the Capitol, and whom your correspondent suggests as eminently qualified to select an architect, and another being Mr. T. U. Walter, who designed the Capitol and the building generally known as the Patent Office, more properly the Interior Department. In what sense the victors in the competition can be called "local practitioners" is not understood, unless to reside at the seat of government be considered a sin against architectural canons, as their work appears in nearly every State from Virginia westward to Colorado.

That plans made under such circumstances, and fully approved by the Librarian of Congress, who has also specially studied the subject, deserve more consideration than to be relegated to the waste-basket at the behest of an anonymous writer, seems obvious enough; and we may add that in the only forum where the subject can be properly judged, that is to say, in the professional periodicals devoted to architecture, the excellence of the designs is not questioned.

Various modifications of architectural detail have been shown in the elevations submitted from time to time, at the desire or for the information of the Congressional committee, and further changes will prob-

ably be found necessary before the final execution of the plans. The architects are willing to receive suggestions from any competent source, but it is not likely that any large amount of benefit can be derived from a writer who is not aware that a round-arched window, surmounted by a triangular pediment for "ornament," is a feature frequently found in the best Renaissance architecture.

Nothing is easier than to criticise a work of art which those addressed have not seen; it is like defaming the absent, and is especially unworthy when the attempt is made before a non-professional audience, unaware of the facts and difficulties of the case.

Very respectfully,

J. L. Smithmeyer, } Architects,
Paul J. Pels. }

authors of the design for the proposed Congressional Library Building at Washington, D. C.

[We gladly give place to the above communication in reply to a statement of the situation in "Topics of the Time" for February. The well-considered opinion expressed in our editorial department is not, however, correctly described in the language used by the architects whose work we felt compelled to criticise, in the interests of the public.—ED.]

Sidney Lanier on the English Novel.

IT is greatly to be regretted that the late Sidney Lanier did not live long enough at least to have revised the course of public lectures on the "English Novel" delivered by him at Johns Hopkins University in 1881. The lectures now published lack not a little in symmetry and finish. There are rough breaks and repetitions, and an unfortunate survival of marks of the original oral delivery. But all unpolished as the book is, it is a work to be thankful for. Like all Lanier's writing, it is rich in thought—in that combination always rare and remarkable of the new and the true. In the "English Novel and the Principle of its Development," as in the earlier "Science of English Verse," the author is deeply philosophic; he seeks to go to the root of the matter. Highly interesting, indeed, the present volume must be even to the most cursory of general readers, for it abounds in apt quotation, searching comment and vigorous expression of personal opinion; and, as we turn its pages, we find ourselves face to face with one of the freshest and most acute of the writers who have discussed literary problems from a scientific point of view.

At first glance the scheme of this study seems ill-balanced. Of the twelve lectures, as originally delivered, seven are occupied with philosophic disquisition not at once seen to be pertinent; and the remaining five are chiefly a discussion of the novels of George Eliot. Richardson, Fielding, Smollett, and Sterne are dismissed hastily and together. "I protest that I can read none of these books," said Lanier, "without feeling as if my soul had been in the rain,—dragged, muddy, miserable." Goldsmith's "Vicar of Wakefield" is called "a snow-drop springing from the muck of the classics"; but no space is spared for Goldsmith, nor for Scott's novels, "which we have all known from our childhood as among the most hale and strengthening waters in which the young soul

ever bathed." A few words of commendation are given to Bulwer, and a few more and warmer to Dickens. Thackeray fares worse. "Under this yearning of Thackeray's after the supposed freedom of Fielding's time lie at once a shortcoming of love, a limitation of view, and an actual fallacy of logic, which always kept Thackeray's work below the highest, and which formed the chief reason why I have been unable to place him here, along with Dickens and George Eliot" (p. 204). Of minor English novelists Lanier says little, and of any American novelists he says nothing.

Now, there is no use in discussing these opinions here, or in offering any defense of Fielding or of Thackeray: if Lanier could not get high pleasure out of their manly pictures of life—so much the worse for him. What gives value to Lanier's book is not these heretical views; it is his philosophic idea of the parallel development of prose fiction and the idea of personality. This it is which gives unity and value to this book far beyond that of more symmetrical volumes of literary criticism, only too often as bare and sterile as this is full and fertile. Lanier declares that "the modern novel is itself the expression of this intensified personality, and an expression which could only be made by greatly extending the form of the Greek drama" (p. 75). In other words, he holds that it is the expression of man's individuality, and of his personal responsibility, as opposed to the idea of Fate. The old theological antithesis between foreordination and free-will represents fairly enough the beginning and the end of the artistic curve. Mr. Lanier shows us successive stages of the evolution by concrete examples. In the "Prometheus Bound" of Æschylus we see the individual full of the desire for improvement, but helpless in the hands of Fate; even the mighty Jove himself, with all his illimitable force, is powerless against the decree; and on this point the Greek audience was at one with the Greek poet. But when in the course of two thousand years Shelley takes up the same myth, the poet cannot but feel that the attitude of his audience has completely changed; and so there comes a tang of insincerity into his work, and a sense of self-conscious effort in his attempt to handle Jove's thunderbolts. "We—we moderns—cannot for our lives help seeing the man in his shirt-sleeves who is turning the crank of the thunder-mill behind the scenes; nay, we are inclined to ask, with a certain proud indignation: How is it that you wish us to tremble at this mere resinous lightning, when we have seen a man (not a Titan, nor a god), one of ourselves, go forth into a thunder-storm and send his kite up into the very bosom thereof, and fairly entice the lightning by his wit to come and perch upon his finger, and be the tame bird of him and his fellows thereafter and forever?" (p. 96). And it is no far cry from Shelley, with this conscious handling of an old myth, to George Eliot, whose work is the most modern yet vouchsafed us, in that it deals almost altogether with the development and the action of the moral responsibility of the individual. When we have thus seized the sequence of Lanier's argument, most of the apparent want of proportion disappears, and the treatise is seen to possess essential unity. That the idea which gives this coherence is more philosophic and nearer the truth than we can find in the work of any one who has hitherto

considered the history of fiction, is indisputable. And it is equally indisputable that no one can afford hereafter to write of the evolution of the novel, or, indeed, of any important department of literature, without taking account of this book.

Arthur Penn.

Central Park as a Botanical Garden.

THE timely comment in *THE CENTURY* and elsewhere on the proposed removal of the caged animals now located around the old Arsenal building at Sixty-fourth street to the South Meadow of Central Park, and the subsequent assurance in the daily newspapers of the abandonment of that scheme by the Park Commissioners, must have given great satisfaction to all who have New York's beautiful pleasure-ground at heart. If the animals are to have a place anywhere in the Park, by all means let them remain where they are.

It is a disgrace to this great city that we have here neither a zoölogical nor a botanical garden — both so generally regarded as valuable agents of popular education in Europe. While the Central Park is no place for a zoölogical collection, it might easily be made useful, to some extent at least, as a botanical garden; * and to bring this idea before the public is my object in writing this letter.

In walking through any part of the Park, a person at all familiar with plants remarks at once the number and variety of rare and interesting trees and shrubs, both native and exotic, and notices also that kinds before unrepresented are occasionally added; there is abundance of room for many more of these. The number of common indigenous species is also noticeable. At present, however, other than as mere objects of beauty, their value to the non-botanical public is lost from the fact that none of them are named, and the same is true of the herbaceous plants and tender shrubs which are placed along the walks in summer, and in winter removed to the conservatories at Mount St. Vincent. It would be an easy and inexpensive undertaking to affix painted metallic labels bearing the scientific and popular names and habitats to the trees themselves, and to stakes driven in the ground alongside of the shrubs and herbs, adopting one of the many methods employed in the popular botanical gardens of the Old World. This would afford a source of great satisfaction and useful instruction to the thousands who daily visit New York's great breathing-place.

The Torrey Botanical Club and a prominent publishing house of this city are now considering the feasibility of preparing a complete catalogue of the plants in the Park, this catalogue to indicate the position of the rarer species along the walks and drives; and as the consent and coöperation of the Commissioners and gardeners has been obtained, this desirable work will doubtless be accomplished. If the plants could also be labeled, a very valuable addition would be made to the Park's usefulness.

In Europe every city of considerable size has a botanical garden, in some cases owned by societies, in

others under government control. Why should New York not follow their example?

N. L. Britton.

COLUMBIA COLLEGE.

I HAVE read the letter from Professor Britton with much interest. In regard to his plan for labeling the most choice and noteworthy specimens of trees along the walks and drives of Central Park, I would like to make the following comment.

Several years ago I wrote a letter to the "Tribune," which was published at the time, proposing a plan of labeling the trees of Central Park, similar to that of Professor Britton. During the past year, while acting as Superintendent of Planting in the Park, I undertook and carried out such a plan of labeling to the extent of importing from Smith's well-known label manufactories, at Stratford-on-Avon, England, samples and price lists of galvanized iron labels, with the names in raised letters.

Unfortunately, however, I was forced to leave the Park at this juncture, when, of course, my plan of labeling trees fell to the ground.

Samuel Parsons, Jr.

A Practical Suggestion.

NOTHING has been published in *THE CENTURY* of late that has commended itself more pointedly to the religious, or even semi-religious, portion of your readers than Dr. Gladden's "Christian League" articles; and as you have kindly offered an "open" space in your magazine for the benefit of readers who do not pretend to be *writers*, permit me to express my own view, as well as that of many who have, in a large sense, the solution of this great question in their hands.

Many of the calls made in behalf of destitute churches are for aid to a feeble, struggling congregation in some Western village where there are already one or more churches, and they but feeble. But there are two or more families that are starving for a Presbyterian, Congregationalist, Methodist, etc., gospel, and it is our duty to help start another weakling. What is the plain duty of the Christian business men on whom rests the responsibility of determining how long this waste of money, energy, and charity shall continue? Evidently to refuse to give, except when the conditions are in accord with common-sense business principles. Denominational boards, enthusiastic agents, and sentimental namby-pamby peripatetics will plead; but pay no attention. Carry out this programme consistently. Consolidate at home as far as possible; where that is impracticable, adopt the League; but in any case put the cause first, methods second. For many years I have felt Dr. Gladden's plan, and have finally come to the conclusion that if our money must be so scattered to sustain such un-Christian methods, I would withhold. Praying is a burlesque, in the face of such misapplication of our Christian principles.

When my brother banker Franklin returns from England, if he will visit us I will give him hearty welcome.

Again I express my gratitude to Dr. Gladden for

* A century ago there was such an institution in the city, the Hosack Botanic Garden.

his timely and sensible contribution, and assure him of the hearty indorsement of many others.

M. P. Ayers.

JACKSONVILLE, ILLINOIS.

"High License."

TO THE EDITOR OF THE CENTURY:

SIR: SINCE writing of the working of high license in Chicago, I have learned that since July 1, the date on which the law went into effect, some eighteen saloons have taken out licenses in accordance with the

law, four paying \$500 each, and fourteen paying \$150 each, for the privilege of selling wine and beer only. I make this statement in justice to Mr. Schaffer, whose statement that the law is being vigorously enforced refers only to the period following July 1.

The Citizens' League is, however, the only vigorous law-enforcer, and has now several suits against the wine and beer sellers who have been selling spirits as well, but without the spirit license.

Mary B. Willard,

161 LA SALLE STREET, CHICAGO, Feb. 13, 1884.

BRIC-A-BRAC.

Epigram on an Epigram.

YOU recollect there has been sung
A proverb, famous in our tongue,
That he who fights and runs away
May live to fight another day.

Methinks the witty adage erred,
And needs a substituted word,—
For he who fights and runs away
May live to *run* another day.

Ben Wood Davis.

Love's Heritage.

BEND o'er me, blue as summer skies,
The azure splendor of thine eyes,
And smile with lips whose murmur tells,
Like lingering sound of far-off bells
O'er shining seas, that thou for me
Art skies and sound and summer sea!

Skies that contain the sun, the moon,
The stars, the birds, the winds of June;
And tones that, swelling far and near,
Bear more than music to mine ear;
And sea, above whose changeless hue
The sun is bright, the sky is blue!

Art thou my star? Sweet Love, thou'rt more
Than all that ever twilight bore.
Art thou my song? Dear Love, from thee
The whole world takes its melody.
Art thou—nay! what can words impart
To tell one dream of what thou art!

Thou art my all: I know that Love
Rains from the deepening dome above
In silver dew-drops, that the earth
Receives with hushed and solemn mirth:
So thou—all seasons linked in one—
Art flower and bird and breeze and sun!

William M. Briggs.

Aphorisms from the Quarters.

'TAINT no consolation to git chewed up by a fus'-class dog.

De bobbykew takes 'way heap o' bad feelin's.

When a man gits too keerful to was'e his 'tater-peelin's, he' runnin' de thing in de groun'.

Sunday breeches fit bes' when dey been paid for.

De dog-chain tromples on ekal rights.

A po' man out o' wuk is wus orf dan a stray dog, 'cause he got to keep on explainin' his sivation.

'Tis dangerous to hab de rotten round ob de ladder on top.

De norf wind hollers 'fo' it hit you.

De quicksand don't fool you but once.

De rabbit aint pertickler 'bout holes when dehoun's git in sight.

J. A. Macon.

It Was a Lass.

IT was a lass, for love a-seeking,
In every heavy red rose peeking—

Ah, well-a-day!—

To see if there he might be hiding;

And all the while herself a-chiding;

For shame, that she desired him so,

And sought him if she would or no.

Ah, well-a-day!

And when by chance a laddie meeting,
She'd blush, and give him trembling greeting—

Ah, well-a-day!—

And shyly in his eyes be peeping,

To see if Love lay in them sleeping;

And if to wake he 'gan to stir,

And dazzle at the sight of her—

Ah, well-a-day!

It was a lass, for love a-hunting,
So still, for fear of him affronting—

Ah, well-a-day!

At last, one eve, with tears and sighing,

She spied him in her own heart lying,

And nowhere else, fore'er and aye—

Ah, well-a-day,

Ah, well-a-day!

Mary E. Wilkins.

Eheu! Fugaces.

SWEET sixteen is shy and cold,
Calls me "sir," and thinks me old;
Hears in an embarrassed way
All the compliments I pay;

Finds my homage quite a bore,
Will not smile on me, and more
To her taste she finds the noise
And the chat of callow boys.

Not the lines around my eye,
Deepening as the years go by;
Not white hairs that strew my head,
Nor my less elastic tread;

Cares I find, nor joys I miss,
Make me feel my years like this:—
Sweet sixteen is shy and cold,
Calls me "sir," and thinks me old.

Walter Learned.

A Cheerful Spirit.

I'm a hopeless, unfortunate creature,
I'm tortured with sorrow and pain,
I'm twisted in figure and feature;
However, I never complain.

My wife is a termagant truly,
She treats me with scorn and disdain,
My children are bad and unruly;
However, I never complain.

My business is sadly declining,
My efforts to prosper are vain,
I've reason for constant repining;
However, I never complain.

I'm neglected by friends and relations,
The snubs which I oft entertain
Might justify loud protestations;
However, I never complain.

This fact will attract your attention,
And this I will always maintain,
Of my woes I make *casual* mention;
However, I never complain.

Stanley Wood.

The Quatrain.

THE world is wide, and thronged with books and men;
What will it be a thousand years from this?
Round a great thought in four strokes of thy pen,
If thou wouldst have thy fame, cross that abyss.

The Couplet.

SMALL as I am, it may be just my strength
Shall keep thy name from perishing at length.

A Dumb Beauty.

HERE is a woman peerless in repose;
All gaze at her, and yet she speaks to none.
Scent is the *voice* of flowers—lo! a rose
Perfect in shape and color, lacking one.

Charlotte Fiske Bates.

The Lion's Government.

A RUSSIAN FABLE.

A LION, who on state affairs was set,
Looked round about to form his cabinet.
A court, and legislature too, was sought,
For which the elephants to him were brought;
But, finding them so few and incomplete,
The asses too were summoned to a seat,
By which the government, as it appears,
Found its majority in donkeys' ears!

The lion-king was foolish, one would say,
To scatter offices in such a way;
For no one, surely, knew so well as he
That strength goes not with mere majority.
But in this way his fathers ruled before,
And what had been must be for evermore;
The heresy he hated to incur
Was to be wiser than his fathers were.
If folly in numbers wisdom far surpasses,
He should have folly and the herd of asses!

And then, thought he, the elephants' discourse
Will neutralize the stupid asininity,
For wisdom is, of course, superior force,
And with such denseness has no true affinity;
But, oh! the asses' folly took the lead,
The elephants nobody cared to heed.
This shows how such a rule all hope harasses—
The elephants themselves grew dull as asses!

Joel Benton.

Ballade of a Swell.

HIS forehead he fringes and decks
With carefully cut Montagues;
He angles his arms semi-X,
And dresses in delicate hues;
His haunts are the rich avenues;
Staccato is somewhat his gait;
It takes but a wink to amuse
His sadly impoverished pate.

His costumes are covered with checks;
He travels in taper-toed shoes
Through Vanity Fair, there to vex
The silly young heart that he woos;
He's clever with cards and with cues,
And banters with Fortune and Fate:
Alas, that the lad cannot lose
His sadly impoverished pate!

He's fond of the frivolous sex;
His light conversation he strews
With "toffy"; aught else would perplex
The topic his fancy pursues;
The cud of contentment he chews,
While women and wealth on him wait;
And nature with nothing endues
His sadly impoverished pate.

ENVOY.

Fair princesses, all who peruse
This ballade, beware ere too late,
Lest Opulence hear you abuse
His sadly impoverished pate!

Frank Dempster Sherman.
